Abstract

In this paper we are interested in examples of locally compact quantum groups (M, Δ) such that both von Neumann algebras, M and the dual \hat{M} , are factors. There is a lot of known examples such that (M, \hat{M}) are respectively of type (I_∞, I_∞) but there is no examples with factors of other types. We construct new examples of type (I_∞, II_∞) , (II_∞, II_∞) and $(III_\lambda, III_\lambda)$ for each $\lambda \in [0, 1]$. Also we show that there is no such example with M or \hat{M} a finite factor.

Key words: Quantum groups, Factors, Crossed product
1991 MSC: 46L52, 46L65

1 Introduction

A locally compact (l.c.) quantum group, in the von Neumann algebra setting (see [6,7]), is a pair (M, Δ) , where M is a von Neumann algebra and Δ is a comultiplication on M , with left and right invariant weight. In a canonical way, every l.c. group is a commutative l.c. quantum group and every von Neumann group algebra of a l.c. group is a cocommutative l.c. quantum group. Conversely, every commutative or cocommutative l.c. quantum group is obtained in this way. Our aim is to obtain new examples of l.c. quantum groups which are as far as possible from groups so we will be interested in the "least commutative and cocommutative" examples. The formulation of the problem is the following. Given a pair of factors of a certain type (x_1, x_2) , is it possible to find a l.c. quantum group (M, Δ) such that M is a type x_1 factor and the dual algebra \hat{M} is a type x_2 factor (in the sense of Murray-von Neumann's and Connes' classification of factors) ? There exists a lot of examples for the

Email address: pierre.fima@math.unicaen.fr (Pierre Fima).

case (I_∞, I_∞) . In particular, it is shown in [2] that for any matched pair of conjugated l.c. groups the bicrossed product is a type (I_∞, I_∞) l.c. quantum group.

We start with a negative result showing that, if (M, Δ) is a l.c. quantum group and M is a finite factor, then \hat{M} is not a factor. On a positive side, our tool to construct examples of l.c. quantum groups is to use the bicrossed product of l.c. groups (see [11]). One can show that, if an action of a l.c. group on a von Neumann algebra is free on its center, then the type of the cocycle crossed product does not depend a lot on the cocycle. This is why we only consider trivial cocycles. We construct for any $\lambda \in [0, 1]$ a l.c. quantum group (M, Δ) such that M and \hat{M} are type III_λ factors. Similarly we obtain examples of type (I_∞, II_∞) and (II_∞, II_∞) . All of them are ITPFI factors, a kind of infinite tensor product of the p -adic version of the Baaj and Skandalis' example (see [11]).

This paper is organized as follows. In the second section we introduce some notations and recall some elementary facts about l.c. quantum groups, bicrossed product construction, infinite tensor product and ITPFI factors. In the third section we prove that a l.c. quantum group (M, Δ) with M a finite factor is compact. In the fourth section we describe our examples using p -adic numbers.

2 Preliminaries

2.0.0.1 Locally compact quantum groups In this paper we suppose that all von Neumann algebras have separable predual and l.c. groups are second countable. We denote by \otimes the tensor product of Hilbert spaces or von Neumann algebras. We refer to [9] for the theory of normal semifinite faithful (n.s.f.) weights on von Neumann algebras. If φ is a n.s.f. weight on M , we use the standard notation

$$\mathcal{M}_\varphi^+ = \{x \in M^+ \mid \varphi(x) < \infty\}, \mathcal{N}_\varphi = \{x \in M \mid x^*x \in \mathcal{M}_\varphi^+\}, \mathcal{M}_\varphi = \mathcal{N}_\varphi^* \mathcal{N}_\varphi.$$

We use l.c. quantum groups in the von Neumann algebraic setting (see [6]). A pair (M, Δ) is called a l.c. quantum group when

- M is a von Neumann algebra and $\Delta \rightarrow M \otimes M$ is a normal and unital *-homomorphism satisfying the coassociativity condition :

$$(\Delta \otimes \iota)\Delta = (\iota \otimes \Delta)\Delta,$$

where ι is the identity map.

- There exist n.s.f. weights φ and ψ on M such that

· φ is left invariant in the sense that

$$\varphi((\omega \otimes \iota)\Delta(x)) = \varphi(x)\omega(1), \quad \forall x \in \mathcal{M}_\varphi^+, \quad \forall \omega \in M_*^+,$$

· ψ is right invariant in the sense that

$$\psi((\iota \otimes \omega)\Delta(x)) = \psi(x)\omega(1), \quad \forall x \in \mathcal{M}_\psi^+, \quad \forall \omega \in M_*^+.$$

From [6] we know that left invariant weights on (M, Δ) are unique to a positive scalar and the same holds for right invariant weights.

A l.c. quantum group is called compact if its left invariant weight is finite.

Let (M, Δ) be a l.c. quantum group, fix a left invariant n.s.f. weight φ on (M, Δ) and represent M on the GNS-space of φ such that (H, ι, Λ) is a GNS construction for φ . Then we can define a unitary W on $H \otimes H$ by

$$W^*(\Lambda(a) \otimes \Lambda(b)) = (\Lambda \otimes \Lambda)(\Delta(b)(a \otimes 1)) \quad \text{for all } a, b \in \mathcal{N}_\varphi.$$

Where $\Lambda \otimes \Lambda$ is the canonical GNS-map for the tensor product weight $\varphi \otimes \varphi$. W is called the fundamental unitary of (M, Δ) . The comultiplication can be given in terms of W by the formula $\Delta(x) = W^*(1 \otimes x)W$ for all $x \in M$. Also the von Neumann algebra M can be written in terms of W as

$$M = \{(\iota \otimes \omega)(W) | \omega \in \mathcal{B}(H)_*\}^{-\sigma\text{-strong}^*},$$

where $\{X\}^{-\sigma\text{-strong}^*}$ denote the σ -strong* closure of X . It is possible to define a new von Neumann algebra

$$\hat{M} = \{(\omega \otimes \iota)(W) | \omega \in \mathcal{B}(H)_*\}^{-\sigma\text{-strong}^*},$$

and a comultiplication on \hat{M} by $\hat{\Delta}(x) = \Sigma W(x \otimes 1)W^*\Sigma$ for $x \in \hat{M}$, where Σ is the flip map on $H \otimes H$. Also, one can construct left and right invariant weight on \hat{M} for $\hat{\Delta}$. We obtain in this way a new l.c. quantum group $(\hat{M}, \hat{\Delta})$ called the dual of (M, Δ) . From [6] we know that the bidual quantum group $(\hat{\hat{M}}, \hat{\hat{\Delta}})$ is isomorphic to (M, Δ) .

If G is an ordinary locally compact group then $M = L^\infty(G)$ with the comultiplication $\Delta_G(f)(s, t) = f(st)$ and left and right invariant weight obtained by left and right Haar measure is a commutative l.c. quantum group. Every commutative l.c. quantum group is obtained in this way. Now, take $\hat{M} = \mathcal{L}(G)$ the group von Neumann algebra and $\hat{\Delta}_G(\lambda_g) = \lambda_g \otimes \lambda_g$ where (λ_g) is the left regular representation of G . One can show that the Plancherel weight on \hat{M} is left invariant. Also, it is easy to obtain a right invariant weight on \hat{M} so $(\mathcal{L}(G), \hat{\Delta}_G)$ is a l.c. quantum group, this the dual of $(L^\infty(G), \Delta_G)$. It is obvious that $\sigma\hat{\Delta}_G = \hat{\Delta}_G$ where σ is the flip map on $M \otimes M$. We say that $(\mathcal{L}(G), \hat{\Delta}_G)$ is cocommutative. One can show that every cocommutative l.c. quantum group is obtained in this way.

2.0.0.2 Bicrossed product Let G_1, G_2 be two closed subgroups of a l.c. group G such that $G_1 \cap G_2 = \{e\}$ and $\mu(G - G_1 G_2) = 0$ where e is the identity element of G and μ is a Haar measure on G . We say that the pair (G_1, G_2) is matched. We will now describe the bicrossed product construction of l.c. group (see [11]). Let (G_1, G_2) be a matched pair of l.c. groups and $g \in G_1, s \in G_2$, then we can write nearly everywhere

$$gs = \alpha_g(s)\beta_s(g).$$

We obtain two maps defined nearly everywhere and measurable

$$\begin{aligned} \alpha : G_1 \times G_2 &\rightarrow G_2 : & (g, s) &\rightarrow \alpha_g(s), \\ \beta : G_2 \times G_1 &\rightarrow G_1 : & (s, g) &\rightarrow \beta_s(g). \end{aligned}$$

Now we define two normal unital *-homomorphisms

$$\begin{aligned} \alpha : L^\infty(G_2) &\rightarrow L^\infty(G_1 \times G_2) : & (\alpha f)(g, s) &= f(\alpha_g(s)), \\ \beta : L^\infty(G_1) &\rightarrow L^\infty(G_2 \times G_1) : & (\beta f)(s, g) &= f(\beta_s(g)), \end{aligned}$$

and we have

$$(\iota \otimes \alpha)\alpha = (\Delta_{G_1} \otimes \iota)\alpha \quad \text{and} \quad (\iota \otimes \beta)\beta = (\Delta_{G_2} \otimes \iota)\beta.$$

Hence α will be an action of G_1 on the von Neumann algebra $L^\infty(G_2)$ and β an action of G_2 on the von Neumann algebra $L^\infty(G_1)$. So we can define the crossed product von Neumann algebra $M = G_1 \rtimes L^\infty(G_2)$ and a faithful *-homomorphism $\Delta : M \rightarrow M \otimes M$

$$\Delta(x) = W^*(1_{L^2(G_1 \times G_2)} \otimes x)W \quad \text{for } x \in M,$$

where W is a unitary in $L^2(G_1 \times G_2 \times G_1 \times G_2)$ defined by

$$(W\xi)(g, s, h, t) = \xi(\beta_{\alpha_g(s)^{-1}t}(h)g, s, h, \alpha_g(s)^{-1}t).$$

Then one can prove that Δ is a comultiplication on M and the dual weight of the left invariant integral on $L^\infty(G_2)$ is left invariant for Δ . In this way we obtain a l.c. quantum group (M, Δ) with dual $(\hat{M}, \hat{\Delta})$ such that

$$\hat{M} = L^\infty(G_1) \rtimes G_2, \quad \hat{\Delta}(x) = \Sigma W(x \otimes 1_{L^2(G_1 \times G_2)})W^* \Sigma \quad \text{for } x \in \hat{M}.$$

2.0.0.3 Infinite tensor product of von Neumann algebras For each $n \in \mathbb{N}$ let M_n be a von Neumann algebra acting on an Hilbert space H_n and ξ_n a norm 1 vector in H_n . The infinite tensor product of M_n relatively to ξ_n is the von Neumann algebra generated by the operators $x_1 \otimes \dots \otimes x_k \otimes 1 \otimes \dots$

for $k \in \mathbb{N}$ and $x_i \in M_i$ in the infinite tensor product of Hilbert spaces H_n relatively to the norm 1 vectors ξ_n . We denote this von Neumann algebra by

$$\bigotimes(M_n, H_n, \xi_n).$$

If each M_n is a factor then $\bigotimes(M_n, H_n, \xi_n)$ is a factor (see [1]).

The following lemma is certainly well known but we could not find a proof in the literature.

Lemma 1 *Let $p_n \neq 0$ be a projection in a von Neumann algebra M_n and ω_n a normal faithful state on M_n with GNS space H_n such that $\omega_n = \omega_{\xi_n}$. Put $M = \bigotimes(M_n, \omega_n)$. The decreasing sequence of projections*

$$p_1 \otimes \dots \otimes p_n \otimes 1 \dots$$

converge to a projection $p \in M$ and we have

$$p \neq 0 \Leftrightarrow \sum_n \|(1 - p_n)\xi_n\|^2 < \infty,$$

and if $p \neq 0$

$$pMp \simeq \bigotimes(p_n M_n p_n, \omega_{\eta_n}), \quad \text{where } \eta_n := \frac{p_n \xi_n}{\|p_n \xi_n\|}.$$

PROOF. $p \neq 0$ if and only if $(\bigotimes \omega_n)(p) > 0$. This is equivalent to

$$\sum_n \|(1 - p_n)\xi_n\|^2 < \infty.$$

The isomorphism is a simple identification. \square

Example 2 *For each $n \in \mathbb{N}$ let M_n be a von Neumann algebra, φ_n a n.s.f. weight on M_n and $q_n \in M_n$ a projector with $\varphi_n(q_n) = 1$. We can take H_n the Hilbert space of the G.N.S. construction for φ_n and $\xi_n = \Lambda_{\varphi_n}(q_n)$. We introduce the notation*

$$M = \bigotimes(M_n, \varphi_n, q_n) := \bigotimes(M_n, H_n, \xi_n).$$

Observe that there is a natural projector $q \in M$ defined by the infinite tensor product of the q_n . When $\varphi_n = \omega_n$ is a normal faithful state on M_n and $q_n = 1$, we use the standard notation

$$\bigotimes(M_n, \omega_n) := \bigotimes(M_n, \omega_n, 1).$$

Proposition 3 *Let M_n , φ_n and q_n be as above and suppose that $q_n \in M_n^{\varphi_n}$. Denote by ω_{ξ_n} the vector state associated to ξ_n . Then ω_{ξ_n} is faithful on $q_n M_n q_n$ and*

$$qMq \simeq \bigotimes (q_n M_n q_n, \omega_{\xi_n}).$$

PROOF. Let J_n be the usual antiunitary operator associated with φ_n and $J = \bigotimes J_n$, $q = \bigotimes q_n$. We have $\|x\xi_n\|^2 = \varphi_n(q_n x^* x q_n)$ thus the faithfulness of φ_n on M_n implies that ω_{ξ_n} is faithful on $q_n M_n q_n$. Note that the close linear subspace of $q_n H_n$ generated by $q_n M_n q_n \xi_n$ is $J_n q_n J_n q_n H_n$. Thus, the GNS space of $\omega := \bigotimes \omega_{\xi_n}$ on $N := \bigotimes (q_n M_n q_n, \omega_{\xi_n})$ is canonically isomorphic with $qJqJH$, and the image of qMq by the restriction homomorphism to the invariant subspace $qJqJH$ is N . This homomorphism is in fact an isomorphism because the closure of $M'qJqJH$ is qH . \square

Remark 4 *One can show that if $q_n \in M_n^{\varphi_n}$ there exists a canonical n.s.f. weight φ on M such that $\sigma_t^\varphi = \bigotimes_n \sigma_t^{\varphi_n}$ and $\varphi q = \bigotimes_n \varphi_n q_n$. This is the noncommutative analogue of the restricted direct product of measurable spaces with non necessarily finite measure.*

2.0.0.4 Restricted direct product action In the sequel, all group actions on von Neumann algebras are supposed to be pointwise σ -weakly continuous. Let G_n be a sequence of l.c. groups and μ_n a left Haar measure on G_n . We suppose that for all n there is a compact open subgroup K_n of G_n such that $\mu_n(K_n) = 1$. Recall that the restricted direct product $\prod' (G_n, K_n)$ is defined as the set of $(x_n) \in \prod G_n$ such that $x_n \in K_n$ for n large enough (see [3] for details). Let M_n be a sequence of von Neumann algebras with actions $\alpha^n : G_n \rightarrow \text{Aut}(M_n)$. Let φ_n be a n.s.f. weight on M_n and q_n a projection in the centralizer of φ_n with $\varphi_n(q_n) = 1$ and such that for all n , for all $g_n \in G_n$, there exists $c_n(g_n) > 0$ such that $\varphi_n \circ \alpha^n = c_n(g_n) \varphi_n$, $c_n|_{K_n} = 1$ and for all $g_n \in K_n$ one has $\alpha_{g_n}^n(q_n) = q_n$. With this data one can construct an action of the restricted direct product $G = \prod' (G_n, K_n)$ on the infinite tensor product $M = \bigotimes (M_n, \varphi_n, q_n)$. We fix a G.N.S. construction (H_n, ι, Λ_n) for φ_n and we put $H = \bigotimes (H_n, \Lambda_n(q_n))$.

Proposition 5 *There exists a unique action $\alpha : G \rightarrow \text{Aut}(M)$, called the restricted direct product of α^n , such that for all $g = (g_n) \in G$ and $x_n \in M_n$*

$$\alpha_g(x_1 \otimes \dots \otimes x_n \otimes 1 \dots) = \alpha_{g_1}^1(x_1) \otimes \dots \otimes \alpha_{g_n}^n(x_n) \otimes 1 \otimes \dots$$

PROOF. The uniqueness part is obvious. To show the existence, we first compute a unitary implementation of the actions α^n . It is easy to see that, for

$g_n \in G_n$, the operator

$$U_n(g_n) : \Lambda_n(x) \mapsto c_n(g_n)^{\frac{1}{2}} \Lambda_n(\alpha_{g_n}^n(x)), \quad \text{for } x \in \mathcal{N}_{\varphi_n},$$

can be extended to a unitary operator on H_n , still denoted by $U_n(g_n)$, and such that

$$\alpha_{g_n}^n(x) = U_n(g_n)xU_n(g_n)^* \quad \text{for all } x \in M_n.$$

The hypothesis implies that for all n and for all $g_n \in K_n$ one has $U_n(g_n)\Lambda_n(q_n) = \Lambda_n(q_n)$. Then for all $g \in G$ one can define a unitary operator U_g on H by $U_g = \otimes_n U_n(g_n)$ where $g = (g_n)$. In this way we obtain a group homomorphism $g \mapsto U_g$ from G to the unitary group of H . Because we have $U_g M U_g^* = M$ this allows us to construct a group homomorphism $\alpha : G \rightarrow \text{Aut}(M)$ defined by

$$\alpha_g(x) = U_g x U_g^* \quad \text{for } x \in M.$$

This is obvious that α is pointwise σ -weakly continuous and verifies the equation. \square

Let us identify the crossed product of G by M with an infinite tensor product of the crossed products of G_n by M_n . We denote by π_n the inclusion of M_n into $G_n \rtimes M_n$ and π the inclusion of M into $G \rtimes M$. We denote by $\tilde{\varphi}_n$ the dual weight of φ_n and by $\mathbb{1}_A$ the characteristic function of a measurable set A .

Proposition 6 *Let $e_n = \pi_n(q_n)(\lambda(\mathbb{1}_{K_n}) \otimes 1)$, where $\lambda(\mathbb{1}_{K_n})$ is the convolution operator by $\mathbb{1}_{K_n}$. Then e_n is a projection in $G_n \rtimes M_n$. Moreover, one has $\tilde{\varphi}_n(e_n) = 1$, $e_n \in (G_n \rtimes M_n)^{\tilde{\varphi}_n}$ and*

$$G \rtimes M \simeq \bigotimes (G_n \rtimes M_n, \tilde{\varphi}_n, e_n).$$

PROOF. Because $\pi_n(q_n)$ and $\lambda(\mathbb{1}_{K_n})$ are projections, if $\pi_n(q_n)$ and $\lambda(\mathbb{1}_{K_n}) \otimes 1$ commute then e_n is a projection. Take $\xi \in L^2(G_n, H_n)$ then

$$\begin{aligned} ((\lambda(\mathbb{1}_{K_n}) \otimes 1)\pi_n(q_n)\xi)(g) &= \int_{G_n} \mathbb{1}_{K_n}(t) \alpha_{g^{-1}t}^n(q_n) \xi(t^{-1}g) d\mu_n(t) \\ &= \alpha_{g^{-1}}^n(q_n) \int_{G_n} \mathbb{1}_{K_n}(t) \xi(t^{-1}g) d\mu_n(t), \quad \text{because } \forall t \in K_n, \alpha_t^n(q_n) = q_n \\ &= (\pi_n(q_n)(\lambda(\mathbb{1}_{K_n}) \otimes 1)\xi)(g). \end{aligned}$$

Thus e_n is a projection. Now, using $K_n \subset \text{Ker}(\delta_{G_n})$ and $c_n|_{K_n} = 1$, we have

$$\sigma_t^{\tilde{\varphi}_n}(\lambda(\mathbb{1}_{K_n}) \otimes 1) = \lambda(\mathbb{1}_{K_n}) \otimes 1.$$

This implies that

$$\sigma_t^{\tilde{\varphi}_n}(e_n) = \pi_n(\sigma_t^{\varphi_n}(q_n)) \sigma_t^{\tilde{\varphi}_n}(\lambda(\mathbb{1}_{K_n}) \otimes 1) = e_n.$$

Next, using definition of the dual weight, we have $\tilde{\varphi}_n(e_n) = \varphi_n(q_n)\mathbb{1}_{K_n}(1) = 1$. Recall that, using the classical explicit G.N.S. construction $(L^2(G_n, M_n), \iota, \tilde{\Lambda}_n)$ for the dual weight, one has (see [10])

$$\tilde{\Lambda}_n(e_n) = \mathbb{1}_{K_n} \otimes \Lambda_n(q_n).$$

We denote this vector by ξ_n . We define the operator

$$U : \bigotimes (L^2(G_n, H_n), \xi_n) \rightarrow L^2(G, H)$$

on a dense subset by

$$U(F_1 \otimes \dots \otimes F_n \otimes \bar{\xi}_n)(g) = \bigotimes_{i=1}^n F_i(g_i) \otimes \left(\bigotimes_{i=n+1}^{\infty} \mathbb{1}_{K_i}(g_i) \Lambda_i(p_i) \right),$$

where $F_i \in L^2(G_i, H_i)$, $g = (g_n) \in G$ and $\bar{\xi}_n = \bigotimes_{i=n+1}^{\infty} \xi_i$. Then U is an isometry with dense range. Thus we obtain a unitary operator, again denoted by U , such that, if $g = (g_1, \dots, g_n, 1, \dots)$,

$$U((\lambda_{g_1} \otimes 1) \otimes \dots \otimes (\lambda_{g_n} \otimes 1) \otimes 1 \otimes \dots) U^* = \lambda_g \otimes 1,$$

$$U(\pi_1(x_1) \otimes \dots \otimes \pi_n(x_n) \otimes 1 \otimes \dots) U^* = \pi(x_1 \otimes \dots \otimes x_n \otimes 1 \otimes \dots).$$

It follows that

$$U\left(\bigotimes (G_n \rtimes M_n, \tilde{\varphi}_n, e_n)\right) U^* = G \rtimes M. \quad \square$$

2.0.0.5 ITPFI factors and Boca-Zaharescu factors In [1] Araki and Woods define ITPFI factors as infinite tensor product of type I factors

$$\bigotimes (M_n, H_n, \xi_n),$$

where M_n is a type I factor acting on H_n and ξ_n is a norm 1 vector in H_n . All these factors are hyperfinite.

If M is a type I factor acting on H , we can write $H = H_1 \otimes H_2$ such that $M = \mathcal{B}(H_1) \otimes 1$. Now, let $\Omega \in H$ be a norm 1 vector and consider the normal state on M

$$\omega(x) = \langle (x \otimes 1)\Omega, \Omega \rangle.$$

Hence there exists a density matrix $\rho_\Omega \in \mathcal{B}(H_1)$ such that $\omega(x) = \text{Tr}(\rho_\Omega x)$. It is easy to see that the ordered list (with multiplicity) of the non zero eigenvalues of the operator ρ_Ω does not depend on the decomposition of H in $H_1 \otimes H_2$. This list is denoted by $\text{Sp}(\Omega | M)$. The type of the ITPFI factor $\bigotimes (M_n, H_n, \xi_n)$ only depends on the list $\text{Sp}(\xi_n | M_n)$. In the fourth section we will use the fact that if each M_n is a type I_{n_ν} factor, with $2 \leq n_\nu \leq \infty$, and

$\text{Sp}(\xi_n | M_n) = \{\lambda_{n_i}, i = 1, 2, \dots, n_\nu\}$ then, if $\lambda_{n_1} \geq \delta$ for some $\delta > 0$ and for all n , M is a type III factor if and only if

$$\sum_{n,i} \lambda_{n_i} \inf \left\{ \left| \frac{\lambda_{n_1}}{\lambda_{n_i}} - 1 \right|^2, C \right\} = \infty,$$

for some positive C .

Let \mathcal{S} be an infinite subset of the set \mathcal{P} of all prime numbers and $\beta \in]0, 1]$. In [4] Boca and Zaharescu studied the following ITPFI factor

$$M_{\beta, \mathcal{S}} := \bigotimes_{p \in \mathcal{S}} \left(\mathcal{B}(l^2(\mathbb{N})), \omega_{p, \beta} \right),$$

where $\omega_p(x) := \sum_n p^{-n\beta} (1 - p^{-\beta}) \langle x e_n, e_n \rangle$ and (e_n) is the canonical basis of $l^2(\mathbb{N})$. We denote by $N_{\mathcal{S}}$ the factor $M_{1, \mathcal{S}}$. In [4] Boca and Zaharescu show that

- (1) For any $\lambda \in [0, 1]$ and $\beta \in]0, 1]$, there is a subset \mathcal{S} of \mathcal{P} such that $M_{\beta, \mathcal{S}}$ is a type III_λ factor.
- (2) For any $\beta \in]0, 1]$, any countable subgroup K of \mathbb{R} and any countable subset Σ of $\mathbb{R} - K$, there exists a subset \mathcal{S} of \mathcal{P} such that $T(M_{\beta, \mathcal{S}})$ contains K and does not intersect Σ ,

where $T(M)$ denotes the Connes' T invariant of the von Neumann algebra M (see [5]).

Remark 7 *It was shown in [4] that $M_{\beta, \mathcal{S}}$ is an ITPFI_2 (infinite tensor product of type I_2 factors) for all $\beta \in]\frac{1}{2}, 1]$. In fact it is possible to show that for all $\beta \in]0, 1]$, $M_{\beta, \mathcal{S}}$ is an ITPFI_m with $\beta > \frac{1}{m}$. Indeed, for such m and β put*

$$q_p(e_n) = \begin{cases} e_n & \text{if } 0 \leq n \leq m - 1 \\ 0 & \text{otherwise.} \end{cases}$$

Then because of

$$\sum_{p \in \mathcal{S}} \sum_{n \geq m} (1 - p^{-\beta}) p^{-n\beta} = \sum_{p \in \mathcal{S}} p^{-m\beta} < \infty,$$

for all $\beta > \frac{1}{m}$, we can apply Lemma 1 to obtain a projection $p \neq 0$ such that $p(M_{\beta, \mathcal{S}})p$ is an ITPFI_m . Moreover, it is easy to see that p is purely infinite, thus $M_{\beta, \mathcal{S}}$ is ITPFI_m .

3 The case of a finite factor

In this section we show that if (M, Δ) is a l.c. quantum group such that M is a finite factor, then (M, Δ) is compact so \hat{M} , being an infinite direct sum of full matrix algebras, is not a factor.

The idea of the proof of the next lemma was taken from [8].

Lemma 8 *Let (M, Δ) be a l.c. quantum group. Suppose that M is a finite factor. Let τ be the unique tracial state on M . Then, for all $\rho \in M_*$ with $0 \leq \rho \leq \tau$, one has :*

$$\rho * \tau = \tau * \rho = \rho(1)\tau.$$

PROOF. Let a be in M and define $b = (\iota \otimes \tau)\Delta(a)$. Then, by unicity of τ , one has $\tau * \tau = \tau$, and using the coassociativity of Δ we obtain

$$\begin{aligned} (\iota \otimes \tau)\Delta(b) &= (\iota \otimes \tau)\Delta((\iota \otimes \tau)\Delta(a)) = (\iota \otimes \tau \otimes \tau)((\Delta \otimes \iota)\Delta(a)) \\ &= (\iota \otimes \tau \otimes \tau)((\iota \otimes \Delta)\Delta(a)) \\ &= (\iota \otimes (\tau * \tau))\Delta(a) = (\iota \otimes \tau)\Delta(a) = b. \end{aligned}$$

This implies the following relations.

$$(\iota \otimes \tau)((b^* \otimes 1)\Delta(b)) = b^*(\iota \otimes \tau)\Delta(b) = b^*b, \quad (1)$$

$$(\iota \otimes \tau)(\Delta(b^*)(b \otimes 1)) = ((\iota \otimes 1\Delta(b))^* b = b^*b. \quad (2)$$

Now define

$$\begin{aligned} k &= (\Delta(b) - b \otimes 1)^* (\Delta(b) - b \otimes 1) \\ &= \Delta(b^*b) - (b^* \otimes 1)\Delta(b) - \Delta(b^*)(b \otimes 1) + b^*b \otimes 1. \end{aligned}$$

Then $k \geq 0$ and, from the equations (1) and (2), we obtain

$$\begin{aligned} (\tau \otimes \tau)(k) &= \tau((\iota \otimes \tau)(k)) = (\tau \otimes \tau)(\Delta(b^*b) - \tau(b^*b)) \\ &= \tau * \tau(b^*b) - \tau(b^*b) = 0. \end{aligned}$$

Then, if $\rho \in M_*$ with $0 \leq \rho \leq \tau$, one has $(\tau \otimes \rho)(k) \leq (\tau \otimes \tau)(k) = 0$. This implies, with the Cauchy-Schwartz inequality, that for all $c \in M$ we have

$$(\tau \otimes \rho)((c \otimes 1)(\Delta(b) - b \otimes 1)) = 0 \quad \text{thus,}$$

$$(\tau \otimes \rho)((c \otimes 1)\Delta(b)) = \rho(1)\tau(cb).$$

Using the definition of b , we see that the last equation is equivalent to

$$\begin{aligned} & (\tau \otimes \rho) ((c \otimes 1) \Delta ((\iota \otimes \tau) \Delta(a))) = \rho(1) \tau (c(\iota \otimes \tau) \Delta(a)) \\ \Leftrightarrow & (\tau \otimes \rho \otimes \tau) ((c \otimes 1 \otimes 1) (\Delta \otimes \iota) \Delta(a)) = \rho(1) (\tau \otimes \tau) ((c \otimes 1) \Delta(a)) \\ \Leftrightarrow & (\tau \otimes (\rho * \tau)) ((c \otimes 1) \Delta(a)) = \rho(1) (\tau \otimes \tau) ((c \otimes 1) \Delta(a)), \end{aligned}$$

and this is true for all a and b in M . Now, because $\Delta(M)(M \otimes 1)$ is σ -weakly dense in $M \otimes M$ and τ is a trace we have, for all $x \in M \otimes M$,

$$(\rho(1) \tau \otimes \tau)(x) = (\tau \otimes (\rho * \tau))(x).$$

Putting $x = 1 \otimes y$ in the last equation, we obtain $\rho(1) \tau = \rho * \tau$. The proof of $\rho(1) \tau = \tau * \rho$ is the same. \square

We are now able to prove that a l.c. quantum group (M, Δ) with M a finite factor is compact.

Theorem 9 *Let (M, Δ) be a l.c. quantum group with M a finite factor. Then (M, Δ) is compact and τ is the Haar state on M , where τ is the unique tracial state on M .*

PROOF. Let (H, Λ, ι) be a G.N.S. construction for τ and J the canonical involutive isometry associated to τ . Let a be in M and consider the positive normal linear form $\omega_{\Lambda(a)}$. We have

$$\begin{aligned} \omega_{\Lambda(a)}(x^* x) &= \|\Lambda(xa)\|^2 = \|Ja^* J\Lambda(x)\|^2 \\ &\leq \|a\|^2 \tau(x^* x). \end{aligned}$$

This implies that $\frac{\omega_{\Lambda(a)}}{\|a\|^2} \leq \tau$ and, using the previous lemma, we conclude that $\omega_{\Lambda(a)} * \tau = \tau * \omega_{\Lambda(a)} = \omega_{\Lambda(a)}(1) \tau$ for all $a \in M$. Now, using that $M \subset \mathcal{B}(H)$ is standard, we know that if $\omega \in M_*$ and $\omega \geq 0$ there exists $\xi \in H$ such that $\omega = \omega_\xi$. Take a net (a_i) in M such that $\Lambda(a_i)$ converges in H to ξ then, for all $x \in M$, $\omega_{\Lambda(a_i)}(x)$ converges to $\omega(x)$. In particular, for x in M , we have

$$\begin{aligned} (\omega_{\Lambda(a_i)} * \tau)(x) &\rightarrow (\omega * \tau)(x) \\ (\tau * \omega_{\Lambda(a_i)})(x) &\rightarrow (\tau * \omega)(x). \end{aligned}$$

Because of

$$(\omega_{\Lambda(a_i)} * \tau)(x) = (\tau * \omega_{\Lambda(a_i)})(x) = \|\Lambda(a_i)\|^2 \tau(x) \rightarrow \|\xi\|^2 \tau(x) = \omega(1) \tau(x),$$

we see that $\omega * \tau = \tau * \omega = \omega(1) \tau$ and, by linearity, the last equality holds for all $\omega \in M_*$. This concludes the proof. \square

4 Examples

Let \mathcal{P} be the set of all prime numbers. In the sequel, if p is a prime number, we denote by \mathbb{Q}_p the field of rational p -adic numbers and \mathbb{Z}_p the ring of p -adic integers. Let \mathcal{S} be an infinite subset of \mathcal{P} and $\mathcal{A}_{\mathcal{S}}$ the restricted direct product of \mathbb{Q}_p relatively to the compact open subgroups \mathbb{Z}_p for $p \in \mathcal{S}$ (see [3]) :

$$\mathcal{A}_{\mathcal{S}} = \prod_{p \in \mathcal{S}} ' (\mathbb{Q}_p, \mathbb{Z}_p).$$

Then $\mathcal{A}_{\mathcal{S}}$ is a second countable l.c. ring. The group of invertible elements of $\mathcal{A}_{\mathcal{S}}$ is

$$\mathcal{A}_{\mathcal{S}}^* = \prod_{p \in \mathcal{S}} ' (\mathbb{Q}_p^*, \mathbb{Z}_p^*).$$

Now, denote by $G_{\mathcal{S}}$ the $ax + b$ -group of $\mathcal{A}_{\mathcal{S}}$:

$$G_{\mathcal{S}} = \mathcal{A}_{\mathcal{S}}^* \times \mathcal{A}_{\mathcal{S}},$$

and define the following subgroups.

$$G_{\mathcal{S}}^1 = \{(a, 0) \in G_{\mathcal{S}}\}, \quad G_{\mathcal{S}}^2 = \{(a_p, (b_p)) \in G, \quad a_p + b_p p = 1 \quad \forall p \in \mathcal{S}\}.$$

We can rewrite $G_{\mathcal{S}}^2$ as

$$G_{\mathcal{S}}^2 = \left\{ \begin{array}{l} \left((a_p), \left(\frac{1-a_p}{p} \right) \right), \quad a_p \neq 0 \quad \forall p \in \mathcal{S} \\ \text{and } a_p \in 1 + p\mathbb{Z}_p \text{ for } p \text{ large enough} \end{array} \right\}.$$

$G_{\mathcal{S}}^1$ is the subgroup of $G_{\mathcal{S}}$ which fixes 0. $G_{\mathcal{S}}^2$ is, formally, the subgroup of $G_{\mathcal{S}}$ which fixes $\left(\frac{1}{p} \right)_{p \in \mathcal{S}}$. We denote by μ_p^+ the additive Haar measure on \mathbb{Q}_p such that $\mu_p^+(\mathbb{Z}_p) = 1$ and by μ_p^\times the multiplicative Haar measure on \mathbb{Q}_p^* such that $\mu_p^\times(\mathbb{Z}_p^*) = 1$. Let μ^+ be the product measure of μ_p^+ , this is an additive Haar measure on $\mathcal{A}_{\mathcal{S}}$, let μ^\times be the product measure of μ_p^\times , this is a Haar measure on $\mathcal{A}_{\mathcal{S}}^*$. On $G_{\mathcal{S}}$, the right Haar measure which is equal to 1 on $\prod_{p \in \mathcal{S}} \mathbb{Z}_p^* \times \mathbb{Z}_p$ is $d\mu^\times(x)d\mu^+(y)$ and the left Haar measure which is equal to 1 on $\prod_{p \in \mathcal{S}} \mathbb{Z}_p^* \times \mathbb{Z}_p$ is $\delta(x)d\mu^\times(x)d\mu^+(y)$, where

$$\delta(x) = \prod_{p \in \mathcal{S}} \frac{1}{|x_p|_p}, \quad x = (x_p) \in \mathcal{A}_{\mathcal{S}}^*.$$

We now prove the following easy lemma.

Lemma 10 *The groups G_S^1, G_S^2 are matched. Moreover, the bicrossed product of G_S^1 by G_S^2 is not regular, it is semi-regular in the sense of [2].*

PROOF. It is clear that G_S^1 and G_S^2 are closed subgroups of G_S and $G_S^1 \cap G_S^2 = \{1\}$. So we must prove that $G_S - G_S^1 G_S^2$ is closed and its Haar measure is zero. From

$$G_S^2 G_S^1 = \left\{ \left((a_p b_p), \left(\frac{1-a_p}{p} \right) \right), b = (b_p)_{p \in \mathcal{S}} \in \mathcal{A}_S^*, a_p \neq 0 \ \forall p \in \mathcal{S} \right\},$$

and $a_p \in 1 + p\mathbb{Z}_p$ for p large enough

we conclude that

$$G_S^2 G_S^1 = \left\{ (a, b) \in G_S, b_p \neq \frac{1}{p} \ \forall p \in \mathcal{S} \text{ with } b = (b_p)_{p \in \mathcal{S}} \right\}.$$

It follows that $G_S^2 G_S^1$ is open and

$$G_S - G_S^2 G_S^1 = \left\{ (a, b) \in G_S, \exists p \in \mathcal{S}, b_p = \frac{1}{p} \text{ with } b = (b_p)_{p \in \mathcal{S}} \right\}$$

has Haar measure equal to zero. \square

Denote by (M_S, Δ_S) the bicrossed product of G_S^1 and G_S^2 . Under the canonical identification of G_S^1 with \mathcal{A}_S^* and G_S^2 with \mathcal{K}_S , where \mathcal{K}_S is the following restricted direct product

$$\mathcal{K}_S = \prod_{p \in \mathcal{S}} ' (\mathbb{Q}_p^*, 1 + p\mathbb{Z}_p),$$

the group actions α of G_S^1 on the measurable space G_S^2 and β of G_S^2 on the measurable space G_S^1 can be easily calculated : take $s = (s_p) \in \mathcal{K}_S$ and $g = (g_p) \in \mathcal{A}_S^*$ such that for all $p \in \mathcal{S}$, $g_p(s_p - 1) + 1 \neq 0$ and, for p large enough, $g_p(s_p - 1) + 1 \in 1 + p\mathbb{Z}_p$. Then

$$\alpha_g(s) = (g_p(s_p - 1) + 1), \quad \beta_s(g) = \left(\frac{g_p s_p}{g_p(s_p - 1) + 1} \right). \quad (3)$$

We define on G_S^1 the Haar measure μ_1 obtained, through the identification with \mathcal{A}_S^* , from the Haar measure μ^\times on \mathcal{A}_S^* . Also, we define on G_S^2 the Haar measure μ_2 corresponding to the product of the measures μ_p on \mathbb{Q}_p^* , where μ_p is the Haar measure on \mathbb{Q}_p^* such that $\mu_p(1 + p\mathbb{Z}_p) = 1$. Taking into account equation (3), we see that α is a restricted direct product action for $p \in \mathcal{S}$ of the $\alpha^p : \mathbb{Q}_p^* \rightarrow \text{Aut}(\mathbb{Q}_p^*)$, $\alpha_{g_p}^p(s_p) = g_p(s_p - 1) + 1$. Also β is a restricted direct

product action of $\beta^p : \mathbb{Q}_p^* \rightarrow \text{Aut}(\mathbb{Q}_p^*)$, $\beta_{s_p}^p(g_p) = \frac{g_p s_p}{g_p(s_p-1)+1}$. We introduce the notation ν_p for the Haar measure on \mathbb{Q}_p such that $\nu_p(\mathbb{Z}_p^*) = 1$. We have

$$\mu_p = (p-1)\mu_p^\times, \quad \nu_p = (1-p^{-1})^{-1}\mu_p^+ \quad \text{and} \quad d\mu_p^+(x) = (1-p^{-1})|x|_p d\mu_p^\times(x).$$

The main result of this section is the following theorem which implies the description of the types of the factors M_S and \hat{M}_S .

Theorem 11 *For any infinite subset \mathcal{S} of \mathcal{P} we have the following isomorphisms*

$$M_S \simeq N_S \quad \text{and} \quad \hat{M}_S \simeq M_S \otimes \mathcal{R},$$

where N_S is the Boca-Zaharescu factor and \mathcal{R} is the hyperfinite II_1 factor.

PROOF. Let π_p be the canonical inclusion of $L^\infty(\mathbb{Q}_p)$ in $\mathbb{Q}_p^* \rtimes L^\infty(\mathbb{Q}_p)$. We first prove the following lemma.

Lemma 12 *Let μ be a Haar measure on \mathbb{Q}_p^* and ν a Haar measure on \mathbb{Q}_p . Let $K \subset \mathbb{Z}_p^*$ be a subgroup of finite index with $\mu(K) = 1$ and L a compact open subset of \mathbb{Z}_p such that $KL = L$ and $\nu(L) = 1$. Define*

$$e(K, L) = (\lambda(\mathbb{1}_K) \otimes 1)\pi_p(\mathbb{1}_L) \quad \text{and} \quad \xi(K, L) = \mathbb{1}_{K \times L}.$$

Then $e(K, L)$ is a projection in $\mathbb{Q}_p^* \rtimes L^\infty(\mathbb{Q}_p)$ and

$$\left(e(K, L) \left(\mathbb{Q}_p^* \rtimes L^\infty(\mathbb{Q}_p) \right) e(K, L), \omega_{\xi(K, L)} \right) \simeq \left(\mathcal{B}(l^2(\mathbb{N})), \omega \right)$$

where ω is the faithful normal state on $\mathcal{B}(l^2(\mathbb{N}))$ with eigenvalue list given by

$$\frac{\mu_p^+(K)}{\mu_p^+(L)} p^{-n} \quad \text{with multiplicity} \quad \left| L \cap p^n \mathbb{Z}_p^* / K \right|, \quad n \in \mathbb{N}.$$

PROOF. The fact that $e(K, L)$ is a projection has been proved in Proposition 6. We define the following unitary

$$U : L^2(\mathbb{Q}_p^* \times \mathbb{Q}_p, \mu \times \nu) \rightarrow L^2(\mathbb{Q}_p^* \times \mathbb{Q}_p^*, \mu \times \mu)$$

$$(U\xi)(x, y) = \left(\frac{\mu_p^+(K)}{\mu_p^+(L)} |y|_p \right)^{\frac{1}{2}} \xi(xy^{-1}, y).$$

Then

$$U\lambda_g \otimes 1U^* = \lambda_g \otimes 1 \quad \text{and} \quad U\pi_p(F)U^* = F \otimes 1,$$

this implies that

$$U\mathbb{Q}_p^* \rtimes L^\infty(\mathbb{Q}_p)U^* = \mathcal{B}(L^2(\mathbb{Q}_p^*, \mu)) \otimes 1.$$

Next, we have

$$(e(K, L)\xi)(x, y) = \mathbb{1}_L(xy) \int_{\mathbb{Q}_p^*} \mathbb{1}_K(t)\xi(t^{-1}x, y) d\mu(t)$$

thus, after a simple computation, we obtain

$$Ue(K, L)U^* = f(K, L) \otimes 1 \quad \text{where,}$$

$$(f(K, L)\xi)(x) = \mathbb{1}_L(x) \int_{\mathbb{Q}_p^*} \mathbb{1}_K(t)\xi(t^{-1}x) d\mu(t).$$

Observe that the image of $f(K, L)$ is the set of functions $\xi \in L^2(\mathbb{Q}_p^*, \mu)$ such that the support of ξ is in $L - \{0\}$ and ξ is invariant under translations of K .

Writing

$$L - \{0\} = \cup_{n \in \mathbb{N}} L \cap p^n \mathbb{Z}_p^*,$$

we see that every function ξ in the image of $f(K, L)$ is of the form

$$\xi = \sum_{n \in \mathbb{N}} \sum_{[y] \in L \cap p^n \mathbb{Z}_p^*/K} \xi(y) \mathbb{1}_{[y]}.$$

Thus we have

$$f(K, L)L^2(\mathbb{Q}_p^*, \mu) = \overline{\text{Span} \langle \mathbb{1}_{[y]}, n \in \mathbb{N}, [y] \in L \cap p^n \mathbb{Z}_p^*/K \rangle},$$

where $\overline{\text{Span} \langle X \rangle}$ means the closed vector space generated by X . Because $\mu([y]) = \mu(K) = 1$, the set of vectors $\mathbb{1}_{[y]}$ for $[y] \in L \cap p^n \mathbb{Z}_p^*/K$ and $n \geq 0$ is an orthonormal basis of $f(K, L)L^2(\mathbb{Q}_p^*, \mu)$. Thus, there is a unitary W between $f(K, L)L^2(\mathbb{Q}_p^*, \mu)$ and $l^2(\mathbb{N})$ such that

$$(W \otimes 1)Ue(K, L) \left(\mathbb{Q}_p^* \times L^\infty(\mathbb{Q}_p) \right) e(K, L)U^*(W^* \otimes 1) = \mathcal{B}(l^2(\mathbb{N})) \otimes 1,$$

and, using the computation

$$U\xi(K, L) = \sum_n \sum_{[y] \in L \cap p^n \mathbb{Z}_p^*/K} \lambda_{n, [y]}^{\frac{1}{2}} \mathbb{1}_{[y]} \otimes \mathbb{1}_{[y]},$$

where $\lambda_{n, [y]} = \frac{\mu_p^+(K)}{\mu_p^+(L)} p^{-n}$, we conclude the proof. \square

Remark 13 We obtain, for $(K, L, \mu, \nu) = (\mathbb{Z}_p^*, \mathbb{Z}_p, \mu_p^\times, \mu_p^+)$, the list $(1-p^{-1})p^{-n}$ with multiplicity one and, for $(K, L, \mu, \nu) = (1 + p\mathbb{Z}_p, \mathbb{Z}_p^* - 1, \mu_p, \nu_p)$, the following list : $(p-1)^{-1}$ with multiplicity $p-2$ and $(p-1)^{-1}p^{-n}$ with multiplicity $p-1$ for $n \geq 1$.

The next ingredient of the proof is the following lemma.

Lemma 14 For any infinite subset $\mathcal{S} \subset \mathcal{P}$ we have

- (1) $M_S \simeq \otimes_{p \in \mathcal{S}} \left(\mathbb{Q}_p^* \rtimes L^\infty(\mathbb{Q}_p), L^2(\mathbb{Q}_p^* \times \mathbb{Q}_p, \mu_p^\times \times \mu_p^+), \xi(\mathbb{Z}_p^*, \mathbb{Z}_p) \right),$
(2) $\hat{M}_S \simeq \otimes_{p \in \mathcal{S}} \left(\mathbb{Q}_p^* \rtimes L^\infty(\mathbb{Q}_p), L^2(\mathbb{Q}_p^* \times \mathbb{Q}_p, \mu_p \times \nu_p), \xi(1 + p\mathbb{Z}_p, \mathbb{Z}_p^* - 1) \right).$

PROOF. To obtain the first isomorphism, recall that

$$G_S^1 \rtimes L^\infty(G_S^2) \simeq G_S^1 \rtimes L^\infty(G_S/G_S^1),$$

and because $G_S^1 = \mathcal{A}_S^* \times \{0\}$, it is easy to see that

$$G_S^1 \rtimes L^\infty(G_S^2) \simeq \mathcal{A}_S^* \rtimes L^\infty(\mathcal{A}_S).$$

Next, using Proposition 6, we obtain immediately the first isomorphism. For the second isomorphism, we first use Proposition 6 and the discussion preceding the lemma to obtain

$$\hat{M}_S \simeq \bigotimes_{p \in \mathcal{S}} \left(\mathbb{Q}_p^* \rtimes_{\beta^p} L^\infty(\mathbb{Q}_p^*), L^2(\mathbb{Q}_p^* \times \mathbb{Q}_p^*, \mu_p \times \mu_p^\times), \mathbb{I}_{(1+p\mathbb{Z}_p) \times \mathbb{Z}_p^*} \right).$$

Now define

$$V : L^2(\mathbb{Q}_p^* \times \mathbb{Q}_p^*, \mu_p \times \mu_p^\times) \rightarrow L^2(\mathbb{Q}_p^* \times \mathbb{Q}_p, \mu_p \times \nu_p),$$

$$(V\xi)(g, s) = \xi(g^{-1}, (s+1)^{-1}) |s+1|^{\frac{1}{p}}.$$

V is unitary and

$$V \left(\mathbb{Q}_p^* \rtimes_{\beta^p} L^\infty(\mathbb{Q}_p^*) \right) V^* = \mathbb{Q}_p^* \rtimes L^\infty(\mathbb{Q}_p),$$

where the action for the crossed product on the right is the translation. Finally, the computation

$$V \mathbb{I}_{(1+p\mathbb{Z}_p) \times \mathbb{Z}_p^*} = \mathbb{I}_{(1+p\mathbb{Z}_p) \times (\mathbb{Z}_p^* - 1)}$$

concludes the proof. \square

We can now prove the Theorem. Using Lemmas 12 and 14, the remark between these two lemmas and Proposition 3 we obtain, using the notation $e_1 = \otimes_{p \in \mathcal{S}} e(\mathbb{Z}_p^*, \mathbb{Z}_p)$ and $e_2 = \otimes_{p \in \mathcal{S}} e(1 + p\mathbb{Z}_p, \mathbb{Z}_p^* - 1)$,

$$e_1 M_S e_1 \simeq N_S \quad \text{and,} \quad e_2 \hat{M}_S e_2 \simeq \bigotimes_{p \in \mathcal{S}} \left(\mathcal{B}(l^2(\mathbb{N})), \psi_p \right),$$

where the eigenvalue list of ψ_p is given by

$$(p-1)^{-1} p^{-n} \quad \text{with multiplicity} \quad \begin{cases} p-2 & \text{if } n=0 \\ p-1 & \text{if } n \geq 1. \end{cases}$$

Next, because $M_{\mathcal{S}}$, $\hat{M}_{\mathcal{S}}$, e_1 and e_2 are purely infinite and e_1 and e_2 have central support equal to 1 we have that $e_1 M_{\mathcal{S}} e_1 \simeq M_{\mathcal{S}}$ and $e_2 \hat{M}_{\mathcal{S}} e_2 \simeq \hat{M}_{\mathcal{S}}$. Thus, to conclude the proof, it is sufficient to prove that

$$\bigotimes_{p \in \mathcal{S}} \left(\mathcal{B}(l^2(\mathbb{N})), \psi_p \right) \simeq N_{\mathcal{S}} \otimes \mathcal{R}.$$

Using Lemma 1 and

$$\sum_{p \in \mathcal{S}} \sum_{n \geq 1} (p-1)^{-1} p^{-n} = \sum_{p \in \mathcal{S}} (p-1)^{-2} < \infty$$

we can remove one copy of p^{-1}, p^{-2}, \dots without changing the isomorphism class of the ITPFI factor (the projection obtained in Lemma 1 is clearly purely infinite), thus, we obtain

$$\bigotimes_{p \in \mathcal{S}} \left(\mathcal{B}(l^2(\mathbb{N})), \psi_p \right) \simeq \bigotimes_{p \in \mathcal{S}} \left(\mathcal{B}(l^2(\mathbb{N})) \otimes M_{p-2}(\mathbb{C}), \omega_p \otimes \tau_p \right),$$

where τ_p is the normalized trace of the matrix algebra $M_{p-2}(\mathbb{C})$. The theorem follows. \square

Corollary 15 *For any infinite subset $\mathcal{S} \subset \mathcal{P}$, we have*

- (1) $\sum_{p \in \mathcal{S}} \frac{1}{p} < +\infty \Leftrightarrow \mu^+(\mathcal{A}_{\mathcal{S}} - \mathcal{A}_{\mathcal{S}}^*) = 0 \Leftrightarrow (M_{\mathcal{S}}, \Delta_{\mathcal{S}})$ is of type $(\text{I}_{\infty}, \text{II}_{\infty})$.
- (2) $\sum_{p \in \mathcal{S}} \frac{1}{p} = +\infty \Leftrightarrow \mu^+(\mathcal{A}_{\mathcal{S}}^*) = 0 \Leftrightarrow (M_{\mathcal{S}}, \Delta_{\mathcal{S}})$ is of type (III, III) .

Moreover we have

- For any $\lambda \in [0, 1]$ there exists a subset $\mathcal{S} \subset \mathcal{P}$ such that $(M_{\mathcal{S}}, \Delta_{\mathcal{S}})$ is of type $(\text{III}_{\lambda}, \text{III}_{\lambda})$.
- For any countable subgroup K of \mathbb{R} and countable subset Σ of $\mathbb{R} - K$ there exists a subset \mathcal{S} of \mathcal{P} such that $T(M_{\mathcal{S}})$ contains K and does not intersect Σ .

PROOF. We have $\mu^+(\prod_{p \in \mathcal{S}} \mathbb{Z}_p^*) = 0 \Leftrightarrow \mu^+(\mathcal{A}_{\mathcal{S}}^*) = 0$. Then, because

$$\mu^+ \left(\prod_{p \in \mathcal{S}} \mathbb{Z}_p^* \right) = \prod_{p \in \mathcal{S}} \mu_p^+ (\mathbb{Z}_p^*) = \prod_{p \in \mathcal{S}} \left(1 - \frac{1}{p} \right),$$

we have

$$\sum_{p \in \mathcal{S}} \frac{1}{p} = +\infty \Leftrightarrow \mu^+(\mathcal{A}_{\mathcal{S}}^*) = 0. \quad (4)$$

Now, the Borel-Cantelli lemma gives $\sum_{p \in \mathcal{S}} \frac{1}{p} < +\infty \Rightarrow \mu^+(\mathcal{A}_{\mathcal{S}} - \mathcal{A}_{\mathcal{S}}^*) = 0$, then (4) implies that the last implication is an equivalence. Note that for any l.c. ring \mathcal{A} , such that $\mathcal{A} - \mathcal{A}^*$ has additive Haar measure zero, the translation

action of \mathcal{A}^* on \mathcal{A} is free and ergodic, and the corresponding crossed product is a type I_∞ factor, the proof of (1) follows.

Now, suppose that $\sum_{p \in \mathcal{S}} \frac{1}{p} = \infty$ then

$$\sum_{p \in \mathcal{S}, i \geq 0} p^{-i}(1-p^{-1}) \inf\{|p^i - 1|^2, 1\} = \sum_{p \in \mathcal{S}, i \geq 1} p^{-i}(1-p^{-1}) = \sum_{p \in \mathcal{S}} \frac{1}{p} = +\infty.$$

This implies, taking into account preliminaries about ITPFI factors, that $M_{\mathcal{S}}$ and $\tilde{M}_{\mathcal{S}}$ are type III factors. The last results follow from [4]. \square

There is a minor modification of the preceding example. Take

$$G_{\mathcal{S}} = \mathcal{K}_{\mathcal{S}} \times \mathcal{A}_{\mathcal{S}}$$

and define the following subgroups

$$G_{\mathcal{S}}^1 = \mathcal{K}_{\mathcal{S}} \times \{0\} \quad \text{and} \quad G_{\mathcal{S}}^2 = \left\{ \left(a_p, \frac{1-a_p}{p} \right), (a_p) \in \mathcal{K}_{\mathcal{S}} \right\}.$$

Then it is easy to see that $(G_{\mathcal{S}}^1, G_{\mathcal{S}}^2)$ is a matched pair. A direct computation gives, for $(a_p), (b_p) \in \mathcal{K}_{\mathcal{S}}$,

$$\alpha_{(a_p, 0)} \left(b_p, \frac{1-b_p}{p} \right) = \left(a_p(b_p - 1) + 1, \frac{a_p(1-b_p)}{p} \right) \quad \text{and,}$$

$$\beta_{\left(b_p, \frac{1-b_p}{p} \right)} (a_p, 0) = \left(\frac{a_p b_p}{a_p(b_p - 1) + 1}, 0 \right).$$

We can construct the bicrossed product l.c. quantum group $(L_{\mathcal{S}}, \Delta_{\mathcal{S}})$ having the following property.

Proposition 16 *For any infinite subset \mathcal{S} of \mathcal{P} , the l.c. quantum group $(L_{\mathcal{S}}, \Delta_{\mathcal{S}})$ is self-dual and*

$$L_{\mathcal{S}} \simeq N_{\mathcal{S}} \otimes \mathcal{R}.$$

PROOF. Define the isomorphism $u : G_{\mathcal{S}}^1 \rightarrow G_{\mathcal{S}}^1$ by

$$u(a_p, 0) = \left(a_p^{-1}, \frac{1-a_p^{-1}}{p} \right),$$

one verifies that

$$u \left(\beta_{\left(b_p, \frac{1-b_p}{p} \right)} (a_p, 0) \right) = \alpha_{u^{-1} \left(b_p, \frac{1-b_p}{p} \right)} (u(a_p, 0)).$$

Hence, interchanging α and β , we get an isomorphic matched pair and so an isomorphic l.c. quantum group. To obtain the isomorphism, recall that $G_S^1 \rtimes L^\infty(G_S^2) \simeq G_S^1 \rtimes L^\infty(G_S/G_S^1)$, and because $G_S^1 = \mathcal{K}_S \times \{0\}$, it is easy to see that $G_S^1 \rtimes L^\infty(G_S^2) \simeq \mathcal{K}_S \rtimes L^\infty(\mathcal{A}_S)$. Next, using Lemma 6 we obtain

$$L_S \simeq \bigotimes_{p \in \mathcal{S}} \left(\mathbb{Q}_p^* \rtimes L^\infty(\mathbb{Q}_p), L^2(\mathbb{Q}_p^* \times \mathbb{Q}_p, \mu_p \times \mu_p^+), \xi(1 + p\mathbb{Z}_p, \mathbb{Z}_p) \right).$$

This implies, using Lemma 12 with $(K, L, \mu, \nu) = (1 + p\mathbb{Z}_p, \mathbb{Z}_p, \mu_p, \mu_p^+)$ and Proposition 3, the following isomorphism

$$L_S \simeq \bigotimes_{p \in \mathcal{S}} \left(\mathcal{B}(l^2(\mathbb{N})) \otimes M_{p-1}(\mathbb{C}), \omega_p \otimes \tau_p \right),$$

where τ_p is the normalized trace of the matrix algebra $M_{p-1}(\mathbb{C})$. \square

Acknowledgements

I would like to thank Prof. S. Vaes for suggesting the subject of the paper and for many comments and Prof. F. Boca for helpful discussions. I am also grateful to Prof. L. Vainerman for many helpful discussions and comments.
