HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

# TWO-SIDED CELLS IN TYPE $B$ (ASYMPTOTIC CASE) 

CÉDRIC BONNAFÉ

Abstract. We compute two-sided cells of Weyl groups of type $B$ for the "asymptotic" choice of parameters. We also obtain some partial results concerning Lusztig's conjectures in this particular case.

Let $W_{n}$ be a Weyl group of type $B_{n}$. The present paper is a continuation of the work done by L. Iancu and the author [3] concerning Kazhdan-Lusztig theory of $W_{n}$ for the asymptotic choice of parameters [3, §6]. To each element $w \in W_{n}$ is associated a pair of standard bi-tableaux $(P(w), Q(w))$ (see [19] or [3, §3]): this can be viewed as a Robinson-Schensted type correspondence. The main result [3, Theorem 7.7] is a complete determination of the left cells: two elements $w$ and $w^{\prime}$ are in the same left cell if and only if $Q(w)=Q\left(w^{\prime}\right)$. We have also computed the character afforded by a left cell representation [3, Proposition 7.11] (this character is irreducible).

The present paper is concerned with the computation of the two-sided cells. Let us state the result here. If $w \in W_{n}$, write $Q(w)=\left(Q^{+}(w), Q^{-}(w)\right)$ and denote by $\lambda^{+}(w)$ and $\lambda^{-}(w)$ the shape of $Q^{+}(w)$ and $Q^{-}(w)$ respectively. Note that $\left(\lambda^{+}(w), \lambda^{-}(w)\right)$ is a bipartition of $n$.

Theorem (see 3.9). For the choice of parameters as in [3, §6], two elements $w$ and $w^{\prime}$ are in the same two-sided cell if and only if $\left(\lambda^{+}(w), \lambda^{-}(w)\right)=\left(\lambda^{+}\left(w^{\prime}\right), \lambda^{-}\left(w^{\prime}\right)\right)$.

Lusztig 17, Chapter 14] has proposed fifteen conjectures on Kazhdan-Lusztig theory of Hecke algebras with unequal parameters. The above theorem is compatible with Lusztig's conjectures $P_{4}, P_{9}, P_{10}$ and $P_{11}$ and with [3, Theorem 7.7]. We also obtain some partial results concerning Lusztig's conjectures (see for instance Proposition 4.3). In the last section, we determine which specializations of the parameters lead to an "isomorphic" situation.

Let us stay in this asymptotic case. In a forthcoming paper [9], Geck and Iancu use some of our results, namely some informations on the preorder $\leqslant_{\mathcal{L} \mathcal{R}}$ (see Theorem 3.5 and Proposition 4.2), to compute the function a and to prove Lusztig's conjectures $P_{i}$, for $i \in\{1,2,3,4,5,6,7,8,11,12,13,14\}$. On the other hand, Geck [8] has shown that Lusztig's conjectures $P_{9}$ and $P_{10}$ hold. More precisely, he proved that the Kazhdan-Lusztig basis is cellular (in the sense of [11]). He also proved a slightly weaker version of $P_{15}$ (but his version is sufficient for constructing the homomorphism from the Hecke algebra to the asymptotic algebra $J$ ).

The present paper is organized as follows. In Section 1, we study some consequences of Lusztig's conjectures on the multiplication by $T_{w_{0}}$, where $w_{0}$ is the longest element of a finite Weyl group. From Section 2 to the end of the paper, we assume that the Weyl group is of type $B_{n}$ and that the choice of parameters is done as in $[3, \S 6]$. In Section 2, we establish some preliminary results concerning the Kazhdan-Lusztig basis. In Section 3, we prove the above theorem by introducing a new basis of the Hecke algebra: this was inspired by the work of Geck on

[^0]the induction of Kazhdan-Lusztig cells [7]. Section 4 contains some results related to Lusztig's conjectures. In Section we determine which specializations of the parameters preserve the Kazhdan-Lusztig basis.

## 1. Generalities

1.A. Notation. We slightly modify the notation used in [3, $\S 5]$. Let $(W, S)$ be a Coxeter group with $|S|<\infty$. We denote by $\ell: W \rightarrow \mathbb{N}=\{0,1,2, \ldots\}$ the length function relative to $S$. If $W$ is finite, $w_{0}$ denotes its longest element. Let $\leqslant$ denote the Bruhat ordering on $W$. If $I \subset S$, we denote by $W_{I}$ the standard parabolic subgroup of $W$ generated by $I$.

Let $\Gamma$ be a totally ordered abelian group which will be denoted additively. The order on $\Gamma$ will be denoted by $\leqslant$. If $\gamma_{0} \in \Gamma$, we set

$$
\begin{gathered}
\Gamma_{<\gamma_{0}}=\left\{\gamma \in \Gamma \mid \gamma<\gamma_{0}\right\}, \quad \Gamma_{\leqslant \gamma_{0}}=\left\{\gamma \in \Gamma \mid \gamma \leqslant \gamma_{0}\right\}, \\
\Gamma_{>\gamma_{0}}=\left\{\gamma \in \Gamma \mid \gamma>\gamma_{0}\right\} \quad \text { and } \quad \Gamma_{\geqslant \gamma_{0}}=\left\{\gamma \in \Gamma \mid \gamma \geqslant \gamma_{0}\right\} .
\end{gathered}
$$

Let $A$ be the group algebra of $\Gamma$ over $\mathbb{Z}$. It will be denoted exponentially: as a $\mathbb{Z}$-module, it is free with basis $\left(v^{\gamma}\right)_{\gamma \in \Gamma}$ and the multiplication rule is given by $v^{\gamma} v^{\gamma^{\prime}}=v^{\gamma+\gamma^{\prime}}$ for all $\gamma, \gamma^{\prime} \in \Gamma$. If $a \in A$, we denote by $a_{\gamma}$ the coefficient of $a$ on $v^{\gamma}$, so that $a=\sum_{\gamma \in \Gamma} a_{\gamma} v^{\gamma}$. If $a \neq 0$, we define the degree and the valuation of $a$ (which we denote respectively by $\operatorname{deg} a$ and $\operatorname{val} a$ ) as the elements of $\Gamma$ equal to

$$
\begin{aligned}
& \operatorname{deg} a=\max \left\{\gamma \mid a_{\gamma} \neq 0\right\} \\
& \operatorname{val} a=\min \left\{\gamma \mid a_{\gamma} \neq 0\right\} .
\end{aligned}
$$

and
By convention, we set $\operatorname{deg} 0=-\infty$ and val $0=+\infty$. So $\operatorname{deg}: A \rightarrow \Gamma \cup\{-\infty\}$ and val : $A \rightarrow \Gamma \cup\{+\infty\}$ satisfy $\operatorname{deg} a b=\operatorname{deg} a+\operatorname{deg} b$ and val $a b=\operatorname{val} a+\operatorname{val} b$ for all $a, b \in A$. We denote by $A \rightarrow A, a \mapsto \bar{a}$ the automorphism of $A$ induced by the automorphism of $\Gamma$ sending $\gamma$ to $-\gamma$. Note that $\operatorname{deg} a=-\operatorname{val} \bar{a}$. If $\gamma_{0} \in \Gamma$, we set

$$
\begin{gathered}
A_{<\gamma_{0}}=\underset{\gamma<\gamma_{0}}{\oplus} \mathbb{Z} v^{\gamma}, \quad A_{\leqslant \gamma_{0}}=\underset{\gamma \leqslant \gamma_{0}}{\oplus} \mathbb{Z} v^{\gamma}, \\
A_{>\gamma_{0}}=\underset{\gamma>\gamma_{0}}{\oplus} \mathbb{Z} v^{\gamma} \quad \text { and } \quad A_{\geqslant \gamma_{0}}=\underset{\gamma \geqslant \gamma_{0}}{\oplus} \mathbb{Z} v^{\gamma} .
\end{gathered}
$$

We fix a weight function $L: W \rightarrow \Gamma$, that is a function satisfying $L\left(w w^{\prime}\right)=$ $L(w)+L\left(w^{\prime}\right)$ whenever $\ell\left(w w^{\prime}\right)=\ell(w)+\ell\left(w^{\prime}\right)$. We also assume that $L(s)>0$ for every $s \in S$. We denote by $\mathcal{H}=\mathcal{H}(W, S, L)$ the Hecke algebra of $W$ associated to the weight function $L$. It is the associative $A$-algebra with $A$-basis $\left(T_{w}\right)_{w \in W}$ indexed by $W$ and whose multiplication is determined by the following two conditions:
(a) $\quad T_{w} T_{w^{\prime}}=T_{w w^{\prime}} \quad$ if $\ell\left(w w^{\prime}\right)=\ell(w)+\ell\left(w^{\prime}\right)$
(b) $\quad T_{s}^{2}=1+\left(v^{-L(s)}-v^{L(s)}\right) T_{s} \quad$ if $s \in S$.

It is easily seen from the above relations that $\left(T_{s}\right)_{s \in S}$ generates the $A$-algebra $\mathcal{H}$ and that $T_{w}$ is invertible for every $w \in W$. If $h=\sum_{w \in W} a_{w} T_{w} \in \mathcal{H}$, we set $\bar{h}=\sum_{w \in W} \bar{a}_{w} T_{w^{-1}}^{-1}$. Then the map $\mathcal{H} \rightarrow \mathcal{H}, h \mapsto \bar{h}$ is a semi-linear involutive automorphism of $\mathcal{H}$. If $I \subset S$, we denote by $\mathcal{H}\left(W_{I}\right)$ the sub- $A$-algebra of $\mathcal{H}$ generated by $\left(T_{s}\right)_{s \in I}$.

Let $w \in W$. By 17, Theorem 5.2], there exists a unique element $C_{w} \in \mathcal{H}$ such that
(a) $\quad C_{w}=\bar{C}_{w}$
(b) $\quad C_{w} \in T_{w}+\left(\underset{y \in W}{\oplus} A_{<0} T_{y}\right)$.

Write $C_{w}=\sum_{y \in W} p_{y, w}^{*} T_{y}$ with $p_{y, w}^{*} \in A$. Then [17, 5.3]

$$
\begin{aligned}
& p_{w, w}^{*}=1 \\
& p_{y, w}^{*}=0
\end{aligned} \quad \text { si } y \not \approx w .
$$

In particular, $\left(C_{w}\right)_{w \in W}$ is an $A$-basis of $\mathcal{H}$ : it is called the Kazhdan-Lusztig basis of $\mathcal{H}$. Write now $p_{y, w}=v^{L(w)-L(y)} p_{y, w}^{*}$. Then

$$
p_{y, w} \in A_{\geqslant 0}
$$

and the coefficient of $p_{y, w}$ on $v^{0}$ is equal to 1 (see 17. Proposition 5.4 (a)].
We define the relations $\leqslant_{\mathcal{L}}, \leqslant_{\mathcal{R}}, \leqslant_{\mathcal{L} \mathcal{R}}, \sim_{\mathcal{L}}, \sim_{\mathcal{R}}$ and $\sim_{\mathcal{L R}}$ as in 17 , §8].
1.B. The function a. Let $x, y \in W$. Write

$$
C_{x} C_{y}=\sum_{z \in W} h_{x, y, z} C_{z}
$$

where $h_{x, y, z} \in A$ for $z \in W$. Of course, we have

$$
\begin{equation*}
\overline{h_{x, y, z}}=h_{x, y, z} . \tag{1.1}
\end{equation*}
$$

The following lemma is well-known 17, Lemma 10.4 (c) and formulas 13.1 (a) et (b)].

Lemma 1.2. Let $x, y$ and $z$ be three elements of $W$. Then

$$
\operatorname{deg} h_{x, y, z} \leqslant \min (L(x), L(y))
$$

Conjecture $\boldsymbol{P}_{\mathbf{0}}$ (Lusztig): There exists $N \in \Gamma$ such that $\operatorname{deg} h_{x, y, z} \leqslant N$ for all $x, y$ and $z$ in $W$.

If $W$ is finite, then $W$ satisfies obviously $P_{0}$. If $W$ is an affine Weyl group, then it also satisfies $P_{0}$ [16, 7.2]. From now on, we assume that $W$ satisfies $P_{0}$, so that the next definition is valid. If $z \in W$, we set

$$
\mathbf{a}(z)=\max _{x, y \in W} \operatorname{deg} h_{x, y, z} .
$$

Since $h_{1,1, z}=1$, we have $\mathbf{a}(z) \in \Gamma \geqslant 0$. If necessary, we will write $\mathbf{a}_{W}(z)$ for $\mathbf{a}(z)$. We denote by $\gamma_{x, y, z^{-1}} \in \mathbb{Z}$ the coefficient of $v^{\mathbf{a}(z)}$ in $h_{x, y, z}$. The next proposition shows how the function a can be calculated by using different bases.

Proposition 1.3. Let $\left(X_{w}\right)_{w \in W}$ and $\left(Y_{w}\right)_{w \in W}$ be two families of elements of $\mathcal{H}$ such that, for every $w \in W, X_{w}-T_{w}$ and $Y_{w}-T_{w}$ belong to $\oplus_{y<w} A_{<0} T_{y}$. For all $x$ and $y$ in $W$, write

$$
X_{x} Y_{y}=\sum_{z \in W} \xi_{x, y, z} C_{z}
$$

Then, if $x, y, z \in W$, we have:
(a) $\operatorname{deg} \xi_{x, y, z} \leqslant \min \{L(x), L(y)\}$.
(b) $\xi_{x, y, z} \in \gamma_{x, y, z^{-1}} v^{\mathbf{a}(z)}+A_{<\mathbf{a}(z)}$.

In particular,

$$
\mathbf{a}(z)=\max _{x, y \in W} \operatorname{deg} \xi_{x, y, z} .
$$

Proof - Clear.
1.C. Lusztig's conjectures. Let $\tau: \mathcal{H} \rightarrow A$ be the $A$-linear application such that $\tau\left(T_{w}\right)=\delta_{1, w}$ if $w \in W$. It is the canonical symmetrizing form on $\mathcal{H}$ (recall that $\left.\tau\left(T_{x} T_{y}\right)=\delta_{x y, 1}\right)$. If $z \in W$, let

$$
\Delta(z)=-\operatorname{deg} p_{1, z}^{*}=-\operatorname{deg} \tau\left(C_{z}\right)
$$

Let $n_{z}$ be the coefficient of $p_{1, z}^{*}$ on $v^{-\Delta(z)}$. Finally, let

$$
\mathcal{D}=\{z \in W \mid \mathbf{a}(z)=\Delta(z)\}
$$

Conjectures (Lusztig): With the above notation, we have:
$\boldsymbol{P}_{\mathbf{1}}$. If $z \in W$, then $\mathbf{a}(z) \leqslant \Delta(z)$.
$\boldsymbol{P}_{\mathbf{2}}$. If $d \in \mathcal{D}$ and if $x, y \in W$ satisfy $\gamma_{x, y, d} \neq 0$, then $x=y^{-1}$.
$\boldsymbol{P}_{\mathbf{3}}$. If $y \in W$, then there exists a unique $d \in \mathcal{D}$ such that $\gamma_{y^{-1}, y, d} \neq 0$.
$\boldsymbol{P}_{4}$. If $z^{\prime} \leqslant_{\mathcal{L} \mathcal{R}} z$, then $\mathbf{a}(z) \leqslant \mathbf{a}\left(z^{\prime}\right)$. Therefore, if $z \sim_{\mathcal{L R}} z^{\prime}$, then $\mathbf{a}(z)=\mathbf{a}\left(z^{\prime}\right)$.
$\boldsymbol{P}_{5}$. If $d \in \mathcal{D}$ and $y \in W$ satisfy $\gamma_{y^{-1}, y, d} \neq 0$, then $\gamma_{y^{-1}, y, d}=n_{d}= \pm 1$.
$\boldsymbol{P}_{\mathbf{6}}$. If $d \in \mathcal{D}$, then $d^{2}=1$.
$\boldsymbol{P}_{\mathbf{7}}$. If $x, y, z \in W$, then $\gamma_{x, y, z}=\gamma_{y, z, x}$.
$\boldsymbol{P}_{8}$. If $x, y, z \in W$ satisfy $\gamma_{x, y, z} \neq 0$, then $x \sim_{\mathcal{L}} y^{-1}, y \sim_{\mathcal{L}} z^{-1}$ and $z \sim_{\mathcal{L}} x^{-1}$.
$\boldsymbol{P}_{\mathbf{9}}$. If $z^{\prime} \leqslant_{\mathcal{L}} z$ and $\mathbf{a}\left(z^{\prime}\right)=\mathbf{a}(z)$, then $z^{\prime} \sim_{\mathcal{L}} z$.
$\boldsymbol{P}_{\mathbf{1 0}}$. If $z^{\prime} \leqslant_{\mathcal{R}} z$ and $\mathbf{a}\left(z^{\prime}\right)=\mathbf{a}(z)$, then $z^{\prime} \sim_{\mathcal{R}} z$.
$\boldsymbol{P}_{11}$. If $z^{\prime} \leqslant_{\mathcal{L R}} z$ and $\mathbf{a}\left(z^{\prime}\right)=\mathbf{a}(z)$, then $z^{\prime} \sim_{\mathcal{L R}} z$.
$\boldsymbol{P}_{\mathbf{1 2}}$. If $I \subset S$ and $z \in W_{I}$, then $\mathbf{a}_{W_{I}}(z)=\mathbf{a}_{W}(z)$.
$\boldsymbol{P}_{\mathbf{1 3}}$. Every left cell $\mathcal{C}$ of $W$ contains a unique element $d \in \mathcal{D}$. If $y \in \mathcal{C}$, then $\gamma_{y^{-1}, y, d} \neq 0$.
$\boldsymbol{P}_{14}$. If $z \in W$, then $z \sim_{\mathcal{L R}} z^{-1}$.
$\boldsymbol{P}_{15}$. If $x, x^{\prime}, y, w \in W$ are such that $\mathbf{a}(y)=\mathbf{a}(w)$, then

$$
\sum_{y^{\prime} \in W} h_{w, x^{\prime}, y^{\prime}} \otimes_{\mathbb{Z}} h_{x, y^{\prime}, y}=\sum_{y^{\prime} \in W} h_{y^{\prime}, x^{\prime}, y} \otimes_{\mathbb{Z}} h_{x, w, y^{\prime}}
$$

in $A \otimes_{\mathbb{Z}} A$.
Lusztig has shown that these conjectures hold if $W$ is a finite or affine Weyl group and $L=\ell$ [17, §15], if $W$ est dihedral and $L$ is any weight function 17, §17] and if $(W, L)$ is quasi-split $17, \S 16]$.
1.D. Lusztig's conjectures and multiplication by $\boldsymbol{T}_{\boldsymbol{w}_{0}}$. We assume in this subsection that $W$ is finite. We are interested here in certain properties of the multiplication by $T_{w_{0}}^{n}$ for $n \in \mathbb{Z}$. Some of them are partially known 14, Lemma 1.11 and Remark 1.12]. If $y \in W$ and $n \in \mathbb{Z}$, we set

$$
T_{w_{0}}^{n} C_{y}=\sum_{x \in W} \lambda_{x, y}^{(n)} C_{x}
$$

Note that $\lambda_{x, y}^{(n)}=0$ if $x \not \nless \mathcal{L} y$.
Proposition 1.4. Assume that $W$ is finite and satisfy Lusztig's conjectures $P_{1}, P_{4}$ et $P_{8}$. Let $n \in \mathbb{Z}$ and let $x$ and $y$ be two elements of $W$ such that $x \leqslant_{\mathcal{L}} y$. Then:
(a) If $n \geqslant 0$, then $\operatorname{deg} \lambda_{x, y}^{(n)} \leqslant n\left(\mathbf{a}(x)-\mathbf{a}\left(w_{0} x\right)\right)$. If moreover $x<_{\mathcal{L}} y$, then $\operatorname{deg} \lambda_{x, y}^{(n)}<n\left(\mathbf{a}(x)-\mathbf{a}\left(w_{0} x\right)\right)$.
(b) If $n \leqslant 0$, then $\operatorname{deg} \lambda_{x, y}^{(n)} \leqslant n\left(\mathbf{a}(y)-\mathbf{a}\left(w_{0} y\right)\right)$. If moreover $x<_{\mathcal{L}} y$, then $\operatorname{deg} \lambda_{x, y}^{(n)}<n\left(\mathbf{a}(y)-\mathbf{a}\left(w_{0} y\right)\right)$.
(c) If $n$ is even and if $x \sim_{\mathcal{L}} y$, then $\lambda_{x, y}^{(n)}=\delta_{x, y} v^{n\left(\mathbf{a}(x)-\mathbf{a}\left(w_{0} x\right)\right)}$.

Proof - If $n=0$, then (a), (b) and (c) are easily checked. Let us now prove (a) and (b). By [17, Proposition 11.4],

$$
T_{w_{0}}=\sum_{u \in W}(-1)^{\ell\left(w_{0} u\right)} p_{1, w_{0} u}^{*} C_{u}
$$

Consequently,

$$
\lambda_{x, y}^{(1)}=\sum_{\substack{u \in W \\ x \leqslant \mathcal{R}^{u} u}}(-1)^{\ell\left(w_{0} u\right)} p_{1, w_{0} u}^{*} h_{u, y, x} .
$$

But, by $P_{1}$, we have $\operatorname{deg} p_{1, w_{0} u}^{*} \leqslant-\mathbf{a}\left(w_{0} u\right)$. If moreover $x \leqslant_{\mathcal{R}} u$, then $w_{0} u \leqslant_{\mathcal{R}} w_{0} x$ and so $-\mathbf{a}\left(w_{0} x\right) \geqslant-\mathbf{a}\left(w_{0} u\right)$ by $P_{4}$. Therefore

$$
\operatorname{deg} \lambda_{x, y}^{(1)} \leqslant \mathbf{a}(x)-\mathbf{a}\left(w_{0} x\right) .
$$

On the other hand, if $\operatorname{deg} \lambda_{x, y}^{(1)}=\mathbf{a}(x)-\mathbf{a}\left(w_{0} x\right)$, then there exists $u \in W$ such that $x \leqslant_{\mathcal{R}} u$ and $\operatorname{deg} h_{u, y, x}=\mathbf{a}(x)$. So, by $P_{8}$, we get that $x \sim_{\mathcal{L}} y$. This shows (a) for $n=1$.

Now, let $\nu: \mathcal{H} \rightarrow \mathcal{H}$ denote the $A$-linear application such that $\nu\left(C_{w}\right)=$ $v^{\mathbf{a}\left(w_{0} w\right)-\mathbf{a}(w)} C_{w}$ for all $w \in W$ and let $\mu: \mathcal{H} \rightarrow \mathcal{H}, h \mapsto T_{w_{0}} h$. Then, if $w \in W$, we have

$$
\nu \mu\left(C_{y}\right)=\sum_{u \leqslant \varsigma^{\perp} y} v^{\mathbf{a}\left(w_{0} u\right)-\mathbf{a}(u)} \lambda_{u, y}^{(1)} C_{u} .
$$

So, by the previous discussion, we have $v^{\mathbf{a}\left(w_{0} u\right)-\mathbf{a}(u)} \lambda_{u, y}^{(1)} \in A_{\leqslant 0}$. Moreover, if $u<_{\mathcal{L}} y$, then $v^{\mathbf{a}\left(w_{0} u\right)-\mathbf{a}(u)} \lambda_{u, y}^{(1)} \in A_{\leqslant 0}$. On the other hand, $\operatorname{det} \mu= \pm 1$ and $\operatorname{det} \nu=1$. Therefore, if we write

$$
\mu^{-1} \nu^{-1}\left(C_{y}\right)=\sum_{u \leqslant\llcorner } \beta_{u, y} C_{u}
$$

then $\beta_{u, y} \in A_{\leqslant 0}$ and, if $u<_{\mathcal{L}} y$, then $\beta_{u, y} \in A_{<0}$. Finally,

$$
\begin{aligned}
T_{w_{0}}^{-1} C_{y} & =\mu^{-1}\left(C_{y}\right) \\
& =\mu^{-1} \nu^{-1} \nu\left(C_{y}\right) \\
& =v^{\mathbf{a}\left(w_{0} y\right)-\mathbf{a}(y)} \mu^{-1} \nu^{-1}\left(C_{y}\right) \\
& =\sum_{u \leqslant \mathcal{L} y} v^{\mathbf{a}\left(w_{0} y\right)-\mathbf{a}(y)} \beta_{u, y} C_{u} .
\end{aligned}
$$

In other words, $\lambda_{x, y}^{(-1)}=v^{\mathbf{a}\left(w_{0} y\right)-\mathbf{a}(y)} \beta_{x, y}$. This shows that (b) holds if $n=-1$. An elementary induction argument using $P_{4}$ shows that (a) and (b) hold in full generality.

Let us now prove (c). Let $K$ be the field of fraction of $A$. Let $C$ be a left cell of $W$ and let $c \in C$. We set

$$
\mathcal{H}^{\leqslant \mathcal{L} C}=\underset{w \leqslant \mathcal{L}^{c}}{\oplus} A C_{w} \quad \text { and } \quad \mathcal{H}^{<\mathcal{L}^{C}}=\underset{w<\mathcal{L}^{c} C}{\oplus} A C_{w}
$$

Then $\mathcal{H} \leqslant{ }_{\kappa} C$ and $\mathcal{H}<{ }_{L} C$ are left ideals of $\mathcal{H}$. The algebra $K \mathcal{H}=K \otimes_{A} \mathcal{H}$ being semisimple, there exists a left ideal $I_{C}$ of $K \mathcal{H}$ such that $K \mathcal{H} \leqslant_{\mathcal{L}}^{C}=K \mathcal{H}^{<\mathcal{L} C} \oplus I_{C}$.

We need to prove that, for all $h \in I_{C}$,

$$
T_{w_{0}}^{n} h=v^{n\left(\mathbf{a}(c)-\mathbf{a}\left(w_{0} c\right)\right)} h
$$

For this, we may, and we will, assume that $n>0$. Let $V_{1}^{C}, V_{2}^{C}, \ldots, V_{n_{C}}^{C}$ be irreducible sub- $K \mathcal{H} \otimes_{A} K$-modules of $I_{C}$ such that

$$
I_{C}=V_{1}^{C} \oplus \cdots \oplus V_{n_{C}}^{C}
$$

Let $j \in\left\{1,2, \ldots, n_{C}\right\}$. Since $T_{w_{0}}^{n}$ is central and invertible in $\mathcal{H}$, there exists $\varepsilon \in$ $\{1,-1\}$ and $i_{j}(C) \in \Gamma$ such that

$$
T_{w_{0}}^{n} h=\varepsilon v^{i_{j}(C)} h
$$

for every $h \in V_{j}^{C}$. By specializing $v^{\gamma} \mapsto 1$, we get that $\varepsilon=1$. Moreover, by (a) and (b), $i_{j}^{C} \leqslant n\left(\mathbf{a}(c)-\mathbf{a}\left(w_{0} c\right)\right)$. On the other hand, since det $\mu= \pm 1$, we have $\operatorname{det} \mu^{n}=1$. But $\operatorname{det} \mu^{n}=v^{r}$, where

$$
\begin{aligned}
r & =\sum_{C \in \mathcal{L C}(W)} \sum_{j=1}^{n_{C}} i_{j}^{C} \operatorname{dim} V_{j}^{C} \\
& \leqslant n \sum_{C \in \mathcal{L C}(W)}\left(\mathbf{a}(C)-\mathbf{a}\left(w_{0} C\right)\right) \sum_{j=1}^{n_{C}} \operatorname{dim} V_{j}^{C} \\
& =n \sum_{C \in \mathcal{L C}(W)}\left(\mathbf{a}(C)-\mathbf{a}\left(w_{0} C\right)\right)|C| \\
& =n \sum_{w \in W}\left(\mathbf{a}(w)-\mathbf{a}\left(w_{0} w\right)\right) \\
& =0
\end{aligned}
$$

Here, $\mathcal{L C}(W)$ denotes the set of left cells in $W$ and, if $C \in \mathcal{L C}(W), \mathbf{a}(C)$ denotes the value of a on $C$ (according to $P_{4}$ ). The fact that $r=0$ forces the equality $i_{j}^{C}=n\left(\mathbf{a}(C)-\mathbf{a}\left(w_{0} C\right)\right)$ for every left cell $C$ and every $j \in\left\{1,2, \ldots, n_{C}\right\}$.

Remark 1.5 - Assume here that $w_{0}$ is central in $W$ and keep the notation of the proof of Proposition 1.4 (c). Let $j \in\left\{1,2, \ldots, n_{C}\right\}$. Then there exists $\varepsilon_{j}(C) \in$ $\{1,-1\}$ et $e_{j}(C) \in \Gamma$ such that $T_{w_{0}} h=\varepsilon_{j}(C) v^{e_{j}(C)} h$ for every $h \in V_{j}^{C}$.
Question: Let $j, j^{\prime} \in\left\{1,2, \ldots, n_{C}\right\}$. Does $\varepsilon_{j}(C)=\varepsilon_{j^{\prime}}(C)$ ?
A positive answer to this question would allow to generalize Proposition 1.4 (c) to the case where $w_{0}^{n}$ is central.

Corollary 1.6. Assume that $W$ is finite and satisfy Lusztig's conjectures $P_{1}, P_{2}$, $P_{4}, P_{8}, P_{9}$ and $P_{13}$. Let $w \in W$ and let $n \in \mathbb{N}$. Then $\operatorname{deg} \tau\left(T_{w_{0}}^{-n} C_{w}\right) \leqslant-\mathbf{a}(w)+$ $n\left(\mathbf{a}\left(w_{0} w\right)-\mathbf{a}(w)\right)$. Moreover, $\operatorname{deg} \tau\left(T_{w_{0}}^{-n} C_{w}\right)=-\mathbf{a}(w)+n\left(\mathbf{a}\left(w_{0} w\right)-\mathbf{a}(w)\right)$ if and only if $w_{0}^{n} w \in \mathcal{D}$.
Proof - Assume first that $n$ is even. In particular, $w_{0}^{n}=1$. By Proposition 1.4, we have

$$
\tau\left(T_{w_{0}}^{-n} C_{w}\right)=v^{n\left(\mathbf{a}\left(w_{0} w\right)-\mathbf{a}(w)\right)} \tau\left(C_{w}\right)+\sum_{x<\mathcal{L} w} \lambda_{x, w}^{(-n)} \tau\left(C_{x}\right)
$$

But, if $x<_{\mathcal{L}} w$, then $\operatorname{deg} \tau\left(C_{x}\right)=-\Delta(x) \leqslant-\mathbf{a}(x) \leqslant-\mathbf{a}(w)$. So, by $P_{1}$ and $P_{4}$ and by Proposition 1.4 (b), we have that $\operatorname{deg} \lambda_{x, w}^{(-n)} \tau\left(C_{x}\right)<-\mathbf{a}(w)+n\left(\mathbf{a}\left(w_{0} w\right)-\mathbf{a}(w)\right)$. Moreover, again by $P_{1}$, we have $\operatorname{deg} \tau\left(C_{w}\right)=-\Delta(w) \leqslant-\mathbf{a}(w)$. This shows that $\operatorname{deg} \tau\left(T_{w_{0}}^{-n} C_{w}\right) \leqslant-\mathbf{a}(w)+n\left(\mathbf{a}\left(w_{0} w\right)-\mathbf{a}(w)\right)$ and that equality holds if and only if $\Delta(w)=\mathbf{a}(w)$, that is, if and only if $w \in \mathcal{D}$, as desired.

Assume now that $n=2 k+1$ for some natural number $k$. Recall that, by 17, Proposition 11.4], $T_{w_{0}}=\sum_{u \in W}(-1)^{\ell\left(w_{0} u\right)} p_{1, w_{0} u}^{*} C_{x}$. Therefore

$$
\begin{aligned}
T_{w_{0}}^{-n} C_{w} & =\sum_{u \in W}(-1)^{\ell\left(w_{0} u\right)} p_{1, w_{0} u}^{*} T_{w_{0}}^{-n-1} C_{u} C_{w} \\
& =\sum_{\substack{u, x \in W \\
u \leqslant \leqslant_{\mathcal{L}} \text { and } u \leqslant_{\mathcal{R}} x}}(-1)^{\ell\left(w_{0} u\right)} p_{1, w_{0} u}^{*} h_{u, w, x} T_{w_{0}}^{-n-1} C_{x} .
\end{aligned}
$$

This implies that
so

$$
\begin{gathered}
\tau\left(T_{w_{0}}^{-n} C_{w}\right)=\sum_{\substack{u, x \in W \\
x \leqslant_{\mathcal{L}} w \text { and } x \leqslant_{\mathcal{R}} u}}(-1)^{\ell\left(w_{0} u\right)} p_{1, w_{0} u}^{*} h_{u, w, x} \tau\left(T_{w_{0}}^{-2} C_{x}\right), \\
\operatorname{deg} \tau\left(T_{w_{0}}^{-n} C_{w}\right) \leqslant \max _{\substack{u, x \in W \\
x \leqslant_{\mathcal{L}} w \text { and } x \leqslant_{\mathcal{R}} u}} \operatorname{deg}\left(p_{1, w_{0} u}^{*} h_{u, w, x} \tau\left(T_{w_{0}}^{-n-1} C_{x}\right)\right) .
\end{gathered}
$$

Let $u$ and $x$ be two elements of $W$ such that $x \leqslant_{\mathcal{L}} w$ and $x \leqslant_{\mathcal{R}} u$. Since $n+1$ is even and by the previous discussion, we have

$$
\operatorname{deg} \tau\left(T_{w_{0}}^{-n-1} C_{x}\right) \leqslant-\mathbf{a}(x)+(n+1)\left(\mathbf{a}\left(w_{0} x\right)-\mathbf{a}(x)\right)
$$

By $P_{1}$ and $P_{4}, \operatorname{deg} p_{1, w_{0} u}^{*} \leqslant-\mathbf{a}\left(w_{0} u\right) \leqslant-\mathbf{a}\left(w_{0} x\right)$. Moreover, $\operatorname{deg} h_{u, w, x} \leqslant \mathbf{a}(x)$. Consequently,

$$
\begin{aligned}
\operatorname{deg}\left(p_{1, w_{0} u}^{*} h_{u, w, x} \tau\left(T_{w_{0}}^{-n-1} C_{x}\right)\right) & \leqslant-\mathbf{a}(x)+n\left(\mathbf{a}\left(w_{0} x\right)-\mathbf{a}(x)\right) \\
& \leqslant-\mathbf{a}(w)+n\left(\mathbf{a}\left(w_{0} w\right)-\mathbf{a}(w)\right)
\end{aligned}
$$

Moreover, equality holds if and only if $w_{0} u \in \mathcal{D}, \operatorname{deg} h_{u, w, x}=\mathbf{a}(x)=\mathbf{a}(w)$ and $x \in \mathcal{D}$.

We first deduce that

$$
\operatorname{deg} \tau\left(T_{w_{0}}^{-n} C_{w}\right) \leqslant-\mathbf{a}(w)+n\left(\mathbf{a}\left(w_{0} w\right)-\mathbf{a}(w)\right)
$$

which is the first assertion of the proposition.
Assume now that $\operatorname{deg} \tau\left(T_{w_{0}}^{-n} C_{w}\right)=-\mathbf{a}(w)+n\left(\mathbf{a}\left(w_{0} w\right)-\mathbf{a}(w)\right)$. Then there exists $u$ and $x$ in $W$ such that $x \leqslant_{\mathcal{L}} w, x \leqslant_{\mathcal{R}} u, w_{0} u \in \mathcal{D}, \operatorname{deg} h_{u, w, x}=\mathbf{a}(x)=\mathbf{a}(w)$ and $x \in \mathcal{D}$. Since $\operatorname{deg} h_{u, w, x}=\mathbf{a}(x)$ and $x \in \mathcal{D}$, we deduce from $P_{2}$ that $w=u^{-1}$, which shows that $w_{0} w \in \mathcal{D}$.

Conversely, assume that $w_{0} w \in \mathcal{D}$. To show that $\operatorname{deg} \tau\left(T_{w_{0}}^{-n} C_{w}\right)=-\mathbf{a}(w)+$ $n\left(\mathbf{a}\left(w_{0} w\right)-\mathbf{a}(w)\right)$, it is sufficient to show that there is a unique pair $(u, x)$ of elements of $W$ such that $x \leqslant_{\mathcal{L}} w, x \leqslant_{\mathcal{R}} u, w_{0} u \in \mathcal{D}$, $\operatorname{deg} h_{u, w, x}=\mathbf{a}(x)=\mathbf{a}(w)$ and $x \in \mathcal{D}$. The existence follows from $P_{13}$ (take $u=w^{-1}$ and $x$ be the unique elément of $\mathcal{D}$ belonging to the left cell containing $w)$. Let us now show unicity. Let $(u, x)$ be such a pair. Since $\operatorname{deg} h_{u, w, x}=\mathbf{a}(x)$ and $x \in \mathcal{D}$, we deduce from $P_{2}$ that $u=w^{-1}$. Moreover, since $\mathbf{a}(x)=\mathbf{a}(w)$ and $x \leqslant_{\mathcal{L}} w$, we have $x \sim_{\mathcal{L}} w$ by $P_{9}$. But, by $P_{13}, x$ is the unique element of $\mathcal{D}$ belonging to the left cell containing $w$.

## 2. Preliminaries on type $B$ (asymptotic case)

From now on, we are working under the following hypothesis.
Hypothesis and notation: We assume now that $W=W_{n}$ is of type $B_{n}, n \geqslant 1$. We write $S=S_{n}=\left\{t, s_{1}, \ldots, s_{n-1}\right\}$ as in [3, §2.1]: the Dynkin diagram of $W_{n}$ is given by

We also assume that $\Gamma=\mathbb{Z}^{2}$ and that $\Gamma$ is ordered lexicographically:

$$
(a, b) \leqslant\left(a^{\prime}, b^{\prime}\right) \Longleftrightarrow a<a^{\prime} \text { or }\left(a=a^{\prime} \text { and } b \leqslant b^{\prime}\right)
$$

We set $V=v^{(1,0)}$ and $v=v^{(0,1)}$ so that $A=\mathbb{Z}\left[V, V^{-1}, v, v^{-1}\right]$ is the Laurent polynomial ring in two algebraically independent indeterminates $V$ and $v$. If $w \in W_{n}$, we denote by $\ell_{t}(w)$ the number of occurences of $t$ in a reduced expression of $w$. We set $\ell_{s}(w)=\ell(w)-\ell_{t}(w)$. Then $\ell_{s}$ and $\ell_{t}$ are weight functions and

> we assume that $L=L_{n}: W_{n} \rightarrow \Gamma, w \mapsto\left(\ell_{t}(w), \ell_{s}(w)\right)$. So $\mathcal{H}=\mathcal{H}_{n}=\mathcal{H}\left(W_{n}, S_{n}, L_{n}\right)$. We denote by $\mathfrak{S}_{n}$ the subgroup of $W$ generated by $\left\{s_{1}, \ldots, s_{n-1}\right\}:$ it is isomorphic to the symmetric group of degree $n$.

We now recall some notation from [3, §2.1 and 4.1]. Let $r_{1}=t_{1}=t$ and, if $1 \leqslant i \leqslant n-1$, let $r_{i+1}=s_{i} r_{i}$ and $t_{i+1}=s_{i} t_{i} s_{i}$. If $0 \leqslant l \leqslant n$, let $a_{l}=r_{1} r_{2} \ldots r_{l}$. We denote by $\mathfrak{S}_{l}, W_{l}, \mathfrak{S}_{l, n-l}, W_{l, n-l}$ the standard parabolic subgroups of $W_{n}$ generated by $\left\{s_{1}, s_{2}, \ldots, s_{l-1}\right\},\left\{t, s_{1}, s_{2}, \ldots, s_{l-1}\right\}, S_{n} \backslash\left\{t, s_{l}\right\}$ and $S_{n} \backslash\left\{s_{l}\right\}$ respectively. The longest element of $\mathfrak{S}_{l}$ is denoted by $\sigma_{l}$. Let

$$
Y_{l, n-l}=\left\{a \in \mathfrak{S}_{n} \mid \forall \sigma \in \mathfrak{S}_{l, n-l}, \ell(a \sigma) \geqslant \ell(\sigma)\right\}
$$

If $w \in W_{n}$ is such that $\ell_{t}(w)=l$, then [3, §4.6] there exist unique $a_{w}, b_{w} \in Y_{l, n-l}$, $\sigma_{w} \in \mathfrak{S}_{l, n-l}$ such that $w=a_{w} a_{l} \sigma_{w} b_{w}^{-1}$. Recall that $\ell(w)=\ell\left(a_{w}\right)+\ell\left(a_{l}\right)+\ell\left(\sigma_{w}\right)+$ $\ell\left(b_{w}\right)$.
2.A. Some submodules of $\mathcal{H}$. If $l$ is a natural number such that $0 \leqslant l \leqslant n$, we set

$$
\begin{gathered}
\mathcal{T}_{l}=\underset{\substack{w \in W_{n} \\
\ell_{t}(w)=l}}{\oplus} A T_{w}, \quad \mathcal{T}_{\leqslant l}=\underset{\substack{w \in W_{n} \\
\ell_{t}(w) \leqslant l}}{\oplus} A T_{w}, \quad \mathcal{T}_{\geqslant l}=\underset{\substack{w \in W_{n} \\
\ell_{t}(w) \geqslant l}}{\oplus} A T_{w}, \\
\mathcal{C}_{l}=\underset{\substack{w \in W_{n} \\
\ell_{t}(w)=l}}{\oplus} A C_{w}, \quad \mathcal{C}_{\leqslant l}=\underset{\substack{w \in W_{n} \\
\ell_{t}(w) \leqslant l}}{ } A C_{w} \quad \text { and } \quad \mathcal{C}_{\geqslant l}=\underset{\substack{w \in W_{n} \\
\ell_{t}(w) \geqslant l}}{\oplus} A C_{w} .
\end{gathered}
$$

Let $\Pi_{?}^{T}: \mathcal{H}_{n} \rightarrow \mathcal{T}_{\text {? }}$ and $\Pi_{?}^{C}: \mathcal{H}_{n} \rightarrow \mathcal{C}_{\text {? }}$ be the natural projections (for ? $\in$ $\{l, \leqslant l, \geqslant l\})$.

Proposition 2.1. Let $l$ be a natural number such that $0 \leqslant l \leqslant n$. Then:
(a) $\mathcal{T}_{l}$ and $\mathcal{C}_{l}$ are sub- $\mathcal{H}\left(\mathfrak{S}_{n}\right)$-modules- $\mathcal{H}\left(\mathfrak{S}_{n}\right)$ of $\mathcal{H}_{n}$. The applications $\Pi_{l}^{T}$ and $\Pi_{l}^{C}$ are morphisms of $\mathcal{H}\left(\mathfrak{S}_{n}\right)$-modules- $\mathcal{H}\left(\mathfrak{S}_{n}\right)$.
(b) $\mathcal{T}_{\leqslant l}=\mathcal{C}_{\leqslant l}$.
(c) $\mathcal{C} \geqslant l$ is a two-sided ideal of $\mathcal{H}_{n}$.

Proof - (a) follows from [3, Theorem 6.3 (b)]. (b) is clear. (c) follows from 级, Corollary 6.7].

The next proposition is a useful characterization of the elements of the two-sided ideal $\mathcal{C}_{n}$.

Proposition 2.2. Let $h \in \mathcal{H}_{n}$. The following are equivalent:
(1) $h \in \mathcal{C}_{n}$.
(2) $\forall x \in \mathcal{H}_{n},\left(T_{t}-V\right) x h=0$.
(3) $\forall x \in \mathcal{H}\left(\mathfrak{S}_{n}\right),\left(T_{t}-V\right) x h=0$.

Proof - If $\ell_{t}(w)=n$, then $t w<w$ so $\left(T_{t}-V\right) C_{w}=0$ by 17, Theorem 6.6 (b)]. Since $\mathcal{C}_{n}$ is a two-sided ideal of $\mathcal{H}_{n}$ (see Proposition 2.1 (c)), we get that (1) implies (2). It is also obvious that (2) implies (3). It remains to show that (3) implies (1).

Let $I=\left\{h \in \mathcal{H}_{n} \mid \forall x \in \mathcal{H}\left(\mathfrak{S}_{n}\right),\left(T_{t}-V\right) x h=0\right\}$. Then $I$ is clearly a sub-$\mathcal{H}\left(\mathfrak{S}_{n}\right)$-module- $\mathcal{H}_{n}$ of $\mathcal{H}_{n}$. We need to show that $I \subset \mathcal{C}_{n}$. In other words, since $\mathcal{C}_{n} \subset I$, we need to show that $I \cap \mathcal{C}_{\leqslant n-1}=0$. Let $I^{\prime}=I \cap \mathcal{C}_{\leqslant n-1}=I \cap \mathcal{T}_{\leqslant n-1}$ (see Proposition 2.1 (b)). Let $X=\left\{w \in W_{n} \mid \tau\left(I^{\prime} T_{w^{-1}}\right) \neq 0\right\}$. Showing that $I^{\prime}=0$ is equivalent to showing $X=\varnothing$.

Assume $X \neq \varnothing$. Let $w$ be an element of $X$ of maximal length and let $h$ be an element of $I^{\prime}$ such that $\tau\left(h T_{w^{-1}}\right) \neq 0$. Since $h \in \mathcal{T}_{\leqslant n-1}$, we have $\ell(w) \leqslant n-1$. Moreover, $T_{t} h=V h$, so $\tau\left(T_{t} h T_{w^{-1}}\right)=\tau\left(h T_{w^{-1}} T_{t}\right) \neq 0$. By the maximality of
$\ell(w)$, we get that $t w<w$. So, there exists $s \in S_{n}$ such that $s w>w$ and $s \neq t$. Then

$$
\begin{aligned}
\tau\left(T_{s} h T_{(s w)^{-1}}\right) & =\tau\left(h T_{(s w)^{-1}} T_{s}\right) \\
& =\tau\left(h T_{w^{-1}}\right)+\left(v-v^{-1}\right) \tau\left(h T_{(s w)^{-1}}\right) \\
& \neq 0
\end{aligned}
$$

the last inequality following from the maximality of $\ell(w)$ (which implies that $\left.\tau\left(h T_{(s w)^{-1}}\right)=0\right)$. But $T_{s} h \in I^{\prime}$ and so $s w \in X$. This contradicts the maximality of $\ell(w)$.
2.B. Some results on the Kazhdan-Lusztig basis. In this subsection, we study the elements of the Kazhdan-Lusztig basis of the form $C_{a_{l} \sigma}$ where $0 \leqslant l \leqslant n$ and $\sigma \in \mathfrak{S}_{n}$.

Proposition 2.3. Let $\sigma \in \mathfrak{S}_{n}$ and let $0 \leqslant l \leqslant n$. Then $C_{a_{l}} C_{\sigma}=C_{a_{l} \sigma}$ and $C_{\sigma} C_{a_{l}}=$ $C_{\sigma a_{l}}$.

Proof - Let $C=C_{a_{l}} C_{\sigma}$. Then $\bar{C}=C$ and

$$
C-T_{a_{l} \sigma}=\sum_{w<a_{l} \sigma} \lambda_{w} T_{w}
$$

with $\lambda_{w} \in A$ for $w<a_{l} \sigma$. To show that $C=C_{a_{l} \sigma}$, it is sufficient to show that $\lambda_{w} \in A_{<0}$.

But, $C_{a_{l}}=T_{a_{l}}+\sum_{x<a_{l}} V^{\ell_{t}(x)-l} \beta_{x} T_{x}$ with $\beta_{x} \in \mathbb{Z}\left[v, v^{-1}\right]$ (see [3, Theorem 6.3 (a)]). Hence,

$$
C=T_{a_{l} \sigma}+\sum_{\tau<\sigma} p_{\tau, \sigma}^{*} T_{a_{l} \tau}+\sum_{x<a_{l}} V^{\ell_{t}(x)-l} \beta_{x} T_{x} C_{\sigma} .
$$

But, if $x<a_{l}$, then $\ell_{t}(x)<l$. This shows that $\lambda_{w} \in A_{<0}$ for every $w<a_{l} \sigma$. This shows the first equality. The second one is obtained by a symmetric argument.

Proposition 2.3 shows that it can be useful to compute in different ways the elements $C_{a_{l}}$ to be able to relate the Kazhdan-Lusztig basis of $\mathcal{H}_{n}$ to the KazhdanLusztig basis of $\mathcal{H}\left(\mathfrak{S}_{n}\right)$. Following the work of Dipper-James-Murphy [ $\dagger$ ], ArikiKoike [2] and Graham-Lehrer [11, §5], we set

$$
\begin{aligned}
P_{l} & =\left(T_{t_{1}}+V^{-1}\right)\left(T_{t_{2}}+V^{-1}\right) \ldots\left(T_{t_{l}}+V^{-1}\right) \\
& =\sum_{0 \leqslant k \leqslant l} V^{k-l}\left(\sum_{1 \leqslant i_{1}<\cdots<i_{k} \leqslant l} T_{t_{i_{1}} \ldots t_{i_{k}}}\right) .
\end{aligned}
$$

Lemma 2.4. $P_{n}$ is central in $\mathcal{H}_{n}$.
Proof - First, $P_{n}$ commutes with $T_{t}$ (indeed, $t t_{i}=t_{i} t>t_{i}$ for $1 \leqslant i \leqslant n$ ). By [2, Lemma 3.3], $P_{n}$ commutes with $T_{s_{i}}$ for $1 \leqslant i \leqslant n-1$. Since the notation and conventions are somewhat different, we recall here a brief proof. First, if $j \notin$ $\{i, i+1\}, s_{i} t_{j}=t_{j} s_{i}>t_{j}$ so $T_{s_{i}}$ commutes with $T_{t_{j}}$. Therefore, it is sufficient to show that $T_{s_{i}}$ commutes with $\left(T_{t_{i}}+V^{-1}\right)\left(T_{t_{i+1}}+V^{-1}\right)$. This follows from a straightforward computation using the fact that $s_{i} t_{i}>t_{i}$, that $t_{i+1} s_{i}<t_{i+1}$ and that $s_{i} t_{i}=t_{i+1} s_{i}$.

Proposition 2.5. If $0 \leqslant l \leqslant n$, then $C_{a_{l}}=P_{l} T_{\sigma_{l}}^{-1}=T_{\sigma_{l}}^{-1} P_{l}$.

Proof - The computation may be performed in the subalgebra of $\mathcal{H}_{n}$ generated by $\left\{T_{t}, T_{s_{1}}, \ldots, T_{s_{l-1}}\right\}$ so we may, and we will, assume that $l=n$. First, we have $T_{t} P_{n}=V P_{n}$. Since $P_{n}$ is central in $\mathcal{H}_{n}$, it follows from the characterization of $\mathcal{C}_{n}$ given by Proposition 2.2 that $P_{n} \in \mathcal{C}_{n}$.

Now, let $h=C_{a_{n}}-P_{n} T_{\sigma_{n}}^{-1}$. Then, by Proposition 2.1 (c), we have $h \in \mathcal{C}_{n}$. Moreover, it is easily checked that $h \in \mathcal{T}_{\leqslant n-1}=\mathcal{C}_{\leqslant n-1}$. So $h=0$.

Corollary 2.6. If $0 \leqslant l \leqslant n$ and $\sigma \in \mathfrak{S}_{n}$, then $\Pi_{0}^{T}\left(C_{a_{l} \sigma}\right)=V^{-l} T_{\sigma_{l}}^{-1} C_{\sigma}$. In particular, $\tau\left(C_{a_{l} \sigma}\right)=V^{-l} \tau\left(T_{\sigma_{l}}^{-1} C_{\sigma}\right)$.

Proof - Since $\Pi_{0}^{T}$ is a morphism of right $\mathcal{H}\left(\mathfrak{S}_{n}\right)$-modules (see Proposition 2.1 (a)) and since $C_{a_{l} \sigma}=P_{l} T_{\sigma_{l}}^{-1} C_{\sigma}$ (see Propositions 2.3 and 2.5), we have $\Pi_{0}^{T}\left(C_{a_{l} \sigma}\right)=$ $\Pi_{0}^{T}\left(P_{l}\right) T_{\sigma_{l}}^{-1} C_{\sigma}$. But, $\Pi_{0}^{T}\left(P_{l}\right)=V^{-l}$. This completes the proof of the corollary.

## 3. Two-Sided cells

The aim of this section is to show that, if $x$ and $y$ are two elements of $W$ such that $\ell_{t}(x)=\ell_{t}(y)$, then $x \leqslant_{\mathcal{L} \mathcal{R}} y$ if and only if $\sigma_{x} \leqslant_{\mathcal{L} \mathcal{R}}^{\mathfrak{S}_{l, n-l}} \sigma_{y}$ (see Theorem 3.5). Here, $\leqslant_{\mathcal{L} \mathcal{R}}^{\mathfrak{G}_{l, n-l}}$ is the preorder $\leqslant_{\mathcal{L R}}$ defined inside the parabolic subgroup $\mathfrak{S}_{l, n-l}$. For this, we adapt an argument of Geck [7] who was considering the preorder $\leqslant_{\mathcal{L}}$.

We start by defining an order relation $\preccurlyeq$ on $W$. Let $x$ and $y$ be two elements of $W$. Then $x \prec y$ if the following conditions are fulfilled:
(1) $\ell_{t}(x)=\ell_{t}(y)$,
(2) $x \leqslant y$,
(3) $a_{x}<a_{y}$ ou $b_{x}<b_{y}$,
(4) $\sigma_{x} \leqslant_{\mathcal{L} \mathcal{R}}^{\mathfrak{S}_{l, n-l}} \sigma_{y}$.

We write $x \preccurlyeq y$ if $x \prec y$ or $x=y$. If $y \in W_{n}$, we set

$$
\Gamma_{y}=T_{a_{y}} C_{a_{\ell_{t}(y)}} C_{\sigma_{y}} T_{b_{y}^{-1}}
$$

Lemma 3.1. Let $y \in W$. Then $\Gamma_{y} \in T_{y}+\oplus_{x<y} A_{<0} T_{x}$.
Proof - First, $\Gamma_{y}$ is a linear combination of elements of the form $T_{a_{y}} T_{z} T_{b_{y}^{-1}}$ with $z \leqslant a_{\ell_{t}(y)} \sigma_{y}$, so it is a linear combination of elements of the form $T_{x}$ with $x \leqslant y$.

Let $l=\ell_{t}(y)$. We have
$\Gamma_{y}=T_{a_{y}} T_{a_{l}} T_{\sigma_{y}} T_{b_{y}^{-1}}+\left(\sum_{\tau<\sigma} p_{\tau, \sigma}^{*} T_{a_{y}} T_{a_{l}} T_{\tau} T_{b_{y}^{-1}}\right)+\left(\sum_{a<a_{l}, \tau \leqslant \sigma} p_{a, a_{l}}^{*} p_{\sigma, \tau}^{*} T_{a_{y}} T_{a} T_{\tau} T_{b_{y}^{-1}}\right)$.
If $\tau<\sigma$, then $T_{a_{y}} T_{a_{l}} T_{\tau} T_{b_{y}^{-1}}=T_{a_{y} a_{l} \tau b_{y}^{-1}}$ by [3, §4.6]. On the other hand, if $a<a_{l}$, then $\ell_{t}(a)<l$ so $T_{a_{y}} T_{a} T_{\tau} T_{b_{y}^{-1}}$ is a linear combination, with coefficients in $\mathbb{Z}\left[v, v^{-1}\right]$ of elements $T_{w}$ with $\ell_{t}(w)=\ell_{t}(a)<l$ (because $a_{y}, \tau$ and $b_{y}^{-1}$ are elements of $\mathfrak{S}_{n}$ ). Since $V^{l-\ell_{t}(a)} p_{a, a_{l}}^{*} \in \mathbb{Z}\left[v, v^{-1}\right]$ by [3, Theorem 6.3 (a)], this proves the lemma.

Lemma 3.2. If $y \in W_{n}$, then

$$
\bar{\Gamma}_{y}=\Gamma_{y}+\sum_{x \prec y} \rho_{x, y} \Gamma_{x}
$$

where the $\rho_{x, y}$ 's belong to $\mathbb{Z}\left[v, v^{-1}\right]$.

Proof - Let $l=\ell_{t}(y)$. Then

$$
T_{a_{y}^{-1}}^{-1}=T_{a_{y}}+\sum_{\substack{a \in Y_{l, n-l}, x \in \mathfrak{S}_{l, n-l} \\ a x<a_{y}}} R_{a x, a_{y}} T_{a} T_{x} .
$$

Moreover, if $a \in Y_{l, n-l}$ et $x \in \mathfrak{S}_{l, n-l}$ are such that $a x<a_{y}$, then $a<a_{y}$ (see 17, Lemma 9.10 (f)]. Thus,

$$
\bar{\Gamma}_{y}=\Gamma_{y}+\sum_{\substack{a, b \in Y_{l, n-l}, x, x^{\prime} \in \mathfrak{S}_{l, n-l} \\\left(a x<a_{y} \text { or } b x^{\prime}<b y\right)}} R_{a x, a_{y}} R_{b x^{\prime}, b_{y}} T_{a}\left(T_{x} C_{a_{l} \sigma} T_{y^{-1}}\right) T_{b^{-1}}
$$

This completes the proof of the lemma.
Corollary 3.3. If $x \preccurlyeq y$, then $\sum_{x \preccurlyeq z \preccurlyeq y} \bar{\rho}_{x, z} \rho_{z, y}=\delta_{x, y}$.
Proof - This follows immediately from Lemma 3.2 and from the fact that $\mathcal{H} \rightarrow \mathcal{H}$, $h \mapsto \bar{h}$ is an involution.

Corollary 3.4. If $w \in W$, then

$$
C_{w}=\Gamma_{w}+\sum_{y \prec w} \pi_{y, w}^{*} \Gamma_{y}
$$

where $\pi_{y, w}^{*} \in v^{-1} \mathbb{Z}\left[v^{-1}\right] \subset A_{<0}$ if $y \prec w$.
Proof - By Corollary 3.3, there exists a unique family $\left(\pi_{y, w}^{*}\right)_{y \prec w}$ of elements of $v^{-1} \mathbb{Z}\left[v^{-1}\right]$ such that $\Gamma_{w}+\sum_{y \prec w} \pi_{y, w}^{*} \Gamma_{y}$ is stable under the involution $h \mapsto \bar{h}$ of $\mathcal{H}_{n}$ (see [6, Page 214]: this contains a general setting for including the arguments in [13, Proposition 2] or in [7, Proposition 3.3]). But, by Lemma 3.1, we have

$$
\Gamma_{w}+\sum_{y \prec w} \pi_{y, w}^{*} \Gamma_{y} \in T_{w}+\left(\underset{y<w}{\oplus} A_{<0} T_{y}\right) .
$$

So $C_{w}=\Gamma_{w}+\sum_{y \prec w} \pi_{y, w}^{*} \Gamma_{y}$.
We are now ready to prove the main theorem of this section.
Theorem 3.5. Let $x$ and $y$ be two elements of $W$ such that $\ell_{t}(x)=\ell_{t}(y)$. Then $x \leqslant_{\mathcal{L R}} y$ if and only if $\sigma_{x} \leqslant_{\mathcal{L} \mathcal{R}}^{\mathfrak{S}_{l n-l}} \sigma_{y}$.
Proof - Let $l=\ell_{t}(x)=\ell_{t}(y)=l$. Assume first that $\sigma_{x} \leqslant_{\mathcal{L}, \mathcal{R}}^{\mathfrak{S}_{l, l}} \sigma_{y}$. Decompose $\sigma_{x}=\left(\sigma_{x}^{\prime}, \sigma_{x}^{\prime \prime}\right)$ with $\sigma_{x}^{\prime} \in \mathfrak{S}_{l}$ and $\sigma_{x}^{\prime \prime} \in \mathfrak{S}_{n-l}$. Then $\sigma_{x}^{\prime} \leqslant_{\mathcal{L} \mathcal{R}}^{\mathfrak{S}_{l, n-l}} \sigma_{y}^{\prime}$ so $\sigma_{l} \sigma_{y}^{\prime} \leqslant_{\mathcal{L} \mathcal{R}}^{\mathfrak{S}_{l}} \sigma_{l} \sigma_{x}^{\prime}$ so $w_{l} \sigma_{l} \sigma_{x}^{\prime} \leqslant_{\mathcal{L} \mathcal{R}}^{W_{l}} \sigma_{l} \sigma_{y}^{\prime}$. In other words, $a_{l} \sigma_{x}^{\prime} \leqslant_{\mathcal{L} \mathcal{R}}^{W_{l}} a_{l} \sigma_{y}^{\prime}$. Therefore, $a_{l} \sigma_{x} \leqslant_{\mathcal{L} \mathcal{R}} a_{l} \sigma_{y}$. But, by [3, Theorem 7.7], we have $x \sim_{\mathcal{L R}} a_{l} \sigma_{x}$ and $y \sim_{\mathcal{L R}} a_{l} \sigma_{y}$. So $x \leqslant_{\mathcal{L R}} y$.

To show the converse statement, it is sufficient to show that
is a two-sided ideal. But, by Corollary 3.4, we have

$$
I=\left(\underset{\substack{u \in W_{n} \\ \ell_{t}(u)=l \text { and } \sigma_{u} \leqslant \mathfrak{S}_{\mathcal{L} R} \mathfrak{F}_{1, n-l}}}{\sigma_{\sigma_{y}}} A \Gamma_{u}\right) \oplus \mathcal{C} \geqslant l+1
$$

By symmetry, we only need to prove that $I$ is a left ideal. Let $h \in \mathcal{H}_{n}$ and let $u \in W_{n}$ such that $\ell_{t}(u)=l$ and $\sigma_{u} \leqslant_{\mathcal{L} \mathcal{R}}^{\mathfrak{S}_{l, n-l}} \sigma_{y}$. We want to prove that $h \Gamma_{u} \in I$. For simplification, let $a=a_{u}, b=b_{u}, \sigma=\sigma_{u}$. Let

$$
X_{l}=\left\{x \in W_{n} \mid \forall w \in W_{l, n-l}, \ell(x w) \geqslant \ell(w)\right\} .
$$

Then, by [7] Proposition 3.3] and [3, Lemma 7.3 and Corollary 7.4],

Let $I^{\prime}$ be the right-hand side of the previous formula. By [ $\mathbb{7}$, Corollary 3.4], $I^{\prime}$ is a left ideal. Therefore, $h T_{a} C_{a_{l} \sigma} \in I^{\prime}$. On the other hand,

$$
I^{\prime} \subset\left(\underset{\substack{x \in Y_{l, n-l} \\ \tau \leqslant{ }_{\mathcal{L}}^{l, n-l} \sigma}}{\oplus} A C_{x a_{l} \tau}\right) \oplus \mathcal{C} \geqslant l+1 .
$$

Now, by Corollary 3.4, we have

$$
I^{\prime} \subset\left(\underset{\substack{x \in Y_{l, n-l} \\ \tau \leqslant{ }_{\mathcal{L}}{ }_{l}, n-l}}{\oplus} A T_{x} C_{a_{l} \tau}\right) \oplus \mathcal{C} \geqslant l+1 .
$$

Therefore, $h \Gamma_{u} \in I^{\prime} T_{b^{-1}} \subset I$, as desired.
Corollary 3.6. Let $x$ and $y$ be two elements of $W_{n}$. Then $x \sim_{\mathcal{L R}} y$ if and only if $\ell_{t}(x)=\ell_{t}(y)(=l)$ and $\sigma_{x} \sim_{\mathcal{L R}}^{\mathfrak{S}_{l, n-l}} \sigma_{y}$.

Remark 3.7 - We associate to each element $w \in W_{n}$ a pair $(P(w), Q(w))$ of standard bi-tableaux as in [3, §3]. Let $l=\ell_{t}(w)$. Write $Q(w)=\left(Q^{+}(w), Q^{-}(w)\right)$ and denote by $\lambda^{?}(w)$ the shape of $Q^{?}(w)$ for $? \in\{+,-\}$. The map $w \mapsto(P(w), Q(w))$ is a generalization of the Robinson-Schensted correspondence (see [19, Theorem 3.3] or [3, Theoreme 3.3]). Then $\lambda^{+}(w)$ is a partition of $n-l$ and $\lambda^{-}(w)$ is a partition of $l$, so that $\lambda(w)=\left(\lambda^{+}(w), \lambda^{-}(w)\right)$ is a bipartition of $n$. If we write $\sigma_{w}=\sigma_{w}^{-} \times \sigma_{w}^{+}$ with $\sigma_{w}^{-} \in \mathfrak{S}_{l}$ and $\sigma_{w}^{+} \in \mathfrak{S}_{n-l}$, note that $\lambda^{?}(w)$ is the shape of the standard tableau associated to $\sigma_{w}^{?}$ by the classical Robinson-Schensted correspondence. Let $\unlhd$ denote the dominance order on partitions: if $\alpha=\left(\alpha_{1} \geqslant \alpha_{2} \geqslant \ldots\right)$ and $\beta=\left(\beta_{1} \geqslant \beta_{2} \geqslant \ldots\right)$ are two partitions of the same natural number, we write $\alpha \unlhd \beta$ if

$$
\sum_{j=1}^{i} \alpha_{j} \leqslant \sum_{j=1}^{i} \beta_{j}
$$

for every $i \geqslant 1$. Now, let $x$ and $y$ be two elements of $W_{n}$. If $\ell_{t}(x)=\ell_{t}(y)$, then Theorem 3.5 is equivalent to:

$$
\begin{equation*}
x \leqslant_{\mathcal{L R}} y \text { if and only if } \lambda^{+}(x) \unlhd \lambda^{+}(y) \text { and } \lambda^{-}(x) \unlhd \lambda^{-}(y) . \tag{3.8}
\end{equation*}
$$

This follows from [18, 3.2] and [5, 2.13.1]. Then, for general $x$ and $y$, Corollary 3.6 is equivalent to:

$$
\begin{equation*}
x \sim_{\mathcal{L R}} y \text { if and only if } \lambda(x)=\lambda(y) . \tag{3.9}
\end{equation*}
$$

## 4. Around Lusztig's conjectures

In this section, we prove some results which are related to Lusztig's conjectures. If $\sigma \in \mathfrak{S}_{n}$, we denote by $\mathbf{a}_{\mathfrak{S}}(\sigma)$ the function a evaluated on $\sigma$ but computed in $\mathfrak{S}_{n}$. It is given by the following formula. Let $\lambda=\left(\lambda_{1} \geqslant \lambda_{2} \geqslant \ldots\right)$ be the shape of the left cell of $z$. Then

$$
\mathbf{a}_{\mathfrak{S}}(\sigma)=\sum_{i \geqslant 1}(i-1) \lambda_{i} .
$$

If $z \in W$, we set

$$
\boldsymbol{\alpha}(z)=\left(\ell_{t}(z), 2 \mathbf{a}_{\mathfrak{S}}\left(\sigma_{z}\right)-\mathbf{a}_{\mathfrak{S}}\left(\sigma_{\ell_{t}(z)} \sigma_{z}\right)\right) \in \mathbb{N}^{2}
$$

We now study some properties of the function $\boldsymbol{\alpha}$.
Remark 4.1 - If Lusztig's conjectures $\left(P_{i}\right)_{1 \leqslant i \leqslant 15}$ hold for $(W, S, L)$, then it follows from [17, Proposition 20.6 (c)] and [3, Theorem 7.7] that $\mathbf{a}=\boldsymbol{\alpha}$.

The first proposition shows that $\boldsymbol{\alpha}$ is decreasing with respect to $\leqslant_{\mathcal{L} \mathcal{R}}$ (compare with Lusztig's conjecture $P_{4}$ ).

Proposition 4.2. Let $z$ and $z^{\prime}$ be two elements of $W$. Then:
(a) If $z \leqslant_{\mathcal{L} \mathcal{R}} z^{\prime}$, then $\boldsymbol{\alpha}\left(z^{\prime}\right) \leqslant \boldsymbol{\alpha}(z)$.
(b) If $z \leqslant_{\mathcal{L R}} z^{\prime}$ and $\boldsymbol{\alpha}(z)=\boldsymbol{\alpha}\left(z^{\prime}\right)$ then $z \sim_{\mathcal{L R}} z^{\prime}$.

Proof - Since $z \leqslant_{\mathcal{L} \mathcal{R}} z^{\prime}$, we have $\ell_{t}(z) \geqslant \ell_{z}\left(z^{\prime}\right)$ by [3, Corollary 6.7]. Therefore, if $\ell_{t}(z)>\ell_{t}\left(z^{\prime}\right)$, then $\boldsymbol{\alpha}(z)>\boldsymbol{\alpha}\left(z^{\prime}\right)$ and $z \not \chi_{\mathcal{L R}} z^{\prime}$. This proves (a) and (b) in this case.

So, assume that $\ell_{t}(x)=\ell_{t}(y)=l$. Then, by Theorem 3.6, we have $\sigma_{z} \leqslant_{\mathcal{L} \mathcal{R}}^{\mathfrak{G}_{l, n-l}} \sigma_{z^{\prime}}$ where $\leqslant_{\mathcal{L} \mathcal{R}} \mathfrak{S}_{l, n-l}$ denote the preorder $\leqslant_{\mathcal{L} \mathcal{R}}$ defined in the group $\mathfrak{S}_{l, n-l}$. Write $\sigma_{z}=(\sigma, \tau)$ and $\sigma_{z^{\prime}}=\left(\sigma^{\prime}, \tau^{\prime}\right)$ where $\sigma, \sigma^{\prime} \in \mathfrak{S}_{l}$ and $\tau, \tau^{\prime} \in \mathfrak{S}_{n-l}$. Then

$$
\boldsymbol{\alpha}(z)=\left(l, 2 \mathbf{a}_{\mathfrak{S}}(\sigma)-\mathbf{a}_{\mathfrak{S}}\left(\sigma_{l} \sigma\right)+\mathbf{a}_{\mathfrak{S}}(\tau)\right)
$$

and

$$
\boldsymbol{\alpha}\left(z^{\prime}\right)=\left(l, 2 \mathbf{a}_{\mathfrak{S}}\left(\sigma^{\prime}\right)-\mathbf{a}_{\mathfrak{S}}\left(\sigma_{l} \sigma^{\prime}\right)+\mathbf{a}_{\mathfrak{S}}\left(\tau^{\prime}\right)\right)
$$

But $\sigma \leqslant_{\mathcal{L} \mathcal{R}}^{\mathfrak{G}_{l}} \sigma^{\prime}$ and $\tau \leqslant_{\mathcal{L}, n}^{\mathcal{S}_{l, n-l}} \tau^{\prime}$. Moreover, $\sigma_{l} \sigma^{\prime} \leqslant_{\mathcal{L} \mathcal{R}}^{\mathfrak{G}_{l}} \sigma_{l} \tau^{\prime}$. Therefore, since Lusztig's conjecture $P_{4}$ holds in the symmetric groups, we obtain (a).

If moreover $\boldsymbol{\alpha}(z)=\boldsymbol{\alpha}\left(z^{\prime}\right)$, then $\mathbf{a}_{\mathfrak{S}_{l}}(\sigma)=\mathbf{a}_{\mathfrak{S}_{l}}\left(\sigma^{\prime}\right)$ so $\sigma \sim_{\mathcal{L R}} \sigma^{\prime}$ by property $P_{11}$ for the symmetric group. Similarly, $\tau \sim_{\mathcal{L R}} \tau^{\prime}$ so $\sigma_{z} \sim_{\mathcal{L R}} \sigma_{z^{\prime}}$. So, by Theorem 3.6, $z \sim_{\mathcal{L R}} z^{\prime}$.

The next proposition relates the functions $\boldsymbol{\alpha}$ and $\Delta$.
Proposition 4.3. Let $z \in W$. Then $\boldsymbol{\alpha}(z) \leqslant \Delta(z)$. Moreover, $\boldsymbol{\alpha}(z)=\Delta(z)$ if and only if $z^{2}=1$.

Proof - Let us start with two results concerning the degree of $\tau\left(\Gamma_{z}\right)$ for $z \in W_{n}$ :
Lemma 4.4. Let $z \in W_{n}$. Then

$$
\tau\left(\Gamma_{z}\right)= \begin{cases}0 & \text { if } a_{z} \neq b_{z} \\ V^{-\ell_{t}(z)} \tau\left(T_{\sigma_{\ell_{t}(z)}}^{-1} T_{\sigma_{z}}\right) & \text { if } a_{z}=b_{z}\end{cases}
$$

Proof of Lemma 4.4 - Write $l=\ell_{t}(z)$. Then, $\tau\left(\Gamma_{z}\right)=\tau\left(\Pi_{0}^{T}\left(\Gamma_{z}\right)\right)$. So, by Proposition 2.1 (a) and Corollary 2.6, we have $\tau\left(\Gamma_{z}\right)=V^{-l} \tau\left(T_{a_{z}} T_{\sigma_{l}}^{-1} T_{\sigma_{z}} T_{b_{z}^{-1}}\right)$. Therefore, $V^{l} \tau\left(\Gamma_{z}\right)$ is equal to the coefficient of $T_{b_{z}}$ in $T_{a_{z}} T_{\sigma_{l}}^{-1} T_{\sigma_{z}}$. Write $T_{\sigma_{l}}^{-1} T_{\sigma_{z}}=$ $\sum_{x \in \mathfrak{S}_{l, n-l}} \beta_{x} T_{x}$. Then $T_{a_{z}} T_{\sigma_{l}}^{-1} T_{\sigma_{z}}=\sum_{x \in \mathfrak{S}_{l, n-l}} \beta_{x} T_{a_{z} x}$. Thus, if $a_{z} \neq b_{z}$, then $b_{z} \notin a_{z} \mathfrak{S}_{l, n-l}$ so $\tau\left(\Gamma_{z}\right)=0$. If $a_{z}=b_{z}$, then $\tau\left(\Gamma_{z}\right)=V^{-l} \beta_{1}=V^{-l} \tau\left(T_{\sigma_{l}}^{-1} T_{\sigma_{z}}\right)$.

Corollary 4.5. Let $z \in W_{n}$. Then :
(a) $\operatorname{deg} \tau\left(\Gamma_{z}\right) \leqslant-\boldsymbol{\alpha}(z)$.
(b) $\operatorname{deg} \tau\left(\Gamma_{z}\right)=-\boldsymbol{\alpha}(z)$ if and only if $z$ is an involution.

Proof of Corollary 4.5 - This follows from Lemma 4.4 and Corollary 1.6 (recall that Lusztig's conjectures $\left(P_{i}\right)_{1 \leqslant i \leqslant 15}$ hold in the symmetric group).

Let us now come back to the computation of $\Delta(z)$. By Corollary 3.4, we have

$$
\tau\left(C_{z}\right)=\tau\left(\Gamma_{z}\right)+\sum_{y \prec z} \pi_{y, z}^{*} \tau\left(\Gamma_{y}\right)
$$

But, if $y \prec z$, then $\boldsymbol{\alpha}(z) \leqslant \boldsymbol{\alpha}(y)$ (see Proposition 4.2 (a)). Therefore, by Corollary 4.5 (a), we have $\operatorname{deg} \pi_{y, z}^{*} \tau\left(\Gamma_{y}\right)<-\boldsymbol{\alpha}(z)$. So $\operatorname{deg} \tau\left(C_{z}\right) \leqslant-\boldsymbol{\alpha}(z)$ and $\operatorname{deg} \tau\left(C_{z}\right)=$ $-\boldsymbol{\alpha}(z)$ if and only if $\operatorname{deg} \tau\left(\Gamma_{z}\right)=-\boldsymbol{\alpha}(z)$ that is, if and only if $z$ is an involution (see Corollary 4.5 (b)).
Remark - Using Theorem 3.5, M. Geck and L. Iancu 99 have proved that $\boldsymbol{\alpha}=\mathbf{a}$. This shows in particular that $P_{1}, P_{4}, P_{6}, P_{11}, P_{12}$ and the first assertion of $P_{13}$ hold (see Propositions 4.2 and 4.3).

## 5. Specialization

We fix now a totally ordered abelian group $\Gamma^{\circ}$ and a weight function $L^{\circ}: W_{n} \rightarrow$ $\Gamma^{\circ}$ such that $L^{\circ}(s)>0$ for every $s \in S_{n}$. Let $A^{\circ}=\mathbb{Z}\left[\Gamma^{\circ}\right]$ be denoted exponentially and let $\mathcal{H}_{n}^{\circ}=\mathcal{H}\left(W_{n}, S_{n}, L^{\circ}\right)$. Let $\left(T_{w}^{\circ}\right)_{w \in W_{n}}$ denote the usual $A^{\circ}$-basis of $\mathcal{H}_{n}^{\circ}$ and let $\left(C_{w}^{\circ}\right)_{w \in W_{n}}$ denote the Kazhdan-Lusztig basis of $\mathcal{H}_{n}^{\circ}$.

Let $b=L^{\circ}(t)$ and $a=L^{\circ}\left(s_{1}\right)=\cdots=L^{\circ}\left(s_{n-1}\right)$. Let $\theta_{\Gamma}: \Gamma \rightarrow \Gamma^{\circ},(r, s) \mapsto a r+$ $b s$. It is a morphism of group which induces a morphism of $\mathbb{Z}$-algebras $\theta_{A}: A \rightarrow A^{\circ}$ such that $\theta_{A}(V)=v^{b}$ and $\theta_{A}(v)=v^{a}$. If $\mathcal{H}_{n}^{\circ}$ is viewed as an $A$-algebra through $\theta_{A}$, then there is a unique morphism of $A$-algebras $\theta_{\mathcal{H}}: \mathcal{H}_{n} \rightarrow \mathcal{H}_{n}^{\circ}$ such that $\theta_{\mathcal{H}}\left(T_{w}\right)=T_{w}^{\circ}$ for every $w \in W_{n}$. The main result of this section is the following:

Proposition 5.1. If $b>(n-1) a$, then $\theta_{\mathcal{H}}\left(C_{w}\right)=C_{w}^{\circ}$ for every $w \in W_{n}$.
Proof - Assume that $b>(n-1) a$. Since $\overline{\theta_{\mathcal{H}}\left(C_{w}\right)}=\theta_{\mathcal{H}}\left(C_{w}\right)$, it is sufficient to show that $\theta_{\mathcal{H}}\left(C_{w}\right) \in T_{w}^{\circ}+\left(\oplus_{y<w} A_{<0}^{\circ} T_{y}^{\circ}\right)$. Since $\theta_{A}\left(\pi_{y, w}^{*}\right) \in A_{<0}^{\circ}$ for every $y<w$, it is sufficient to show that $\theta_{\mathcal{H}}\left(\Gamma_{w}\right) \in T_{w}^{\circ}+\left(\oplus_{y<w} A_{<0}^{\circ} T_{y}^{\circ}\right)$. For simplification, we set $l=\ell_{t}(w), a=a_{w}, b=b_{w}$ and $\sigma=\sigma_{w}$. We set $\Gamma_{w}^{\prime}=T_{a} C_{a_{l}} T_{\sigma} T_{b^{-1}}$. Then $\Gamma_{w}=\sum_{\tau \leqslant \sigma} p_{\tau, \sigma}^{*} \Gamma_{a a_{l} \tau b^{-1}}^{\prime}$, with $p_{\tau, \sigma}^{*} \in v^{-1} \mathbb{Z}\left[v^{-1}\right]$ if $\tau<\sigma$ and $p_{\sigma, \sigma}^{*}=1$. So it is sufficient to show that $\theta_{\mathcal{H}}\left(\Gamma_{w}^{\prime}\right) \in T_{w}^{\circ}+\left(\oplus_{y<w} A_{<0}^{\circ} T_{y}^{\circ}\right)$. By Corollary 2.6, we have

$$
\begin{aligned}
\Gamma_{w}^{\prime} & =T_{a} P_{l} T_{\sigma_{l}}^{-1} T_{\sigma} T_{b^{-1}} \\
& =\sum_{k=0}^{l} V^{k-l}\left(\sum_{1 \leqslant i_{1}<i_{2}<\cdots<i_{k} \leqslant l} T_{a} T_{t_{i_{1} t_{i_{2}} \ldots t_{i}}} T_{\sigma_{l}}^{-1} T_{\sigma b^{-1}}\right) \\
& =\sum_{k=0}^{l} V^{k-l}\left(\sum_{1 \leqslant i_{1}<i_{2}<\cdots<i_{k} \leqslant l} T_{a \alpha\left(i_{1}, \ldots, i_{k}\right)} T_{a_{k}} T_{\alpha\left(i_{1}, \ldots, i_{k}\right)^{-1}} T_{\sigma_{l}}^{-1} T_{\sigma b^{-1}}\right),
\end{aligned}
$$

where $t_{i_{1}} \ldots t_{i_{k}}=\alpha\left(i_{1}, \ldots, i_{k}\right) a_{k} \beta\left(i_{1}, \ldots, i_{k}\right)$ with $\alpha\left(i_{1}, \ldots, i_{k}\right) \in Y_{k, n-k} \cap \mathfrak{S}_{l}$ and $\beta\left(i_{1}, \ldots, i_{k}\right) \in \mathfrak{S}_{l}$. Note that $\alpha\left(i_{1}, \ldots, i_{k}\right) a_{k}=r_{i_{1}} \ldots r_{i_{k}}$ (recall that $r_{i}$ is defined as in [3, §4.1]) so that $\ell\left(\beta\left(i_{1}, \ldots, i_{k}\right)\right)=\left(i_{1}-1\right)+\cdots+\left(i_{k}-1\right)$. Now, let $\gamma\left(i_{1}, \ldots, i_{k}\right)=$ $\sigma_{l} \beta\left(i_{1}, \ldots, i_{k}\right)^{-1}$. Then

$$
\Gamma_{w}^{\prime}=T_{w}+\sum_{k=0}^{l-1} V^{k-l}\left(\sum_{1 \leqslant i_{1}<i_{2}<\cdots<i_{k} \leqslant l} T_{a \alpha\left(i_{1}, \ldots, i_{k}\right)} T_{a_{k}} T_{\gamma\left(i_{1}, \ldots, i_{k}\right)}^{-1} T_{\sigma b^{-1}}\right)
$$

If $0 \leqslant k \leqslant l-1 \leqslant n-1$, we define

$$
Y_{k, l-k, n-l}=\left\{\sigma \in \mathfrak{S}_{n} \mid \forall i \in\{1,2, \ldots, n-1\} \backslash\{k, l\}, \sigma s_{i}>\sigma\right\}
$$

Then $Y_{k, l-k, n-l}=Y_{l, n-l}\left(Y_{k, n-k} \cap \mathfrak{S}_{l}\right)$. Therefore, $a \alpha\left(i_{1}, \ldots, i_{k}\right) \in Y_{k, l-k, n-l}$. But, $Y_{k, l-k, n-l}=Y_{k, n-k}\left(Y_{l, n-l} \cap \mathfrak{S}_{k, n-k}\right)$. So we can write $a \alpha\left(i_{1}, \ldots, i_{k}\right)=$ $\alpha_{i_{1}, \ldots, i_{k}} \alpha^{\prime}\left(i_{1}, \ldots, i_{k}\right)$ with $\alpha_{i_{1}, \ldots, i_{k}} \in Y_{k, n-k}$ and $\alpha^{\prime}\left(i_{1}, \ldots, i_{k}\right) \in Y_{l, n-l} \cap \mathfrak{S}_{k, n-k}$. Then $\ell\left(\alpha^{\prime}\left(i_{1}, \ldots, i_{k}\right)\right) \leqslant(l-k)(n-l)$ (indeed, $Y_{l, n-l} \cap \mathfrak{S}_{k, n-k}$ may be viewed as a set of minimal length coset representatives of $\left.\mathfrak{S}_{n-k} / \mathfrak{S}_{l-k, n-l}\right)$. So, if we set
$\alpha^{\prime \prime}\left(i_{1}, \ldots, i_{k}\right)=a_{k} \alpha^{\prime}\left(i_{1}, \ldots, i_{k}\right) a_{k} \in \mathfrak{S}_{k, n-k}$, then again $\ell\left(\alpha^{\prime \prime}\left(i_{1}, \ldots, i_{k}\right)\right) \leqslant(l-$ $k)(n-l)$ and

$$
\Gamma_{w}^{\prime}=T_{w}+\sum_{k=0}^{l-1} V^{k-l}\left(\sum_{1 \leqslant i_{1}<i_{2}<\cdots<i_{k} \leqslant l} T_{\alpha_{i_{1}}, \ldots, i_{k}} a_{k} T_{\alpha^{\prime \prime}\left(i_{1}, \ldots, i_{k}\right)} T_{\gamma\left(i_{1}, \ldots, i_{k}\right)}^{-1} T_{\sigma b^{-1}}\right) .
$$

If we write $T_{u} T_{v}^{-1} T_{\sigma b^{-1}}=\sum_{\tau \in \mathfrak{S}_{n}} \eta_{u, v, \tau} T_{\tau}$ with $\eta_{u, v, \tau} \in \mathbb{Z}\left[v, v^{-1}\right]$, then, by 17 , Lemma 10.4 (c)], we have $\operatorname{deg} \eta_{u, v, \tau} \leqslant \ell(u)+\ell(v)$. Moreover,

$$
\Gamma_{w}^{\prime}=T_{w}+\sum_{k=0}^{l-1} V^{k-l}\left(\sum_{1 \leqslant i_{1}<i_{2}<\cdots<i_{k} \leqslant l}\left(\sum_{\tau \in \mathfrak{S}_{n}} \eta_{\alpha^{\prime \prime}\left(i_{1}, \ldots, i_{k}\right), \gamma\left(i_{1}, \ldots, i_{k}\right), \tau} T_{\alpha_{i_{1}, \ldots, i_{k}} a_{k} \tau}\right)\right) .
$$

So it is sufficient to show that, for every $k \in\{0,1, \ldots, l-1\}$ and every sequence $1 \leqslant i_{1}<\cdots<i_{k} \leqslant l$, we have

$$
\begin{equation*}
(k-l) b+\left(\ell\left(\alpha^{\prime \prime}\left(i_{1}, \ldots, i_{k}\right)\right)+\ell\left(\gamma\left(i_{1}, \ldots, i_{k}\right)\right)\right) a<0 \tag{*}
\end{equation*}
$$

But, $\ell\left(\alpha^{\prime \prime}\left(i_{1}, \ldots, i_{k}\right)\right) \leqslant(l-k)(n-l)$ and

$$
\begin{aligned}
\ell\left(\gamma\left(i_{1}, \ldots, i_{k}\right)\right) & =\ell\left(\sigma_{l}\right)-\ell\left(\beta\left(i_{1}, \ldots, i_{k}\right)\right) \\
& =\frac{l(l-1)}{2}-\left(i_{1}-1\right)-\cdots-\left(i_{k}-1\right) \\
& \leqslant \frac{l(l-1)}{2}-\frac{k(k-1)}{2} \\
& =\frac{1}{2}(l-k)(l+k-1) .
\end{aligned}
$$

So, in order to prove $(*)$, it is sufficient to prove that
(**)

$$
2(k-l) b+(l-k)(2(n-l)+(l+k-1)) a<0 .
$$

But,
$2(k-l) b+a(l-k)(2(n-l)+(l+k-1)) a=2(k-l)(b-(n-1) a)+(l-k)(k+1-l) a$.
Since $k-l<0, b-(n-1) a>0$ and $k+1-l \leqslant 0$, we get $(* *)$.
If $x$ and $y$ are two elements of $W_{n}$, we write

$$
C_{x}^{\circ} C_{y}^{\circ}=\sum_{z \in W_{n}} h_{x, y, z}^{\circ} C_{z}^{\circ}
$$

where $h_{x, y, z}^{\circ} \in A^{\circ}$. We denote by $\leqslant_{\mathcal{L}}^{\circ}, \leqslant_{\mathcal{R}}^{\circ}, \leqslant_{\mathcal{L} \mathcal{R}}^{\circ}$ the preorders $\leqslant_{\mathcal{L}}, \leqslant_{\mathcal{R}}$ and $\leqslant_{\mathcal{L R}}$ defined in $\mathcal{H}_{n}^{\circ}$. Similarly, we define $\sim_{\mathcal{L}}^{\circ}, \sim_{\mathcal{R}}^{\circ}$ and $\sim_{\mathcal{L} \mathcal{R}}^{\circ}$.

Corollary 5.2. Assume that $b>(n-1) a$. Let $x, y$ and $z$ be elements of $W_{n}$ and let $? \in\{\mathcal{L}, \mathcal{R}, \mathcal{L R}\}$. Then:
(a) $h_{x, y, z}^{\circ}=\theta_{A}\left(h_{x, y, z}\right)$.
(b) If $x \leqslant$ ? $y$, then $x \leqslant$ ? $y$.
(c) $x \sim_{?}^{\circ} y$ if and only if $x \sim_{?} y$.

Proof - (a) follows from Proposition 5.1. (b) follows from (a). (c) follows from (b) and from the counting argument in the proof of 3 , Theorem 7.7].

Let $\tau^{\circ}: \mathcal{H}_{n}^{\circ} \rightarrow A^{\circ}$ denote the canonical symmetrizing form. If $z \in W_{n}$, we set

$$
\begin{gathered}
\mathbf{a}^{\circ}(z)=\max _{x, y \in W_{n}} \operatorname{deg} h_{x, y, z}^{\circ}, \\
\Delta^{\circ}(z)=-\operatorname{deg} \tau^{\circ}\left(C_{z}^{\circ}\right)
\end{gathered}
$$

and

$$
\boldsymbol{\alpha}^{\circ}(z)=\theta_{\Gamma}(\boldsymbol{\alpha}(z))
$$

By Corollary 5.2 (b) and by the same argument as in the proof of Proposition 4.2 , we have, for every $z, z^{\prime} \in W_{n}$ such that $\ell_{t}(z)=\ell_{t}\left(z^{\prime}\right)$ and $z \leqslant_{\mathcal{L} \mathcal{R}}^{\circ} z^{\prime}$,

$$
\begin{equation*}
\boldsymbol{\alpha}^{\circ}\left(z^{\prime}\right) \leqslant \boldsymbol{\alpha}^{\circ}\left(z^{\prime}\right) \tag{5.3}
\end{equation*}
$$

Remark - Assume that $b>(n-1) a$. We expect that $\boldsymbol{\alpha}^{\circ}(z) \leqslant \boldsymbol{\alpha}^{\circ}\left(z^{\prime}\right)$ if $z \leqslant{ }_{\mathcal{L} \mathcal{R}}^{\circ} z^{\prime}$ (even if $\ell_{t}(z) \neq \ell_{t}\left(z^{\prime}\right)$ ) but we are not able to prove it. This would follow from Lusztig's conjectures but we are not able to prove it a priori. On the other hand, if we could have a proof of this fact a priori, then the same argument as in would give that $\boldsymbol{\alpha}^{\circ}=\mathbf{a}^{\circ}$.

Proposition 5.4. Assume that $b>(n-1) a$. Let $z \in W_{n}$. Then:
(a) $\Delta^{\circ}(z)=\theta_{\Gamma}(\Delta(z)) \geqslant \boldsymbol{\alpha}^{\circ}(z)$.
(b) $\Delta^{\circ}(z)=\boldsymbol{\alpha}^{\circ}(z)$ if and only if $z^{2}=1$.

Proof - First, note that $\tau^{\circ} \circ \theta_{\mathcal{H}}=\theta_{\mathcal{H}} \circ \tau$. Moreover, by Proposition 5.1, we have $\theta_{\mathcal{H}}\left(C_{z}\right)=C_{z}^{\circ}$. Since $V^{\ell_{t}(z)} \tau\left(C_{z}\right) \in \mathbb{Z}\left[v, v^{-1}\right]$, we get that $\Delta^{\circ}(z)=\theta_{\Gamma}(\Delta(z))$. The other assertions follow easily.

We conclude this section by showing that the bound given by Proposition 5.1 is optimal.

Proposition 5.5. If $b \leqslant(n-1) a$, there exists $w \in W_{n}$ such that $\theta_{\mathcal{H}}\left(C_{w}\right) \neq C_{w}^{\circ}$.
Proof - Assume that $b \leqslant(n-1) a$. To prove the proposition, it is sufficient to show that there exists $w \in W_{n}$ such that $\theta_{\mathcal{H}}\left(C_{w}\right) \notin T_{w}^{\circ} \oplus_{y<w} A_{<0}^{\circ} T_{y}^{\circ}$. Using Corollary 3.4, we see that it is sufficient to show that there exists $w \in W_{n}$ such that $\theta_{\mathcal{H}}\left(\Gamma_{w}\right) \notin T_{w}^{\circ} \oplus_{y<w} A_{<0}^{\circ} T_{y}^{\circ}$. This follows from the next lemma:

Lemma 5.6. Let $w=s_{n-1} \ldots s_{2} s_{1} t \sigma_{n}$. Then $\theta_{\mathcal{H}}\left(\Gamma_{w}\right) \notin T_{w}^{\circ} \oplus_{y<w}$ $A_{<0}^{\circ} T_{y}^{\circ}$.
Proof - We have, by Proposition 2.3,

$$
\Gamma_{w}=T_{s_{n-1} \ldots s_{2} s_{1} t} C_{\sigma_{n}}+V^{-1} T_{s_{n-1} \ldots s_{2} s_{1}} C_{\sigma_{n}}
$$

But, $T_{s_{n-1} \ldots s_{2} s_{1}} C_{\sigma_{n}}=v^{n-1} C_{\sigma_{n}}$ (see 17, Theorem 6.6 (b)]). Therefore, since $\theta_{\mathcal{H}}\left(C_{\sigma}\right)=C_{\sigma}^{\circ}$ for every $\sigma \in \mathfrak{S}_{n}$, we have

$$
\theta_{\mathcal{H}}\left(\Gamma_{w}\right)=\left(\sum_{\tau \in \mathfrak{S}_{n}} v^{\left(\ell(\tau)-\ell\left(\sigma_{n}\right)\right) a} T_{s_{n-1} \ldots s_{2} s_{1} t \tau}^{\circ}\right)+v^{-b+(n-1) a} C_{\sigma_{n}}^{\circ}
$$

(Recall that $C_{\sigma_{n}}=\sum_{\tau \in \mathfrak{S}_{n}} v^{\left(\ell(\tau)-\ell\left(\sigma_{n}\right)\right.} T_{\tau}$ by 17, Corollary 12.2].) So the coefficient of $\theta_{\mathcal{H}}\left(\Gamma_{w}\right)$ on $T_{\sigma_{n}}$ is equal to $v^{-b+(n-1) a}$, which does not belong to $A_{<0}^{\circ}$.
