

Thermodynamique des Processus Irréversibles
Quiberon, 16-22 sept. 2018

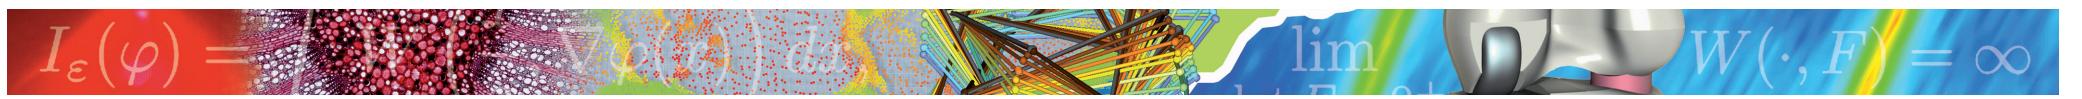

7ème école d'été de mécanique théorique

Effets de couplage et effets dissipatifs accompagnant la déformation des matériaux solides

(2^{ème} partie)

André Chrysochoos
LMGC, UMR 5508 CNRS-UM

Programme

1 - Cadre thermomécanique et bilan d'énergie
(TPI-MSG)

2 - Quelques éléments rhéologiques à la sauce MSG
(d'une vision mécanique à vision thermomécanique)

3 - Analyse expérimentale des bilans d'énergie
(imagerie quantitative)

4 - Effet du temps : couplage thm et/ou viscosité ?
(interaction forte et/ou irréversibilité)

5 - Effet dissipatif dans les métaux
(fatigue : HCF & VHCF)

$$I_\varepsilon(\varphi) = \int_{\mathbb{R}^n} V(\varphi(x)) dx + \lim_{\eta \rightarrow 0^+} W(\cdot, F) = \infty$$

- 3 -

Analyse expérimentale des bilans d'énergie (imagerie quantitative)

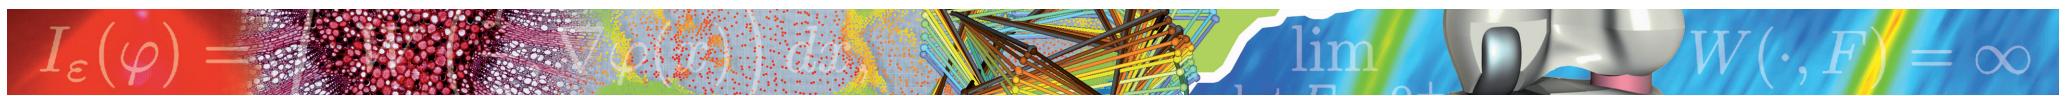

Motivations – stratégie

Observer les effets cinématiques, thermiques et calorimétriques accompagnant le processus de déformation.

Utilisation combinée de techniques de corrélation (DIC)
et de thermographie (IRT)

Domaine d'activités : « Quantitative imaging techniques – full field measurements »

DIC - Mechanics	IRT - Thermodynamics
- displacement fields	- temperature fields
- strain and strain rate,	- heat source (via the heat equation)
- kinetic energy rate	- intrinsic dissipation
- deformation energy rate	- coupling heat sources

Thermomécanique expérimentale

Très bref historique ...

1805, Gough, caoutchouc naturel

... 1857, Joule, métaux vs. caoutchouc, µcalorimètre (a)

... 1900, Charbonnier & Galy Aché, métaux en compression + µcalorimètre

... 1933, Taylor & Quinney, 1933, métaux en torsion → µcalorimètre

... 1965, Scanner IR Agema IR Systems

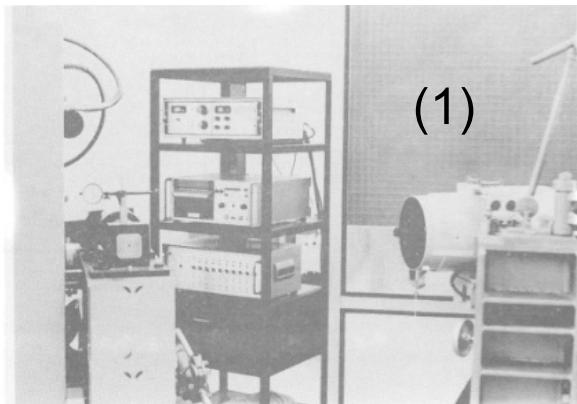

1975, J.J. Moreau, P. Germain, Q. S. Nguyen & B. Halphen, MSG/TPI

... 1976, Saix, XC38, flexion, radiomètre (1)

... 1978, naissance de FLIR

... 1982, LMA, Thèse de P. Brémond, fatigue, fissure, PVC, Aga 780 (2)

1982, Lemaître & Chaboche, Greco 47 GDE

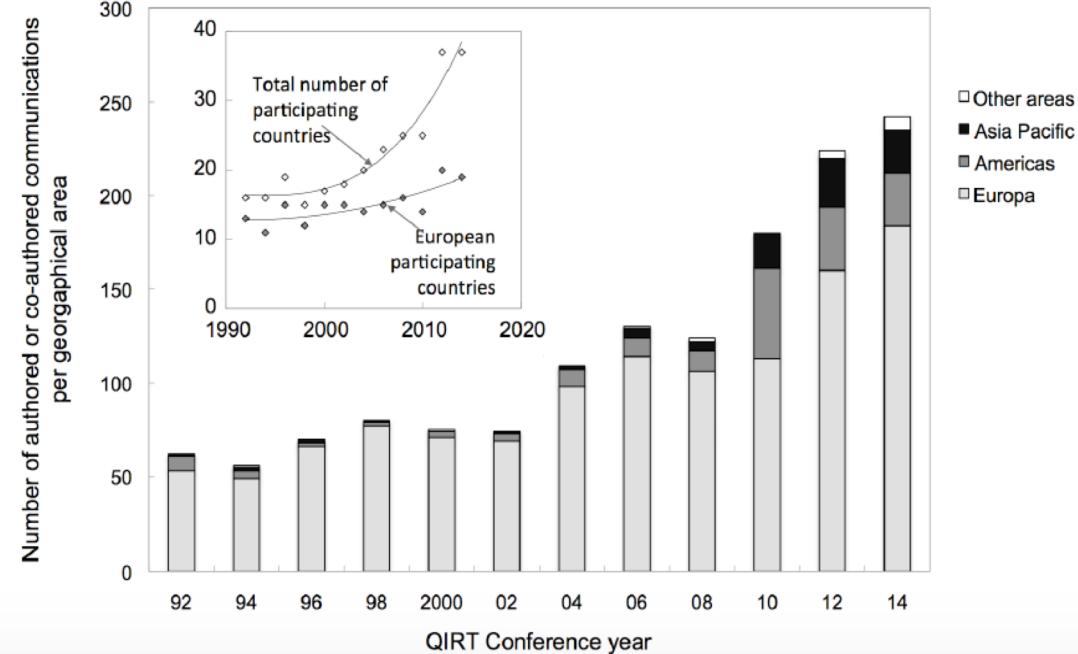

(a) (Joule, 1857) J.P. Joule, On some thermodynamic properties of solids, *Phil. Mag. 4th Ser.* **14**, p.227 (1857)

Très bref état des lieux ...

1992

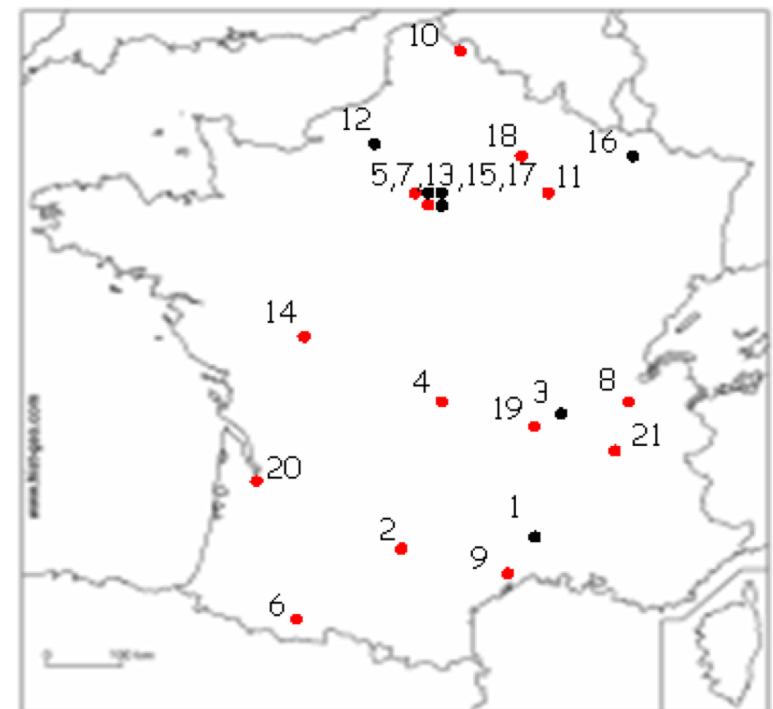

Quantitative InfraRed Thermography

2003-2014

Renouvelé 2 fois !

$$I_\varepsilon(\varphi) = \int_{\mathbb{R}^n} V(\varphi(x)) dx - \frac{1}{2} \int_{\mathbb{R}^n} |\nabla \varphi|^2 dx + \frac{\lambda}{4} \int_{\mathbb{R}^n} \varphi^4 dx$$

Exemple de dispositif expérimental

Vue d'ensemble d'un dispositif

Utilisation combinée de la «DIC» et de la «IRT»

image de granularité

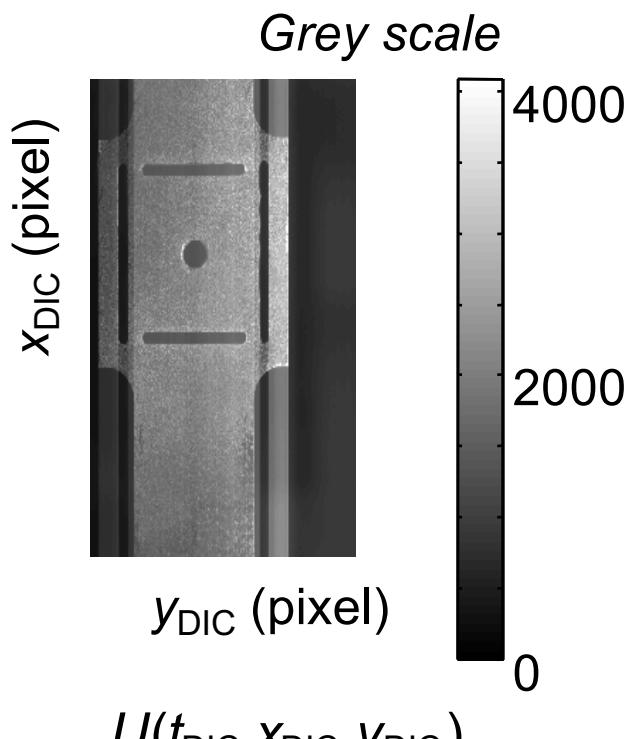

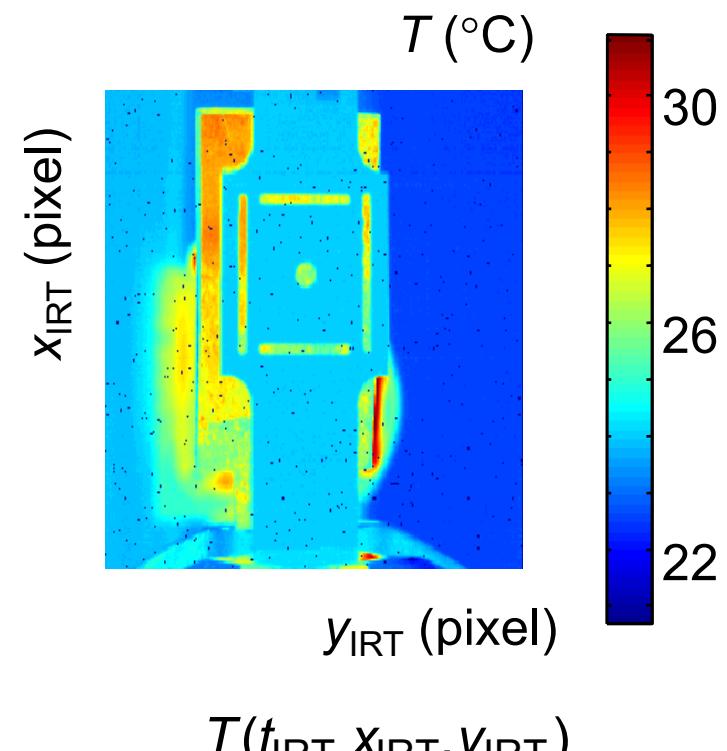

image infrarouge

t_{DIC}

$(x_{\text{DIC}}, y_{\text{DIC}})$

Synchrocam (*)

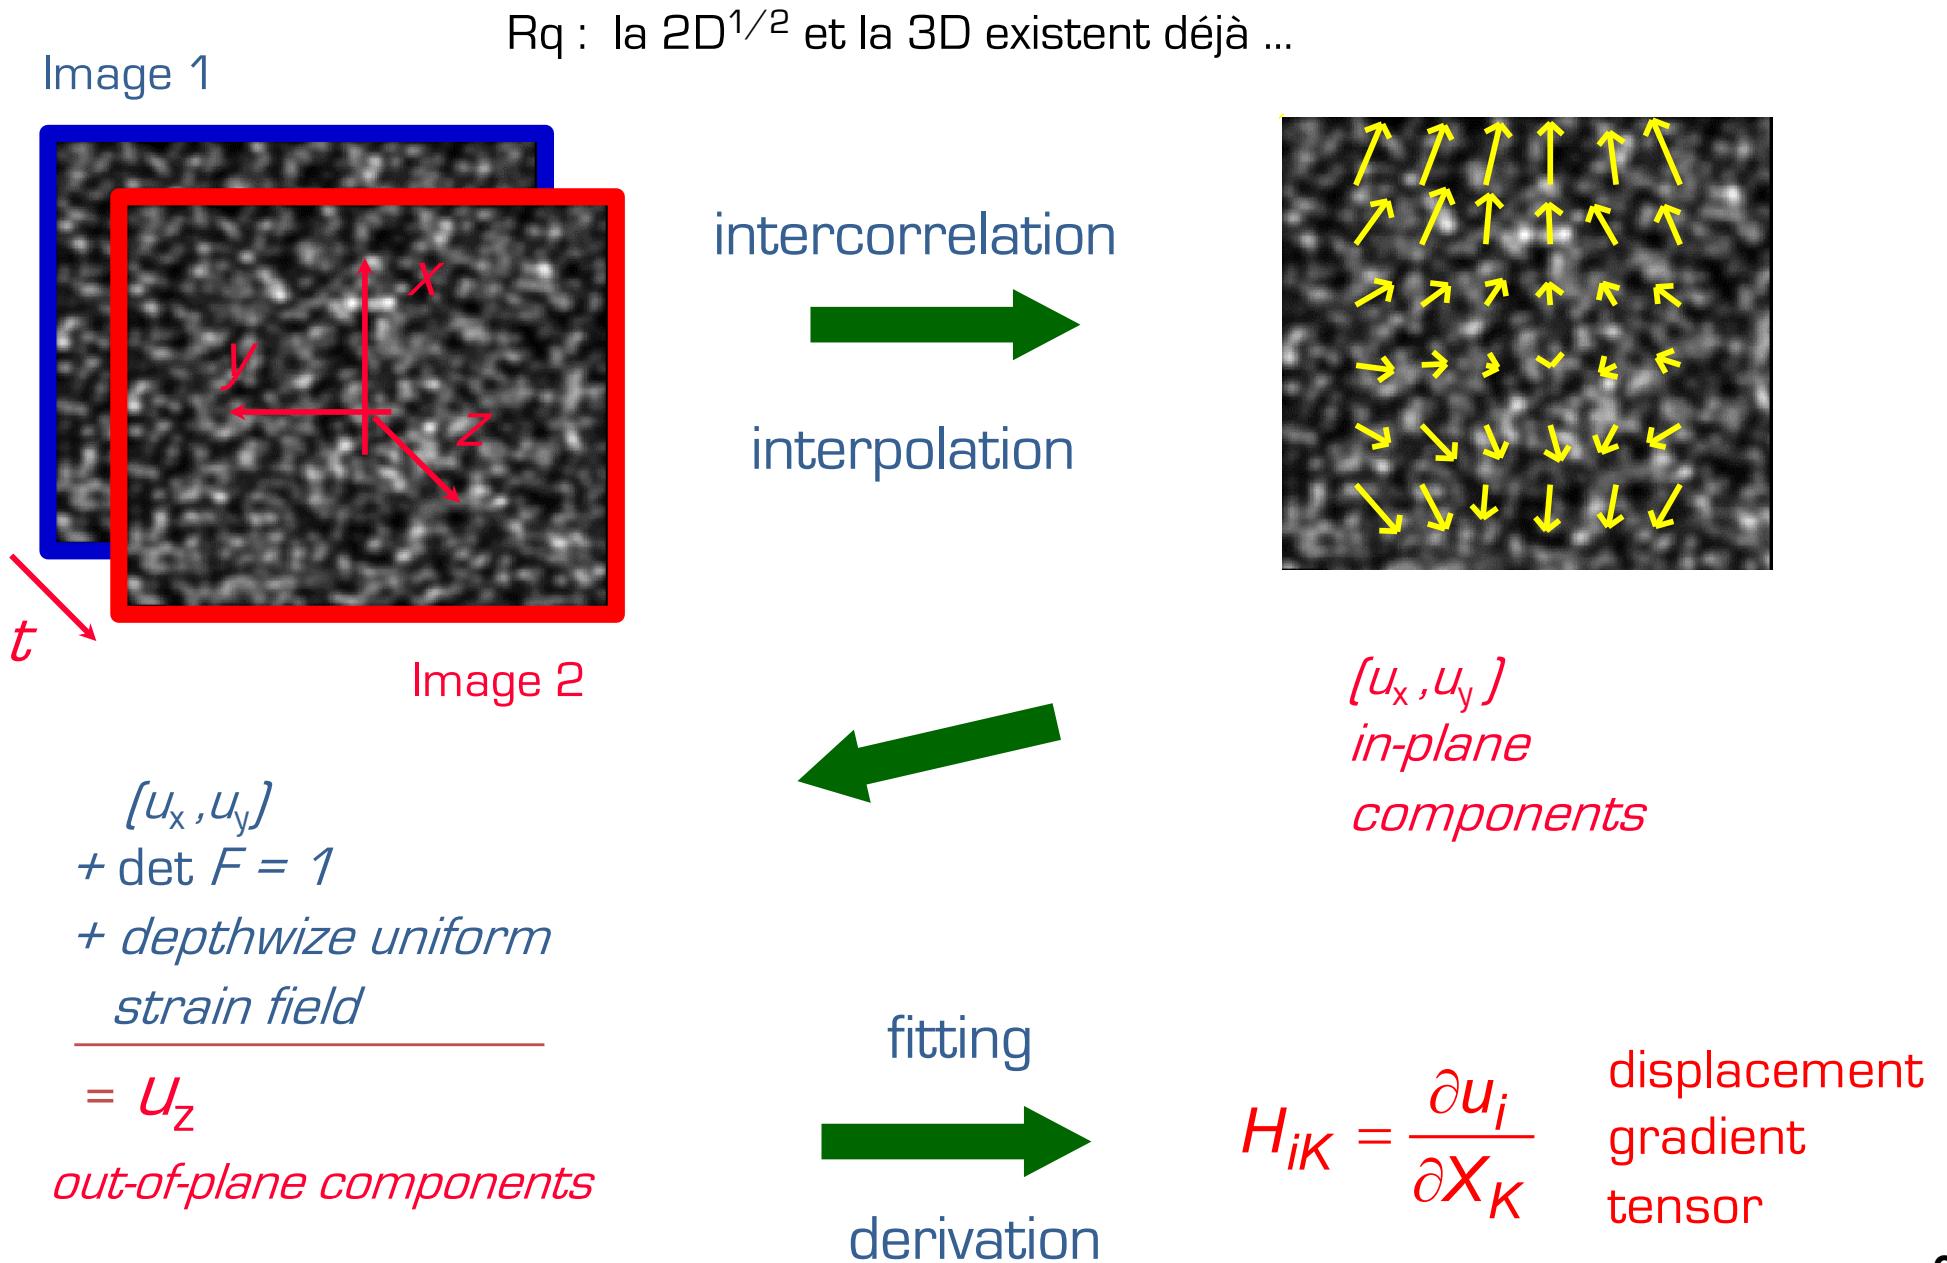

cible

t_{IRT}

$(x_{\text{IRT}}, y_{\text{IRT}})$

Correspondance entre données cinématiques et thermiques

Quelques mots sur la DIC (2D)

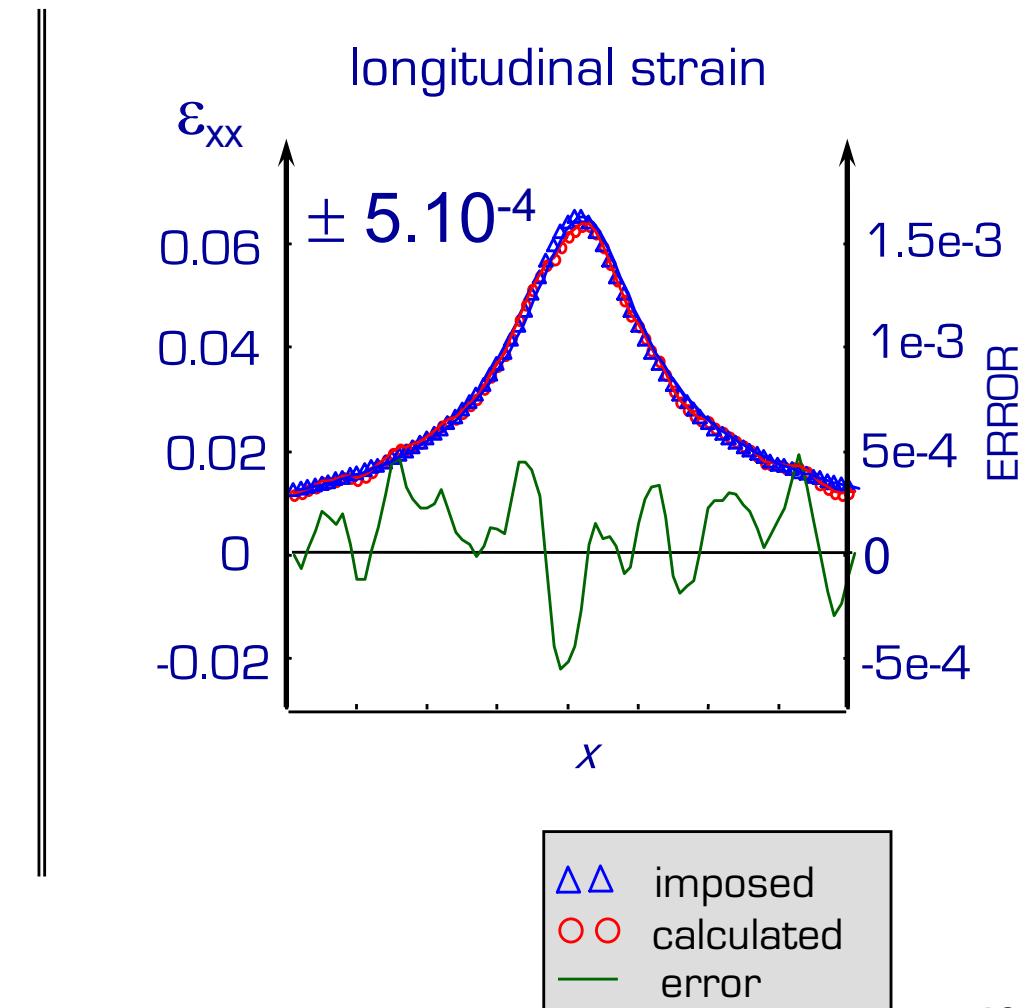

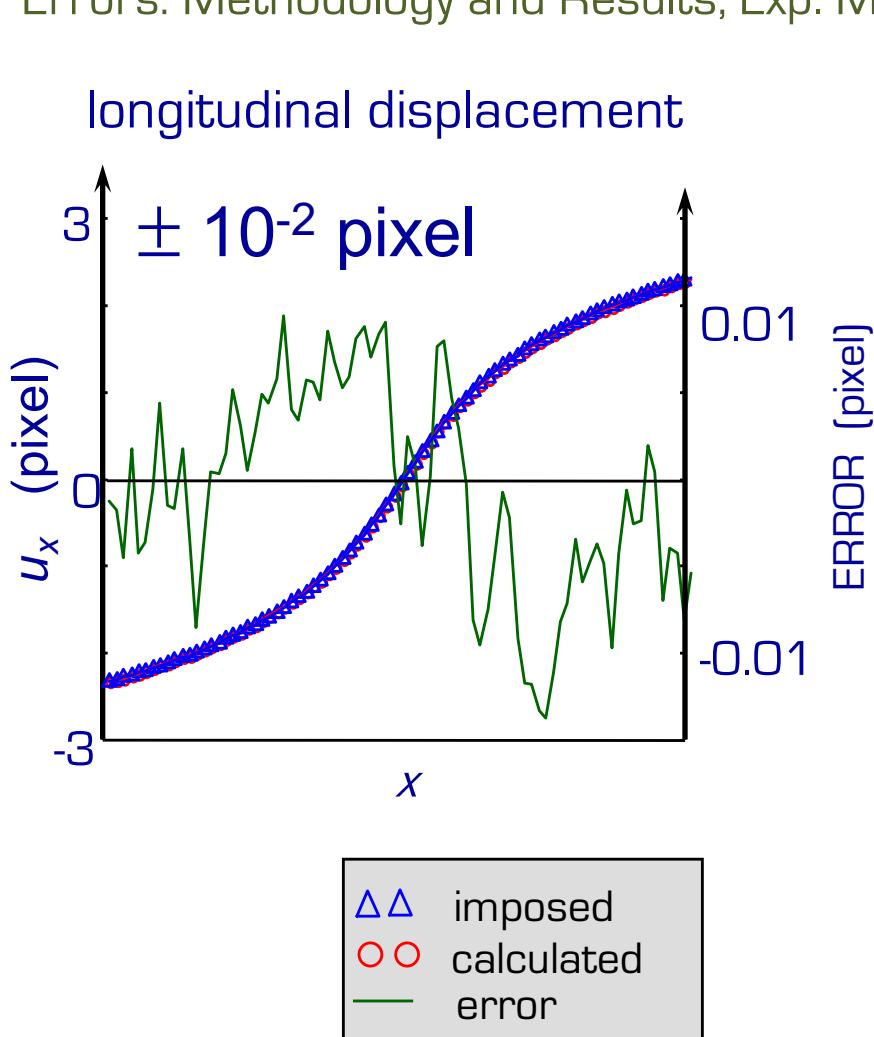

DIC (2) : précision des mesures cinématiques

Utilisation d'images de granularité « artificielles »

Champ de déplacements donné

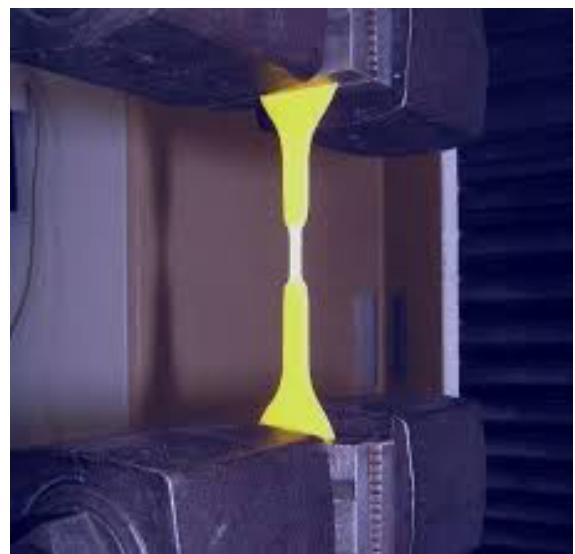

[Bornert et al., Assessment of Digital Image Correlation Measurement Errors: Methodology and Results, Exp. Mech., 2009] - Prix SEM 2011.

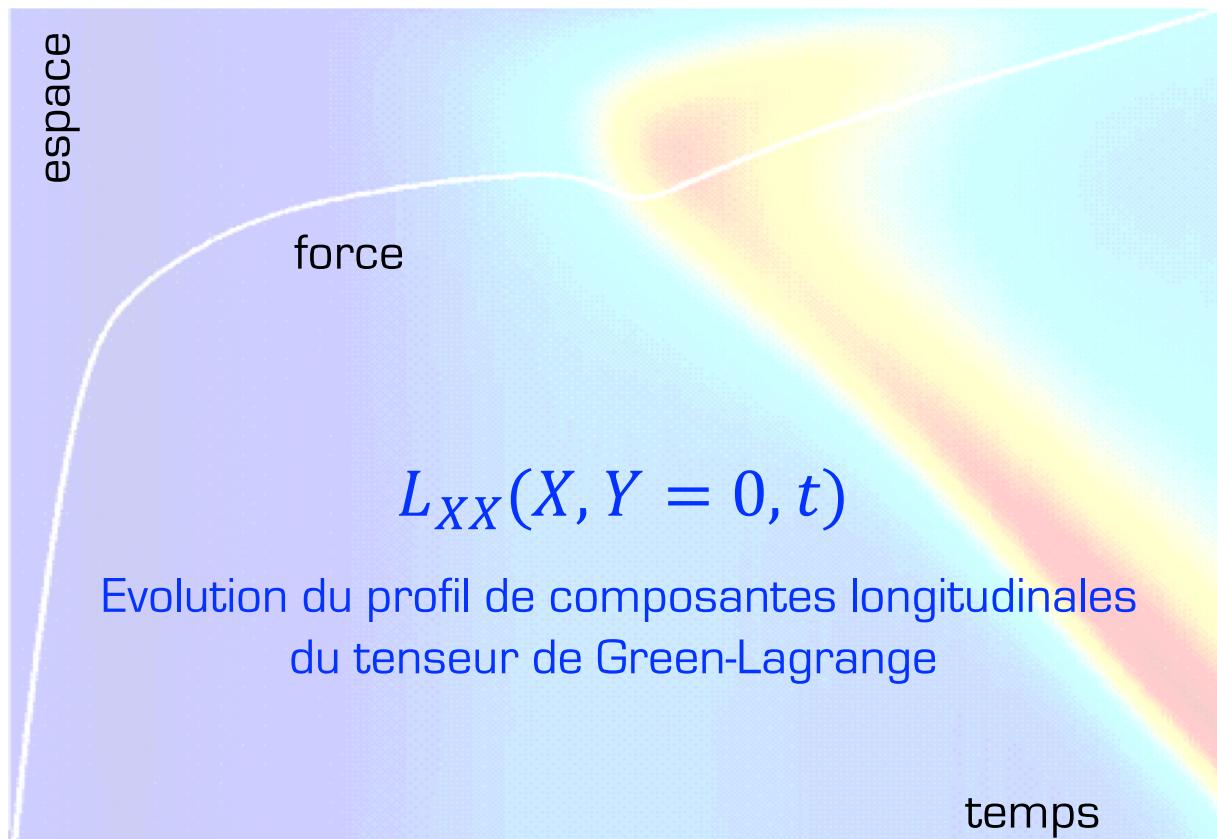

$$I_\varepsilon(\varphi) = \int_{\Omega} V_\varepsilon(\varphi) \, dx \quad \lim_{\varepsilon \rightarrow 0^+} I_\varepsilon(\varphi) = W(\cdot, F) = \infty$$

Un exemple de champ 1D au cours du temps

PA11 : thermoplastique semi-cristallin
propagation de lèvres de striction

Allongement de la zone
« strictionnée »

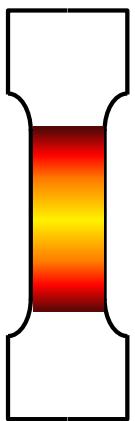

[Muracciole et al., Strain (2008)]

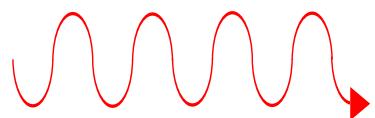

Un minimum de radiométrie IR

Objectif : mesurer des températures de surface pour estimer les sources de chaleur

cible rayonnante

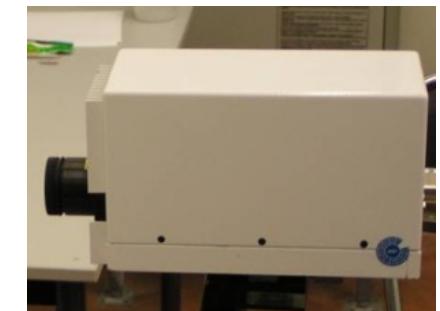

atmosphère

rayonnement I.R.

détecteur IR

$$\Delta_\lambda = 3-5 \mu\text{m} / 4-8 \mu\text{m} / 8-12 \mu\text{m}$$

Moyen : caméra IR matricielle

détecteur : délivre un signal électrique (V) lié à la puissance rayonnée (W)

émittance : flux global émis par la cible par unité de surface (W.m^{-2})

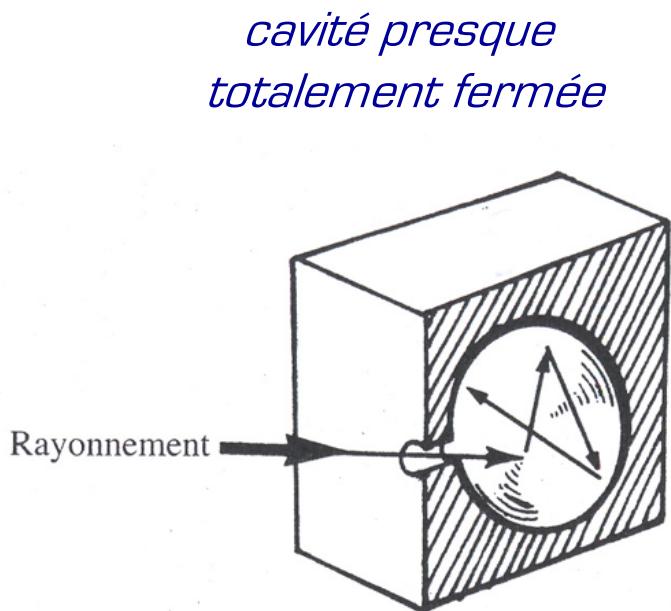

... pour une bande passante donnée

$$R = \int_{\Delta_\lambda} \frac{\partial R(\lambda, T)}{\partial \lambda} d\lambda$$

émittance spectrale
varie avec T !

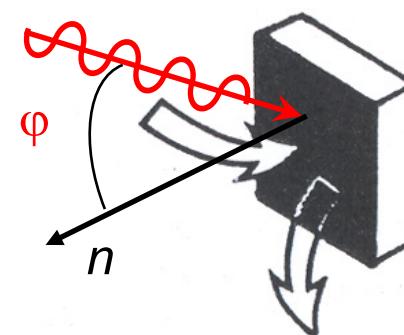

Une situation sympa ...

- **Cible** : corps noir capable d'absorber tout rayonnement incident, $\forall \varphi, \forall \lambda$,
(i.e. pas de réflexion, pas de transmission)

[G. Gaussorgues, TEC & DOC, 99]

revêtement absorbant parfait ()*

(*) peinture noir mat ...
Pub.: 3M velvet coating

- **Atmosphère** : petite distance, air sec, transparent aux IR, transmission parfaite.
(i.e. ce qui est émis par la cible, est reçu par le détecteur)

... où s'appliquent directement les lois du rayonnement

- Loi de Planck

$$\frac{\partial R_{cn}(\lambda, T)}{\partial \lambda} = \frac{2\pi h c^2 \lambda^{-5}}{\exp(\frac{hc}{\lambda k T}) - 1}$$

R : exitance spectrale, W.m^{-3}

h : Planck, $6,66 \cdot 10^{34}$ J.s

k : Bolzmann, $1,38 \cdot 10^{23}$ J.K^{-1}

c : lumière, $3 \cdot 10^8 \text{ m.s}^{-1}$

T : température, K

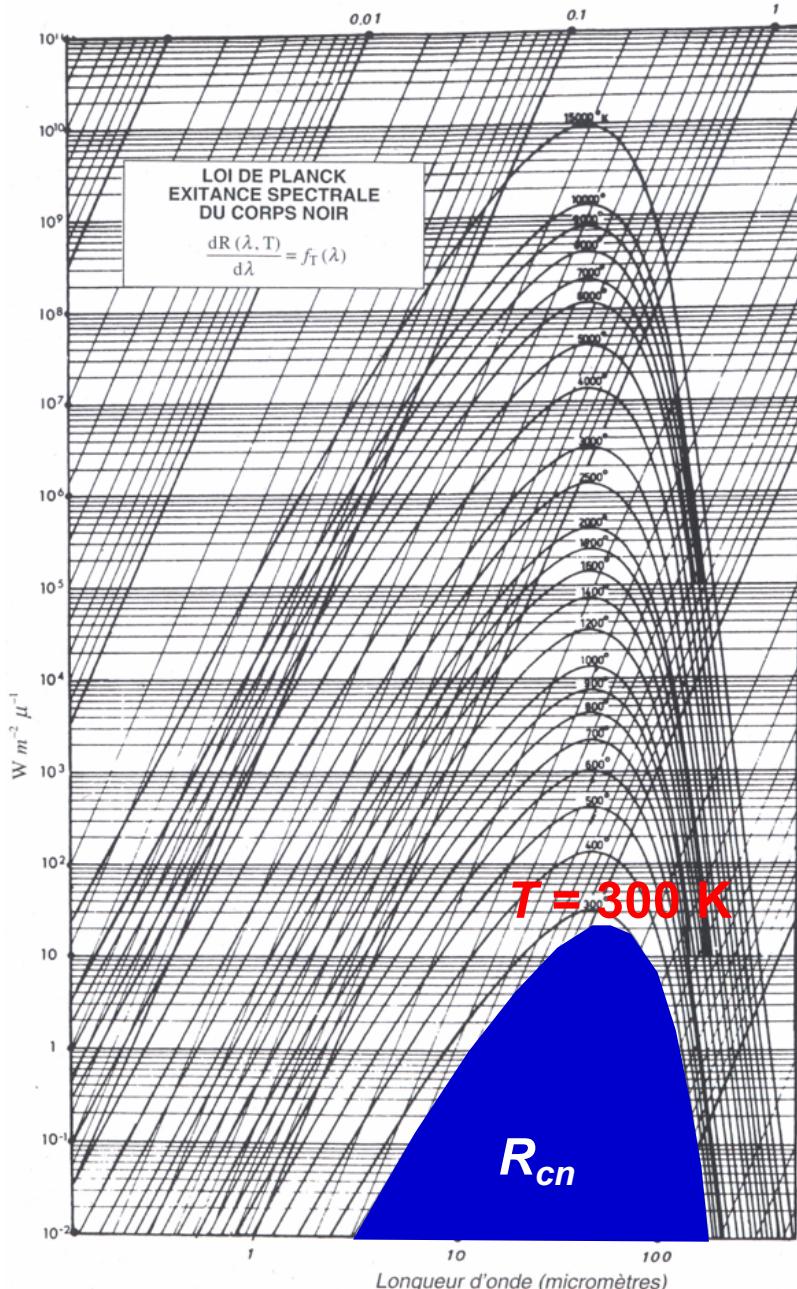

- Loi de Stefan-Boltzmann

$$R_{cn} = \sigma_s T^4$$

σ_s : constante de Stephan

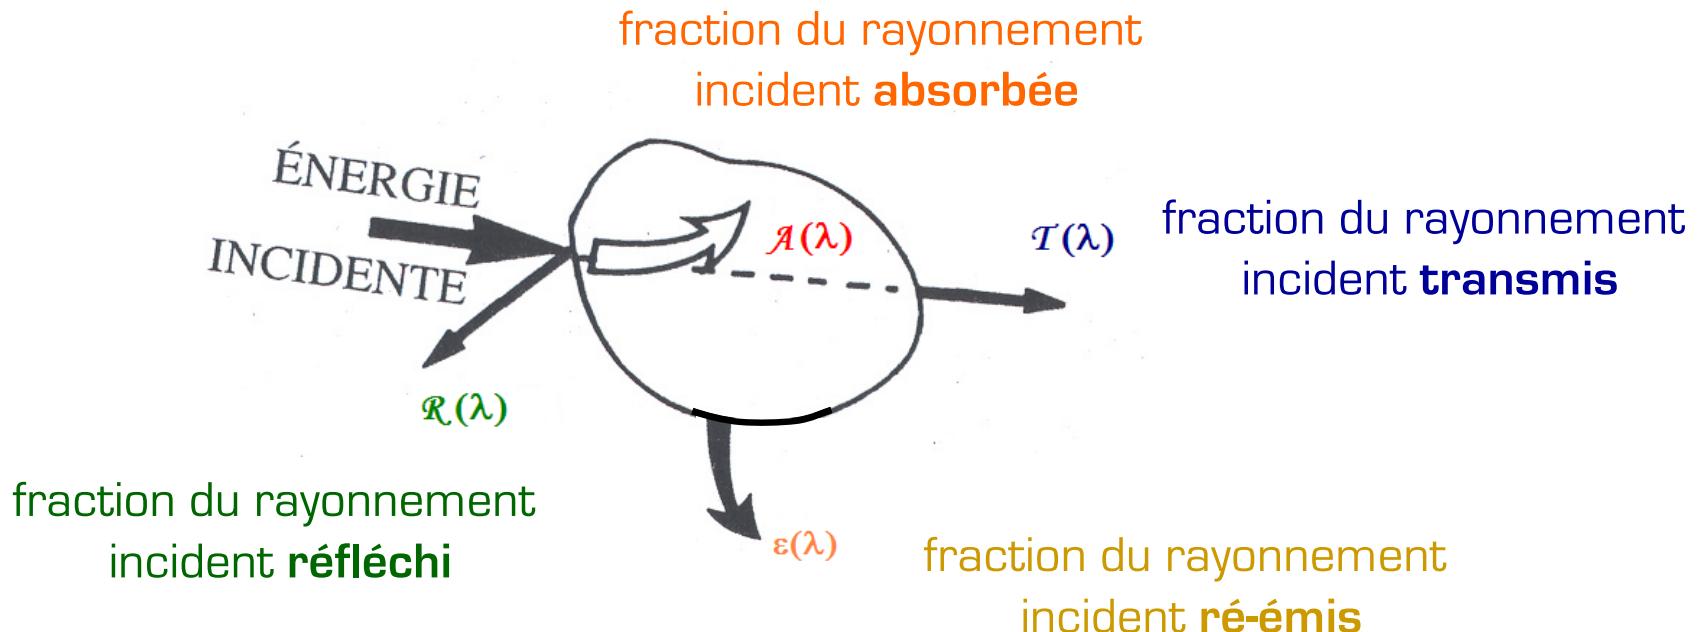

$$\sigma_s = \frac{2\pi^5 k^4}{15c^2 h^3} = 5,67 \cdot 10^{-8} \text{ W.m}^{-2}.K^{-4}$$

[G. Gaussorgues]

$$I_\varepsilon(\varphi) = \int_{\mathbb{R}^d} V_\varepsilon(\varphi(x)) dx \quad \lim_{\varepsilon \rightarrow 0^+} I_\varepsilon(\varphi) = W(\cdot, F) = \infty$$

Cible et environnement quelconques ...
... ça se complique un peu !

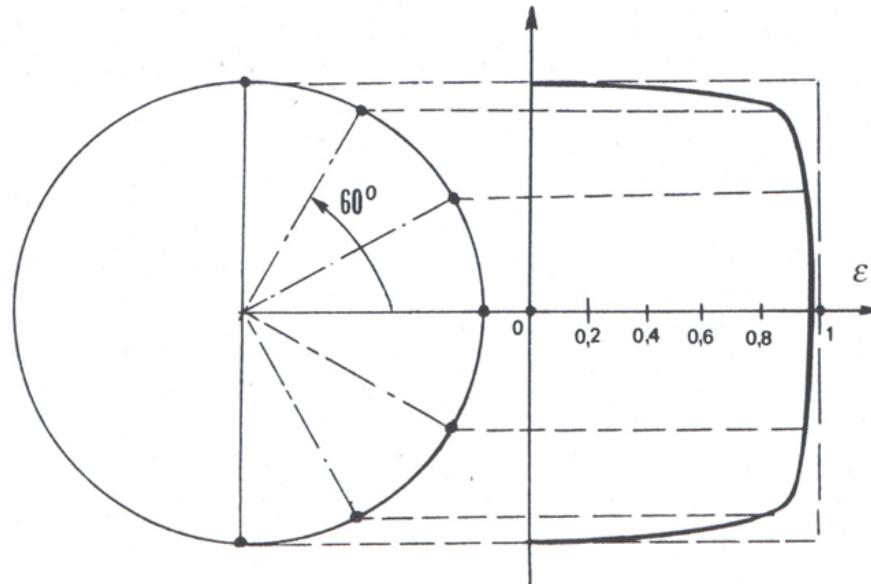

- conservation de l'énergie $\mathcal{A}(\lambda) + \mathcal{R}(\lambda) + \mathcal{T}(\lambda) = 1$

- équilibre « thermodynamique » ... $\mathcal{A}(\lambda) = \epsilon(\lambda)$

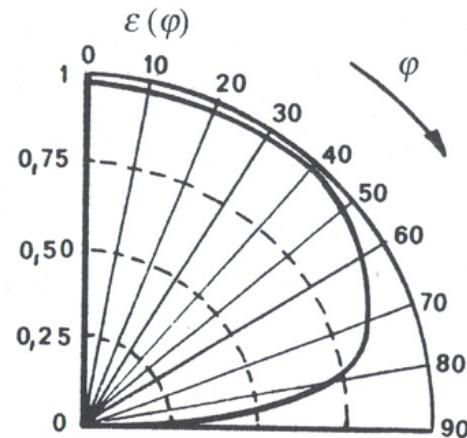

$$I_\varepsilon(\varphi) = \lim_{\Delta\lambda \rightarrow 0} \frac{1}{\Delta\lambda} \int_{\Delta\lambda} V_\varepsilon(\varphi) d\lambda \quad W(\cdot, F) = \infty$$

Rôle de l'incidence du rayonnement

émissivité : fonction de l'incidence

ε : émissivité

φ : angle observation

émissivité de l'eau à $\lambda=10 \mu\text{m}$

Jusqu'à 45-50 degrés, corps lambertiens ... $\partial\varepsilon/\partial\varphi \approx 0$

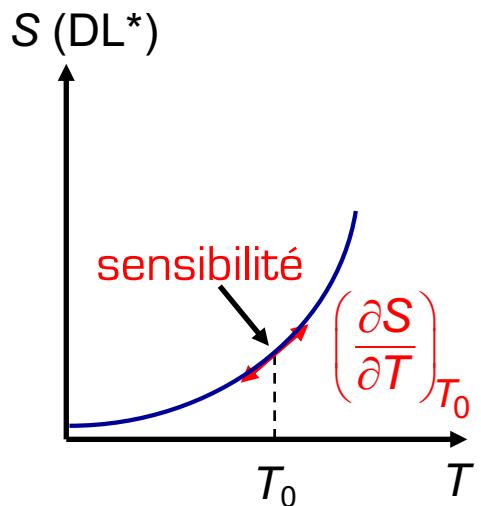

Risque faibles : éprouvettes planes \perp axe optique de la caméra
+ corps gris à forte émissivité (peinture)

$$R_{\Delta\lambda}(T) \approx \varepsilon R_{cn_{\Delta\lambda}}(T)$$

Une caméra IR en quelques chiffres

Cedip MW (4-8 μm)

(*) DL : digital level

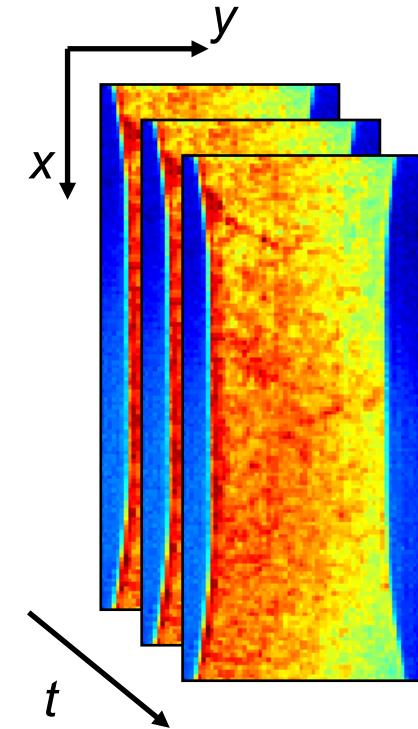

Image : 320×240 pixels

Codage : 14 bits

Fréq. Acq. : 50 images/seconde

Résolution spatiale : 100 μm/pix

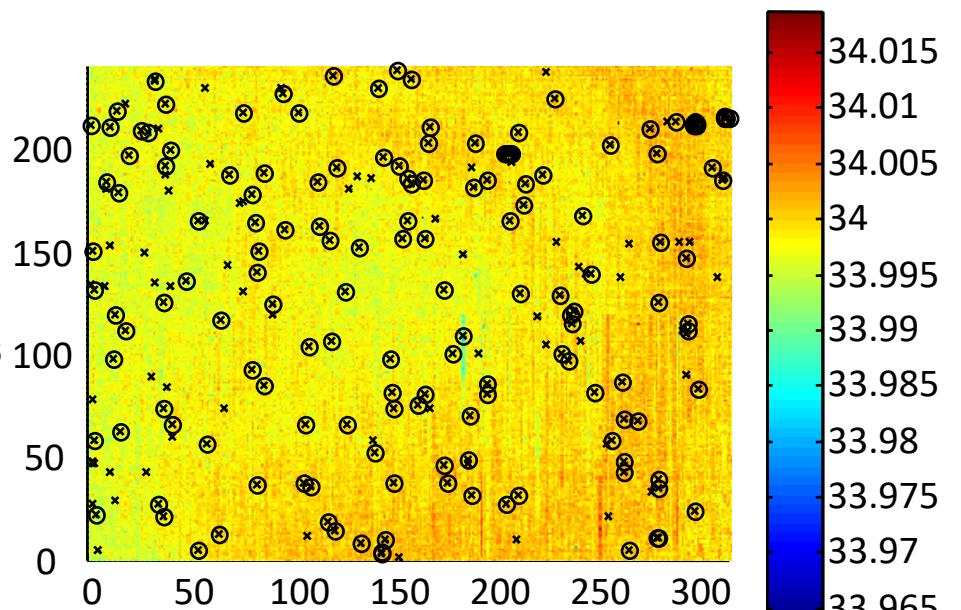

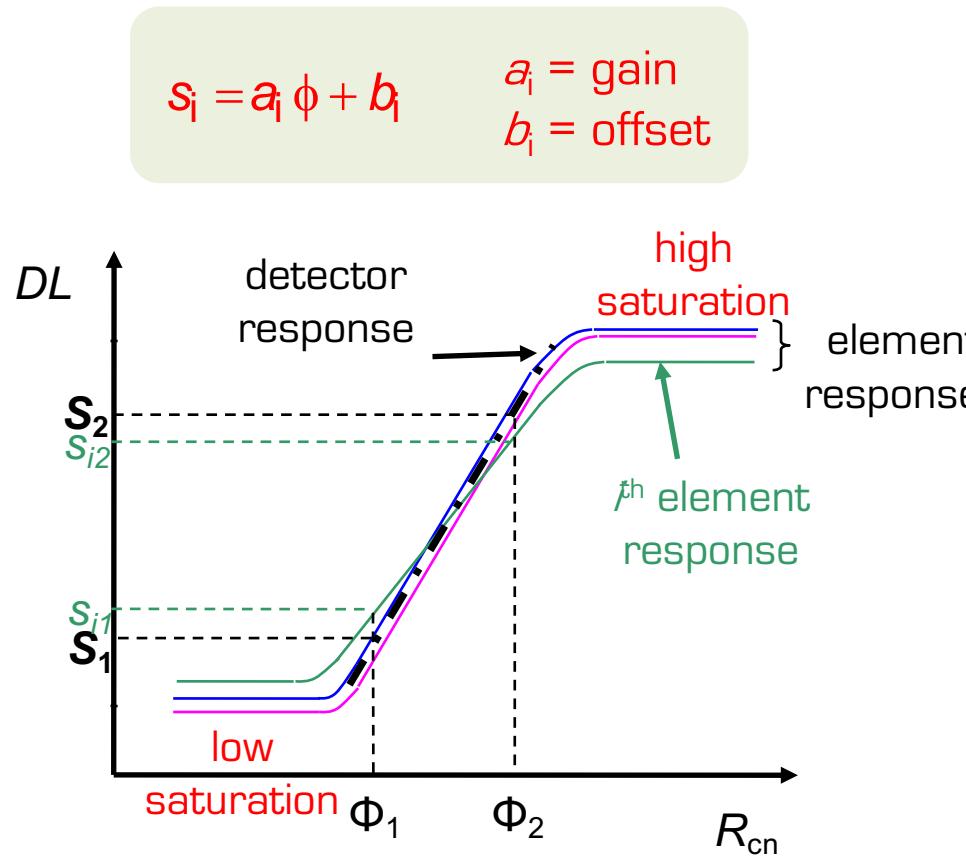

NETD : 20 mK à l' ambiante

NETD : [noise equivalent temperature difference]
Différence de Température Équivalente à la valeur efficace du bruit mesuré sur le thermosignal.

Etalonnage : constructeur

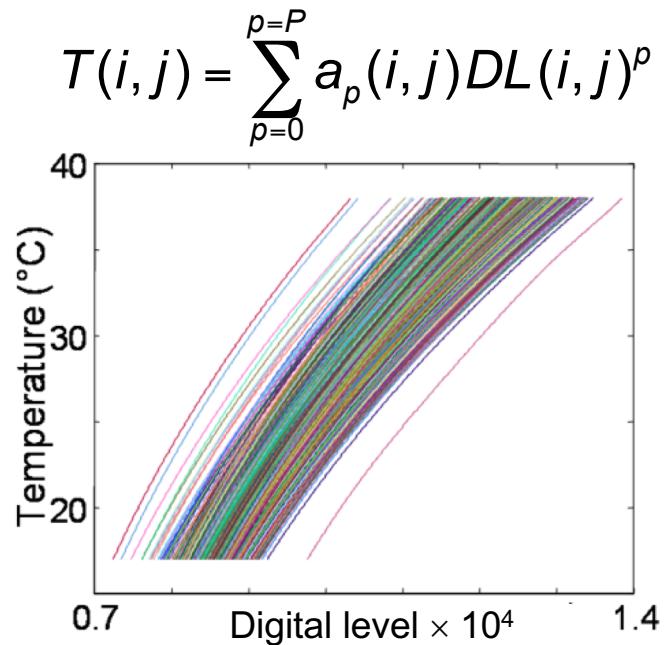

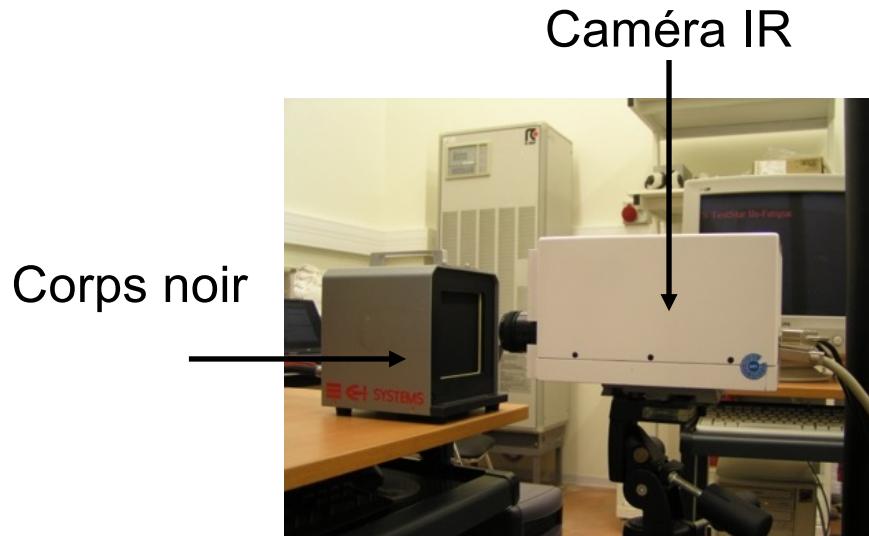

- 2 scènes thermiques uniformes (Φ_1 et Φ_2)
feuille blanche + main ...
- 50 % de la dynamique des capteurs (partie linéaire)
- opérations NUC et BPR

Etalonnage : laboratoire

Calibration pixel à pixel [Honorat et al., QIRT 2005]

- nécessité d'un corps noir plan (20 mK) + 30 k€ (+ 40-120 k€ de caméra !)
- stabilité thermique de la caméra (4-5 h) et de la salle d'essai ...
- étalonnage pixel à pixel (polynôme de degré 5)
- précision 20 mK et plus de remplacement de «bad pixel»
- à refaire dès que l'on modifie un paramètre (temps d'intégration, taille des images, objectif, ...)

Estimation des sources de chaleur

Equation de la chaleur moyennée suivant l'épaisseur d'un éprouvette mince et plate

$$\rho C \left(\frac{\partial \bar{\theta}}{\partial t} + v_x \frac{\partial \bar{\theta}}{\partial x} + v_y \frac{\partial \bar{\theta}}{\partial y} + \frac{\bar{\theta}}{\tau_{th}} \right) - k \left(\frac{\partial^2 \bar{\theta}}{\partial x^2} + \frac{\partial^2 \bar{\theta}}{\partial y^2} \right) = \bar{w}_h.$$

1980-90

- *Estimation directe de sources en utilisant des données discrètes et bruitées*

- Le traitement d'image a évolué avec les performances des caméras

- *Estimation d'opérateur aux dérivées partielles*

caméra mono-détecteur

- projection des données thermiques sur une solution spectrale analytique [1990]

caméra à matrice de détecteur

- outils de Fourier, filtrage convolutif, prolongement périodique (2000)
- lissage local par moindres carrés (2004)
- POD: préfiltrage des données thermiques (1D : 2014 - 2D : 2017)

$$I_\varepsilon(\varphi) = \lim_{\delta \rightarrow 0^+} \frac{1}{\delta} \int_{\mathbb{R}^d} \nabla \varphi(x) \cdot \nabla \varphi(x) dx$$

Thm analysis of a monotonous tensile test on steel

[AC et al., JoMMS, 2009] from slide #21 to #34

❖ Material - sample

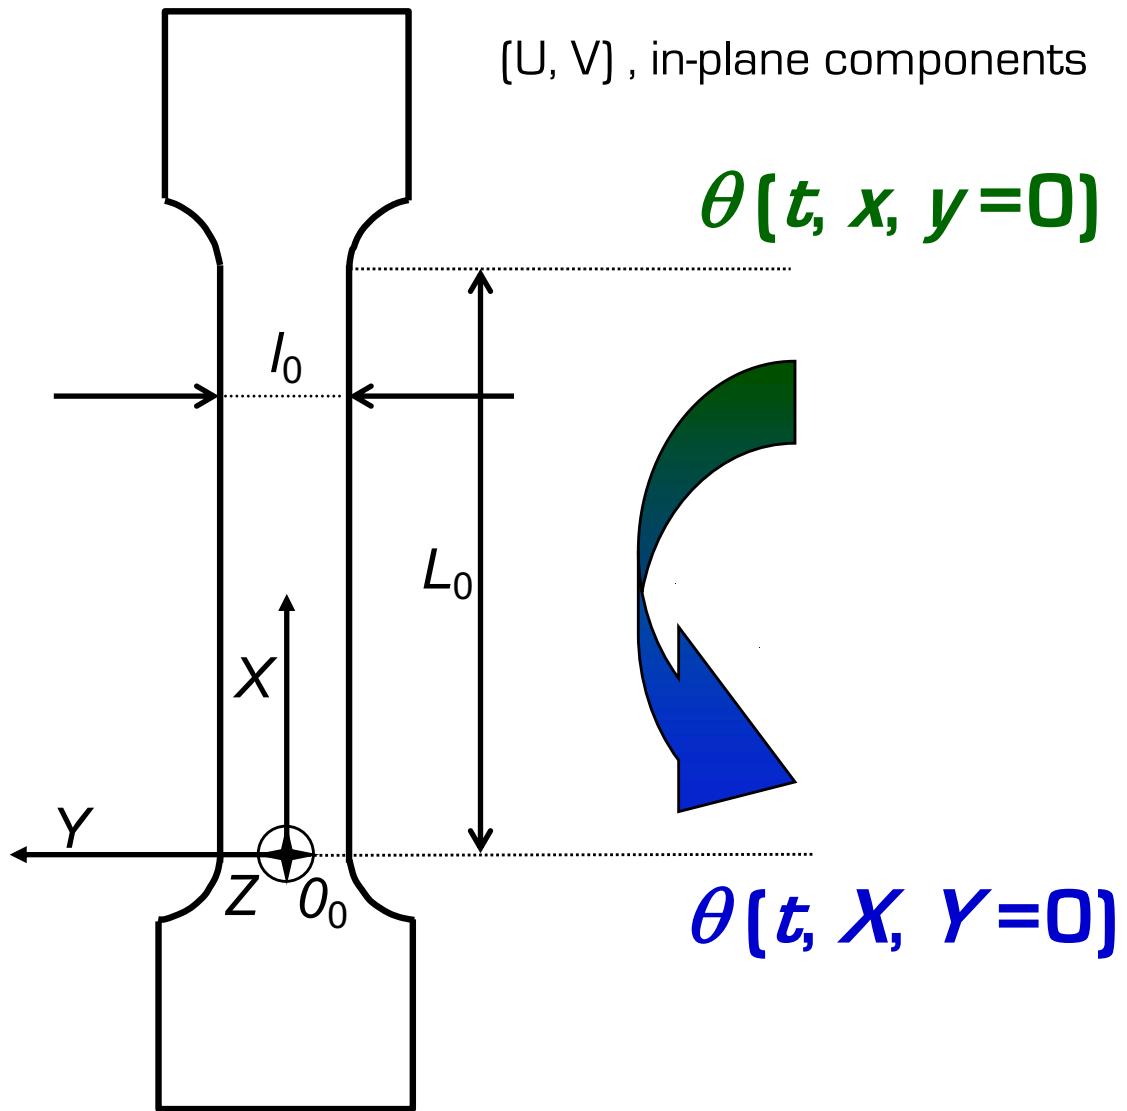

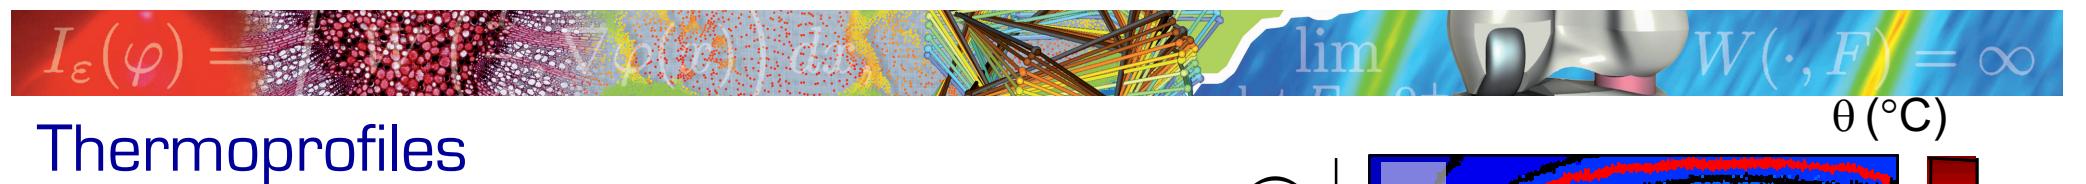

- IF Ti steel (Arcelor-Mittal)
- steel generally used in metal forming (deep drawing)

	C	Mn	P	S	Si	Al	N	Ti
% (w)	0.003	0.15	0.007	0.007	0.007	0.02	0.003	0.06

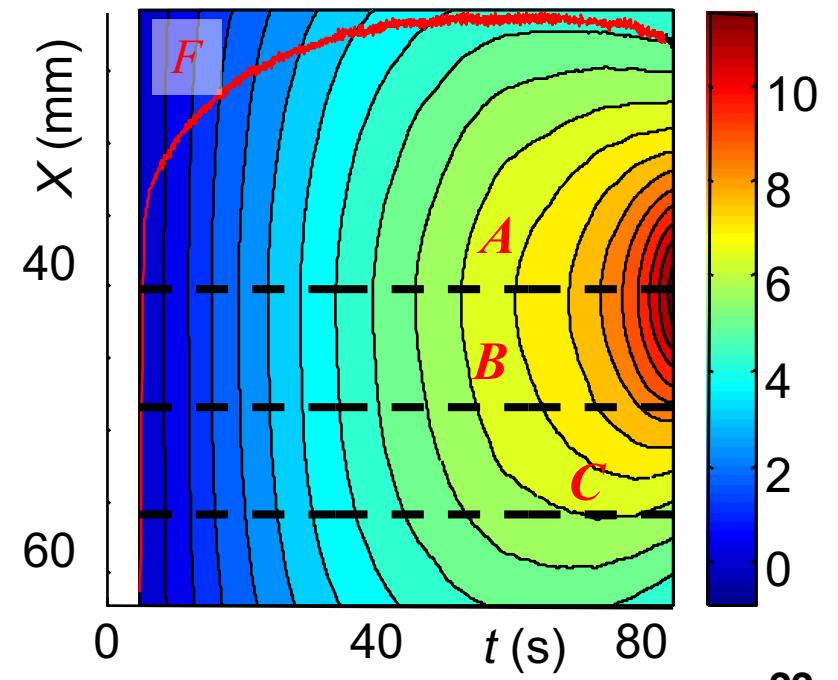

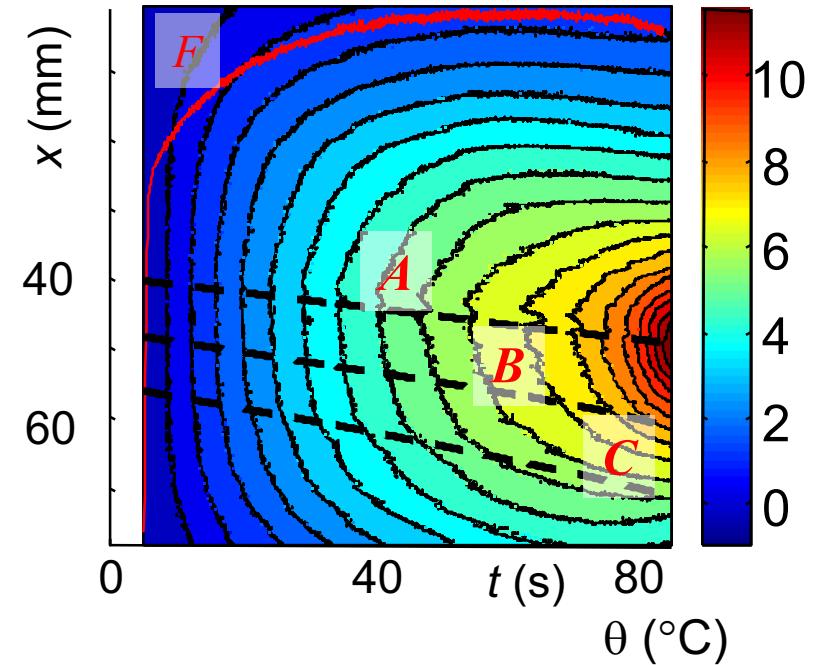

- $\rho = 7800 \text{ kg.m}^{-3}$, $C = 480 \text{ J.kg}^{-1}\text.{}^\circ\text{C}^{-1}$, $k = 60 \text{ W.m}^{-1}\text.{}^\circ\text{C}^{-1}$
- thin flat samples: $50 \times 12.5 \times 0.3 \text{ [mm}^3]$

❖ Test

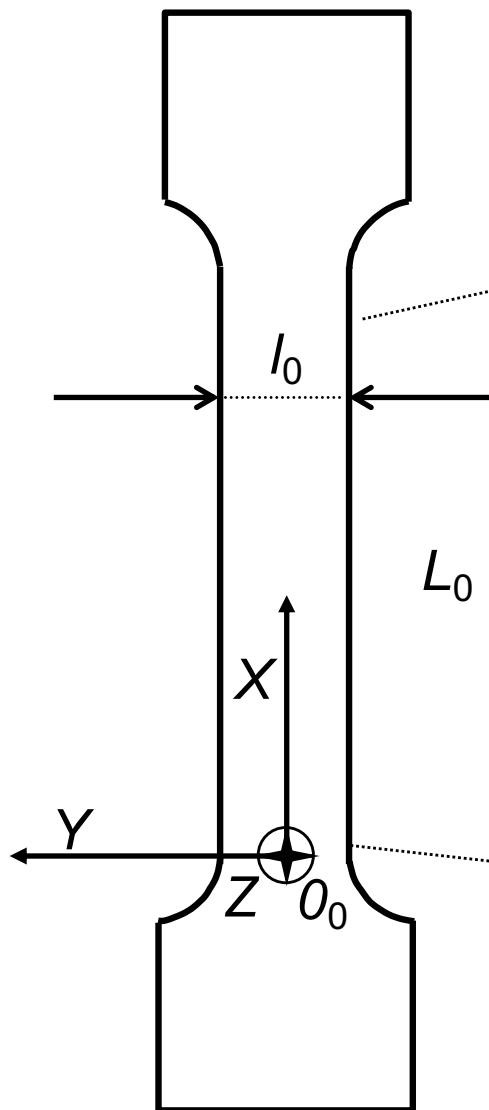

- quasi-static loading test
- displacement-controlled: $250 \mu\text{m s}^{-1}$ (5.10^{-3} s^{-1})
- room temperature: $T_0 = 300 \text{ K}$
- kinematic and thermal data processing : local least squares fitting

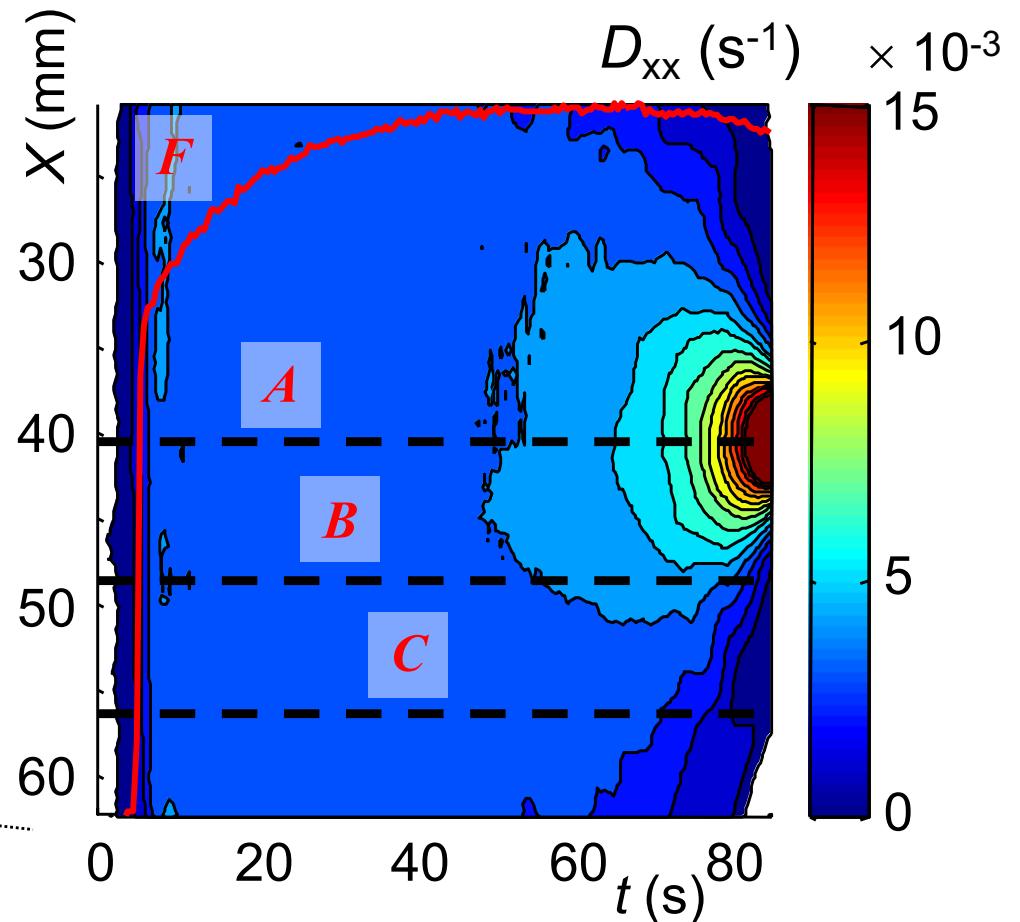

*A, B, C, 3 material surface elements
Progressive concentration of level curves*

Strain rate profile $D_{xx}(t, X, Y=0)$

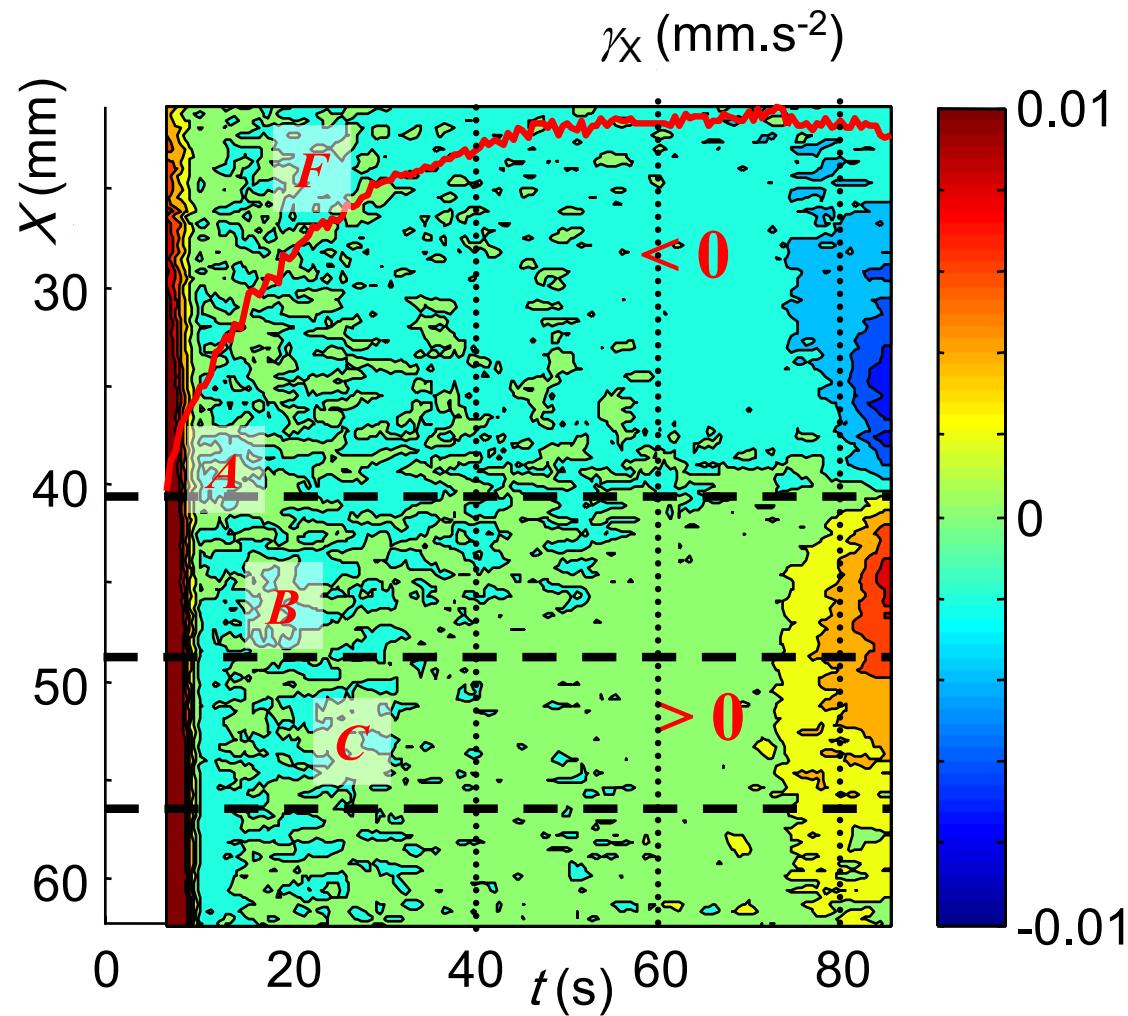

$$\begin{aligned}
 v_0 &= 250 \text{ } \mu\text{m s}^{-1} \\
 \dot{\varepsilon}_c &= v_0 / L_0 \\
 &= 5 \cdot 10^{-3} \text{ s}^{-1}
 \end{aligned}$$

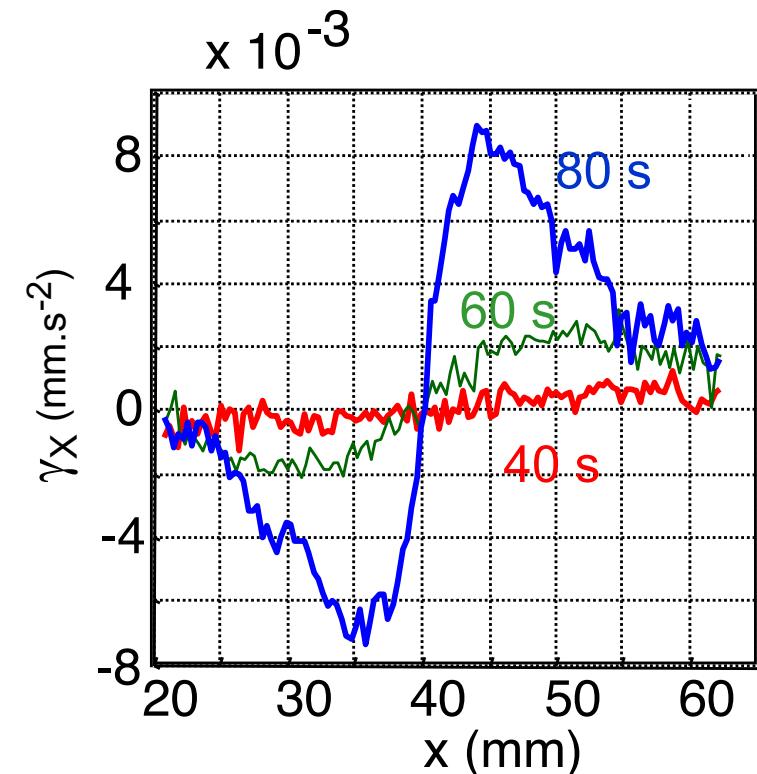

Sample / structure
Early progressive development of localization
Progressive transition [diffuse/localized]

Acceleration field

Aziz? مكتوب, again?

Acceleration remains small ($< 10^{-4} \text{ m.s}^{-2}$); quasi-static process

Fracture zone = zero acceleration with change of sign

Gradual transition between localized necking and fracture

$$I_\varepsilon(\varphi) = \int_{\Omega} V\varphi(\boldsymbol{x}) \, d\boldsymbol{x} - \lim_{\delta \rightarrow 0^+} \frac{1}{\delta} \int_{\Omega} F(\boldsymbol{x}, \nabla \varphi(\boldsymbol{x})) \, d\boldsymbol{x}$$

Stress I: computation

$$\begin{cases} \frac{\partial \sigma_{xx}(x,y,t)}{\partial x} + \frac{\partial \sigma_{xy}(x,y,t)}{\partial y} = 0 \\ \frac{\partial \sigma_{xy}(x,y,t)}{\partial x} + \frac{\partial \sigma_{yy}(x,y,t)}{\partial y} = 0 \end{cases}$$

$$\sigma_{xx}(x,t) = \frac{f(t)}{S_0} \exp(\varepsilon_{xx}(x,t))$$

$$\sigma_{xy}(x,y,t) = -\sigma_{xx}(x,t) \frac{\partial \varepsilon_{xx}(x,t)}{\partial x} y$$

$$\sigma_{yy}(x,y,t) = \frac{\partial}{\partial x} \left(\frac{\sigma_{xx}(x,t)}{2} \frac{\partial \varepsilon_{xx}}{\partial x} \right) \cdot \left(\frac{l(x,t)^2}{4} - y^2 \right)$$

quasi-static process [!]

plane stress [?]

uniform distribution [?]

ε_{xx} y-independent [!]

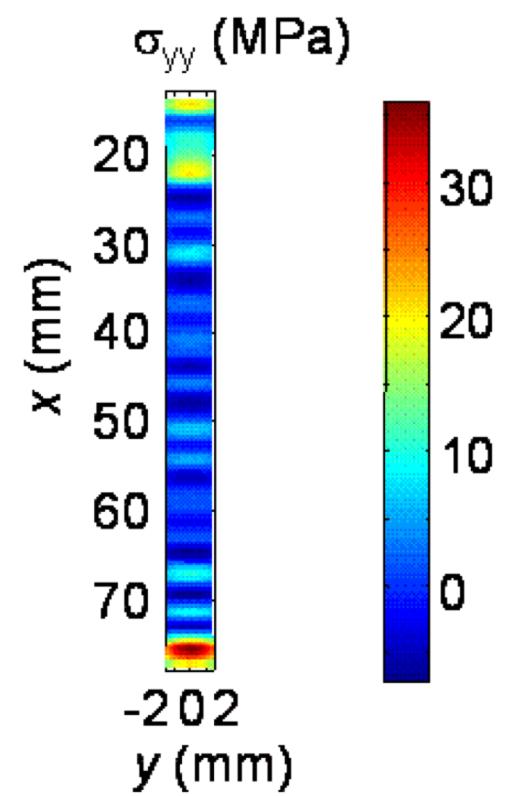

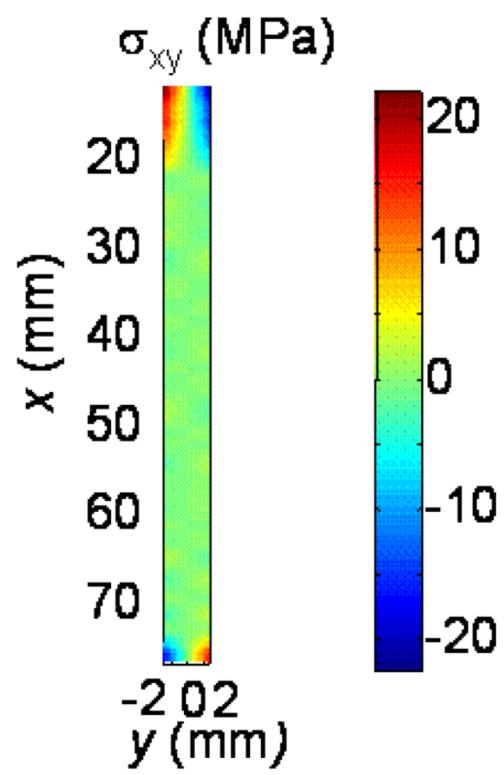

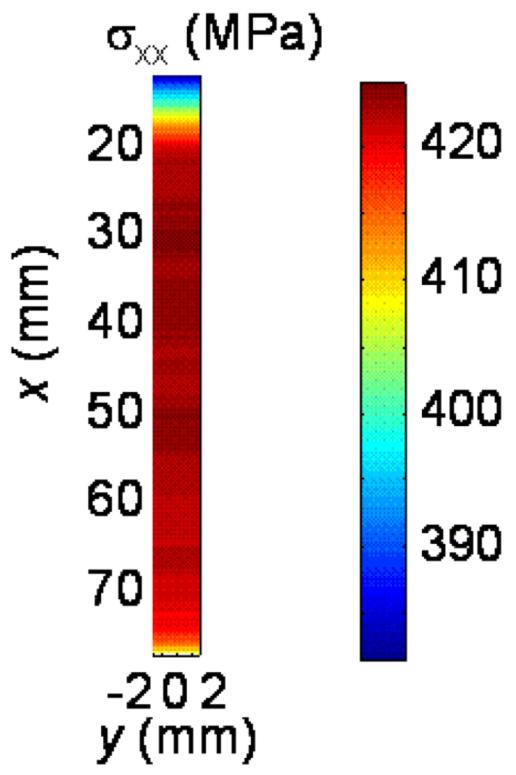

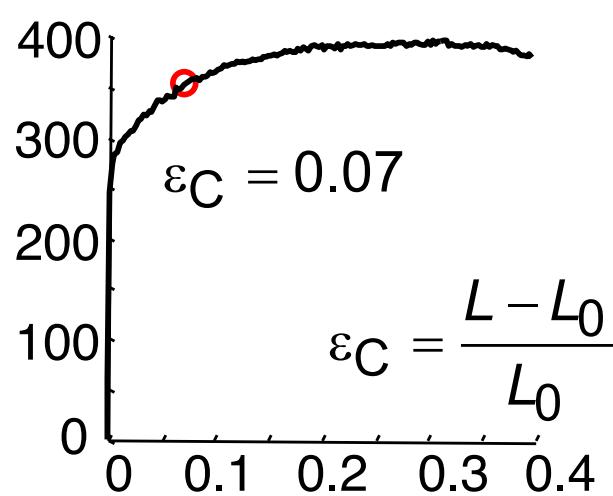

$\varepsilon_{yy}(x,y,t) \approx \varepsilon_{yy}(x,-y,t)$ [!]

no overall shear force [?]

lateral surfaces: free
of normal stresses [!]

Stress II : patterns

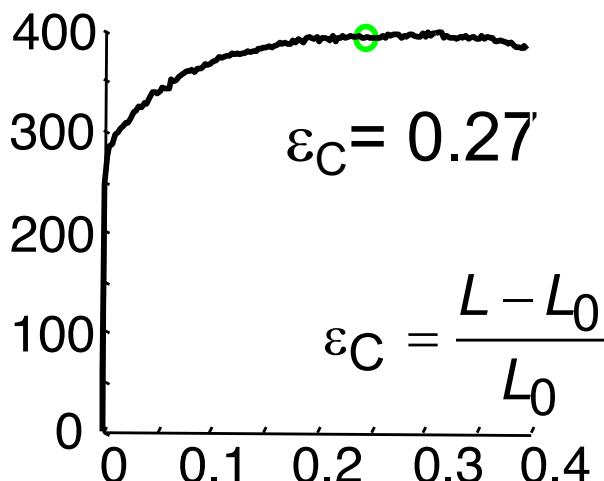

$$\sigma_C = \frac{F}{S_0} \text{ (MPa)}$$

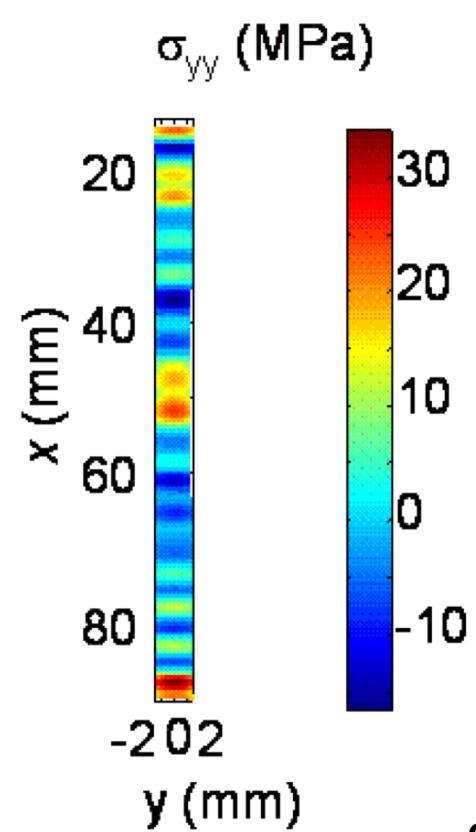

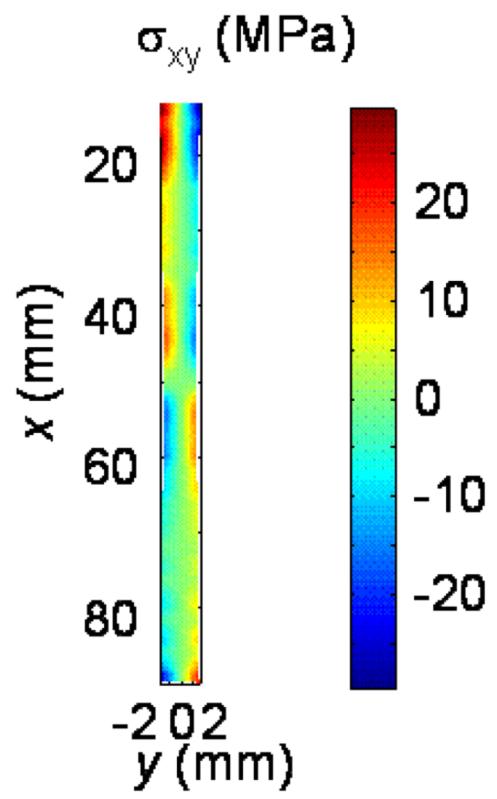

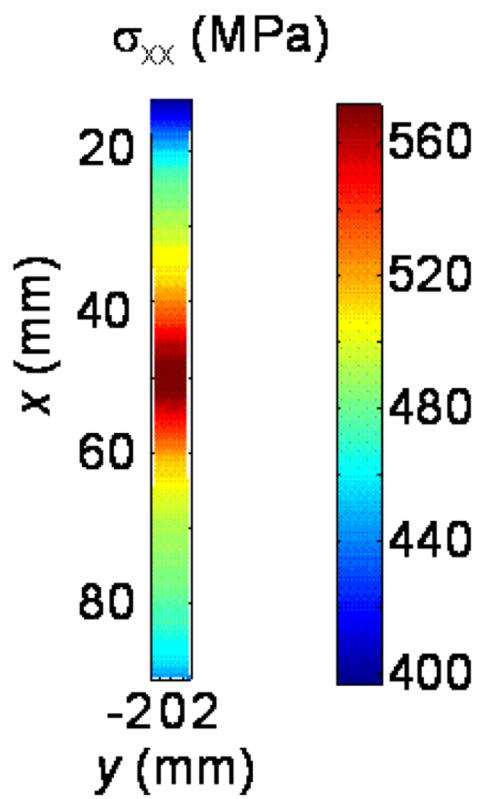

$$I_\varepsilon(\varphi) = \int_{\Omega} V(\varphi(x)) dx \quad \lim_{\varepsilon \rightarrow 0^+} I_\varepsilon(\varphi) = W(\cdot, F) = \infty$$

Stress III: patterns

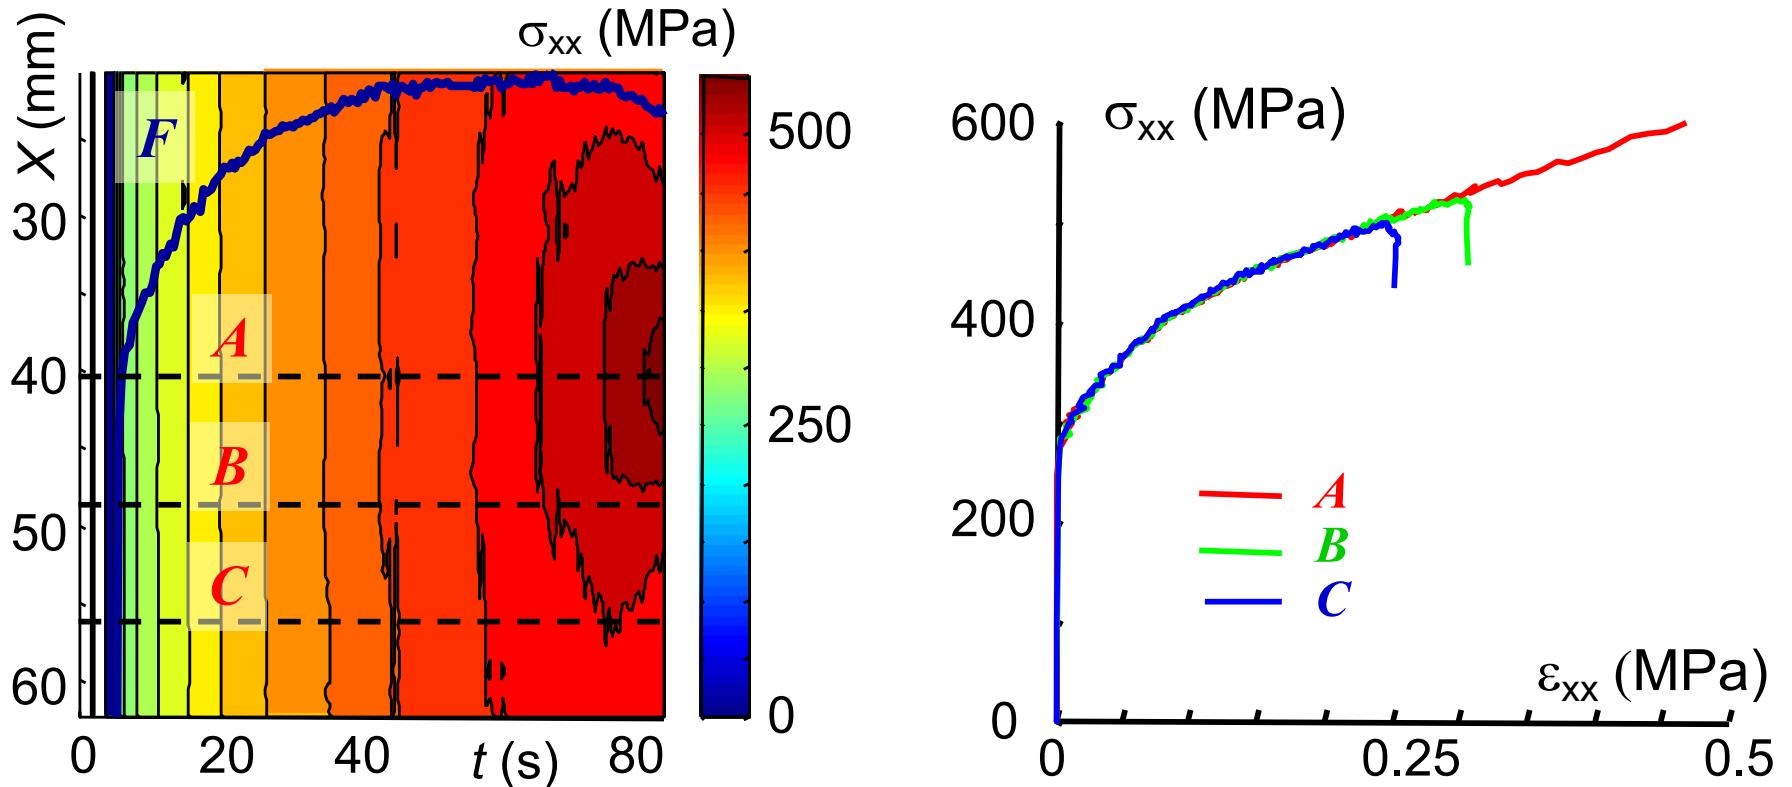

$$\sigma_C = \frac{F}{S_0} \text{ (MPa)}$$

$$\epsilon_C = \frac{L - L_0}{L_0}$$

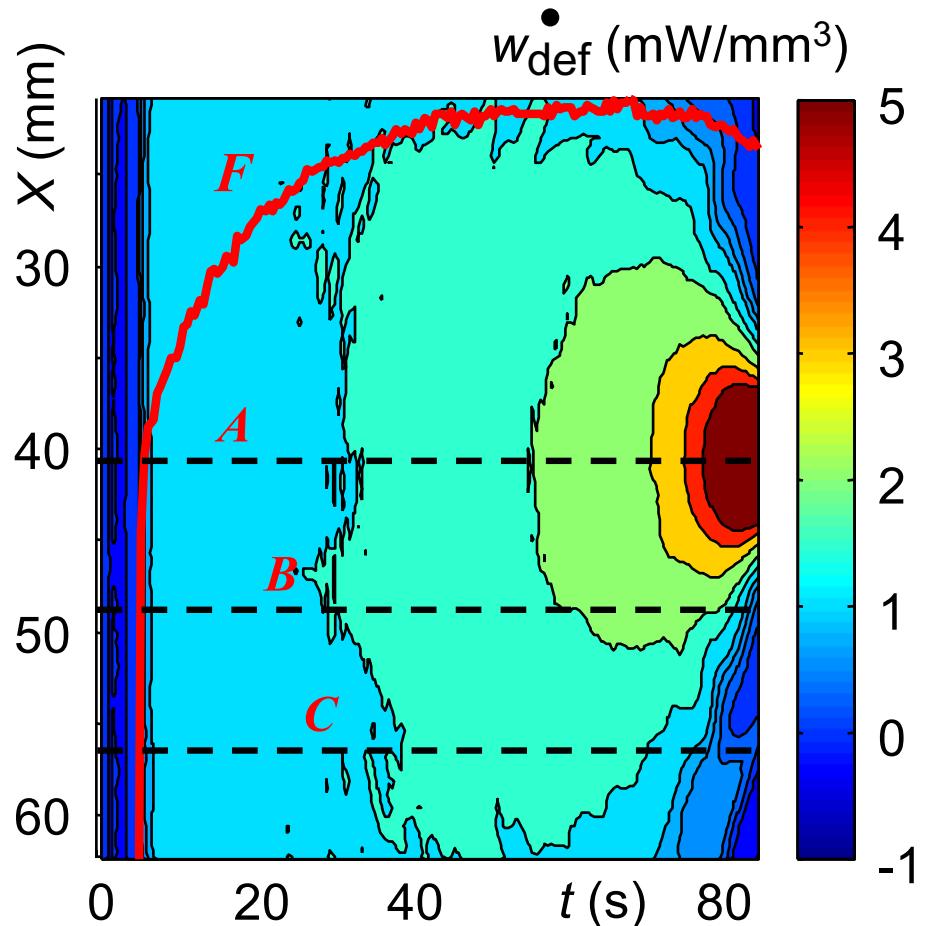

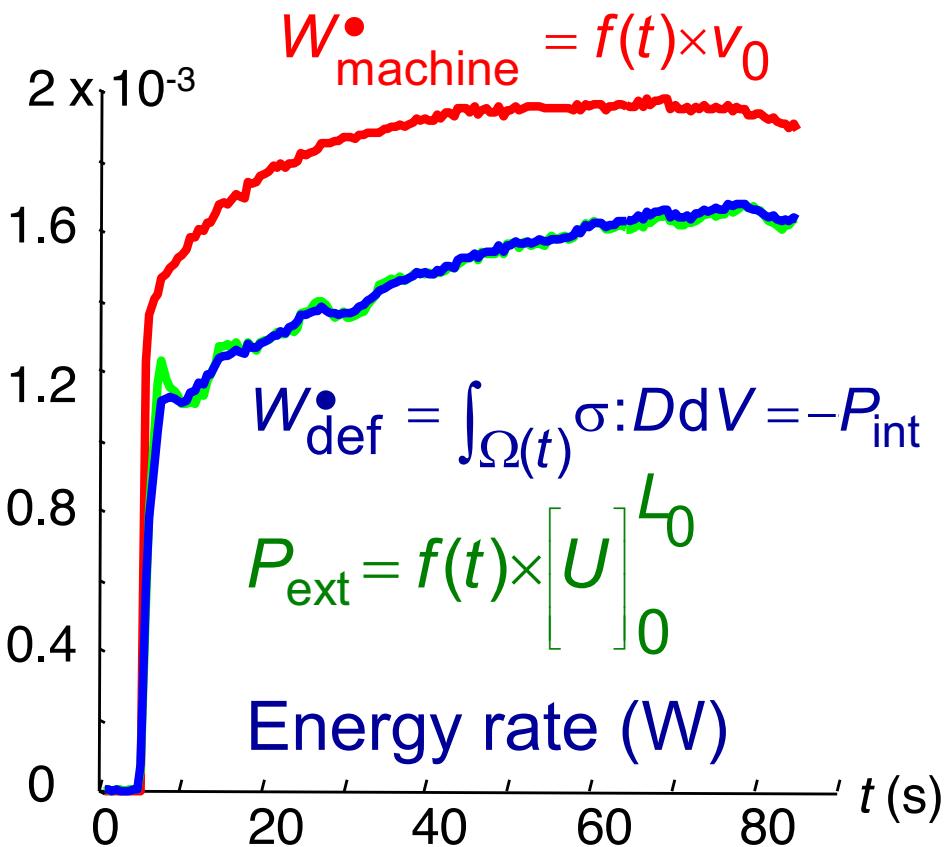

Stress III : tensile stress – stress vs strain

Sample softening = strain hardening within localization zone + elastic unloading outside this zone

Deformation energy rate

quasi-static process $\Rightarrow P_{\text{ext}} + P_{\text{int}} = 0$

elastic loading: finite stiffness of the testing machine

plastic deformation of the connection zones of the sample

$$I_\varepsilon(\varphi) = \int_{\Omega} V(\varphi(x)) \, dx + \lim_{\substack{\longrightarrow \\ h \in \mathcal{E}_\varepsilon}} \int_{\Omega} W(\cdot, F) = \infty$$

Volume heat rate

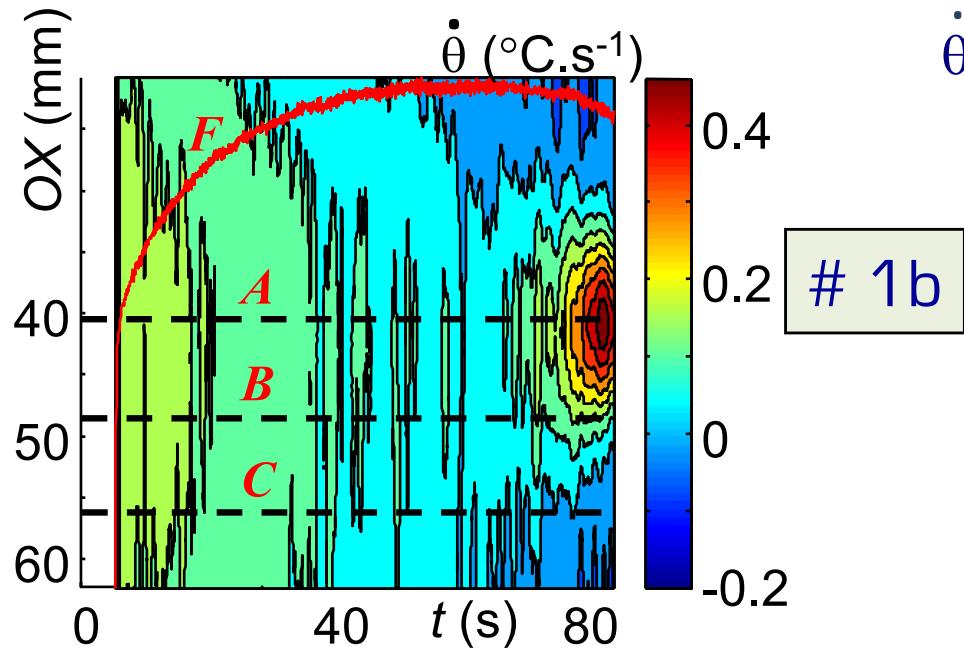

$$\rho C \left(\frac{\partial \theta}{\partial t} + v_x \frac{\partial \theta}{\partial x} + v_y \frac{\partial \theta}{\partial y} + \frac{\theta}{\tau_{th}} \right) - k \left(\frac{\partial^2 \theta}{\partial x^2} + \frac{\partial^2 \theta}{\partial y^2} \right) = w_h^\bullet$$

1 - Time derivative: $\dot{\theta}(t,x,y) = \frac{\partial \theta}{\partial t} + v_x \frac{\partial \theta}{\partial x} + v_y \frac{\partial \theta}{\partial y} = \frac{\partial \theta(t,X,Y)}{\partial t}$

2 - Out of plane heat losses: linear heat losses - $\tau_{th} = \frac{\rho C}{2h} \left(\frac{el}{e+l} \right)$

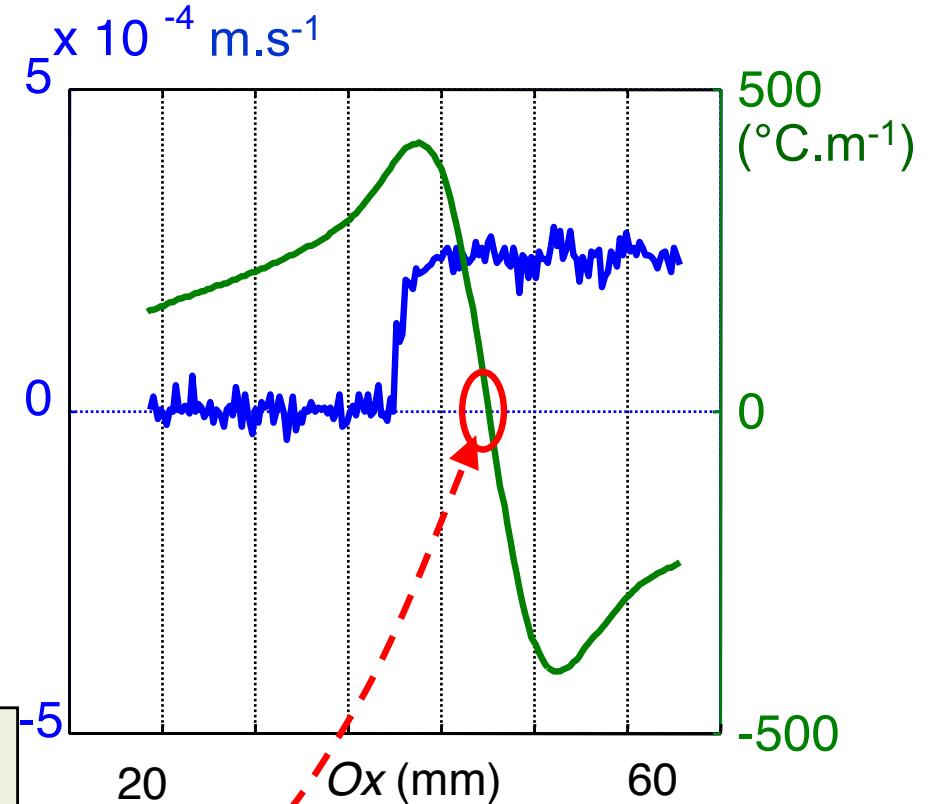

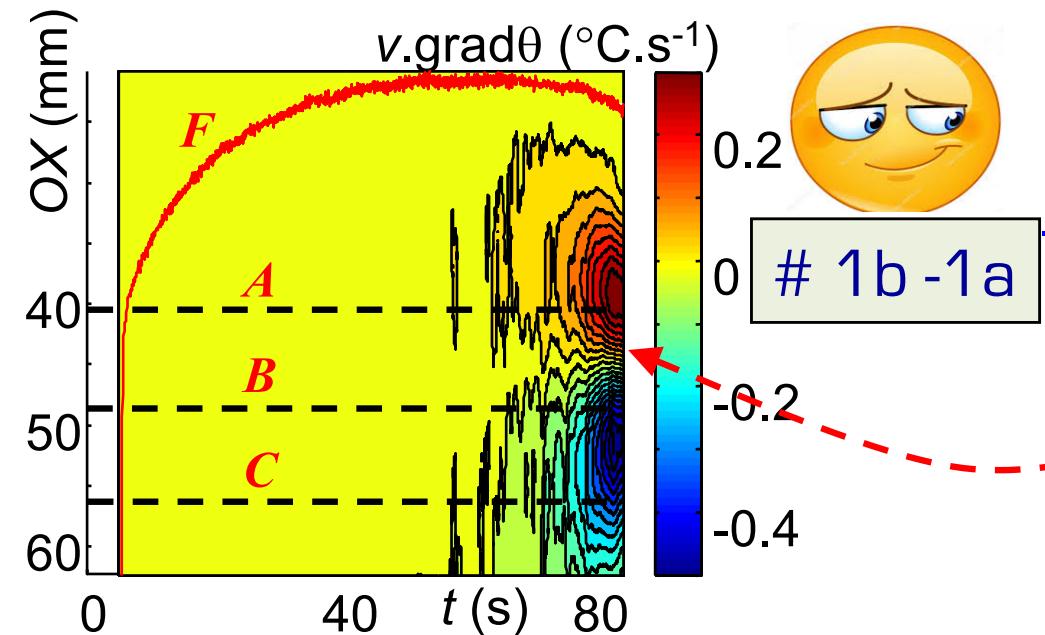

3 - In plane heat losses by conduction - 2D Laplacian

Particular time derivative

$$\dot{\theta}(t,x,y) = \frac{\partial \theta}{\partial t} + v_x \frac{\partial \theta}{\partial x} + v_y \frac{\partial \theta}{\partial y} = \frac{\partial \theta(t,X,Y)}{\partial t}$$

1a 1b

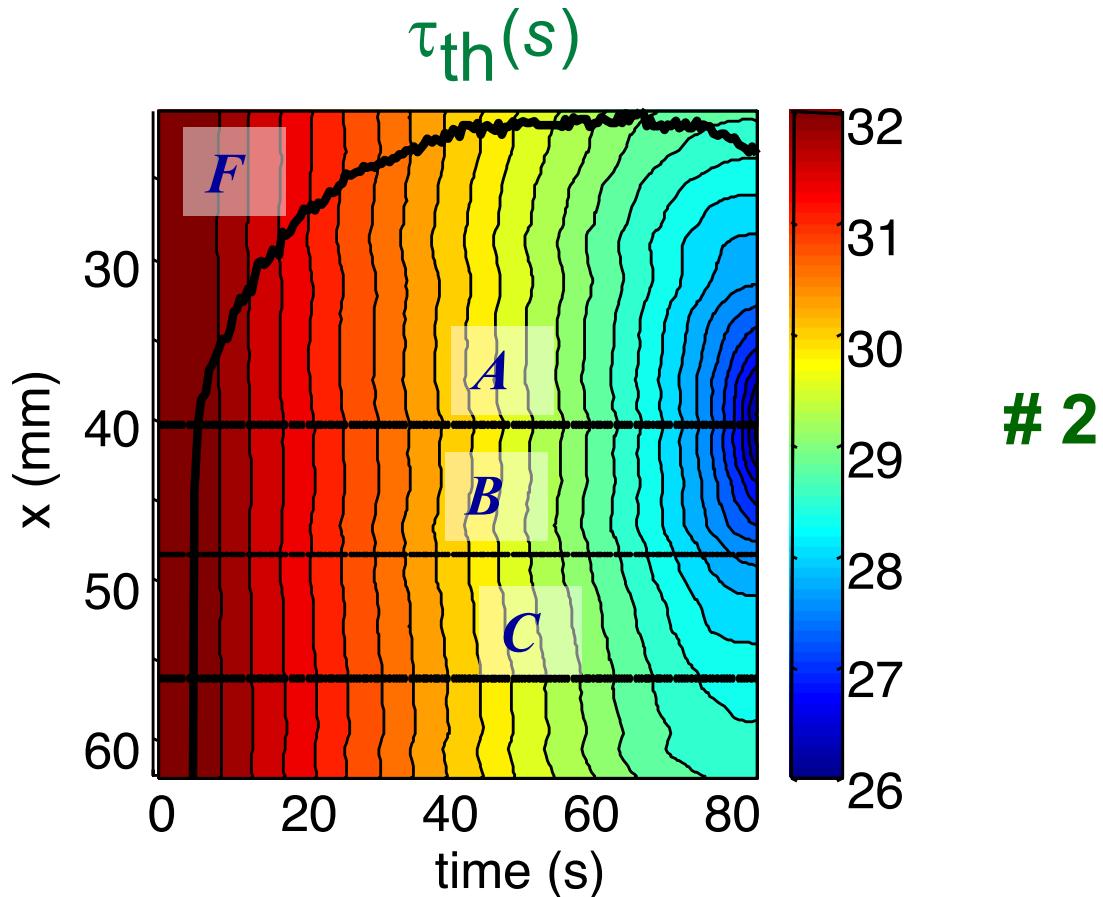

*Convective terms
are not negligible!*

$$I_\varepsilon(\varphi) = \int_{\Omega} V(\varphi(x)) \, dx + \lim_{\delta \rightarrow 0^+} \frac{1}{\delta} \int_{\Omega} \frac{|x - \nabla \varphi(x)|}{|x - \nabla \varphi(x)| + \delta} \, dx$$

Out of plane heat losses – time “constant”

$$\theta/\tau_{\text{th}}$$

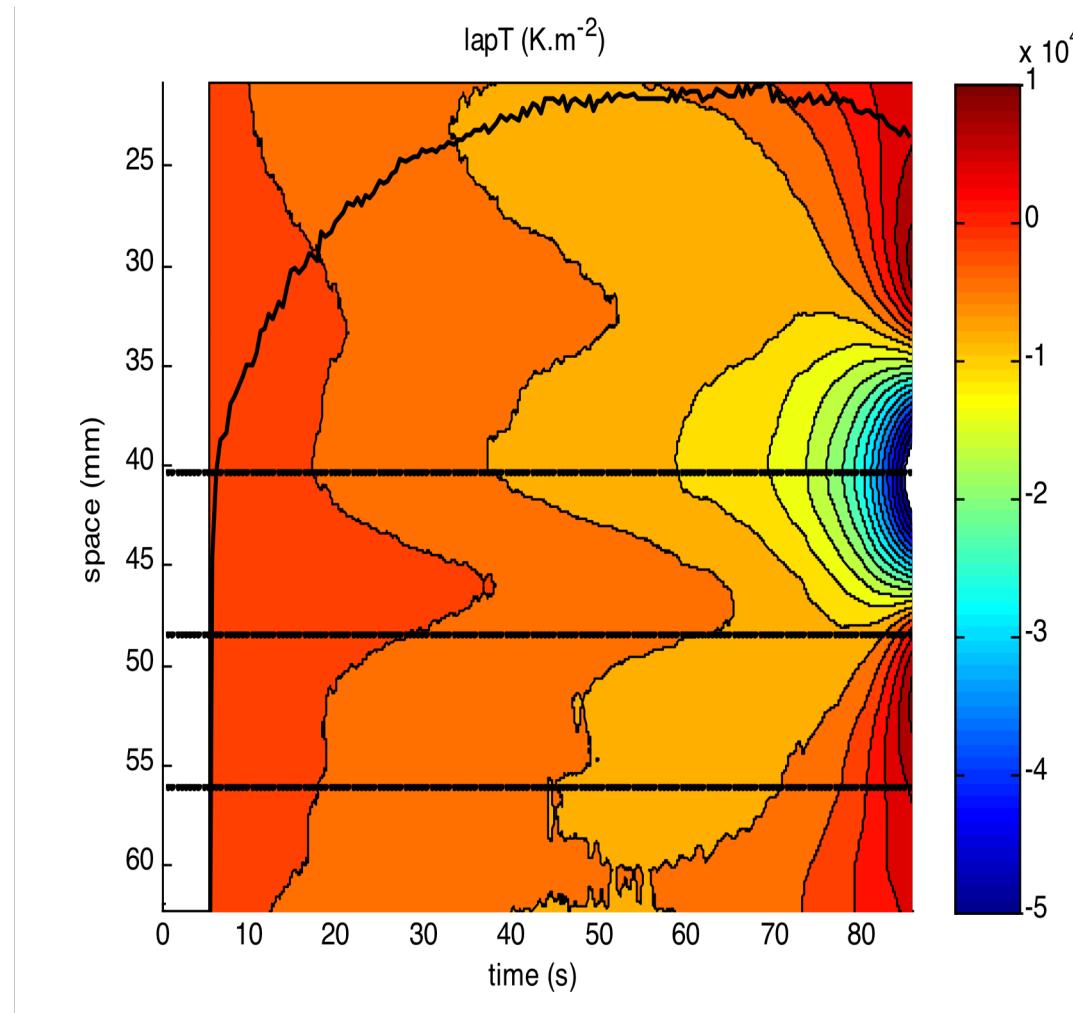

Significant geometrical effects induced by necking

$$I_\varepsilon(\varphi) = \int_{\Omega} V(\varphi(x)) \, dx + \lim_{\delta \rightarrow 0^+} \frac{1}{\delta} \int_{\Omega} \int_{\Omega} \frac{\delta^2}{|\mathbf{x} - \mathbf{y}|^2} |\nabla \varphi(\mathbf{x})| |\nabla \varphi(\mathbf{y})| \, d\mathbf{x} \, d\mathbf{y}$$

Laplacian assessment

$\Delta_{xy}\theta$

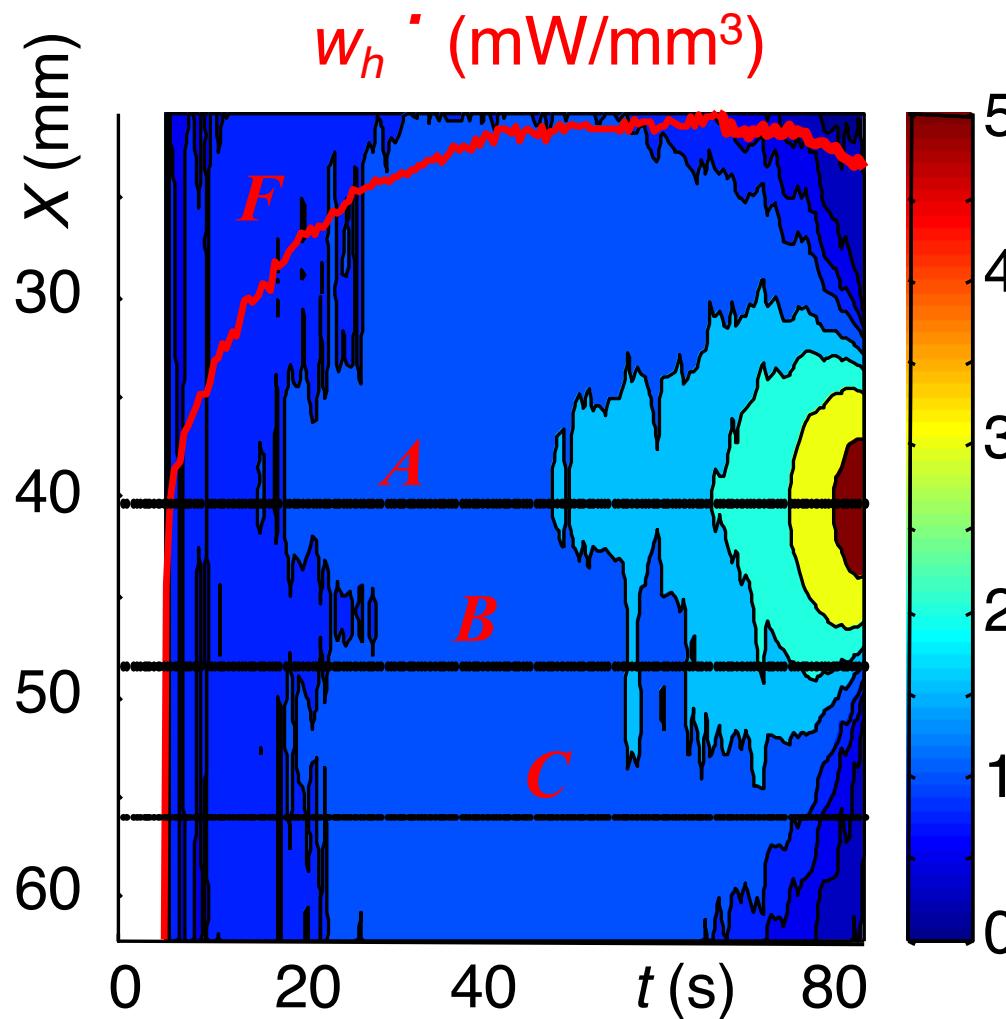

Significant geometrical effects induced by necking

Overall heat source

Qualitatively !

Quantitatively ?!

ρ, C, k, τ_{th}
SNR
data processing
POD ?!

gradual concentration of level curves

Proper Orthogonal Decomposition ... some words

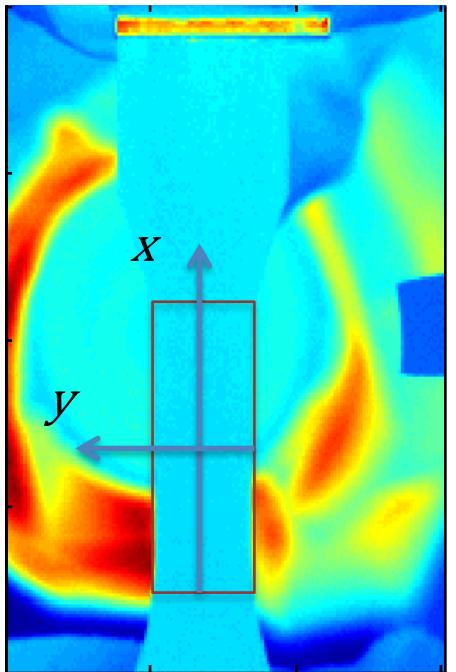

- Applications : réduction de modèle, turbulence, compression de données, ...
Hotelling (1933), Karhunen (1946), Loève (1955)
- Intérêts : Approcher un système de grande dimension, par un autre, de dimension significativement plus petite
Déterminer une base de modes propres orthogonaux représentatifs des “réalisations les plus probables”
- Images thermiques :
$$\vartheta(x_i, y_j, t_k) \simeq \sum_{p=1}^P a_p(t_k) \Phi_p(x_i, y_j)$$

où les composantes $\Phi_p(x_i, y_j)$ sont les modes propres orthogonaux (POM), “vecteurs” propres de la matrice des “clichés” (“snapshots”).

$$A = \Theta \Theta^T$$

$$A \tilde{\Phi}_p = \omega_p \Phi_p$$

Benchmark test : a penalizing case

● 2D heat diffusion problem (averaged over the thickness)

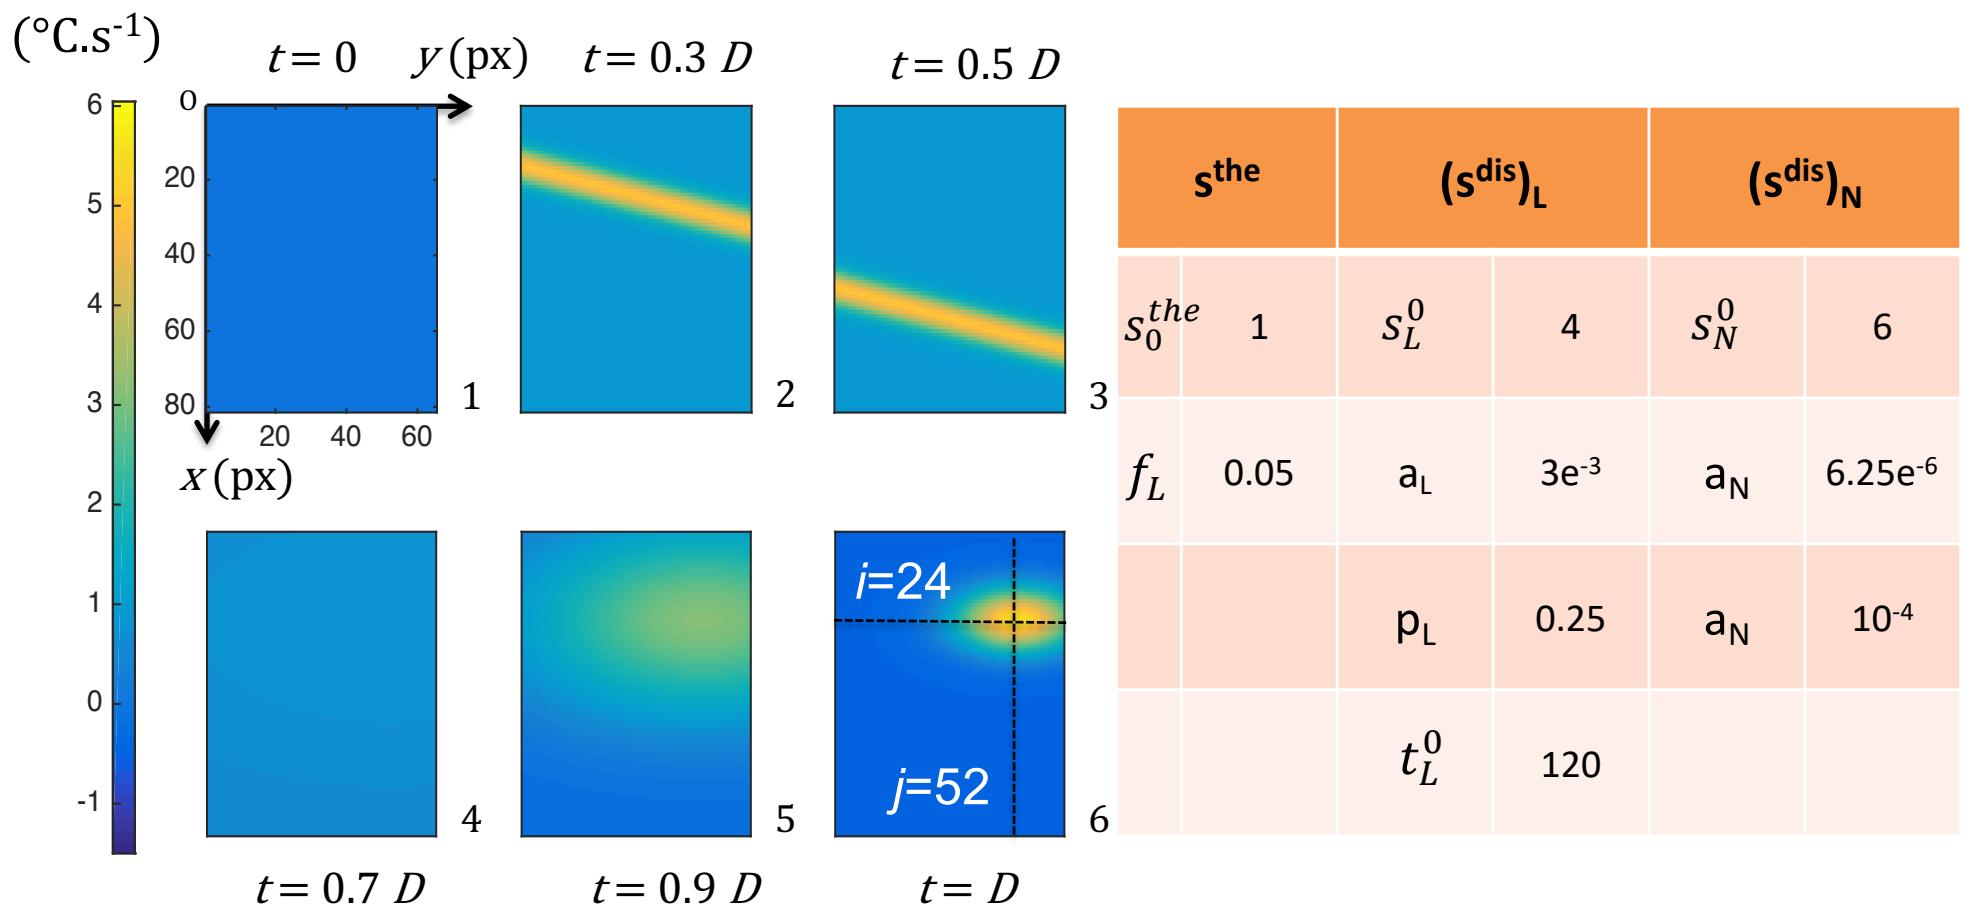

$$\begin{cases} \rho C \left(\frac{\partial \bar{\vartheta}_i(x, y, t)}{\partial t} + \frac{\bar{\vartheta}_i(x, y, t)}{\tau_{th}^{2D}} \right) - k_c \left(\frac{\partial^2 \bar{\vartheta}_i(x, y, t)}{\partial x^2} + \frac{\partial^2 \bar{\vartheta}_i(x, y, t)}{\partial y^2} \right) = \bar{s}^h(x, y, t), \\ \frac{\partial \bar{\vartheta}_i}{\partial x} \left(\pm \frac{L}{2}, y, t \right) = \mp \lambda_x \bar{\vartheta}_{i \pm \frac{L}{2}} \left(\pm \frac{L}{2}, y, t \right), \quad \frac{\partial \bar{\vartheta}_i}{\partial y} \left(x, \pm \frac{l}{2}, t \right) = \mp \lambda_y \bar{\vartheta}_{i \pm \frac{l}{2}} \left(x, \pm \frac{l}{2}, t \right) \\ \bar{\vartheta}_i(x, y, 0) = 0 \end{cases}$$

● Domain : $-L/2 \leq x \leq L/2, -l/2 \leq y \leq l/2, 0 \leq t \leq D$

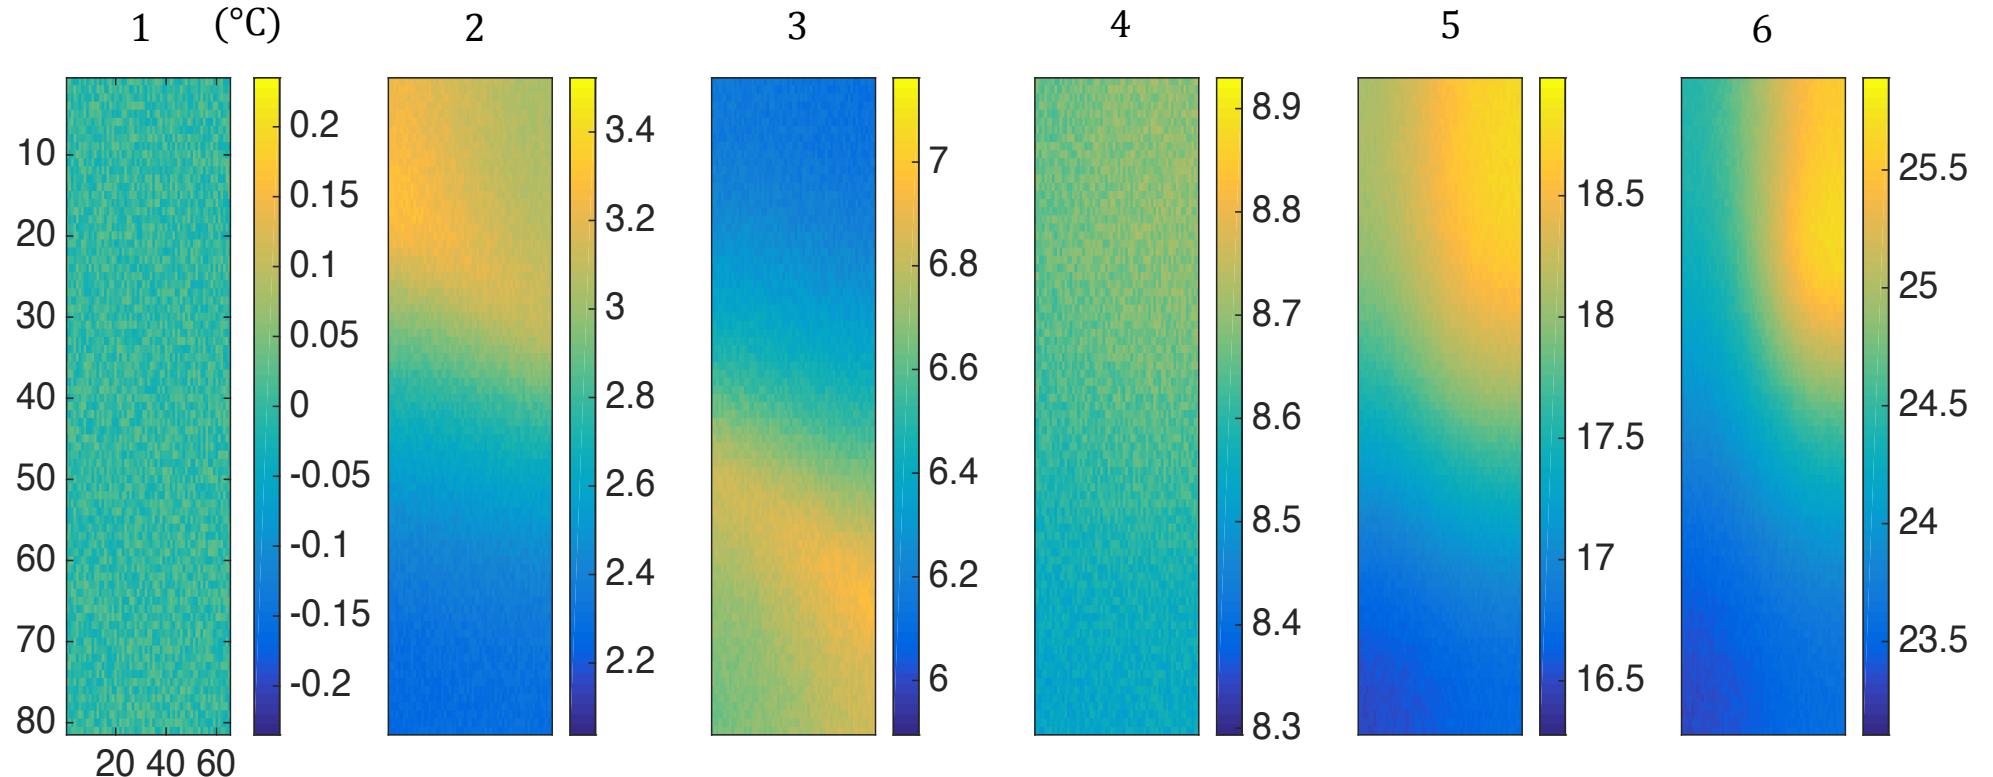

- Material of high thermal diffusivity (pure copper : $10^{-4} \text{ m}^2/\text{s}$)
- High longitudinal heat exchange coefficient ($\lambda_x = 170 \text{ W/m/K}$)
- Noise superimposition (rnd / $\delta\theta = 70 \text{ mK}$)
- Complex heat source distribution ...

Heat source fields

- $0 \leq t \leq D$ $\bar{S}^{the} = S_0^{the} \sin(2\pi f_L t)$ cyclique coupling source
- $0.1 D \leq t \leq 0.6 D$ $\bar{S}_L^{dis} = S_L^0 \exp(-a_L [x - p_L y - v_L(t - t_L^0)]^2)$ Lüders' band
- $0.6 D \leq t \leq D$ $\bar{S}_N^{dis} = S_N^0 \tilde{t}^2 \exp(-a_N r^2(x, y)/[1 - \alpha_N \tilde{t}])$ localization

Noisy temperature fields

$$\bar{\vartheta}_r = \bar{\vartheta}_i + N_g$$

- Peak-to-peak signal noise $N_g = 70$ mK
- Regularizing effect of heat diffusion

$$I_\varepsilon(\varphi) = \int_{\Omega} V(\varphi(x)) dx, \quad \lim_{\varepsilon \rightarrow 0^+} I_\varepsilon(\varphi) = W(\cdot, F) = \infty$$

Lifting of the heat diffusion problem

$$\bar{\vartheta}_r \downarrow \quad \bar{\vartheta}_s + \bar{\vartheta}_\ell = \bar{\vartheta}_i + N_g = \bar{\vartheta}_r$$

$$\begin{cases} \rho C \left(\frac{\partial \bar{\vartheta}_\ell(x, y, t)}{\partial t} + \frac{\bar{\vartheta}_\ell(x, y, t)}{\tau_{th}^{2D}} \right) - k_c \left(\frac{\partial^2 \bar{\vartheta}_\ell(x, y, t)}{\partial x^2} + \frac{\partial^2 \bar{\vartheta}_\ell(x, y, t)}{\partial y^2} \right) = 0 \\ \bar{\vartheta}_\ell \left(\pm \frac{L}{2}, y, t \right) = \bar{\vartheta}_r \left(\pm \frac{L}{2}, y, t \right), \quad \bar{\vartheta}_\ell \left(x, \pm \frac{l}{2}, t \right) = \bar{\vartheta}_r \left(x, \pm \frac{l}{2}, t \right), \\ \bar{\vartheta}_\ell(x, y, 0) = 0, \end{cases}$$

$\bar{\vartheta}_\ell \rightarrow \bar{\vartheta}_s = \bar{\vartheta}_r - \bar{\vartheta}_\ell$

$$\begin{cases} \rho C \left(\frac{\partial \bar{\vartheta}_s(x, y, t)}{\partial t} + \frac{\bar{\vartheta}_s(x, y, t)}{\tau_{th}^{2D}} \right) - k_c \left(\frac{\partial^2 \bar{\vartheta}_s(x, y, t)}{\partial x^2} + \frac{\partial^2 \bar{\vartheta}_s(x, y, t)}{\partial y^2} \right) = \bar{s}^h(x, y, t), \\ \bar{\vartheta}_s \left(\pm \frac{L}{2}, y, t \right) = 0, \quad \bar{\vartheta}_s \left(x, \pm \frac{l}{2}, t \right) = 0, \\ \bar{\vartheta}_s(x, y, 0) = 0, \end{cases}$$

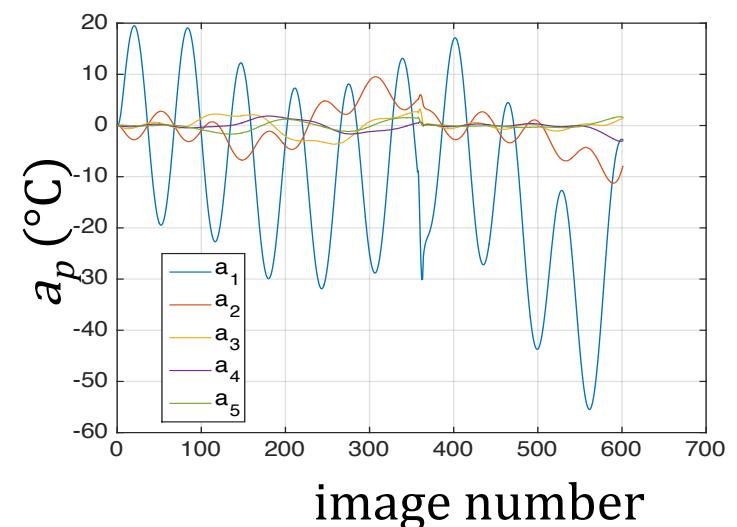

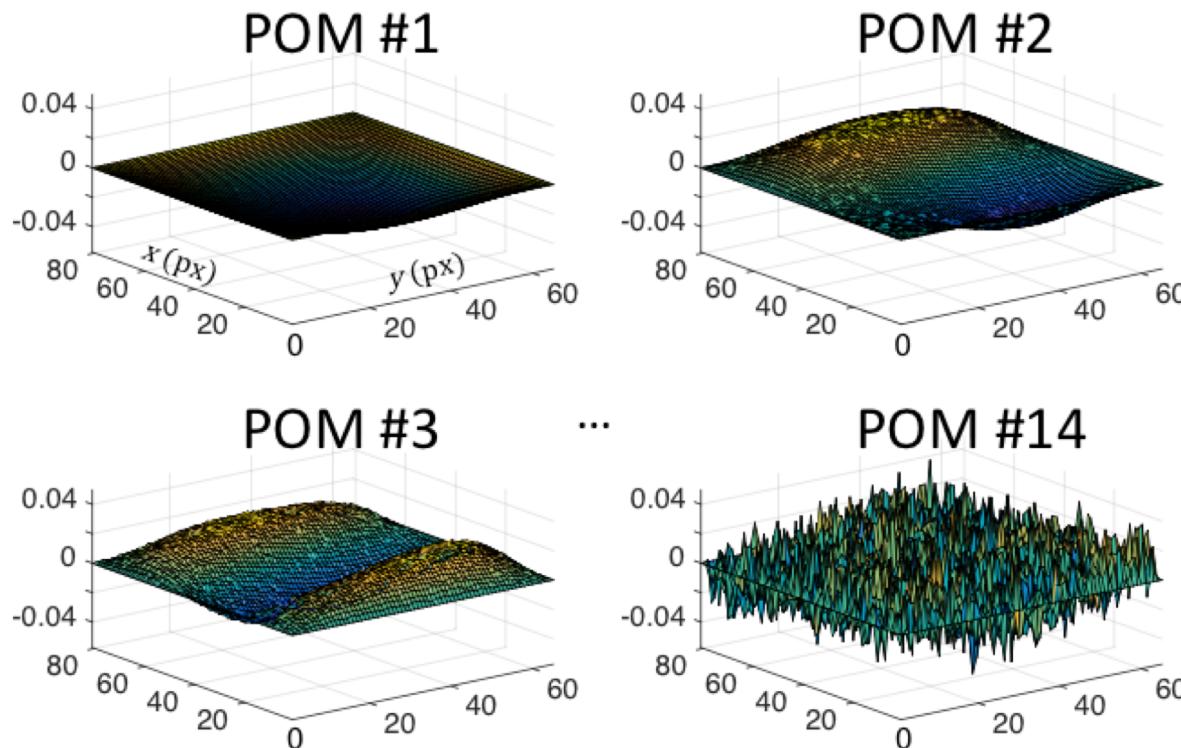

↑ POD of $\bar{\vartheta}_s$ data

$$I_\varepsilon(\varphi) = \int_{\Omega} V(\varphi(x)) \, dx + \lim_{\delta \rightarrow 0^+} \frac{1}{\delta} \int_{\Omega} F(\varphi(x)) \, dx$$

First POMs and components

$$A\Phi_p = \omega_p \Phi_p$$

$$\vartheta_{POD}(x_i, y_j, t_k) \simeq \sum_{p=1}^P a_p(t_k) \Phi_p(x_i, y_j)$$

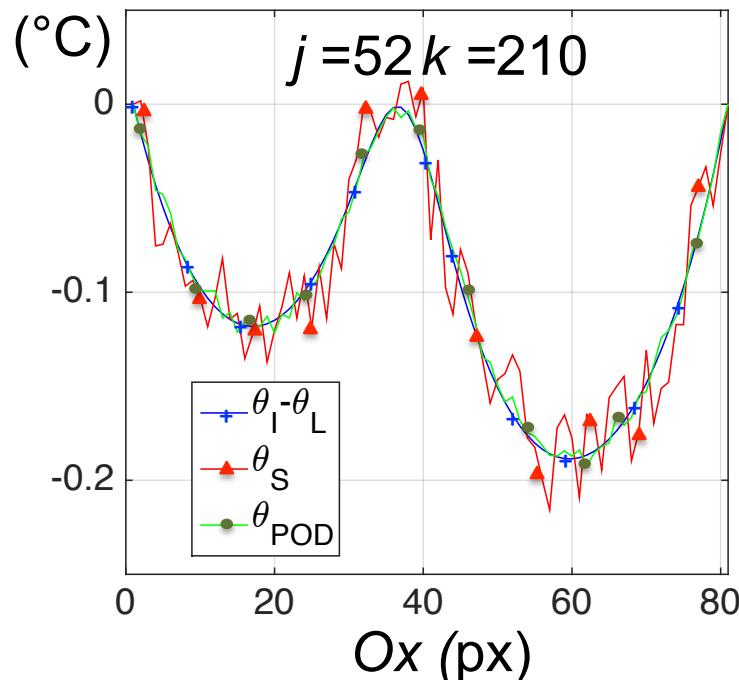

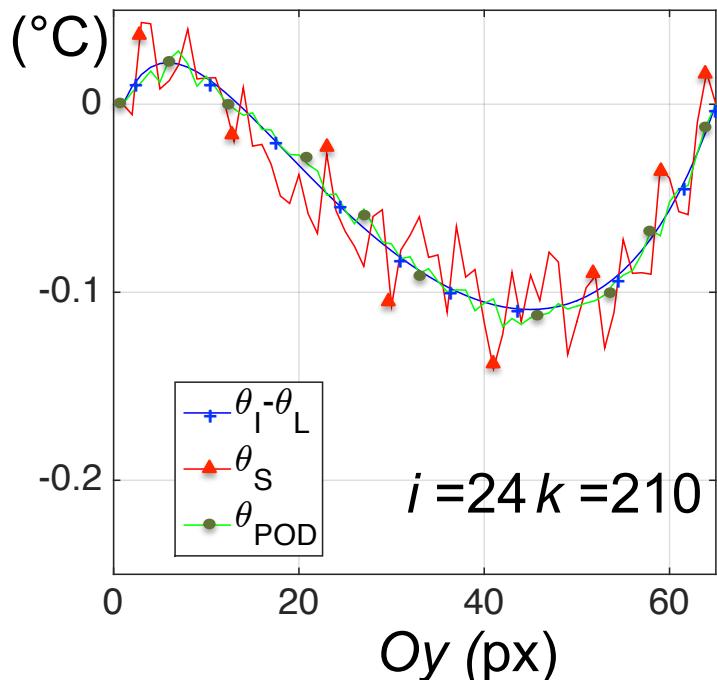

Examples of thermo-profile

number of POMs = 14

$Ng = 0.07 \times (\text{rnd}_{ij} - 0.5)$

reduction of the noise amplitude

curvature preservation

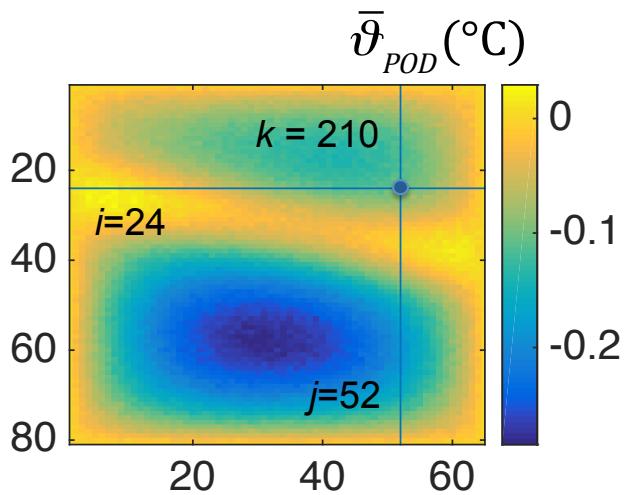

Estimations du laplacien de la température

Remember !

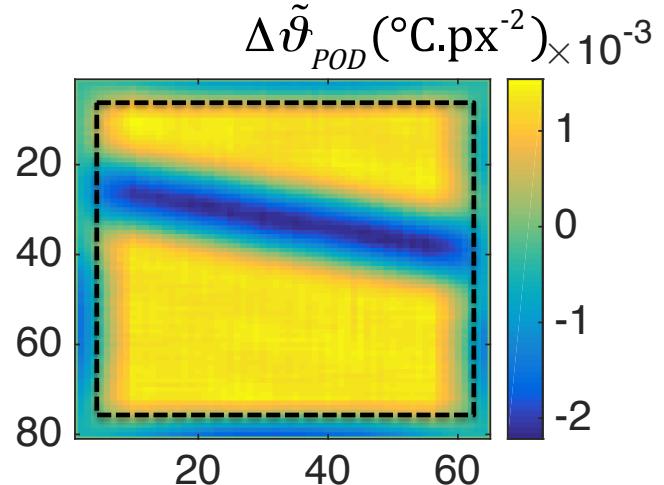

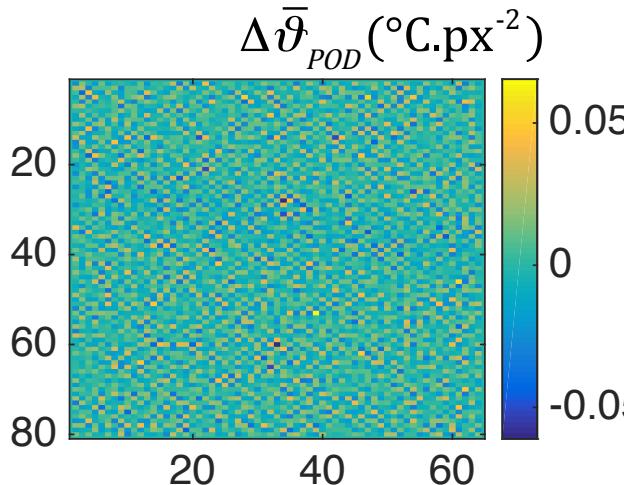

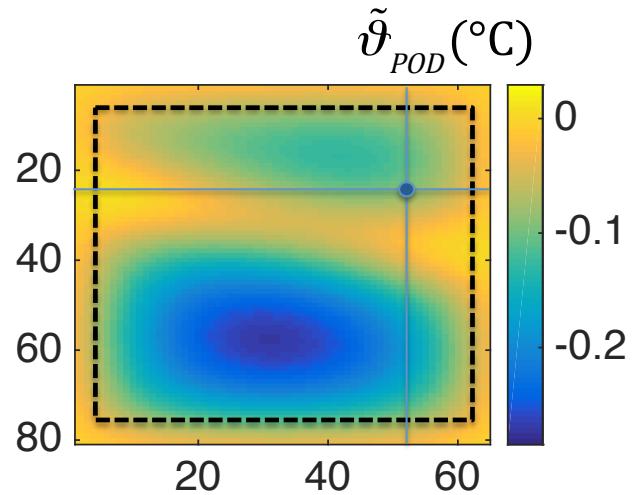

- High diffusivity
- Poor SNR
- Complex HS Distribution

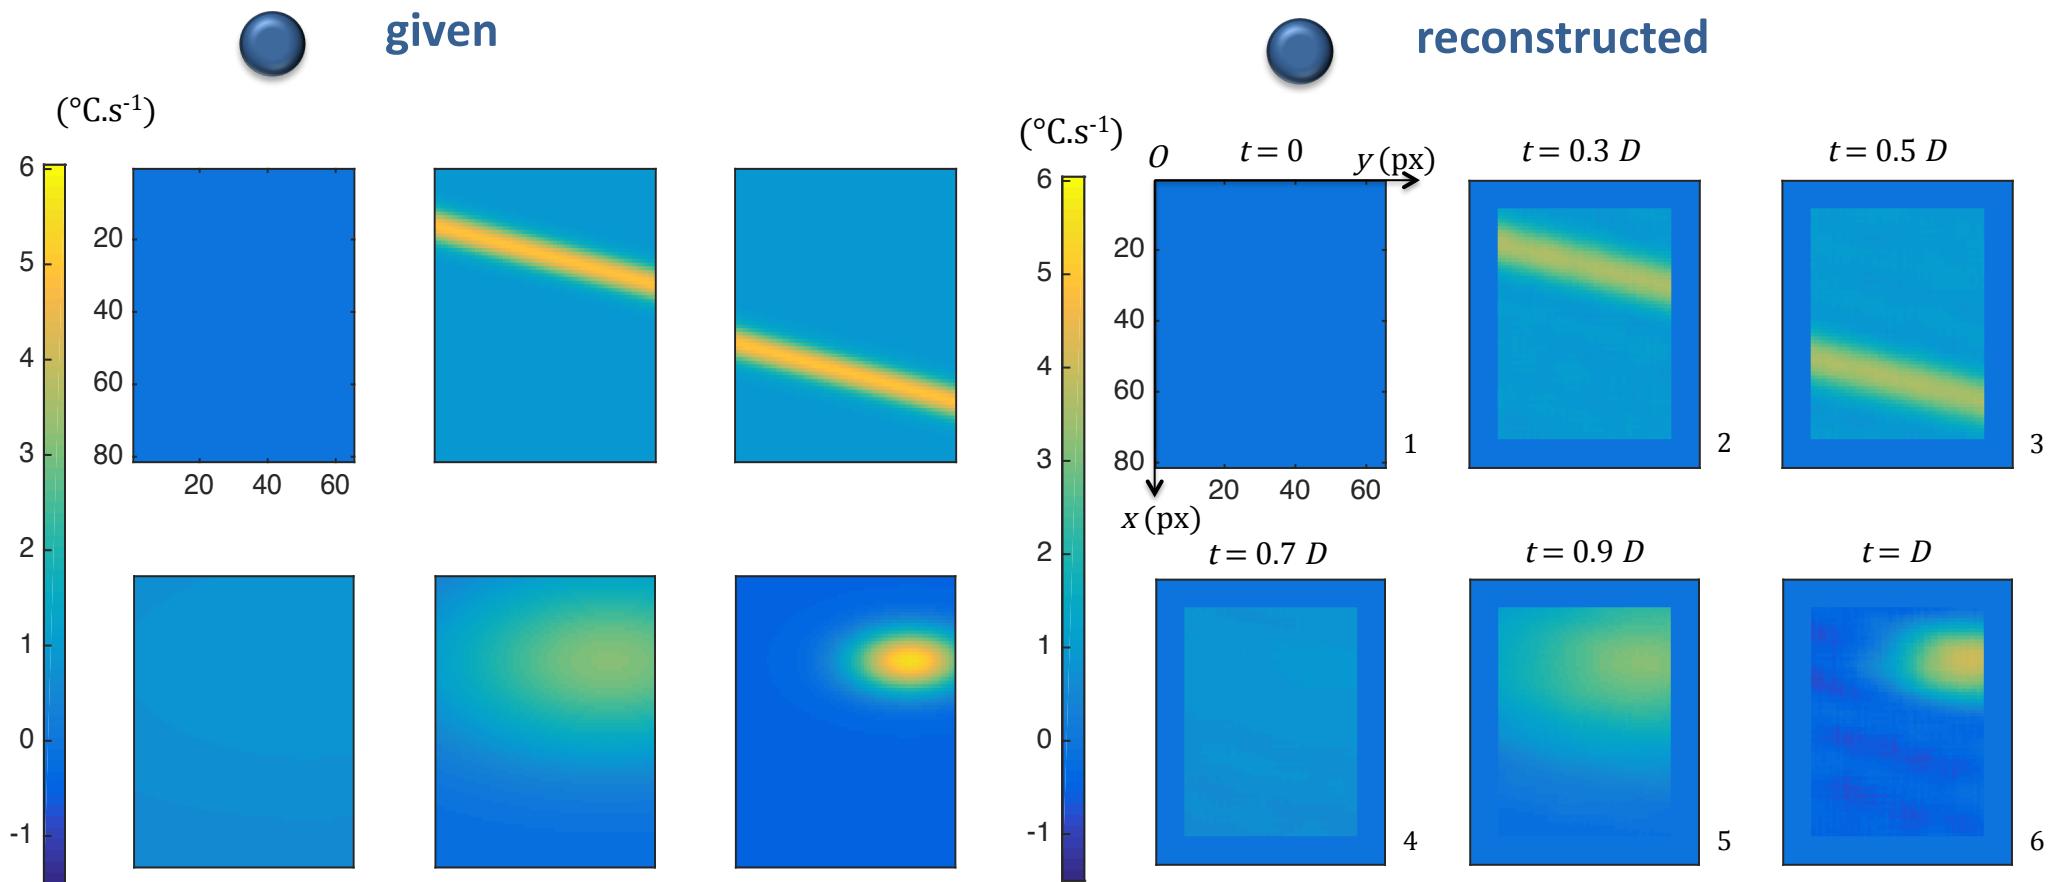

direct computation
using a finite difference
method

«slight» 2D convulsive
filtering prior to a finite
difference computation

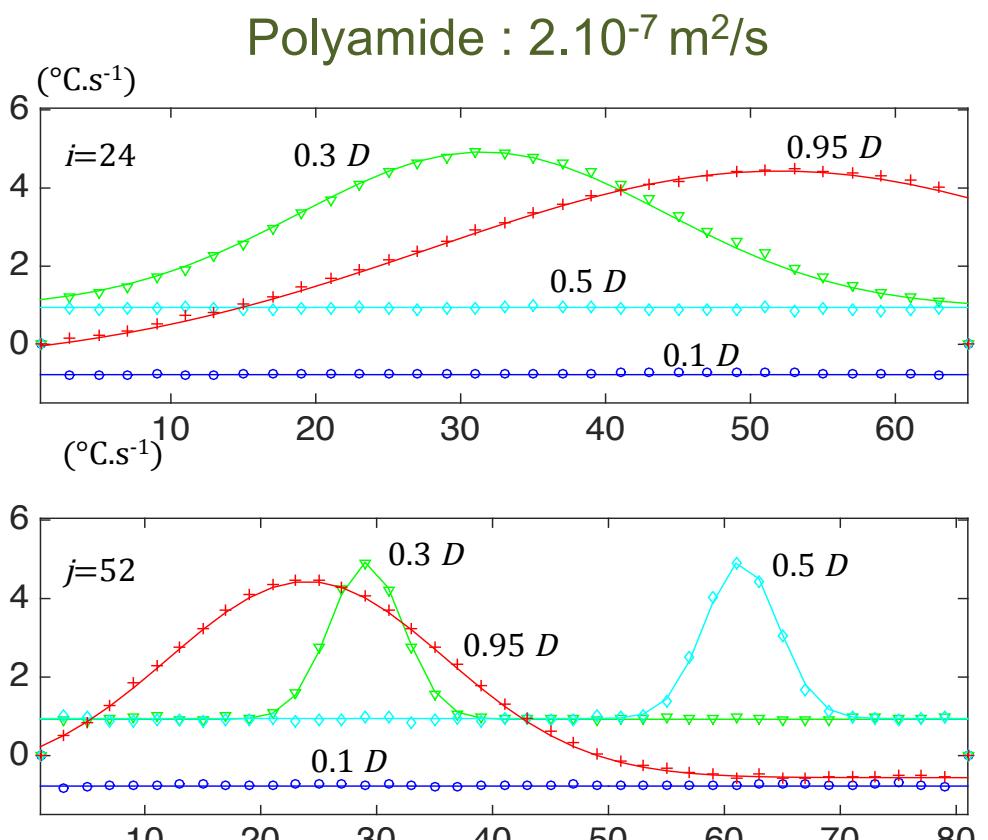

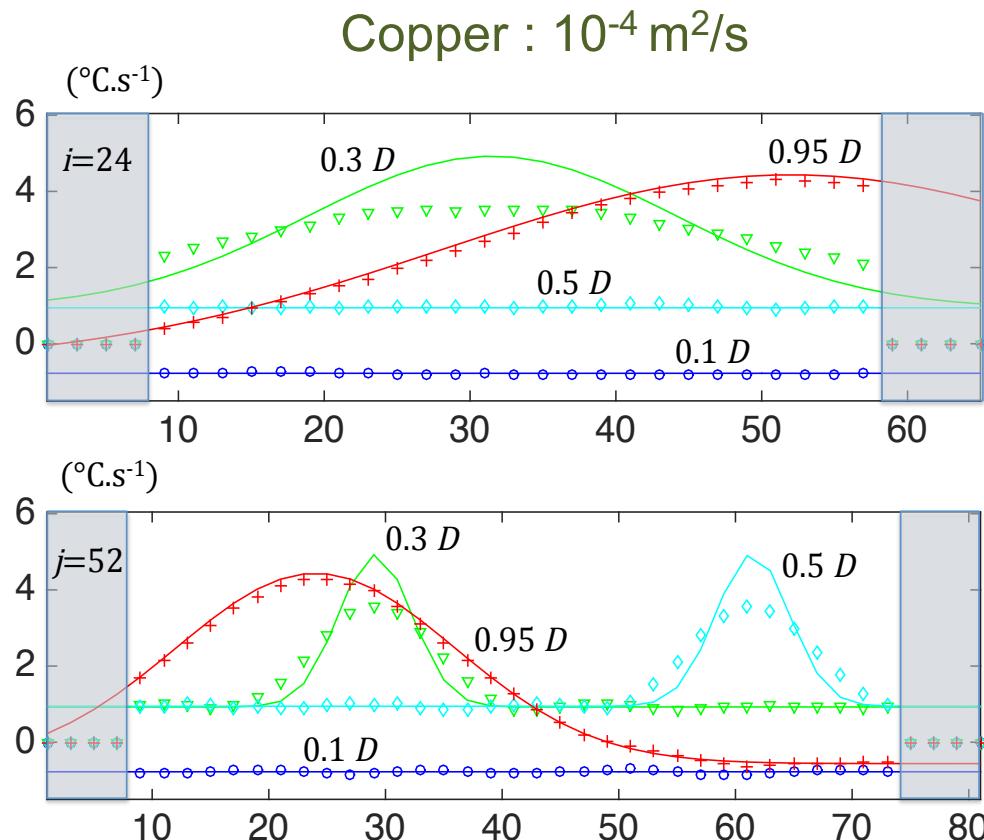

Heat source fields

- filtering induces a slight crushing of thermoprofiles
- and thus a spreading of sources
- loss of part of the HS field due to zero-padding

Heat source profiles

continuous lines : given sources ; symbols : reconstructed sources

- High diffusivity : Slight spreading of HS concentration due to filtering!

- Low diffusivity : POD directly used.
Direct estimates using FD!

LSQ vs. POD (PA6.6)

- Fatigue test on short glass fiber reinforced PA 6.6
- $R_s=0.1$, $f_L=10$ Hz
- Mean dissipation per cycle

- LSQ vs. POD : low mismatch!
- $|\delta s| \leq 10^{-2} \text{ } ^\circ\text{C.s}^{-1}$

- JACKPOT : CPU times !
- $\text{POD/LSQ} \approx 10^{-3}$!
- Data : 60 Go

- 3 months → 1 hour
- PC: Intel Core i7 2.5 GHz processor
- RAM: 16 GB
