HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

# REPRESENTATION THEORY OF MANTACI-REUTENAUER ALGEBRAS 

C. BONNAFÉ

#### Abstract

We study some aspects of the representation theory of Mantaci-Reutenauer algebras: Cartan matrix, Loewy length, modular representations.

Let $W_{n}$ be a Coxeter group of type $B_{n}$ (i.e. the group of permutations $\sigma$ of $I_{n}=$ $\{ \pm 1, \ldots, \pm n\}$ such that $\sigma(-i)=-\sigma(i)$ for every $\left.i \in I_{n}\right)$ and let $R$ be a commutative ring. Mantaci and Reutenauer [MR] have defined a subalgebra $R \Sigma^{\prime}\left(W_{n}\right)$ of the group algebra $R W_{n}$ which contains both the Solomon descent algebra of the symmetric group $\mathfrak{S}_{n}$ and the one of $W_{n}$. In $[\mathrm{BH}]$, the authors have provided another construction of the MantaciReutenauer algebra $R \Sigma^{\prime}\left(W_{n}\right)$ which relies more on the structure of $W_{n}$ as a Coxeter group. As a consequence of their work, they were able to generalize to this algebra the classical results of Solomon on the Solomon descent algebra (construction of a morphism to the character ring of $W_{n}$, description of the radical whenever $R$ is a field of characteristic $0 \ldots)$. For instance, the description of the simple $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$-modules was obtained in $[\mathrm{BH}$, Proposition 3.11]: they are all of dimension 1.

In this paper, we study the representation theory of $K \Sigma^{\prime}\left(W_{n}\right)$ whenever $R=K$ is a field of any characteristic: simple modules, radical, projective modules, Cartan matrix... We also define some morphisms between different Mantaci-Reutenauer algebras. Let us gather here some of the main results obtained all along the text:

Theorem. Let $p$ denote the characteristic of $K$. Then:
(a) There exists a natural morphism of algebras $K \Sigma^{\prime}\left(W_{n}\right) \rightarrow K \Sigma^{\prime}\left(W_{n-1}\right)$; it is surjective if $p=0$.
(b) If $p \neq 2$, then the Loewy length of $K \Sigma^{\prime}\left(W_{n}\right)$ is $n$. If $p=2$, then this Loewy length lies in $\{n, n+1, \ldots, 2 n-1\}$.
(c) If $p$ does not divide $\left|W_{n}\right|$ (i.e. is $p=0$ or $p>\max (2, n)$ ), then the Cartan matrix of $K \Sigma^{\prime}\left(W_{n}\right)$ is unitriangular.
(d) If $p$ does not divide the order of $W_{n}$, then the Cartan matrix of $K \Sigma^{\prime}\left(W_{n}\right)$ is a submatrix of the Cartan matrix of $K \Sigma^{\prime}\left(W_{n+1}\right)$.

[^0]Note that, in the statement (a), we expect that the homomorphism is surjective even if $p>0$, but we are unable to prove it. In the statement (b), we expect that the Loewy length of $\mathbb{F}_{2} \Sigma^{\prime}\left(W_{n}\right)$ is equal to $2 n-1$ whenever $n \geqslant 2$.

The paper is organized as follows. In the first section, we gather (and sometimes improve, or make more precise) some of the principal results of $[\mathrm{BH}]$. In the second section, we study some particular families of left, right and two-sided ideals of $R \Sigma^{\prime}\left(W_{n}\right)$. In the third section, we introduce a class of positive elements of $K \Sigma^{\prime}\left(W_{n}\right)$ (whenever $K$ is an ordered field) and study the ideals they generate (and also some other properties: centralizer, minimal polynomial). In the fourth section, we study the action of the longest element $w_{n}$ of $W_{n}$ on simple modules and on $K \Sigma^{\prime}\left(W_{n}\right)$ : since $w_{n}$ is central (and is an element of $K \Sigma^{\prime}\left(W_{n}\right)$ ), this provides a first decomposition of the Mantaci-Reutenauer algebra (at least when $K$ is not of characteristic 2: we also give a basis of $K \Sigma^{\prime}\left(W_{n}\right)$ consisting of eigenvectors for the action of $w_{n}$ by left multiplication). In the fifth section, we define some morphisms between Mantaci-Reutenauer algebras and prove the statement (a) of the Theorem above. In the sixth section, we study the simple modules and compute explicitly the radical of $K \Sigma^{\prime}\left(W_{n}\right)$ (this is done in any characteristic). Section 7 is devoted to the computation of the Loewy length of $K \Sigma^{\prime}\left(W_{n}\right)$, that is to the proof of the statement (b) of the above Theorem. We also obtain the Loewy length of the algebra $K \operatorname{Irr} W_{n}$ in any characteristic. The section 8 is concerned with the projective modules and the Cartan matrix of $K \Sigma^{\prime}\left(W_{n}\right)$ : the statement (c) and (d) of the above Theorem are proved. We also obtain some results about the structure of $K W_{n}$ as a $K \Sigma^{\prime}\left(W_{n}\right)$-module. We give in section 9 some numerical results (character tables, primitive idempotents and the Cartan matrices for small values of $n$ ). In the final section, we address some questions that are raised by the present work.

Most of this work is largely inspired by works of several authors on Solomon descent algebras (see for instance [A], [BBHT], [APVW], [BP]...). Sections 2, 3, 4, 5 are analogous to $[\mathrm{BP}, \S 2,3,4]$ (for $\S 5$, see also $[\mathrm{A}]$ and $[\mathrm{BBHT}]$ ). Sections 6 and 8 are inspired by [APVW]). Section 7 is the analogue of [BP, §5]. The question 6 in section 10 has been suggested by a similar question of G. Pfeiffer on Solomon descent algebras.

## 1. Notation, preliminaries

1.A. General notation. All along this paper, $R$ will denote a fixed commutative ring and $K$ a fixed field. If $G$ is a finite group, the group algebra of $G$ over $R$ is denoted by $R G$ and the set of irreducible characters of $G$ over $\mathbb{C}$ is denoted by $\operatorname{Irr} G$. We denote by $R \operatorname{Irr} G$ the ring of formal $R$-linear combinations of irreducible characters of $G$ (with multiplication given by tensor product). In particular, $\mathbb{Z} \operatorname{Irr} G$ can be identified with the Grothendieck ring of the category of finite dimensional $\mathbb{C} G$-module (which is usually called the character ring of $G$ ) and $R \operatorname{Irr} G=R \otimes_{\mathbb{Z}} \mathbb{Z} \operatorname{Irr} G$. If $A$ is a finite dimensional $K$-algebra, we denote by $\operatorname{Rad} A$ its radical.
1.B. Weyl group of type $\boldsymbol{B}_{\boldsymbol{n}}$. If $n \geqslant 1$, we denote by $\left(W_{n}, S_{n}\right)$ a Weyl group of type $B_{n}$ : write $S_{n}=\left\{t, s_{1}, s_{2}, \ldots, s_{n-1}\right\}$ in such a way that the Dynkin diagram of $W_{n}$ is

Let $S_{-n}=\left\{s_{1}, s_{2}, \ldots, s_{n-1}\right\}$ and $W_{-n}=<S_{-n}>$. Note that $W_{-n} \simeq \mathfrak{S}_{n}$. We denote by $\ell: W_{n} \rightarrow \mathbb{N}$ the length function attached to $S_{n}$.

Let $I_{n}=\{ \pm 1, \pm 2, \ldots, \pm n\}$. We identify $W_{n}$ with the group of permutations $\sigma$ of $I_{n}$ such that $\sigma(-i)=-\sigma(i)$ for every $i \in I_{n}$. The identification is as follows: $t$ corresponds to the transposition $(1,-1)$ while $s_{i}$ corresponds to $(i, i+1)(-i,-i-1)$. Let $t_{1}=t$ and, if $1 \leqslant i \leqslant n-1$, let $t_{i+1}=s_{i} t_{i} s_{i}$. As a permutation of $I_{n}, t_{i}$ is equal to $(i,-i)$. Now, we set $T_{n}=\left\{t_{1}, \ldots, t_{n}\right\}$ and $S_{n}^{\prime}=S_{n} \cup T_{n}$. Then the reflection subgroup $\mathfrak{T}_{n}$ generated by $T_{n}$ is naturally identified with $(\mathbb{Z} / 2 \mathbb{Z})^{n}$. Therefore $W_{n}=W_{-n} \ltimes \mathfrak{T}_{n}$ is, abstractly, the wreath product of $\mathfrak{S}_{n}$ by $\mathbb{Z} / 2 \mathbb{Z}$.

Let $\left(e_{1}, \ldots, e_{n}\right)$ denote the canonical basis of the euclidean $\mathbb{R}$-vector space $\mathbb{R}^{n}$. If $\alpha \in \mathbb{R}^{n}$, we denote by $s_{\alpha}$ the orthogonal reflection such that $s_{\alpha}(\alpha)=-\alpha$. Let

$$
\Phi_{n}=\left\{ \pm 2 e_{i} \mid 1 \leqslant i \leqslant n\right\} \cup\left\{ \pm e_{i} \pm e_{j} \mid 1 \leqslant i<j \leqslant n\right\}
$$

Then $\Phi_{n}$ is a root system and $W_{n}$ can be also identified with the Weyl group of $\Phi_{n}$ : through this identification, we have $t_{i}=s_{2 e_{i}}$ and $s_{i}=s_{e_{i+1}-e_{i}}$. Let

$$
\Delta_{n}=\left\{2 e_{1}, e_{2}-e_{1}, e_{3}-e_{2}, \ldots, e_{n}-e_{n-1}\right\}
$$

Then $\Delta_{n}$ is a basis of $\Phi_{n}$ and we denote by $\Phi_{n}^{+}$the set of roots which are linear combinations with non-negative coefficients of roots in $\Delta_{n}$. If $\alpha \in \Phi_{n}$, we write $\alpha>0$ if $\alpha \in \Phi_{n}^{+}$and $\alpha<0$ otherwise.
1.C. Signed compositions, bipartitions. A signed composition is a finite sequence $C=\left(c_{1}, \ldots, c_{r}\right)$ of non-zero elements of $\mathbb{Z}$. The number $r$ is called the length of $C$ and will be denoted by $\lg (C)$. We denote by $\lg ^{+}(C)$ (respectively $\lg ^{-}(C)$ ) the number of positive (respectively negative) parts of $C$. In particular, $\lg (C)=\lg ^{+}(C)+\lg ^{-}(C)$. We set $|C|=\sum_{i=1}^{r}\left|c_{i}\right|$. If $|C|=n$, we say that $C$ is a signed composition of $n$ and we write $C \Vdash n$. We also define $C^{+}=\left(\left|c_{1}\right|, \ldots,\left|c_{r}\right|\right) \| n$ and $C^{-}=-C^{+}$. We denote by $\operatorname{Comp}(n)$ the set of signed compositions of $n$. In particular, any composition is a signed composition (any part is positive). Note that

$$
\begin{equation*}
|\operatorname{Comp}(n)|=2.3^{n-1} \tag{1.1}
\end{equation*}
$$

If $C=\left(c_{1}, \ldots, c_{r}\right)$ and $D=\left(d_{1}, \ldots, d_{s}\right)$ are signed compositions of $m$ and $n$ respectively, we denote by $C \sqcup D$ the signed composition $\left(c_{1}, \ldots, c_{r}, d_{1}, \ldots, d_{s}\right)$ of $m+n$.

A bipartition of $n$ is a pair $\lambda=\left(\lambda^{+}, \lambda^{-}\right)$of partitions such that $|\lambda|:=\left|\lambda^{+}\right|+\left|\lambda^{-}\right|=n$. We set $\lg ^{+}(\lambda)=\lg \left(\lambda^{+}\right), \lg ^{-}(\lambda)=\lg \left(\lambda^{-}\right)$and $\lg (\lambda)=\lg \left(\lambda^{+}\right)+\lg \left(\lambda^{-}\right)$. We write $\lambda \Vdash n$ to say that $\lambda$ is a bipartition of $n$, and the set of bipartitions of $n$ is denoted by $\operatorname{Bip}(n)$. We define $\hat{\lambda}$ as the signed composition of $n$ obtained by concatenation of $\lambda^{+}$and $-\lambda^{-}$. In other words, $\hat{\lambda}=\lambda^{+} \sqcup-\lambda^{-}$. The map $\operatorname{Bip}(n) \rightarrow \operatorname{Comp}(n), \lambda \mapsto \hat{\lambda}$ is injective.

Now, let $C$ be a signed composition of $n$. We define $\boldsymbol{\lambda}(C)=\left(\lambda^{+}, \lambda^{-}\right)$as the bipartition of $n$ such that $\lambda^{+}$(resp. $\lambda^{-}$) is obtained from $C$ by reordering if necessary the positive parts of $C$ (resp. the absolute value of the negative parts of $C$ ). Note that $\lg (\boldsymbol{\lambda}(C))=\lg (C)$, $\lg ^{+}(\boldsymbol{\lambda}(C))=\lg ^{+}(C)$ and $\lg ^{-}(\boldsymbol{\lambda}(C))=\lg ^{-}(C)$. One can easily check that the map

$$
\boldsymbol{\lambda}: \operatorname{Comp}(n) \longrightarrow \operatorname{Bip}(n)
$$

is surjective (indeed, if $\lambda \in \operatorname{Bip}(n)$, then $\boldsymbol{\lambda}(\hat{\lambda})=\lambda$ ).
1.D. $\boldsymbol{A}$ class of reflection subgroups of $\boldsymbol{W}_{\boldsymbol{n}}$. Now, to each $C=\left(c_{1}, \ldots, c_{r}\right) \Vdash n$, we associate a reflection subgroup $W_{C}$ of $W_{n}$ which is isomorphic to $W_{c_{1}} \times \ldots \times W_{c_{r}}$. We proceed as follows: for $1 \leq i \leq r$, set

$$
I_{C}^{(i)}= \begin{cases}I_{C,+}^{(i)} & \text { if } c_{i}<0 \\ I_{C,+}^{(i)} \cup-I_{C,+}^{(i)} & \text { if } c_{i}>0\end{cases}
$$

where $I_{C,+}^{(i)}$ is the set of natural numbers $k$ such that $\left|c_{1}\right|+\cdots+\left|c_{i-1}\right|+1 \leqslant k \leqslant\left|c_{1}\right|+\cdots+\left|c_{i}\right|$. Then

$$
W_{C}=\left\{w \in W_{n} \mid \forall 1 \leqslant i \leqslant r, w\left(I_{C}^{(i)}\right)=I_{C}^{(i)}\right\}
$$

is a reflection subgroup generated by

$$
S_{C}=\left(S_{-n} \cap W_{C}\right) \cup\left\{t_{\left|c_{1}\right|+\cdots+\left|c_{j-1}\right|+1} \in T_{n} \mid c_{j}>0\right\} \quad \subset S_{n}^{\prime}
$$

Note that $\left(W_{C}, S_{C}\right)$ is a Coxeter group. Moreover, $W_{C} \simeq W_{c_{1}} \times \cdots \times W_{c_{r}}$. Let $T_{C}=$ $T_{n} \cap W_{C}$. Then $\left.W_{C}=\mathfrak{S}_{C^{+}} \ltimes<T_{C}\right\rangle$, where $\mathfrak{S}_{C^{+}}=W_{C^{-}}$.

Now let $\Phi_{C}=\left\{\alpha \in \Phi_{n} \mid s_{\alpha} \in W_{C}\right\}$. Then $\Phi_{C}$ is a root system and $W_{C}$ is naturally identified with the Weyl group of $\Phi_{C}$. Let $\Phi_{C}^{+}=\Phi_{C} \cap \Phi_{n}^{+}$and $\Delta_{C}=\left\{\alpha \in \Phi_{C}^{+} \mid s_{\alpha} \in S_{C}\right\}$. Then $\Delta_{C}$ is a basis of $\Phi_{C}$, and $\Phi_{C}^{+}$is a positive root system of $\Phi_{C}$.

If $C, D \| n$, then we write $C \subset D$ if $W_{C} \subset W_{D}$. This defines an order $\subset$ on $\operatorname{Comp}(n)$.
Remark 1.2 - If $C \subset D$, then $\lg (C) \geqslant \lg (D)$ and $\lg ^{-}(C) \geqslant \lg ^{-}(D)$. If $C \subset D, \lg (C)=$ $\lg (D)$ and $\lg ^{-}(C)=\lg ^{-}(D)$, then $C=D$.

Example - It might happen that $C \subset D$ and $\lg ^{+}(C)<\lg ^{+}(D)$. For example, take $C=(-n)$ and $D=(n)$.
1.E. Conjugacy classes. If $C \Vdash n$, we denote by $\operatorname{cox}_{C}$ a Coxeter element of $\left(W_{C}, S_{C}\right)$. If $C, C^{\prime} \subset D$ and if $W_{C}$ and $W_{C^{\prime}}$ are conjugate under $W_{D}$, then we write $C \equiv{ }_{D} C^{\prime}$. Note that $\operatorname{cox}_{C}$ and $\operatorname{cox}_{C^{\prime}}$ are conjugate in $W_{D}$ if and only if $C \equiv{ }_{D} C^{\prime}$. Moreover, every element of $W_{D}$ is $W_{D}$-conjugate to $\operatorname{cox}_{C}$ for some $C \subset D$. If $D=(n)$, we write $\equiv$ instead of $\equiv_{D}$. We recall the following easy proposition:

Proposition A. Let $C, D \Vdash n$. Then $W_{C}$ and $W_{D}$ are conjugate in $W_{n}$ if and only if $\boldsymbol{\lambda}(C)=\boldsymbol{\lambda}(D)$.

If $w \in W_{n}$, we denote by $\boldsymbol{\Lambda}(w)$ the unique bipartition $\lambda$ of $n$ such that $w$ is conjugate to $\operatorname{cox}_{C}$ for some (every) $C \in \boldsymbol{\lambda}^{-1}(\lambda)$. The map

$$
\boldsymbol{\Lambda}: W_{n} \longrightarrow \operatorname{Bip}(n)
$$

is well-defined, surjective and its fibers are precisely the conjugacy classes of $W_{n}$ : if $\lambda \in$ $\operatorname{Bip}(n)$, we set $\mathcal{C}(\lambda)=\boldsymbol{\Lambda}^{-1}(\lambda)$ and we fix an element $\operatorname{cox}_{\lambda} \in \mathcal{C}(\lambda)$ (if $C \in \operatorname{Comp}(n), \operatorname{cox}_{\boldsymbol{\lambda}(C)}$ is conjugate to $\left.\operatorname{cox}_{C}\right)$. We denote by $o(\lambda)$ the order of an element of $\mathcal{C}(\lambda)$ : if $\lambda=\left(\lambda^{+}, \lambda^{-}\right)$ where $\lambda^{+}=\left(\lambda_{1}^{+}, \ldots, \lambda_{k}^{+}\right)$and $\lambda^{-}=\left(\lambda_{1}^{-}, \ldots, \lambda_{l}^{-}\right)$, then $o(\lambda)$ is the least common multiple of $\left\{2 \lambda_{1}^{+}, \ldots, 2 \lambda_{k}^{+}, \lambda_{1}^{-}, \ldots, \lambda_{l}^{-}\right\}$.
1.F. Mantaci-Reutenauer algebra. Let $C \vDash n$, then

$$
X_{C}=\left\{x \in W_{n} \mid \forall w \in W_{C}, \ell(x w) \geqslant \ell(x)\right\}
$$

is a distinguished set of minimal coset representatives for $W_{n} / W_{C}$ (see [ BH , Proposition 2.8 (a)]). It is readily seen that

$$
\begin{aligned}
X_{C} & =\left\{w \in W_{n} \mid \forall s \in S_{C}, \ell(w s)>\ell(w)\right\} \\
& =\left\{w \in W_{n} \mid \forall \alpha \in \Phi_{C}^{+}, w(\alpha)>0\right\} \\
& =\left\{w \in W_{n} \mid \forall \alpha \in \Delta_{C}, w(\alpha)>0\right\} .
\end{aligned}
$$

Now, we set

$$
x_{C}=\sum_{w \in X_{C}} w \quad \in R W_{n}
$$

(Recall that $R$ is a fixed commutative ring.) By $[\mathrm{BH}, \S 3.1]$, the family $\left(x_{C}\right)_{C \in \operatorname{Comp}(n)}$ is free over $R$. Let

$$
R \Sigma^{\prime}\left(W_{n}\right)=\underset{C \in \operatorname{Comp}(n)}{\oplus} R x_{C} \quad \subset R W_{n}
$$

For simplification, we set $\Sigma^{\prime}\left(W_{n}\right)=\mathbb{Z} \Sigma^{\prime}\left(W_{n}\right)$, so that $R \Sigma^{\prime}\left(W_{n}\right)=R \otimes_{\mathbb{Z}} \Sigma^{\prime}\left(W_{n}\right)$.
Remark - The algebra $R \Sigma^{\prime}\left(W_{n}\right)$ is nothing else but the algebra constructed by Mantaci and Reutenauer [MR] by combinatorial methods (see [BH, Remark of Subsection 3.1] for the identification).

Let $\left(\xi_{C}\right)_{C \in \operatorname{Comp}(n)}$ denote the basis $\operatorname{Hom}_{R}\left(R \Sigma^{\prime}\left(W_{n}\right), R\right)$ dual to $\left(x_{C}\right)_{C \in \operatorname{Comp}(n)}$. In other words, we have, for every $x \in R \Sigma^{\prime}\left(W_{n}\right)$,

$$
x=\sum_{C \in \operatorname{Comp}(n)} \xi_{C}(x) x_{C}
$$

We now define

$$
\theta_{n}^{R}: R \Sigma^{\prime}\left(W_{n}\right) \longrightarrow R \operatorname{Irr} W_{n}
$$

as the unique $R$-linear map such that

$$
\theta_{n}^{R}\left(x_{C}\right)=\operatorname{Ind}_{W_{C}}^{W_{n}} 1_{C}
$$

for every $C \in \operatorname{Comp}(n)$. Here, $1_{C}$ is the trivial character of $W_{C}$. We denote by $\varepsilon_{C}$ the sign character of $W_{C}$. We can now recall the following result.

## Theorem B [BH, Theorem 3.7].

(a) $R \Sigma^{\prime}\left(W_{n}\right)$ is a unitary sub-R-algebra of $R W_{n}$.
(b) $\theta_{n}^{R}: R \Sigma^{\prime}\left(W_{n}\right) \rightarrow R \operatorname{Irr} W_{n}$ is a morphism of $R$-algebras.
(c) $\theta_{n}^{R}$ is surjective and $\operatorname{Ker} \theta_{n}^{R}=\sum_{C \equiv D} R\left(x_{C}-x_{D}\right)$.
(d) If $K$ is a field of characteristic 0 , then $\operatorname{Ker} \theta_{n}^{K}$ is the radical of the $K$-algebra $K \Sigma^{\prime}\left(W_{n}\right)$.

Let $\mathrm{Comp}^{+}(n)$ be the set of compositions of $n$. A signed composition $C=\left(c_{1}, \ldots, c_{r}\right)$ is called semi-positive (resp. parabolic) if $c_{i} \geqslant-1$ (resp. $c_{i}<0$ ) for every $i \geqslant 1$ (resp. for every $i \geqslant 2$ ). Note that $C$ is parabolic if and only if $W_{C}$ is a standard parabolic subgroup of $W$ (i.e. if and only if $S_{C} \subset S_{n}$ ). We denote by $\operatorname{Comp}_{\mathrm{par}}(n)$ the set of parabolic compositions of $n$. Let
and

$$
\begin{aligned}
& R \Sigma\left(W_{n}\right)=\underset{C \in \operatorname{Comp}_{\mathrm{par}}(n)}{\oplus} R x_{C} \\
& R \Sigma\left(\mathfrak{S}_{n}\right)=\underset{C \in \operatorname{Comp}^{+}(n)}{\oplus} R x_{C}
\end{aligned}
$$

Then $R \Sigma\left(W_{n}\right)$ and $R \Sigma\left(\mathfrak{S}_{n}\right)$ are sub- $R$-algebras of $R \Sigma^{\prime}\left(W_{n}\right)$ : $R \Sigma\left(W_{n}\right)$ is the Solomon descent algebra of $W_{n}$ (see $[\mathrm{S}]$ for the definition of Solomon descent algebras of finite Coxeter groups) and it is easy to check $[\mathrm{BH}, \S 3.2]$ that $R \Sigma\left(\mathfrak{S}_{n}\right)$ is the Solomon descent algebra of $\mathfrak{S}_{n}=W_{-n}$.

The restriction of $\theta_{n}^{R}$ to $R \Sigma\left(W_{n}\right)$ is equal to the classical Solomon homomorphism. On the other hand, the canonical surjective morphism $W_{n} \rightarrow \mathfrak{S}_{n}$ induces an injective morphism of algebras $R \operatorname{Irr} \mathfrak{S}_{n} \hookrightarrow R \operatorname{Irr} W_{n}$. We view $R \operatorname{Irr} \mathfrak{S}_{n}$ naturally as a subalgebra of $R \operatorname{Irr} W_{n}$ through this morphism. Then the image, through $\theta_{n}^{R}$, of an element of $R \Sigma\left(\mathfrak{S}_{n}\right)$ belongs to $R \operatorname{Irr} \mathfrak{S}_{n}$. Also, the restriction of $\theta_{n}^{R}$ to a morphism (still denoted by $\theta_{n}^{R}$ ) of algebras $R \Sigma\left(\mathfrak{S}_{n}\right) \rightarrow R \operatorname{Irr} \mathfrak{S}_{n}$ is again equal to the classical Solomon homomorphism. By construction, the diagram

is commutative [BH, Diagram 3.4].
1.G. On the multiplication in $\boldsymbol{R} \boldsymbol{\Sigma}^{\prime}\left(\boldsymbol{W}_{\boldsymbol{n}}\right)$. By Theorem B, $R \Sigma^{\prime}\left(W_{n}\right)$ is a sub- $R$-algebra of $R W_{n}$ and $\theta_{n}^{R}$ is a morphism of algebras. However, the multiplication in $R \Sigma^{\prime}\left(W_{n}\right)$ is not described. In fact, it turns out that its description is much more complicated than the multiplication in the Solomon descent algebra. Theoretically, it is possible to extract from the proof of [ BH , Theorem 3.7] an inductive process for this multiplication. We shall not do it here. We shall just give some easy consequences of this inductive process.

First, if $\mathcal{F}$ is a subset of $\operatorname{Comp}(n)$, we set

$$
R \Sigma_{\mathcal{F}}^{\prime}\left(W_{n}\right)=\underset{C \in \mathcal{F}}{\oplus} R x_{C} .
$$

For instance, $R \Sigma\left(W_{n}\right)=R \Sigma_{\operatorname{Comp}_{\text {par }}(n)}^{\prime}\left(W_{n}\right)$ and $R \Sigma\left(\mathfrak{S}_{n}\right)=R \Sigma_{\operatorname{Comp}^{+}(n)}^{\prime}\left(W_{n}\right)$.
We shall now describe an order $\preccurlyeq$ on $\operatorname{Comp}(n)$ which is finer than $\subset$. Let $C$ and $D$ be two signed composition of $n$. We write $C \preccurlyeq D$ if one of the following two conditions is satisfied:
(1) $C \subset D$.
(2) $C \subset D^{+}$and $\lg (C)>\lg (D)$ and $\lg ^{-}(C) \geqslant \lg ^{-}(D)$.

One can easily check that it defines an order $\preccurlyeq$ on $\operatorname{Comp}(n)$ (see Remark 1.2). We set

$$
\mathcal{F}_{\prec D}=\{C \in \operatorname{Comp}(n) \mid C \prec D\}
$$

and

$$
\mathcal{F}_{\preccurlyeq D}=\{C \in \operatorname{Comp}(n) \mid C \preccurlyeq D\} .
$$

For simplification, we set

$$
R \Sigma_{\prec D}^{\prime}\left(W_{n}\right)=R \Sigma_{\mathcal{F}_{\prec D}}^{\prime}\left(W_{n}\right) \text { and } R \Sigma_{\preccurlyeq D}^{\prime}\left(W_{n}\right)=R \Sigma_{\mathcal{F}}^{\prime}{ }_{\preccurlyeq D}\left(W_{n}\right) .
$$

Remark 1.4 - If $C \preccurlyeq D$, then $C^{+} \subset D^{+}, \lg (C) \geqslant \lg (D)$ and $\lg ^{-}(C) \geqslant \lg ^{-}(D)$.
We shall now describe a preorder $\subset_{\boldsymbol{\lambda}}$ on $\operatorname{Comp}(n)$. First, note that the order $\subset$ on $\operatorname{Comp}(n)$ induces an order on $\operatorname{Bip}(n)$ which we still denote by $\subset$. If $C$ and $D$ are two signed compositions of $n$, we then write $C \subset_{\boldsymbol{\lambda}} D$ if $\boldsymbol{\lambda}(C) \subset \boldsymbol{\lambda}(D)$. In other words, $C \subset_{\boldsymbol{\lambda}} D$ if and only if $W_{C}$ is contained in some conjugate of $W_{D}$. We write $C \not{ }_{\boldsymbol{\lambda}} D$ if $\boldsymbol{\lambda}(C) \nsubseteq \boldsymbol{\lambda}(D)$. Similarly as above, we set
and

$$
\mathcal{F}_{\mp_{\boldsymbol{\lambda}} D}=\left\{C \in \operatorname{Comp}(n) \mid C \not 千_{\boldsymbol{\lambda}} D\right\}
$$

For simplification, we set

$$
R \Sigma_{\not{ }_{\nexists D} D}^{\prime}\left(W_{n}\right)=R \Sigma_{\mathcal{F}_{\Xi_{\lambda} D}}^{\prime}\left(W_{n}\right) \quad \text { and } \quad R \Sigma_{C_{\lambda} D}^{\prime}\left(W_{n}\right)=R \Sigma_{\mathcal{F}_{C_{\lambda} D}}^{\prime}\left(W_{n}\right)
$$

Remark 1.5 - It is easily checked that $\subset_{\boldsymbol{\lambda}}$ is a preorder on $\operatorname{Comp}(n)$ and that the equivalence relation associated to the preorder $\subset_{\boldsymbol{\lambda}}$ is exactly the relation $\equiv$.

We now recall some notation from [BH, Proposition 2.13]. If $C$ and $D$ are two signed compositions of $n$, we set

$$
X_{C D}=X_{C}^{-1} \cap X_{D}
$$

Moreover, if $d \in X_{C D}$, we denote by $C \cap^{d} D$ the unique signed composition of $n$ such that $W_{C} \cap{ }^{d} W_{D}=W_{C \cap^{d} D}$. If $C, C^{\prime} \subset D$, we set $X_{C}^{D}=X_{C} \cap W_{D}, x_{C}^{D}=\sum_{w \in X_{C}^{D}} w \in R W_{D}$, $X_{C C^{\prime}}^{D}=X_{C C^{\prime}} \cap W_{D}, R \Sigma^{\prime}\left(W_{D}\right)=\oplus_{C \subset D} R x_{C}^{D}$ and we define $\theta_{D}^{R}: R \Sigma^{\prime}\left(W_{D}\right) \rightarrow R \operatorname{Irr} W_{D}$, $x_{C}^{D} \mapsto \operatorname{Ind}_{W_{C}}^{W_{D}} 1_{C}$. Then $R \Sigma^{\prime}\left(W_{D}\right)$ is a sub- $R$-algebra of $R W_{D}$ and $\theta_{D}^{R}$ is a surjective morphism of algebras. Moreover, if $D=\left(d_{1}, \ldots, d_{r}\right)$, then

$$
R \Sigma^{\prime}\left(W_{D}\right) \simeq R \Sigma^{\prime}\left(W_{d_{1}}\right) \otimes_{R} \cdots \otimes_{R} R \Sigma^{\prime}\left(W_{d_{r}}\right)
$$

where $\Sigma^{\prime}\left(W_{d}\right)=\Sigma\left(\mathfrak{S}_{-d}\right)$ if $d<0$.
Proposition C (see [BH, Proof of Theorem 3.7]). Let $C$ and $D$ be two signed compositions of $n$. Then
(a) There is a map $f_{C D}: X_{C D} \rightarrow \operatorname{Comp}(n)$ such that:
(1) For every $d \in X_{C D}, f_{C D}(d) \subset D$ and $f_{C D}(d) \equiv_{D}{ }^{d^{-1}} C \cap D$.
(2) $x_{C} x_{D}-\sum_{d \in X_{C D}} x_{f_{C D}(d)} \in R \Sigma_{\not{ }_{\lambda} C}^{\prime}\left(W_{n}\right) \cap R \Sigma_{\langle D}^{\prime}\left(W_{n}\right) \cap \operatorname{Ker} \theta_{n}^{R}$.
(b) If $C$ is parabolic or if $D$ is semi-positive, then $f_{C D}(d)={ }^{d^{-1}} C \cap D$ for every $d \in X_{C D}$ and $x_{C} x_{D}=\sum_{d \in X_{C D}} x_{d^{-1} C \cap D}$.

Proof. In fact, (b) is proved in [BH, Example 3.2]. Let us now prove (a). We first need an easy lemma about double cosets representatives:

Lemma 1.6. Let $C, D$ and $D^{\prime}$ be three signed compositions of $n$ such that $D \subset D^{\prime}$. Let $\mathcal{E}=\left\{(d, e) \mid d \in X_{C D^{\prime}}\right.$ and $\left.e \in X_{\left(d^{-1} C \cap D^{\prime}\right), D}^{D^{\prime}}\right\}$. Let $f: \mathcal{E} \rightarrow X_{C D}$ be the map defined by de $\in W_{C} f(d, e) W_{D}$. Then $f$ is bijective and $W_{f(d, e)^{-1} C \cap D}$ is conjugate, inside $W_{D}$, to ${ }^{(d e)^{-1}} W_{C} \cap W_{D}$.

Now, by arguing by induction on $n$ as in [BH, Proof of Theorem 3.7] and by using Lemma 1.6, we are reduced to the case where $C=(k, l)$ with $k, l \geqslant 1$ and $k+l=n$ and $D=(-n)$. Then this follows from [BH, Example 2.25].
1.H. Some morphisms of algebras $\boldsymbol{R} \boldsymbol{\Sigma}^{\prime}\left(\boldsymbol{W}_{\boldsymbol{n}}\right) \rightarrow \boldsymbol{R}$. If $\lambda \in \operatorname{Bip}(n)$, let $\pi_{\lambda}: \Sigma^{\prime}\left(W_{n}\right) \rightarrow$ $\mathbb{Z}, x \mapsto \theta_{n}(x)\left(\operatorname{cox}_{\lambda}\right)$. Recall that $\theta_{n}(x)$ is a $\mathbb{Z}$-linear combination of permutation characters, so $\theta_{n}(x)(w)$ lies in $\mathbb{Z}$. Moreover, $\pi_{\lambda}$ does not depend on the choice of $\operatorname{cox}_{\lambda}$ in $\mathcal{C}(\lambda)$, and is a morphism of $\mathbb{Z}$-algebras. We denote by $\pi_{\lambda}^{R}: R \Sigma^{\prime}\left(W_{n}\right) \rightarrow R$ the morphism of algebras $\operatorname{Id}_{R} \otimes_{\mathbb{Z}} \pi_{\lambda}$. We denote by $\mathcal{D}_{\lambda}^{R}$ the left $R \Sigma^{\prime}\left(W_{n}\right)$-module whose underlying $R$-module is free of rank one and on which $R \Sigma^{\prime}\left(W_{n}\right)$ acts through $\pi_{\lambda}^{R}$. If $K$ is a field, then $\mathcal{D}_{\lambda}^{K}$ is a simple $K \Sigma^{\prime}\left(W_{n}\right)$-module.

If $C$ and $D$ are two signed compositions of $n$, let $X_{C D}^{\subset}=\left\{d \in X_{C D} \mid{ }^{d^{-1}} W_{C} \subset W_{D}\right\}$. Then

$$
\begin{equation*}
\pi_{\boldsymbol{\lambda}(C)}\left(x_{D}\right)=\left|X_{C D}^{\subset}\right| \tag{1.7}
\end{equation*}
$$

Proof. By definition, we have

$$
\pi_{\boldsymbol{\lambda}(C)}\left(x_{D}\right)=\left(\operatorname{Ind}_{W_{D}}^{W_{n}} 1_{D}\right)\left(\operatorname{cox}_{C}\right)=\left(\operatorname{Res}_{W_{C}}^{W_{n}} \operatorname{Ind}_{W_{D}}^{W_{n}} 1_{D}\right)\left(\operatorname{cox}_{C}\right)
$$

Therefore, by the Mackey formula,

$$
\pi_{\boldsymbol{\lambda}(C)}\left(x_{D}\right)=\sum_{d \in X_{C D}}\left(\operatorname{Ind}_{W_{C \cap \cap_{D}}^{W_{C}}}^{W_{C \cap{ }^{d} D}}\right)\left(\operatorname{cox}_{C}\right)
$$

But, by the argument in the proof of [BH, proposition 3.12], we get that cox ${ }_{C}$ lies in a subgroup of $W_{C}$ conjugate to $W_{C \cap^{d} D}$ if and only if $C \cap^{d} D=C$. This shows the result.
1.I. Action of the normalizer. If $C$ and $D$ are two signed compositions of $n$, we set $X_{\overline{\bar{C}} D}=\left\{d \in X_{C D} \mid W_{C}={ }^{d} W_{D}\right\}$. Then

$$
\begin{equation*}
X_{\overline{\bar{C}} D}^{\overline{\overline{ }}}=\left\{d \in W_{n} \mid \Delta_{C}=d\left(\Delta_{D}\right)\right\} \tag{1.8}
\end{equation*}
$$

Proof. Let $\mathcal{X}=\left\{d \in W_{n} \mid \Delta_{C}=d\left(\Delta_{D}\right)\right\}$. Then it is clear that $\mathcal{X} \subset X_{\overline{\bar{C}}}{ }_{D}$. Conversely, if $d \in X_{\overline{\bar{C}}}{ }_{D}$, then $d\left(\Phi_{D}\right)=\Phi_{C}$. So $d\left(\Delta_{D}\right)$ is a basis of $\Phi_{C}$, hence there exists $w \in W_{C}$ such that $d\left(\Delta_{D}\right)=w\left(\Delta_{C}\right)$. So $d^{-1} w \in X_{C}$ and $d^{-1} \in X_{C}$. So $w=1$, as desired.

Remark 1.9 - If $D$ and $D^{\prime}$ are two signed compositions of $n$ and if $d \in X_{D D^{\prime}}$ is such that ${ }^{d} W_{D^{\prime}}=W_{D}$, then $d\left(\Delta_{D^{\prime}}\right)=\Delta_{D}$ by 1.8 and

$$
X_{D^{\prime}}=X_{D} d \quad \text { and } \quad x_{D^{\prime}}=x_{D} d .
$$

Moreover, for every $C \subset D^{\prime}$, we have $d x_{C}^{D^{\prime}} d^{-1}=x_{d_{C}}^{D}$ (here, note that $d \in X_{D C}$, and we denote for simplification ${ }^{d} C \cap D$ by ${ }^{d} C$ because ${ }^{d} W_{C} \cap W_{D}={ }^{d} W_{C}$ ). So conjugacy by $d$ induces a morphism of algebras $d_{*}: R \Sigma^{\prime}\left(W_{D^{\prime}}\right) \rightarrow R \Sigma^{\prime}\left(W_{D}\right)$.

If $C \equiv D$, then $X_{\overline{\bar{C}}}^{D}{ }_{D}=X_{C D}^{\subset}$. If $D \in \operatorname{Comp}(n)$, we define $\mathcal{W}(D)=X_{D D}^{\subset}$.
Lemma 1.10. Let $D$ be a signed compositions of $n$. Then:
(a) $\mathcal{W}(D)=\left\{w \in W_{n} \mid w\left(\Delta_{D}\right)=\Delta_{D}\right\}$.
(b) $\mathcal{W}(D)$ is a subgroup of $N_{W_{n}}\left(W_{D}\right)$.
(c) The natural map $\mathcal{W}(D) \rightarrow N_{W_{n}}\left(W_{D}\right) / W_{D}$ is an isomorphism of groups.
(d) $N_{W_{n}}\left(W_{D}\right)=\mathcal{W}(D) \ltimes W_{D}$.
(e) If $C \in \operatorname{Comp}(n)$, then $|\mathcal{W}(D)|$ divides $\left|X_{C D}^{C}\right|$.

Proof. (a), (b), (c) and (d) follow immediately from 1.8. Let us now prove (e). First, by 1.7, $\left|X_{C D}^{\subset}\right|$ is equal to the number of fixed points of $\operatorname{cox}_{C}$ in its action on $W_{n} / W_{D}$ by left multiplication. But $\mathcal{W}(D)$ acts on $W_{n} / W_{D}$ by right translation and this action commutes with the left action of $\operatorname{cox}_{C}$. Therefore, $\mathcal{W}(D)$ permutes the fixed points of $\operatorname{cox}_{C}$. Since $\mathcal{W}(D)$ acts freely on $W_{n} / W_{D}$, (e) follows.

## 2. On the ideals of $R \Sigma^{\prime}\left(W_{n}\right)$

This section is inspired by [BP, $\S 3 . \mathrm{A}]$. We shall define some families of left, right and two-sided ideals of $R \Sigma^{\prime}\left(W_{n}\right)$ related to the order $\preccurlyeq$ and the preorder $\subset_{\boldsymbol{\lambda}}$ defined in the previous section. We need the following definition: if $x \in R \Sigma^{\prime}\left(W_{n}\right)$, the support of $x$ (denoted by $\operatorname{Supp}(x))$ is the subset of $\operatorname{Comp}(n)$ defined by

$$
\operatorname{Supp}(x)=\left\{C \in \operatorname{Comp}(n) \mid \xi_{C}(x) \neq 0\right\} .
$$

2.A. Some left ideals. A subset $\mathcal{F}$ of $\operatorname{Comp}(n)$ is called left-saturated if, for every $D \in \mathcal{F}$ and every $C \in \operatorname{Comp}(n)$ such that $C \preccurlyeq D$, we have $C \in \mathcal{F}$. By Proposition C (a), if $\mathcal{F}$ is left-saturated, then $R \Sigma_{\mathcal{F}}^{\prime}\left(W_{n}\right)$ is a left ideal of $R \Sigma^{\prime}\left(W_{n}\right)$.

If $x \in R \Sigma^{\prime}\left(W_{n}\right)$, we set

$$
\operatorname{Sat}_{l}(x)=\{C \in \operatorname{Comp}(n) \mid \exists D \in \operatorname{Supp}(x), C \preccurlyeq D\} .
$$

Then $\operatorname{Sat}_{l}(x)$ is the minimal left-saturated subset of $\operatorname{Comp}(n)$ containing the support of $x$. By the previous remark,

$$
\begin{equation*}
R \Sigma^{\prime}\left(W_{n}\right) x \subset R \Sigma_{\operatorname{Sat}_{l}(x)}^{\prime}\left(W_{n}\right) \tag{2.1}
\end{equation*}
$$

Example 2.2 - If $D \in \operatorname{Comp}(n)$, then $\mathcal{F}_{\preccurlyeq D}$ and $\mathcal{F}_{\prec D}$ are left-saturated. In fact, $\mathcal{F}_{\preccurlyeq D}=\operatorname{Sat}_{l}\left(x_{D}\right)$. Consequently, $R \Sigma^{\prime}{ }_{\preccurlyeq D}\left(W_{n}\right)$ and $R \Sigma_{\prec D}^{\prime}\left(W_{n}\right)$ are left ideals of $R \Sigma^{\prime}\left(W_{n}\right)$. Note that $R \Sigma_{\preccurlyeq D}^{\prime}\left(W_{n}\right) / R \Sigma_{\prec D}^{\prime}\left(W_{n}\right)$ is a left $R \Sigma^{\prime}\left(W_{n}\right)$-module which is free of rank 1 over $R$ (it is generated by the image of $\left.x_{D}\right)$. The action of $R \Sigma^{\prime}\left(W_{n}\right)$ on this module is described in the next proposition.

Proposition 2.3. Let $D$ be a signed composition of $n$ and let $x \in \Sigma^{\prime}\left(W_{n}\right)$. Then

$$
x x_{D}-\pi_{\lambda(D)}^{R}(x) x_{D} \in R \Sigma_{\prec D}^{\prime}\left(W_{n}\right) .
$$

In other words, $R \Sigma_{\preccurlyeq D}^{\prime}\left(W_{n}\right) / R \Sigma_{\prec D}^{\prime}\left(W_{n}\right) \simeq \mathcal{D}_{\lambda(D)}^{R}$.
Proof. By Proposition C, we only need to show that $\xi_{D}\left(x x_{D}\right)=\pi_{\boldsymbol{\lambda}(D)}(x)$ for every $x \in$ $R \Sigma^{\prime}\left(W_{n}\right)$. Let $C \in \operatorname{Comp}(n)$. By Proposition C, we have

$$
\xi_{D}\left(x_{C} x_{D}\right)=\left|\left\{d \in X_{C D} \mid W_{D} \subset{ }^{d^{-1}} W_{C}\right\}\right|=\left|X_{C D}^{\subset}\right|
$$

So the result follows from 1.7.
The next result follows immediately from Proposition 2.3.
Corollary 2.4. Let $\mathcal{F}$ be a left-saturated subset of $\operatorname{Comp}(n)$ and let $\chi_{\mathcal{F}}$ denote the character of the left $K \Sigma^{\prime}\left(W_{n}\right)$-module $K \Sigma_{\mathcal{F}}^{\prime}\left(W_{n}\right)$. then

$$
\chi_{\mathcal{F}}=\sum_{C \in \mathcal{F}} \pi_{\lambda(C)}^{K} .
$$

If $a \in R \Sigma^{\prime}\left(W_{n}\right)$, we denote by $f_{a}(T) \in R[T]$ its minimal polynomial. Let $\gamma_{a}$ : $R \Sigma^{\prime}\left(W_{n}\right) \rightarrow R \Sigma^{\prime}\left(W_{n}\right), x \mapsto a x$ be the left multiplication by $a$ and let $\Gamma_{a}$ be the matrix of $\gamma_{a}$ in the basis $\left(x_{C}\right)_{C \in \operatorname{Comp}(n)}$. Then $f_{a}$ is the minimal polynomial of $\gamma_{a}$ (or of the matrix $\Gamma_{a}$ ). By 2.3, $\Gamma_{a}$ is triangular (with respect to the order $\preccurlyeq$ on $\operatorname{Comp}(n)$ ) and its characteristic polynomial is

$$
\begin{equation*}
\prod_{C \in \operatorname{Comp}(n)}\left(T-\pi_{\lambda(C)}^{R}(a)\right) . \tag{2.5}
\end{equation*}
$$

In particular:
Corollary 2.6. $f_{a}$ is split over $R$.
2.B. Some right ideals. A subset $\mathcal{F}$ of $\operatorname{Comp}(n)$ is called right-saturated if, for every $D \in \mathcal{F}$ and every $C \in \operatorname{Comp}(n)$ such that $C \subset_{\boldsymbol{\lambda}} D$, we have $C \in \mathcal{F}$. If $\mathcal{F}$ is right-saturated, then $R \Sigma_{\mathcal{F}}^{\prime}(W)$ is a right ideal of $R \Sigma^{\prime}\left(W_{n}\right)$ (see Proposition D (a)). It must be noticed that, by opposition with the case of the classical Solomon algebra [BP, $\S 3 . \mathrm{B}], R \Sigma_{\mathcal{F}}^{\prime}(W)$ is not necessarily a two-sided ideal of $R \Sigma^{\prime}\left(W_{n}\right)$ (see Example 2.8 below).

Example 2.7 - If $D \in \operatorname{Comp}(n)$, then $\mathcal{F}_{C_{\lambda} D}$ and $\mathcal{F}_{\mathscr{F}_{\lambda} D}$ are left-saturated. In fact, $\mathcal{F}_{\subset_{\lambda} D}=\operatorname{Sat}_{r}\left(x_{D}\right)$. Consequently, $R \Sigma_{C_{\lambda} D}^{\prime}\left(W_{n}\right)$ and $R \Sigma_{\nsubseteq \lambda}^{\prime} D\left(W_{n}\right)$ are right ideals of $R \Sigma^{\prime}\left(W_{n}\right)$.

Example 2.8 - Assume here that $n=2$. Then $R \Sigma_{C_{\lambda}(-2)}\left(W_{2}\right)=R x_{(-2)} \oplus R x_{(-1,-1)}$ is not a two-sided ideal of $\Sigma_{R}^{\prime}\left(W_{n}\right)$ because

$$
x_{(1,1)} x_{(-2)}=x_{(-1,-1)}+x_{(-1,1)}-x_{(1,-1)} .
$$

If $x \in R \Sigma^{\prime}\left(W_{n}\right)$, we set

$$
\operatorname{Sat}_{r}(x)=\left\{C \in \operatorname{Comp}(n) \mid \exists D \in \operatorname{Supp}(a), C \subset_{\boldsymbol{\lambda}} D\right\}
$$

Then $\operatorname{Sat}_{r}(x)$ is the minimal right-saturated subset of $\operatorname{Comp}(n)$ containing the support of $x$. By the previous remark,

$$
\begin{equation*}
x R \Sigma^{\prime}\left(W_{n}\right) \subset R \Sigma_{\operatorname{Sat}_{r}(x)}^{\prime}\left(W_{n}\right) . \tag{2.9}
\end{equation*}
$$

We shall construct in Section 3 a class of elements $x$ for which equality holds in 2.9.
2.C. Some two-sided ideals. A subset $\mathcal{F}$ of $\operatorname{Comp}(n)$ is called saturated if it is leftsaturated and right-saturated. If $\mathcal{F}$ is saturated, then $R \Sigma_{\mathcal{F}}^{\prime}\left(W_{n}\right)$ is a two-sided ideal of $R \Sigma^{\prime}\left(W_{n}\right)$.

Example 2.10-If $k \geqslant 0$, we set $\mathcal{F}_{k}(n)=\{C \in \operatorname{Comp}(n) \mid \lg (C) \geqslant k+1\}$ and $\mathcal{F}_{k}^{-}(n)=$ $\left\{C \in \operatorname{Comp}(n) \mid \lg (C)+\lg ^{-}(C) \geqslant k+1\right\}$. Then, by the Remarks 1.2 and 1.4, $\mathcal{F}_{k}(n)$ and $\mathcal{F}_{k}^{-}(n)$ are saturated subsets of $\operatorname{Comp}(n)$.

## 3. Positivity properties

In this section, and only in this section, we assume that $K$ is an ordered (for instance $K=\mathbb{Q}$ or $K=\mathbb{R}$ ). Recall that this implies that $K$ has characteristic 0 . We shall now construct a class of elements of $K \Sigma^{\prime}\left(W_{n}\right)$ for which equality holds in 2.9. We denote by $K \Sigma^{\prime}\left(W_{n}\right)^{+}$the set of elements $a \in K \Sigma^{\prime}\left(W_{n}\right)$ such that $\xi_{C}(a) \geqslant 0$ for every $C \in \operatorname{Comp}(n)$. Note that $x_{C} \in K \Sigma^{\prime}\left(W_{n}\right)^{+}$for any $C \in \operatorname{Comp}(n)$. If $a$ and $b$ are two elements of $K \Sigma^{\prime}\left(W_{n}\right)^{+}$, then

$$
\begin{equation*}
a+b \in K \Sigma^{\prime}\left(W_{n}\right)^{+} . \tag{3.1}
\end{equation*}
$$

However, contrarily to the case of Solomon algebras [BP, 3.2], it might happen that $a b \notin K \Sigma^{\prime}\left(W_{n}\right)^{+}$(see example 2.8). However, the analogue of [BP, First statement of Proposition 3.6] holds:

Proposition 3.2. Assume that $K$ is an ordered field. Let $a \in K \Sigma^{\prime}\left(W_{n}\right)^{+}$. Then

$$
a K \Sigma^{\prime}\left(W_{n}\right)=K \Sigma_{\operatorname{Sat}_{r}(a)}^{\prime}\left(W_{n}\right) .
$$

Proof. Let $\mathcal{F}=\operatorname{Sat}_{r}(a)$. By 2.9, we have $a K \Sigma^{\prime}\left(W_{n}\right) \subset K \Sigma_{\mathcal{F}}^{\prime}\left(W_{n}\right)$. We shall show by induction on $C \in \mathcal{F}$ (induction with respect to the order $\preccurlyeq$ ) that $x_{C} \in a K \Sigma^{\prime}\left(W_{n}\right)$. For this, we may, and we will, assume that $a \neq 0$.

First, if $C=(-1,-1, \ldots,-1)$, then $x_{C}=\sum_{w \in W_{n}} w$ so

$$
a x_{C}=\left(\sum_{D \in \operatorname{Comp}(n)} \xi_{D}(a)\left|X_{D}\right|\right) x_{C}
$$

Since $a \neq 0$ and $a \in K \Sigma^{\prime}\left(W_{n}\right)^{+}$, we have by definition $\sum_{D \in \operatorname{Comp}(n)} \xi_{D}(a)\left|X_{D}\right|>0$. So $x_{(-1,-1, \ldots,-1)} \in a K \Sigma^{\prime}\left(W_{n}\right)$.

Now, let $C \in \mathcal{F}$ and assume that, if $C^{\prime} \in \mathcal{F}$ is such that $C^{\prime} \prec C$, then $x_{C^{\prime}} \in a K \Sigma^{\prime}\left(W_{n}\right)$. Then, by Propositions C and 2.3, we have

$$
a x_{C}-\pi_{\boldsymbol{\lambda}(C)}(a) x_{C} \in K \Sigma_{\prec C}^{\prime}\left(W_{n}\right)
$$

But, by the induction hypothesis, we have that $K \Sigma_{\subset_{\lambda} C}^{\prime}\left(W_{n}\right) \subset a K \Sigma^{\prime}\left(W_{n}\right)$. So it remains to show that $\pi_{\boldsymbol{\lambda}(C)}(a) \neq 0$. But,

$$
\pi_{\boldsymbol{\lambda}(C)}(a)=\sum_{D \in \operatorname{Supp}(a)} \xi_{D}(a) \pi_{\boldsymbol{\lambda}(C)}\left(x_{D}\right)
$$

Since $\xi_{D}(a)>0$ and $\pi_{\boldsymbol{\lambda}(C)}\left(x_{D}\right) \geqslant 0$ for every $D \in \operatorname{Supp}(a)$, it remains to show that there exists $D \in \operatorname{Supp}(a)$ such that $\pi_{\boldsymbol{\lambda}(C)}\left(x_{D}\right)>0$. But, by the definition of $\mathcal{F}$, there exists $D \in \operatorname{Supp}(a)$ such that $W_{C}$ is contained in a conjugate of $W_{D}$. So, for this particular $D$, we have that $\operatorname{cox}_{C}$ is contained in a conjugate of $W_{D}$. So $\pi_{\boldsymbol{\lambda}(C)}\left(x_{D}\right)=\operatorname{Ind}_{W_{D}}^{W_{n}}\left(\operatorname{cox}_{C}\right) \geqslant 1$ and the proof of the proposition is complete.

The next four corollaries must be compared with [BP, Corollaries 4.7, 3.8 and 3.12 and Proposition 3.10].

Corollary 3.3. Assume that $K$ is an ordered field. Let $a \in K \Sigma^{\prime}\left(W_{n}\right)^{+}$. Then $a$ is invertible in $K \Sigma^{\prime}\left(W_{n}\right)$ if and only if $\xi_{n}(a)>0$.

Corollary 3.4. Assume that $K$ is an ordered field. Let $a_{1}, \ldots, a_{r} \in K \Sigma^{\prime}\left(W_{n}\right)^{+}$. Then $a_{1}+\cdots+a_{r} \in K \Sigma^{\prime}\left(W_{n}\right)^{+}$and

$$
a_{1} K \Sigma^{\prime}\left(W_{n}\right)+\cdots+a_{r} K \Sigma^{\prime}\left(W_{n}\right)=\left(a_{1}+\cdots+a_{r}\right) K \Sigma^{\prime}\left(W_{n}\right)
$$

The proof of the next corollary follows an argument of Atkinson [A].
Corollary 3.5. Assume that $K$ is an ordered field. Let $a \in K \Sigma^{\prime}\left(W_{n}\right)^{+}$and let $r$ be $a$ non-zero natural number. Then:
(a) val $f_{a} \leqslant 1$.
(b) $a^{r} K \Sigma^{\prime}\left(W_{n}\right)=a K \Sigma^{\prime}\left(W_{n}\right)$.
(c) $K \Sigma^{\prime}\left(W_{n}\right) a^{r}=K \Sigma^{\prime}\left(W_{n}\right) a$.

Proof. Recall that $f_{a}$ is the minimal polynomial of $a$. We first prove (b). It is sufficient to show the result for $r=2$. Let $m: a K \Sigma^{\prime}\left(W_{n}\right) \rightarrow a K \Sigma^{\prime}\left(W_{n}\right), x \mapsto a x$. Then, by Proposition 3.2, we have $a K \Sigma^{\prime}\left(W_{n}\right)=K \Sigma_{\text {Sat }_{r}(a)}^{\prime}\left(W_{n}\right)$. But, by the proof of Proposition 3.2, we have $\pi_{\boldsymbol{\lambda}(C)}(a)>0$ for every $C \in \operatorname{Sat}_{r}(a)$. Therefore, by Proposition 2.3, the matrix of $m$ in the basis $\left(x_{C}\right)_{C \in \operatorname{Sat}_{r}(a)}$ is triangular (with respect to the order $\preccurlyeq$ ) and has positive diagonal coefficients. So it is invertible. This shows (b).
(a) By (b), the minimal polynomial $f \in K[T]$ of $m$ has a non-zero constant term. But, $f(a) a=f(m)(a)=0$. Therefore, $f_{a}$ divides $T f(T)$. This shows (a).
(c) Now, by (a), we have that $a \in K[a] a^{2}$. So $a \in K \Sigma^{\prime}\left(W_{n}\right) a^{2}$, as desired.

Recall that $\gamma_{a}$ denote the left multiplication $K \Sigma^{\prime}\left(W_{n}\right) \rightarrow K \Sigma^{\prime}\left(W_{n}\right), x \mapsto a x$. Let $\delta_{a}: K \Sigma^{\prime}\left(W_{n}\right) \rightarrow K \Sigma^{\prime}\left(W_{n}\right), x \mapsto x a$ denote the right multiplication by $a$.

Corollary 3.6. Assume that $K$ is an ordered field. Let $a \in K \Sigma^{\prime}\left(W_{n}\right)^{+}$. Then:
(a) $\operatorname{Ker} \gamma_{a} \oplus \operatorname{Im} \gamma_{a}=K \Sigma^{\prime}\left(W_{n}\right)$.
(b) $\operatorname{Ker} \delta_{a} \oplus \operatorname{Im} \delta_{a}=K \Sigma^{\prime}\left(W_{n}\right)$.

Proof. (a) For dimension reasons, it is sufficient to prove that $\operatorname{Ker} \gamma_{a} \cap \operatorname{Im} \gamma_{a}=0$. Let $x \in \operatorname{Ker} \gamma_{a} \cap \operatorname{Im} \gamma_{a}$. Then $a x=0$ and there exists $y \in K \Sigma^{\prime}\left(W_{n}\right)$ such that $x=a y$. So $a^{2} y=0$. Therefore, $a^{r} y=0$ for every $r \geqslant 2$. But $a \in \sum_{r \geqslant 2} K a^{r}$ by Corollary 3.5 (a). So $a y=0$. In other words, $x=0$, as desired. The proof of (b) is similar.

Remark 3.7 - By opposition with the case of Solomon descent algebras, it may happen that $f_{x_{C}}$ is not square-free (compare with [BP, Proposition 3.10]). For instance, if $n=4$ and if $K=\mathbb{Q}$, we have

$$
f_{x_{(-3,1)}}(T)=T(T-2)(T-4)(T-8)^{2}(T-32) .
$$

This computation has been done using CHEVIE [Chevie].
We close this section by a result on the centralizers of positive elements (compare with [BP, Corollary 3.12]: the proof presented here is really different):

Proposition 3.8. Assume that $K$ is an ordered field. Let $a \in K \Sigma^{\prime}\left(W_{n}\right)^{+}$and $r$ be $a$ non-zero natural number. Then $Z_{K \Sigma^{\prime}\left(W_{n}\right)}(a)=Z_{K \Sigma^{\prime}\left(W_{n}\right)}\left(a^{r}\right)$.

Proof. Let $A=\operatorname{End}_{K} K \Sigma^{\prime}\left(W_{n}\right)$. Let $\gamma: K \Sigma^{\prime}\left(W_{n}\right) \rightarrow A, x \mapsto \gamma_{x}$. It is an injective homomorphism of algebras. Therefore, $Z_{K \Sigma^{\prime}\left(W_{n}\right)}(a)=\gamma^{-1}\left(Z_{A}\left(\gamma_{a}\right)\right)$. So, in order to prove the proposition, we only need to prove that $Z_{A}\left(\gamma_{a}\right)=Z_{A}\left(\gamma_{a}^{r}\right)$.

Let $A^{\prime}=\operatorname{End}_{K}\left(\operatorname{Ker} \gamma_{a}\right)$ and $A^{\prime \prime}=\operatorname{End}_{K}\left(\operatorname{Im} \gamma_{a}\right)$. Then, by Corollary 3.6, $A^{\prime} \oplus A^{\prime \prime}$ is a sub- $K$-algebra of $A$ and $Z_{A}\left(\gamma_{a}\right)$ is contained in $A^{\prime} \oplus A^{\prime \prime}$. Let $\gamma^{\prime \prime}$ denote the restriction of $\gamma_{a}$ to $\operatorname{Im} \gamma_{a}$. Then $Z_{A}\left(\gamma_{a}\right)=A^{\prime} \oplus Z_{A^{\prime \prime}}\left(\gamma^{\prime \prime}\right)$. Since $\operatorname{Ker} \gamma_{a}^{r}=\operatorname{Ker} \gamma_{a}$ and $\operatorname{Im} \gamma_{a}^{r}=\operatorname{Im} \gamma_{a}$, we only need to prove that $Z_{A^{\prime \prime}}\left(\gamma^{\prime \prime}\right)=Z_{A^{\prime \prime}}\left(\gamma^{\prime \prime r}\right)$. But, by Proposition 3.2 and its proof, $\left(x_{C}\right)_{C \in \operatorname{Sat}_{r}(a)}$ is a basis of $\operatorname{Im} \gamma_{a}$ and the matrix of $\gamma^{\prime \prime}$ in this basis is triangular (with
respect to the order $\preccurlyeq)$ with positive coefficients on the diagonal. So the proposition follows from Lemma 3.9 below.

Lemma 3.9. Let $m$ be a non-zero natural number. Let $M=\left(m_{i j}\right) \in \operatorname{Mat}_{m}(K)$ be an upper triangular $m \times m$ matrix such that $m_{i i}>0$ for every $i \in\{1,2, \ldots, m\}$. Then

$$
Z_{\operatorname{Mat}_{m}(K)}(M)=Z_{\operatorname{Mat}_{m}(K)}\left(M^{r}\right)
$$

for every $r \geqslant 1$.
Proof of Lemma 3.9. Let $E=\operatorname{Mat}_{m}(K)$. Since $M$ is invertible, we can write $M=S U=U S$ where $S$ (resp. $U$ ) is a diagonalizable (resp. unipotent) matrix. Then $Z_{E}(M)=Z_{E}(S) \cap Z_{E}(U)$. So it is sufficient to show that $Z_{E}(S)=Z_{E}\left(S^{r}\right)$ and $Z_{E}(U)=Z_{E}\left(U^{r}\right)$.

Since $S$ is diagonalizable, we may assume that it is diagonal. Now the fact that $Z_{E}(S)=Z_{E}\left(S^{r}\right)$ follows from the fact that, if $x, y \in K$ are such that $x>0, y>0$ and $x^{r}=y^{r}$, then $x=y$ (because $K$ is an ordered field).

Let us now show that $Z_{E}(U)=Z_{E}\left(U^{r}\right)$. Since $K$ is an ordered field, its characteristic is zero. Let $N$ be a nilpotent matrix such that $U=e^{N}$ (exponential). Then $Z_{E}(U)=Z_{E}(N)$ and, since $U^{r}=e^{r N}$, we have $Z_{E}\left(U^{r}\right)=Z_{E}(r N)=Z_{E}(N)$ (because $r \neq 0$ in $K$ ).

## 4. Action of the longest element

If $C \in \operatorname{Comp}(n)$, we denote by $w_{C}$ the longest element of $W_{C}$. If $C \in \operatorname{Comp}^{+}(n)$, we denote by $\sigma_{C}$ the longest element of $\mathfrak{S}_{C}$ (in other words, $\sigma_{C}=w_{-C}$ ). In particular, $w_{n}$ is the longest element of $W_{n}$. Recall that $w_{n} \in R \Sigma^{\prime}\left(W_{n}\right)$ (in fact $w_{n} \in R \Sigma\left(W_{n}\right)$ ) and that $\theta_{n}^{R}\left(w_{n}\right)=\varepsilon_{n}$, the sign character of $W_{n}$ (see for instance $[\mathrm{S}]$ ). Moreover, $w_{n}$ is central in $W_{n}$, so it is central in $R \Sigma^{\prime}\left(W_{n}\right)$.

First, note that

$$
\begin{equation*}
\varepsilon_{n}(\operatorname{cox} C)=(-1)^{n-\lg ^{-}(C)} \tag{4.1}
\end{equation*}
$$

Recall that the function $\lg ^{-}: \operatorname{Comp}(n) \rightarrow \mathbb{N}$ has been defined in $\S 1 . C$. In particular,

$$
\begin{equation*}
\pi_{\lambda}\left(w_{n}\right)=(-1)^{n-\lg ^{-}(\lambda)} \tag{4.2}
\end{equation*}
$$

for all $\lambda \in \operatorname{Bip}(n)$.

From now on, and until the end of this section, we assume that 2 is invertible in $R$. Write

$$
e_{n}^{+}=\frac{1}{2}\left(1+w_{n}\right) \quad \text { and } \quad e_{n}^{-}=\frac{1}{2}\left(1-w_{n}\right)
$$

Since $w_{n}$ is central in $W_{n}, e_{n}^{+}$and $e_{n}^{-}$are central idempotents of $K \Sigma^{\prime}\left(W_{n}\right)$. Moreover, they are orthogonal and $e_{n}^{+}+e_{n}^{-}=1$.

We shall now describe a basis of $R \Sigma^{\prime}\left(W_{n}\right) e_{n}^{+}$and $R \Sigma^{\prime}\left(W_{n}\right) e_{n}^{-}$. This is build on the same model as for the classical Solomon algebra [BP, §2.B]. First, note that

$$
\begin{equation*}
w_{n} X_{C}=X_{C} w_{C} \tag{4.3}
\end{equation*}
$$

for every signed composition $C$ of $n$. This is proved as follows. An element $w \in W_{n}$ belongs to $X_{C}$ if and only if $w(\alpha)>0$ for every $\alpha \in \Phi_{C}^{+}$. In other words, $w \in w_{n} X_{C}$ if and only if $w(\alpha)<0$ for every $\alpha \in \Phi_{C}^{+}$. A similar argument applies to show that $w \in X_{C} w_{C}$ if and only if $w(\alpha)<0$ for every $\alpha \in \Phi_{C}^{+}$. This shows 4.3. Consequently,

$$
\begin{equation*}
w_{n} x_{C}=x_{C} w_{C} \tag{4.4}
\end{equation*}
$$

Since 2 is invertible in $R$, we can define

$$
x_{C}^{\prime}=\sum_{\substack{D \in \operatorname{Comp}(n) \\ S_{D} \subset S_{C}}}\left(-\frac{1}{2}\right)^{\left|S_{C}\right|-\left|S_{D}\right|} x_{D}
$$

These elements have the following properties:
Proposition 4.5. If 2 is invertible in $R$, then:
(a) $\left(x_{C}^{\prime}\right)_{C \in \operatorname{Comp}(n)}$ is an $R$-basis of $R \Sigma^{\prime}\left(W_{n}\right)$.
(b) $\operatorname{Ker} \theta_{n}^{R}=\sum_{C \equiv D} R\left(x_{C}^{\prime}-x_{D}^{\prime}\right)$.
(c) $w_{n} x_{C}^{\prime}=(-1)^{\left|S_{C}\right|} x_{C}^{\prime}=(-1)^{n-\lg ^{-}(C)} x_{C}^{\prime}$.

Proof. (a) is trivial. Note for information that

$$
x_{C}=\sum_{\substack{D \in \operatorname{Comp}^{\prime}(n) \\ S_{D} \subset S_{C}}}\left(\frac{1}{2}\right)^{\left|S_{C}\right|-\left|S_{D}\right|} x_{D}^{\prime}
$$

(b) follows from Theorem B (c) and Remark 1.9.

Let us now prove (c). First, we set

$$
\tilde{x}_{C}=\sum_{\substack{D \in \operatorname{Comp}(n) \\ S_{D} \subset S_{C}}}\left(-\frac{1}{2}\right)^{\left|S_{C}\right|-\left|S_{D}\right|} x_{D}^{C}
$$

Now, by 4.4, we get $w_{n} x_{C}=x_{C} w_{C} \tilde{x}_{C}$. But now, $\tilde{x}_{C}$ is an element of the classical Solomon descent algebra $R \Sigma\left(W_{C}\right)$ to which the result of [BP, 2.12] can be applied: we get $w_{C} \tilde{x}_{C}=(-1)^{\left|S_{C}\right|} \tilde{x}_{C}$. This shows the first equality. The second equality is easy from the definition of $S_{C}$.

Corollary 4.6. If 2 is invertible in $R$, then $\operatorname{dim}_{R} R \Sigma^{\prime}\left(W_{n}\right) e_{n}^{+}=\operatorname{dim}_{R} R \Sigma^{\prime}\left(W_{n}\right) e_{n}^{-}=3^{n-1}$.
Proof. Let

$$
\mathcal{C}^{+}=\left\{C \in \operatorname{Comp}(n) \mid \lg ^{-}(C) \equiv n \quad \bmod 2\right\}
$$

and

$$
\mathcal{C}^{-}=\left\{C \in \operatorname{Comp}(n) \mid \lg ^{-}(C) \equiv n+1 \quad \bmod 2\right\}
$$

Then, by Proposition 4.5 (a) and (c), we have $\operatorname{dim}_{R} R \Sigma^{\prime}\left(W_{n}\right) e_{n}^{?}=\left|\mathcal{C}^{?}\right|$ for $? \in\{+,-\}$. It is now sufficient to show that $\left|\mathcal{C}^{+}\right|=\left|\mathcal{C}^{-}\right|=3^{n-1}$. Since the number of compositions of $n$ of length $k$ is equal to $\binom{n-1}{k-1}$, we have

$$
\left|\mathcal{C}^{+}\right|=\sum_{k=1}^{n}\binom{n-1}{k-1} 2^{k-1}=3^{n-1}
$$

and similarly for $\left|\mathcal{C}^{-}\right|$.
Example 4.7 - We consider in this example the elements of the form $x_{\nu_{1}, \nu_{2}, \ldots, \nu_{n}}^{\prime}$ of $R \Sigma^{\prime}\left(W_{n}\right)$ where $\nu_{i} \in\{1,-1\}$. We shall show that they are quasi-idempotents. We first need some notation. Let $I_{n}^{+}=\{1,2, \ldots, n\}$. If $\sigma \in W_{n}$, let $\mathbf{I}(\sigma)=\left\{i \in I_{n}^{+} \mid \sigma(i)>0\right\}$. If $I \subset I_{n}^{+}$, we denote by $\mathbf{C}(I)$ the signed composition $\left(\nu_{1}, \ldots, \nu_{n}\right)$, where $\nu_{i}=1$ (respectively $\nu_{i}=-1$ ) if $i \in I$ (respectively $i \notin I$ ). We also define $\gamma_{I}: W_{n} \rightarrow R^{\times}, \sigma \mapsto(-1)^{|I|-|I \cap \mathbf{I}(\sigma)|}$. For instance, $\gamma_{\varnothing}=1_{n}$ and $\gamma_{I_{n}^{+}}$is a linear character of $W_{n}$ (it will be denoted by $\gamma_{n}$ for simplification). Note also that the restriction of $\gamma_{I}$ to $\mathfrak{T}_{n}$ is always a linear character (the group $\mathfrak{T}_{n}$ has been defined in $\S 1 . \mathrm{B}$ : it is the group generated by $t_{1}, \ldots, t_{n}$ ). Moreover, if $\sigma \in \mathfrak{S}_{n}$ and $\tau \in W_{n}$, we have $\mathbf{I}(\sigma \tau)=\mathbf{I}(\tau)$, so $\gamma_{I}(\sigma \tau)=\gamma_{I}(\tau)$. Finally, we denote by $\mathfrak{S}_{n}(I)$ the stabilizer of $I$ in $\mathfrak{S}_{n}$.

With this notation, we have

$$
\begin{equation*}
x_{\mathbf{C}(I)}^{\prime}=\frac{1}{2^{|I|}} \sum_{\sigma \in W_{n}} \gamma_{I}(\sigma) \sigma . \tag{4.8}
\end{equation*}
$$

Proof of 4.8. First, note that

$$
x_{\mathbf{C}(I)}^{\prime}=\sum_{J \subset I}\left(-\frac{1}{2}\right)^{|I|-|J|} x_{\mathbf{C}(J)}
$$

Now, let $\sigma \in W_{n}$ and $J \subset I_{n}^{+}$. Then $\sigma \in X_{\mathbf{C}(J)}$ if and only $J \subset \mathbf{I}(\sigma)$. Therefore, by the previous equality, the coefficient of $\sigma$ in $x_{\mathbf{C}(I)}^{\prime}$ is equal to

$$
\sum_{J \subset I \cap \mathbf{I}(\sigma)}\left(-\frac{1}{2}\right)^{|I|-|J|}=\frac{(-1)^{|I|-|I \cap \mathbf{I}(\sigma)|}}{2^{|I|}}
$$

as desired.
If $I$ and $J$ are two subsets of $I_{n}^{+}$, then

$$
x_{\mathbf{C}(I)}^{\prime} x_{\mathbf{C}(J)}^{\prime}= \begin{cases}2^{n-|I|}\left|\mathfrak{S}_{n}(I)\right| x_{\mathbf{C}(J)}^{\prime} & \text { if }|I|=|J|  \tag{4.9}\\ 0 & \text { otherwise }\end{cases}
$$

Proof of 4.9. Let $e_{I}=\sum_{\tau \in \mathfrak{T}_{n}} \gamma_{I}(\tau) \tau$ and let $e=\sum_{\sigma \in \mathfrak{S}_{n}} \sigma$. Then, by 4.8, we have $x_{\mathbf{C}(I)}^{\prime}=e e_{I} / 2^{|I|}$. Moreover,

$$
e_{I} e_{J}= \begin{cases}2^{n} e_{I} & \text { if } I=J \\ 0 & \text { otherwise }\end{cases}
$$

Therefore,

$$
\begin{aligned}
x_{\mathbf{C}(I)}^{\prime} x_{\mathbf{C}(J)}^{\prime} & =\frac{1}{2^{|I|+|J|}} e e_{I}\left(\sum_{\sigma \in \mathfrak{S}_{n}} \sigma\right) e_{J} \\
& =\frac{1}{2^{|I|+|J|}} \sum_{\sigma \in \mathfrak{S}_{n}} e \sigma^{-1} e_{I} \sigma e_{J} \\
& =\frac{1}{2^{|I|+|J|}} \sum_{\sigma \in \mathfrak{S}_{n}} e e_{\sigma^{-1}(I)} e_{J}
\end{aligned}
$$

If $|I| \neq|J|$, then $\sigma^{-1}(I) \neq J$ for every $\sigma \in \mathfrak{S}_{n}$. If $|I|=|J|$, then the number of elements $\sigma \in \mathfrak{S}_{n}$ such that $\sigma^{-1}(I)=J$ is equal to $\left|\mathfrak{S}_{n}(I)\right|=|I|!(n-|I|)$ !. This shows the result in this last case.
In particular, if $2\left|\mathfrak{S}_{n}(I)\right|$ is invertible in $R$, then $x_{\mathbf{C}(I)}^{\prime} /\left(2^{n-|I|}\left|\mathfrak{S}_{n}(I)\right|\right)$ is an idempotent of $R \Sigma^{\prime}\left(W_{n}\right)$. We shall show later that it is a primitive idempotent of $R \Sigma^{\prime}\left(W_{n}\right)$ (see 8.4). A description of the module $\mathbb{Q} W_{n} x_{\mathbf{C}(I)}^{\prime}$ will be given in Example 10.1.

Since $\gamma_{I_{n}^{+}}=\gamma_{n}$ is a linear character of $W_{n}$, we deduce immediately the following two properties of $x_{1,1, \ldots, 1}^{\prime}$ :

$$
\begin{equation*}
x_{1,1, \ldots, 1}^{\prime} \text { is central in } \mathbb{Q} W_{n}, \text { hence is central in } \mathbb{Q} \Sigma^{\prime}\left(W_{n}\right) ; \tag{4.10}
\end{equation*}
$$

In particular, if $p$ does not divide $\left|W_{n}\right|$, then $x_{1,1, \ldots, 1} / n$ ! is a primitive central idempotent of $\mathbb{Q} W_{n}$, hence is a primitive central idempotent of $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$.

## 5. Restriction morphisms between Mantaci-Reutenauer algebras

F. Bergeron, N. Bergeron, R.B. Howlett and D.E. Taylor [BBHT] have constructed socalled restriction morphisms between the Solomon algebra of a finite Coxeter group and the Solomon algebras of its standard parabolic subgroups. We shall construct here a restriction morphism $R \Sigma^{\prime}\left(W_{n}\right) \rightarrow R \Sigma^{\prime}\left(W_{D}\right)$ whenever $D$ is a semi-positive signed compositions of $n$. It might be possible that such a morphism exists for every signed compositions, but we are not able to prove it (or to prove that there is no analogue in general). Most of the results of this section have an analogue in the context of Solomon's descent algebras [BP, §4].
5.A. Definition. We fix in this section a semi-positive signed composition $D$ of $n$. We denote by $\operatorname{Res}_{D}: R \Sigma^{\prime}\left(W_{n}\right) \rightarrow R \Sigma^{\prime}\left(W_{D}\right)$ the unique $R$-linear map such that

$$
\operatorname{Res}_{D} x_{C}=\sum_{d \in X_{C D}} x_{d^{-1} C \cap D}^{D}
$$

for every $C \in \operatorname{Comp}(n)$. If $C \subset D$ is a semi-positive signed composition, we define $\operatorname{Res}_{C}^{D}: R \Sigma^{\prime}\left(W_{D}\right) \rightarrow R \Sigma^{\prime}\left(W_{C}\right)$ similarly.

Proposition 5.1. Let $D$ be a semi-positive signed composition of $n$. Then:
(a) If $x \in \Sigma\left(W_{n}\right)$, then $x_{D} \operatorname{Res}_{D}(x)=x x_{D}$.
(b) $\operatorname{Res}_{D}$ is a morphism of algebras.
(c) If $C \subset D$ is also semi-positive, then $\operatorname{Res}_{C}^{D} \circ \operatorname{Res}_{D}=\operatorname{Res}_{C}$.
(d) The diagram

is commutative.
(e) If $D^{\prime}$ is another signed composition of $n$ and if $d \in X_{D D^{\prime}}$ is such that ${ }^{d} S_{D^{\prime}}=S_{D}$, then $D^{\prime}$ is semi-positive and $d_{*} \circ \operatorname{Res}_{D^{\prime}}=\operatorname{Res}_{D}$.

Proof. (a) follows from Proposition C (b). (b) and (c) follow from (a) and from the fact that the map $\mu_{D}: R \Sigma^{\prime}\left(W_{D}\right) \rightarrow R \Sigma^{\prime}\left(W_{n}\right), x \mapsto x_{D} x$ is injective. (d) follows from the Mackey formula. (e) follows easily from Remark 1.9 and from (a).

By Remark 1.9, the group $\mathcal{W}(D)$ acts on $R \Sigma^{\prime}\left(W_{D}\right)$. Moreover, by Proposition 5.1 (e), we have

$$
\begin{equation*}
\operatorname{Im}_{\operatorname{Res}_{D}} \subset R \Sigma^{\prime}\left(W_{D}\right)^{\mathcal{W}(D)} . \tag{5.2}
\end{equation*}
$$

Let $\operatorname{Comp}(D)=\{C \in \operatorname{Comp}(n) \mid C \subset D\}$. Write $D=\left(d_{1}, \ldots, d_{r}\right)$ and $\operatorname{Bip}(D)=$ $\operatorname{Bip}\left(d_{1}\right) \times \cdots \times \operatorname{Bip}\left(d_{r}\right):$ here, if $d<0, \operatorname{Bip}(d)$ denotes the set of partitions of $-d$. If $C \in \operatorname{Comp}(D)$, we denote by $\boldsymbol{\lambda}_{D}(C)$ the element of $\operatorname{Bip}(D)$ defined in the natural way component by component. Then $\boldsymbol{\lambda}_{D}(C)=\boldsymbol{\lambda}_{D}\left(C^{\prime}\right)$ if and only if $C \equiv_{D} C^{\prime}$. Therefore, the canonical injection $\operatorname{Comp}(D) \hookrightarrow \operatorname{Comp}(n)$ induces a unique map $\tau_{D}: \operatorname{Bip}(D) \rightarrow \operatorname{Bip}(n)$ such that $\tau_{D}\left(\boldsymbol{\lambda}_{D}(C)\right)=\boldsymbol{\lambda}(C)$.

Corollary 5.3. Let $D$ be a semi-positive signed composition of $n$ and let $\lambda \in \Lambda_{D}$. Then $\pi_{\tau_{D}(\lambda)}^{R}=\pi_{\lambda}^{R} \circ \operatorname{Res}_{D}$.

Proof. Let $\left(\xi_{C}^{D}\right)_{C \in \operatorname{Comp}(D)}$ denote the basis of $\operatorname{Hom}_{R}\left(R \Sigma^{\prime}\left(W_{D}\right), R\right)$ dual to $\left(x_{C}^{D}\right)_{C \in \operatorname{Comp}(D)}$. Let $C$ be a signed composition of $n$ which is contained in $D$ and let $\lambda=\boldsymbol{\lambda}_{D}(C) \in \operatorname{Bip}(D)$. Then, if $x \in R \Sigma^{\prime}\left(W_{D}\right)$, we have by Proposition 2.3,

$$
\pi_{\lambda}^{R}(x)=\xi_{C}^{D}\left(x x_{C}^{D}\right)
$$

Therefore, if $x \in R \Sigma^{\prime}\left(W_{n}\right)$, we have

$$
\begin{aligned}
\pi_{\lambda}^{R}\left(\operatorname{Res}_{D} x\right) & =\xi_{C}^{D}\left(\left(\operatorname{Res}_{D} x\right) x_{C}^{D}\right) \\
& =\xi_{C}\left(x_{D}\left(\operatorname{Res}_{D} x\right) x_{C}^{D}\right) \\
& =\xi_{C}\left(x x_{D} x_{C}^{D}\right) \\
& =\xi_{C}\left(x x_{C}\right) \\
& =\pi_{\boldsymbol{\lambda}(C)}(x) .
\end{aligned}
$$

Now, the result follows from the fact that $\boldsymbol{\lambda}(C)=\tau_{D}(\lambda)$ by definition.
We conclude this subsection by a result on the kernel of $\operatorname{Res}_{D}$.
Proposition 5.4. We have:
(a) $\operatorname{Ker}\left(\operatorname{Res}_{D}\right)=\left\{x \in R \Sigma^{\prime}\left(W_{n}\right) \mid x x_{D}=0\right\}$.
(b) If $K$ is a field of characteristic zero, then $K \Sigma^{\prime}\left(W_{D}\right)=\operatorname{Ker}\left(\operatorname{Res}_{D}\right) \oplus K \Sigma^{\prime}\left(W_{n}\right) x_{D}$.

Proof. (a) follows from Proposition 5.1 (a). To prove (b), we may, and we will, assume that $K=\mathbb{Q}$. Then, since $\mathbb{Q}$ is an ordered field, (b) follows from (a) and Corollary 3.6.
5.B. Restriction to the Solomon algebra of $\mathfrak{S}_{n}$. If $D$ is a semi-positive signed composition of $n$, then $\mathfrak{S}_{D^{+}}$is a parabolic subgroup of $\mathfrak{S}_{n}$. So there is a restriction morphism $\operatorname{Res}_{D^{+}}^{\mathfrak{S}}: R \Sigma\left(\mathfrak{S}_{n}\right) \rightarrow R \Sigma\left(\mathfrak{S}_{D^{+}}\right)$which was constructed in $[\mathrm{BBHT}]$ (see also $[\mathrm{BP}$, Proposition 4.1] for the proof of the fact that it is a morphism of algebras: it works as in the Proposition 5.1 above). Then the diagram

is commutative. Indeed, if $x \in R \Sigma\left(\mathfrak{S}_{n}\right)$, then, by definition, we have

$$
x_{D} \operatorname{Res}_{D}(x)=x x_{D}=x x_{D^{+}} x_{D}^{D^{+}}=x_{D^{+}} \operatorname{Res}_{D^{+}}^{\mathfrak{S}_{+}}(x) x_{D}^{D^{+}} .
$$

So it remains to show that, if $u \in R \Sigma\left(\mathfrak{S}_{D^{+}}\right)$, then $u x_{D}^{D^{+}}=x_{D}^{D^{+}} u$. By direct product, we are reduce to prove this whenever $D=D^{+}$(in which case it is trivial) or whenever $D=D^{-}$. In this last case, since $D$ is semi-positive, we have $D^{+}=(1)$ and the result follows from the fact that the algebra $R \Sigma^{\prime}\left(W_{1}\right)=R W_{1}$ is commutative.
5.C. An example. Now, let us consider a particular semi-positive signed composition. If $D=(k,-1,-1, \ldots,-1)$, where $k \geqslant 1$, then $\operatorname{Res}_{D}$ induces in fact a morphism of algebras $\operatorname{Res}_{k}^{n}: R \Sigma^{\prime}\left(W_{n}\right) \rightarrow R \Sigma^{\prime}\left(W_{k}\right)$. Since $D$ is also parabolic, we have that $\operatorname{Res}_{k}^{n}\left(R \Sigma\left(W_{n}\right)\right) \subset$
$R \Sigma\left(W_{k}\right)$, that the induced map $R \Sigma\left(W_{n}\right) \rightarrow R \Sigma\left(W_{k}\right)$ coincides with the map denoted by $\operatorname{Res}_{S_{k}}^{S_{n}}$ in $[\mathrm{BP}, \S 4 . \mathrm{B}]$ and that the diagram

is commutative. The next result can be compared with [BP, Proposition 4.15].
Proposition 5.7. If $R=K$ is a field of characteristic zero, then $\operatorname{Res}_{k}^{n}$ is surjective.
Remark 5.8 - It is probable that the above proposition remains valid for every commutative ring $R$ (i.e. for $R=\mathbb{Z}$ ). It has been checked for $n \leqslant 5$ using CHEVIE [Chevie].

Proof. By transitivity (see Proposition 5.1 (c)), we only need to prove that $\operatorname{Res}_{n-1}^{n}$ is surjective. We almost reproduce the argument in [BP, Proposition 4.15]. We have

$$
\begin{aligned}
& X_{n-1,-1}=\left\{s_{i} s_{i+1} \ldots s_{n-1} \mid 1 \leqslant i \leqslant n\right\} \\
& \text { 【 }\left\{s_{i} s_{i-1} \ldots s_{1} t s_{1} s_{2} \ldots s_{n-1} \mid 0 \leqslant i \leqslant n-1\right\} .
\end{aligned}
$$

Therefore, if $d \in W_{n}$ and $i \in\{1,2, \ldots, n-1\}$ (resp. $i \in\{1,2, \ldots, n\}$ ) are such that $d^{-1} \in$ $X_{n-1,-1}, \ell\left(d s_{i}\right)>\ell(d)\left(\right.$ resp. $\left.\ell\left(d t_{i}\right)>\ell(d)\right)$, and $d s_{i} d^{-1} \in S_{n-1}^{\prime}$ (resp. $\left.d t_{i} d^{-1} \in S_{n-1}^{\prime}\right)$, then

$$
\begin{equation*}
d s_{i} d^{-1} \in\left\{s_{i}, s_{i-1}\right\} \tag{*}
\end{equation*}
$$

(resp.
(**)

$$
d t_{i} d^{-1} \in\left\{t_{i}, t_{i-1}\right\} .
$$

We now define a total order $\unlhd$ on $\operatorname{Comp}(n-1)$. Let $C$ and $D$ be two signed compositions of $n-1$. We write $C \unlhd D$ if and only if one of the following two conditions are satisfied:
(1) $\left|S_{C}^{\prime}\right|<\left|S_{D}^{\prime}\right|$;
(2) $\left|S_{C}^{\prime}\right|=\left|S_{D}^{\prime}\right|$ and $S_{C}^{\prime}$ is smaller than $S_{D}^{\prime}$ for the lexicographic order induced by the order $t_{1}<t_{2}<\cdots<t_{n-1}<s_{1}<\cdots<s_{n-2}$ on $S_{n-1}^{\prime}$.
It follows immediately from (*) and (**) that

$$
\operatorname{Res}_{n-1}^{n} x_{D \sqcup(-1)} \in \alpha_{D} x_{D}+\sum_{C \triangleleft D} K x_{C}
$$

with $\alpha_{D} \in \mathbb{Z}, \alpha_{D}>0$ (for every $D \in \operatorname{Comp}(n-1)$ ). Recall that the operation $\sqcup$ (concatenation) has been defined in §1.C. The proof of the proposition is complete.

## 6. Simple modules, RADICAL

Hypothesis and notation: From now on, and until the end of this paper, we assume that $R=K$ is a field. We denote by $p$ its characteristic ( $p \geqslant 0$ ). We denote by $\operatorname{Bip}_{p^{\prime}}(n)$ the set of bipartitions $\lambda$ of $n$ such that $o(\lambda)$ is invertible in $K$ (recall that $o(\lambda)$ denotes the order of $\operatorname{cox}_{\lambda}$ ). If $\lambda \in \operatorname{Bip}(n)$, we denote by $\lambda_{p^{\prime}}$ the bipartition of $n$ such that the $p^{\prime}$-part of $\operatorname{cox}_{\lambda}$ is conjugate to $\operatorname{cox}_{\lambda_{p^{\prime}}}$ (if $p=0$, then $\lambda_{p^{\prime}}=\lambda$ ).
6.A. Simple modules. Since $\operatorname{Ker} \theta_{n}^{K}$ is a nilpotent two-sided ideal of $K \Sigma^{\prime}\left(W_{n}\right)$, it is contained in the kernel of every simple representation of $K \Sigma^{\prime}\left(W_{n}\right)$. Therefore, every simple representation factorizes ( $\operatorname{through} \theta_{n}^{K}$ ) to a simple representation of $K \operatorname{Irr} W_{n}$. Since every irreducible character of $W_{n}$ has value in $\mathbb{Z}$, and since $\theta_{n}^{K}$ is surjective by Theorem B (c), we get (see for instance [B2, Proposition 2.14 and Corollary 2.15]):

Proposition 6.1. Let $\lambda$ and $\mu$ be two bipartitions of $n$.
(a) $\mathcal{D}_{\lambda}^{K} \simeq \mathcal{D}_{\mu}^{K}$ if and only if $\lambda_{p^{\prime}}=\mu_{p^{\prime}}$.
(b) $\left\{\mathcal{D}_{\lambda}^{K} \mid \lambda \in \operatorname{Bip}_{p^{\prime}}(n)\right\}$ is a set of representatives of isomorphy classes of simple left $K \Sigma^{\prime}\left(W_{n}\right)$-modules.

Corollary 6.2. $K \Sigma^{\prime}\left(W_{n}\right)$ is split.
Corollary 6.3. $\operatorname{Irr}_{K} K \Sigma^{\prime}\left(W_{n}\right)=\left\{\pi_{\lambda}^{K} \mid \lambda \in \operatorname{Bip}_{p^{\prime}}(n)\right\}$.
The formula for the irreducible characters of $K \Sigma^{\prime}\left(W_{n}\right)$ is given by 1.7.
6.B. Radical. The aim of this subsection is to describe the radical of $K \Sigma^{\prime}\left(W_{n}\right)$ in full generality. If $p=0$, then this is done in Theorem $\mathrm{B}(\mathrm{d})$. Let $\operatorname{Comp}_{p}(n)=\{C \in$ $\operatorname{Comp}(n) \mid p$ divides $|\mathcal{W}(C)|\}$. The next result must be compared with [APVW, Theorem $3]$ :

Theorem 6.4. If $K$ is a field of characteristic $p$, then

$$
\operatorname{Rad} K \Sigma^{\prime}\left(W_{n}\right)=\operatorname{Ker} \theta_{n}^{K}+\sum_{C \in \operatorname{Comp}_{p}(n)} K x_{C}
$$

Proof. Let $\mathcal{I}=\operatorname{Ker} \theta_{n}^{K}+\sum_{C \in \operatorname{Comp}_{p}(n)} K x_{C}$. By Proposition 6.1, we get that

$$
\operatorname{Rad} K \Sigma^{\prime}\left(W_{n}\right)=\bigcap_{\lambda \in \operatorname{Bip}(n)} \operatorname{Ker} \pi_{\lambda}^{K}
$$

Now, if $\lambda \in \operatorname{Bip}(n)$, then $\operatorname{Ker} \theta_{n}^{K} \subset \operatorname{Ker} \pi_{\lambda}^{K}$ and $x_{C} \subset \operatorname{Ker} \pi_{\lambda}^{K}$ for every $C \in \operatorname{Comp}_{p}(n)$ by 1.7 and by Lemma 1.10 (e). Therefore, $\mathcal{I} \subset \operatorname{Rad} K \Sigma^{\prime}\left(W_{n}\right)$.

Now, let $x \in \operatorname{Rad} K \Sigma^{\prime}\left(W_{n}\right)$. We want to prove that $x \in I$. Let $C \in \operatorname{Comp}(n)$ be maximal (for the preorder $\subset_{\boldsymbol{\lambda}}$ ) such that $\xi_{C}(x) \neq 0$. By an easy induction argument (on
the preorder $\subset_{\boldsymbol{\lambda}}$ ) we only need to prove that $x^{\prime}=\sum_{C^{\prime} \equiv C} \xi_{C^{\prime}}(x) x_{C^{\prime}}$ belongs to $\mathcal{I}$. Let $\lambda=\boldsymbol{\lambda}(C)$. Then, by Lemma 1.10 (d) and by 1.7, we have

$$
0=\pi_{\lambda}(x)=\pi_{\lambda}\left(x^{\prime}\right)=|\mathcal{W}(C)| \sum_{C^{\prime} \equiv C} \xi_{C^{\prime}}(x) .
$$

To cases may occur:

- If $C \in \operatorname{Comp}_{p}(n)$, then $x^{\prime} \in \sum_{D \in \operatorname{Comp}_{p}(n)} K x_{D} \subset \mathcal{I}$.
- If $C \notin \operatorname{Comp}_{p}(n)$, then $p$ does not divide $|\mathcal{W}(C)|$, so $\sum_{C^{\prime} \equiv C} \xi_{C^{\prime}}(x)=0$. So $x^{\prime} \in$ $\operatorname{Ker} \theta_{n}^{K} \subset \mathcal{I}$. This completes the proof of the proposition.

Corollary 6.5. $|\operatorname{Bip}(n)|=\left|\operatorname{Bip}_{p^{\prime}}(n)\right|+\left|\boldsymbol{\lambda}\left(\operatorname{Comp}_{p}(n)\right)\right|$.
Proof. By Proposition 6.4, we get that

$$
\operatorname{dim}_{K}\left(\operatorname{Rad} K \Sigma^{\prime}\left(W_{n}\right)\right)=\operatorname{dim}_{K}\left(\operatorname{Ker} \theta_{n}^{K}\right)+\left|\boldsymbol{\lambda}\left(\operatorname{Comp}_{p}(n)\right)\right| .
$$

On the other hand, we have

$$
\operatorname{dim}_{K} K \Sigma^{\prime}\left(W_{n}\right)=\operatorname{dim}_{K}\left(\operatorname{Ker} \theta_{n}^{K}\right)+|\operatorname{Bip}(n)|
$$

and

$$
\operatorname{dim}_{K} K \Sigma^{\prime}\left(W_{n}\right)=\operatorname{dim}_{K}\left(\operatorname{Rad} K \Sigma^{\prime}\left(W_{n}\right)\right)+\left|\operatorname{Bip}_{p^{\prime}}(n)\right| .
$$

(the last equality follows from Proposition 6.1 (b)). The corollary now follows from these observations.

Note that the above corollary could have been proved directly by a pure combinatorial argument. Let us sketch it here. First, a bipartition $\lambda=\left(\lambda^{+}, \lambda^{-}\right)$is said p-regular (respectively $p$-singular) if it does not belong (respectively if it belongs) to $\boldsymbol{\lambda}\left(\operatorname{Comp}_{p}(n)\right)$. The set of $p$-regular partitions of $n$ (which will be denoted by $\operatorname{Bip}_{p-\mathrm{reg}}(n)$ ) can be described more concretely as follows. If $i \geqslant 1$, we denote by $r_{i}^{+}(\lambda)$ (respectively $\left.r_{i}^{-}(\lambda)\right)$ the number of occurrences of $i$ as a part of $\lambda^{+}$(respectively $\lambda^{-}$). Similarly, if $C \in \operatorname{Comp}(n)$, we denote by $r_{i}^{+}(C)$ (respectively $r_{i}^{-}(C)$ ) the number of occurrences of $i$ (respectively $-i$ ) as a part of $C$. In other words, $r_{i}^{+}(C)=r_{i}^{+}(\boldsymbol{\lambda}(C))$ and $r_{i}^{-}(C)=r_{i}^{-}(\boldsymbol{\lambda}(C))$. It is readily seen that

$$
\begin{equation*}
\mathcal{W}(C) \simeq N_{W_{n}}\left(W_{C}\right) / W_{C} \simeq \mathfrak{S}_{r_{1}^{+}(C)} \times \cdots \times \mathfrak{S}_{r_{n}^{+}(C)} \times W_{r_{1}^{-}(C)} \times \cdots \times W_{r_{n}^{-}(C)} \tag{6.6}
\end{equation*}
$$

Consequently,

$$
\begin{equation*}
\operatorname{Bip}_{2-\mathrm{reg}}(n)=\left\{\lambda \in \operatorname{Bip}(n) \mid \forall i \geqslant 1, r_{i}^{+}(\lambda) \leqslant 1 \text { and } r_{i}^{-}(\lambda)=0\right\} \tag{6.7}
\end{equation*}
$$

and, if $p$ is an odd prime number,

$$
\begin{equation*}
\operatorname{Bip}_{p-\mathrm{reg}}(n)=\left\{\lambda \in \operatorname{Bip}(n) \mid \forall i \geqslant 1, r_{i}^{+}(\lambda) \leqslant p-1 \text { and } r_{i}^{-}(\lambda) \leqslant p-1\right\} . \tag{6.8}
\end{equation*}
$$

Now, recall from $\S 1$.E that the order $o(\lambda)$ of $\operatorname{cox}_{\lambda}$ is equal to the lowest common multiple of $\left(2 \lambda_{1}^{+}, \ldots, 2 \lambda_{r}^{+}, \lambda_{1}^{-}, \ldots, \lambda_{s}^{-}\right)$, where $\lambda^{+}=\left(\lambda_{1}^{+}, \ldots, \lambda_{r}^{+}\right)$and $\left(\lambda_{1}^{-}, \ldots, \lambda_{s}^{-}\right)$. Therefore,

$$
\begin{equation*}
\operatorname{Bip}_{2^{\prime}}(n)=\left\{\lambda \in \operatorname{Bip}(n) \mid \forall i \geqslant 1, r_{i}^{+}(\lambda)=r_{2 i}^{-}(\lambda)=0\right\} \tag{6.9}
\end{equation*}
$$

and, if $p$ is an odd prime number,

$$
\begin{equation*}
\operatorname{Bip}_{p^{\prime}}(n)=\left\{\lambda \in \operatorname{Bip}(n) \mid \forall i \geqslant 1, r_{p i}^{+}(\lambda)=r_{p i}^{-}(\lambda)=0\right\} . \tag{6.10}
\end{equation*}
$$

Now, Corollary 6.5 asserts that

$$
\begin{equation*}
\left|\operatorname{Bip}_{p-\mathrm{reg}}(n)\right|=\left|\operatorname{Bip}_{p^{\prime}}(n)\right| . \tag{6.11}
\end{equation*}
$$

This can be proved directly by using the descriptions $6.7,6.8,6.9$ and 6.10 of both sets and by using the classical argument for proving the analogue of 6.11 for partitions instead of bipartitions.
6.C. Character table. Let us now talk about the character table of $K \Sigma^{\prime}\left(W_{n}\right)$. By Theorem 6.4, the classes of the elements of the family $\left(x_{\hat{\lambda}}\right)_{\lambda \in \operatorname{Bip}_{p-\text { reg }}(n)}$ in the semisimple quotient $K \Sigma^{\prime}\left(W_{n}\right) / \operatorname{Rad}\left(K \Sigma^{\prime}\left(W_{n}\right)\right)$ form a $K$-basis of this last space (recall that $\hat{\lambda}$ has been defined in §1.C: it is a representative of $\left.\boldsymbol{\lambda}^{-1}(\lambda)\right)$. Therefore, to compute an irreducible character of $K \Sigma^{\prime}\left(W_{n}\right)$, we only need to give the values on $\left(x_{\hat{\lambda}}\right)_{\lambda \in \operatorname{Bip}_{p-\mathrm{reg}}(n)}$. We call the character table of $K \Sigma^{\prime}\left(W_{n}\right)$ the square matrix $\left(\pi_{\lambda}^{K}\left(x_{\hat{\mu}}\right)\right)_{\lambda \in \operatorname{Bip}_{p^{\prime}}(n), \mu \in \operatorname{Bip}_{p-\mathrm{reg}}(n)}$. By 1.7, we have :

$$
\begin{equation*}
\text { The character table of } K \Sigma^{\prime}\left(W_{n}\right) \text { is upper triangular } \tag{6.12}
\end{equation*}
$$

(for the order $\subset$ on $\operatorname{Bip}(n)$ ).
The character tables of $\mathbb{Q} \Sigma^{\prime}\left(W_{2}\right)$ and $\mathbb{Q} \Sigma^{\prime}\left(W_{3}\right)$ will be given at the end of this paper. If $p>0$, the character table of $K \Sigma^{\prime}\left(W_{2}\right)$ and $K \Sigma^{\prime}\left(W_{3}\right)$ are obtained from the previous ones by reduction modulo $p$ and by deleting the appropriate rows and columns.

## 7. Loewy length

Recall that the Loewy length of a finite dimensional $K$-algebra $A$ is the smallest natural number $r \geqslant 1$ such that $(\operatorname{Rad} A)^{r}=0$. In this section, we shall use the description of the radical obtained in Theorem 6.4 to compute the Loewy length of $K \Sigma^{\prime}\left(W_{n}\right)$ (except if $p=2$ ). But before doing this, we determine the Loewy length of the algebra $K \operatorname{Irr} W_{n}$ :
Proposition 7.1. The Loewy length of $K \operatorname{Irr} W_{n}$ is equal to $\begin{cases}1, & \text { if } p=0 ; \\ n+1, & \text { if } p=2 ; \\ {[n / p]+1,} & \text { if } p>2 .\end{cases}$
Proof. The result is obvious if $p=0$ so we may, and we will, assume that $p>0$. If $G$ is a finite group, we denote by $\ell_{p}(G, 1)$ the Loewy length of the principal block of $K \operatorname{Irr} G$ (see [B2, $\S 3]$ for the definition of the principal block of $K \operatorname{Irr} G$ : it is the unique block on which the degree map deg: $K \operatorname{Irr} G \rightarrow K$ is non-zero). We denote by $\ell_{p}(n)$ the Loewy length of $K \operatorname{Irr} W_{n}$. Then

$$
\begin{equation*}
\ell_{p}(n) \geqslant \ell_{p}\left(W_{n}, 1\right) \tag{1}
\end{equation*}
$$

If $p$ is odd, then it follows from [B2, Proposition 4.7 (d)] that $\ell_{p}\left(W_{n}, 1\right)=\ell_{p}\left(\mathfrak{S}_{n}, 1\right)$. But, by $\left[\mathrm{B} 2\right.$, Corollary 5.8], we have $\ell_{p}\left(\mathfrak{S}_{n}, 1\right)=[n / p]+1$. On the other hand, since $W_{n}$ is isomorphic to a subgroup of $\mathfrak{S}_{2 n}$ of odd index, it follows from [B2, Proposition 4.7 (a)] that $\ell_{2}\left(W_{n}, 1\right) \geqslant \ell_{2}\left(\mathfrak{S}_{2 n}, 1\right)$. But, by [B2, Corollary 5.8], we have $\ell_{2}\left(\mathfrak{S}_{2 n}, 1\right)=n+1$. So, by using (1), we have proved that

$$
\ell_{p}(n) \geqslant \begin{cases}n+1, & \text { if } p=2  \tag{2}\\ {[n / p]+1,} & \text { if } p>2\end{cases}
$$

We shall now prove that these inequalities are actually equalities. For this, we shall need some notation. Recall that the $p$-rank of a finite group $G$ is the maximal possible rank of an elementary abelian $p$-subgroup of $G$. It will be denoted by $\mathrm{rk}_{p}(G)$. We have

$$
\operatorname{rk}_{p}\left(\mathfrak{S}_{n}\right)=[n / p] \quad \text { and } \quad \operatorname{rk}_{p}\left(W_{n}\right)= \begin{cases}n & \text { if } p=2 \\ {[n / p]} & \text { if } p>2\end{cases}
$$

If $\lambda \in \operatorname{Bip}(n)$, we set

$$
\varphi_{\lambda}=\theta_{n}^{K}\left(x_{\hat{\lambda}}\right) \quad \text { and } \quad \operatorname{rk}_{p}(\lambda)=\operatorname{rk}_{p}(\mathcal{W}(\hat{\lambda})) .
$$

In other words, by 6.6, we have

$$
\operatorname{rk}_{p}(\lambda)= \begin{cases}\sum_{i \geqslant 1}\left(\left[r_{i}^{+}(\lambda) / 2\right]+r_{i}^{-}(\lambda)\right) & \text { if } p=2, \\ \sum_{i \geqslant 1}\left(\left[r_{i}^{+}(\lambda) / p\right]+\left[r_{i}^{-}(\lambda) / p\right]\right) & \text { if } p>2 .\end{cases}
$$

In particular, $\pi_{2}(\lambda) \in\{0,1,2, \ldots n\}$ and, if $p$ is odd, then $\pi_{p}(\lambda) \in\{0,1,2, \ldots,[n / p]\}$. Note that $\lambda \in \operatorname{Bip}_{p-\mathrm{reg}}(n)$ if and only if $\pi_{p}(\lambda)=0$. Note also that $\left(\varphi_{\lambda}\right)_{\lambda \in \operatorname{Bip}(n)}$ is a $K$-basis of $K \operatorname{Irr} W_{n}$ (see Theorem B). Now, by (2), it is sufficient to show that, if $i \geqslant 0$, then

$$
\begin{equation*}
\left(\operatorname{Rad}\left(K \operatorname{Irr} W_{n}\right)\right)^{i} \subset \underset{\operatorname{rk}_{p}(\lambda) \geqslant i}{\oplus} K \varphi_{\lambda} . \tag{3}
\end{equation*}
$$

So let us now prove (3). Let $\mathcal{I}_{i}=\underset{\mathrm{rk}_{p}(\lambda) \geqslant i}{\oplus} K \chi_{\lambda}$. We denote by $\mathcal{I}_{i} \mathcal{I}_{j}$ the space of $K$-linear combinations of elements of the form $x y$, where $x \in \mathcal{I}_{i}$ and $y \in \mathcal{I}_{j}$. Then

$$
\begin{equation*}
\mathcal{I}_{i} \mathcal{I}_{j} \subset \mathcal{I}_{i+j} \tag{4}
\end{equation*}
$$

Proof of (4). We proceed as in [B1, proof of ( $\boldsymbol{\mathcal { H }})$ ]. For simplification, we set $\mathcal{N}_{C}=N_{W_{n}}\left(W_{C}\right)$ for every $C \in \operatorname{Comp}(n)$. We have, for $\lambda, \mu \in \operatorname{Bip}(n)$,

$$
\varphi_{\lambda} \varphi_{\mu}=\sum_{d \in X_{\lambda \hat{\mu}}} \varphi_{\lambda(\hat{\lambda} \cap d \hat{\mu})} .
$$

The group $\mathcal{W}(\hat{\lambda}) \times \mathcal{W}(\hat{\mu})$ acts on $X_{\hat{\lambda} \hat{\mu}}(\mathcal{W}(\hat{\lambda})$ acts by left multiplication while $\mathcal{W}(\hat{\mu})$ acts by right multiplication). If $d \in X_{\hat{\lambda} \hat{\mu}}$ and $(x, y) \in \mathcal{W}(\hat{\lambda}) \times \mathcal{W}(\hat{\mu})$, then the groups $W_{\hat{\lambda}} \cap{ }^{d} W_{\hat{\mu}}$ and $W_{\hat{\lambda}} \cap^{x d y^{-1}} W_{\hat{\mu}}={ }^{x}\left(W_{\hat{\lambda}} \cap^{d} W_{\hat{\mu}}\right)$ are conjugate. In other words,

$$
\boldsymbol{\lambda}\left(\hat{\lambda} \cap{ }^{d} \hat{\mu}\right)=\boldsymbol{\lambda}\left(\hat{\lambda} \cap^{x d y^{-1}} \hat{\mu}\right) .
$$

So, if $X_{\hat{\lambda} \hat{\mu}}^{\prime}$ denotes a set of representatives of $(\mathcal{W}(\hat{\lambda}) \times \mathcal{W}(\hat{\mu}))$-orbits in $X_{\hat{\lambda} \hat{\mu}}$, then

$$
\varphi_{\lambda} \varphi_{\mu}=\sum_{d \in X_{\hat{\lambda} \hat{\mu}}^{\prime}} n_{\lambda, \mu, d} \varphi_{\boldsymbol{\lambda}(\hat{\lambda} \cap d \hat{\mu})}
$$

where $n_{\lambda, \mu, d}$ denotes the cardinality of the orbit of $d$. So it is sufficient to show that, if $p$ does not divide $n_{\lambda, \mu, d}$, then $\operatorname{rk}_{p}\left(\boldsymbol{\lambda}\left(\hat{\lambda} \cap{ }^{d} \hat{\mu}\right)\right) \geqslant \operatorname{rk}_{p}(\lambda)+\operatorname{rk}_{p}(\mu)$.

So let $d \in X_{\hat{\lambda} \hat{\mu}}^{\prime}$ be such that $p$ does not divide $n_{\lambda, \mu, d}$. Let

$$
\begin{aligned}
& \Delta_{d}: \mathcal{N}_{\hat{\lambda}} \cap{ }^{d} \mathcal{N}_{\hat{\mu}} \longrightarrow \\
& w \longmapsto\left(\mathcal{N}_{\hat{\lambda}} \times \mathcal{N}_{\hat{\mu}}\right. \\
& \longmapsto\left(w, d^{-1} w d\right) .
\end{aligned}
$$

Let $\tilde{\Delta}_{d}: \mathcal{N}_{\hat{\lambda}} \cap^{d} \mathcal{N}_{\hat{\mu}} \rightarrow \mathcal{W}(\hat{\lambda}) \times \mathcal{W}(\hat{\mu})$ denote the composition of $\Delta_{d}$ with the canonical projection. Then $\tilde{\Delta}_{d}$ induces an injective morphism $\bar{\Delta}_{d}$ : $\mathcal{W}(\lambda, \mu, d) \rightarrow \mathcal{W}(\hat{\lambda}) \times \mathcal{W}(\mu)$, where $\mathcal{W}(\lambda, \mu, d)=\left(\mathcal{N}_{\hat{\lambda}} \cap^{d} \mathcal{N}_{\hat{\mu}}\right) / W_{\hat{\lambda} \cap d \hat{\mu}}$. Then it is easily checked that $\bar{\Delta}_{d}(\mathcal{W}(\lambda, \mu, d))$ is the stabilizer of $d$ in $\mathcal{W}(\hat{\lambda}) \times \mathcal{W}(\hat{\mu})$. In particular,

$$
n_{\lambda, \mu, d}=\frac{|\mathcal{W}(\hat{\lambda})| \cdot|\mathcal{W}(\hat{\mu})|}{|\mathcal{W}(\lambda, \mu, d)|}
$$

So, since $p$ does not divide $n_{\lambda, \mu, d}$, this means that, if $P$ a Sylow $p$-subgroup of $\mathcal{W}(\lambda, \mu, d)$, then $\bar{\Delta}_{d}(P)$ is a Sylow $p$-subgroup of $\mathcal{W}(\hat{\lambda}) \times \mathcal{W}(\hat{\mu})$. In particular, $\operatorname{rk}_{p}(\mathcal{W}(\lambda, \mu, d)) \geqslant \operatorname{rk}_{p}(\lambda)+\operatorname{rk}_{p}(\mu)$. Now, $\mathcal{W}(\lambda, \mu, d)$ is a subgroup of $\mathcal{W}\left(\hat{\lambda} \cap{ }^{d} \hat{\mu}\right)$. So $\operatorname{rk}_{p}\left(\boldsymbol{\lambda}\left(\hat{\lambda} \cap{ }^{d} \hat{\mu}\right)\right) \geqslant \operatorname{rk}_{p}(\lambda)+\operatorname{rk}_{p}(\mu)$, as desired.

By (4), $\mathcal{I}_{i}$ is an ideal of $K \operatorname{Irr} W_{n}=\mathcal{I}_{0}$. Moreover, again by (4), $\mathcal{I}_{1}$ consists of nilpotent elements. So $\mathcal{I}_{1} \subset \operatorname{Rad}\left(K \operatorname{Irr} W_{n}\right)$. On the other hand, $\operatorname{dim}_{K} \mathcal{I}_{1}=|\operatorname{Bip}(n)|-\left|\operatorname{Bip}_{p-\mathrm{reg}}(n)\right|$, so $\operatorname{dim}_{K} \mathcal{I}_{1}=\operatorname{dim}_{K}\left(\operatorname{Rad}\left(K \operatorname{Irr} W_{n}\right)\right)\left(\right.$ see $[B 2$, Corollary 2.16] $)$. So $\mathcal{I}_{1}=\operatorname{Rad}\left(K \operatorname{Irr} W_{n}\right)$. But, by (4), $\mathcal{I}_{1}^{i} \subset \mathcal{I}_{i}$. This shows (3), so the proof of the proposition is complete.

We are now ready to prove the main theorem of this section (compare with [BP, §5.E]):
Theorem 7.2. If $p \neq 2$, then the Loewy length of $K \Sigma^{\prime}\left(W_{n}\right)$ is $n$. If $p=2$, then this Loewy length lies in $\{n, n+1, \ldots, 2 n-1\}$.

Proof. Let $l_{p}(n)$ denote the Loewy length of $K \Sigma^{\prime}\left(W_{n}\right)$. If $n=1$, then the result of the Theorem is easily checked. So we may, and we will, assume that $n \geqslant 2$. The proof will proceed in two steps.

- First step: upper bound. We use here the notation of Example 2.10. Let us first prove the following result: if $k \geqslant 0$ and if $x \in \operatorname{Rad} K \Sigma^{\prime}\left(W_{n}\right)$, then:

$$
\begin{equation*}
x K \Sigma_{\mathcal{F}_{k}^{-}(n)}^{\prime}\left(W_{n}\right) \subset K \Sigma_{\mathcal{F}_{k+1}^{-}(n)}^{\prime}\left(W_{n}\right) \tag{1}
\end{equation*}
$$

$$
\begin{equation*}
\text { If } p \neq 2 \text {, then } x K \Sigma_{\mathcal{F}_{k}(n)}^{\prime}\left(W_{n}\right) \subset K \Sigma_{\mathcal{F}_{k+1}(n)}^{\prime}\left(W_{n}\right) \tag{2}
\end{equation*}
$$

Proof of (1) and (2). Let $A_{n}$ denote the algebra $K \Sigma^{\prime}\left(W_{n}\right) / K \Sigma_{\mathcal{F}_{1}^{-}(n)}^{\prime}\left(W_{n}\right)$. Recall that $K \Sigma_{\mathcal{F}_{1}^{-}(n)}^{\prime}\left(W_{n}\right)$ is a two-sided ideal of $K \Sigma^{\prime}\left(W_{n}\right)$ (see Example 2.10). Then $A_{n} \simeq K[T] /(T(T-2))$, where $T$ is an indeterminate. Indeed, $A_{n}$ has dimension 2 and is generated by the image $t_{n}$ of $x_{(-n)}$ and it is easily checked that $t_{n}^{2}=2 t_{n}$ (this follows for instance from Proposition C (c), from Proposition 2.3, from Lemma 1.10 (c) and from the fact that $\left.\left|N_{W_{n}}\left(\mathfrak{S}_{n}\right) / \mathfrak{S}_{n}\right|=|\mathcal{W}(-n)|=2\right)$. In particular, if $p \neq 2$, then $A_{n} \simeq K \times K$ is split semisimple.

Now, let $D \in \operatorname{Comp}(n)$. Write $D=\left(d_{1}, \ldots, d_{r}\right)$ and let $a=\operatorname{Res}_{D^{+}}(x)$. Then

$$
x x_{D}=x_{D^{+}} a x_{D}^{D^{+}} .
$$

Since $\operatorname{Res}_{D^{+}}$is a morphism of algebras, $a$ is a nilpotent element of the algebra $\Sigma^{\prime}\left(W_{D^{+}}\right) \simeq \Sigma^{\prime}\left(W_{\left|d_{1}\right|}\right) \otimes \cdots \otimes \Sigma^{\prime}\left(W_{\left|d_{r}\right|}\right)$. In particular, its image $\bar{a}$ in $A_{D^{+}}=A_{\left|d_{1}\right|} \otimes \cdots \otimes A_{\left|d_{r}\right|}$ is also nilpotent. So, if $D \in \mathcal{F}_{k}^{-}(n)$ (respectively if $D \in \mathcal{F}_{k}(n)$ and $\left.p \neq 2\right)$ then the above description of $A_{n}$ shows that $x x_{D} \in K \Sigma_{\mathcal{F}_{k+1}^{-}(n)}^{\prime}\left(W_{n}\right)$ (respectively $\left.x x_{D} \in K \Sigma_{\mathcal{F}_{k+1}(n)}^{\prime}\left(W_{n}\right)\right)$.

Since $\mathcal{F}_{n}(n)=\mathcal{F}_{2 n}^{-}(n)=\varnothing$, then the statement (1) above shows that $l_{2}(n) \leqslant 2 n$ and the statement (2) shows that, if $p \neq 2$, then $l_{p}(n) \leqslant n$. We shall show now that, if $n \geqslant 2$, then $l_{2}(n) \leqslant 2 n-1$. So let $a_{1}, \ldots, a_{2 n-1} \in \operatorname{Rad} K \Sigma^{\prime}\left(W_{n}\right)$. Then, by (a), we have

$$
a_{1} \ldots a_{2 n-1} \in K \Sigma_{\mathcal{F}_{2 n}(n)}^{\prime}\left(W_{n}\right)=K x_{(-1,-1, \ldots,-1)} .
$$

Let $\lambda \in K$ be such that $a_{1} \ldots a_{2 n-1}=\lambda x_{(-1,-1, \ldots,-1)}$. Then $\theta_{n}^{K}\left(a_{1} \ldots a_{2 n-1}\right)=\lambda \chi_{n}$, where $\chi_{n}$ is the regular character of $W_{n}$. But, since $\theta_{n}^{K}\left(a_{i}\right)$ belongs to the radical of the $K$-algebra $K \operatorname{Irr} W_{n}$, since this algebra has Loewy length $\leqslant n+1$ (see Proposition 7.1) and since $n+1 \leqslant 2 n-1$ (because $n \geqslant 2$ ), we get that $\lambda=0$, as desired. So we have proved the following results:

$$
\begin{equation*}
\text { If } n \geqslant 2 \text {, then } l_{2}(n) \leqslant 2 n-1 \text {. } \tag{3}
\end{equation*}
$$

$$
\begin{equation*}
\text { If } p \neq 2 \text {, then } l_{p}(n) \leqslant n \text {. } \tag{4}
\end{equation*}
$$

- Second step: lower bound. Let $a=x_{(n-1,-1)}-x_{(-1, n-1)}$. Then $a \in \operatorname{Ker} \theta_{n}^{K}$. If $1 \leqslant i \leqslant n$, let $C_{i}$ denote the signed compositions $(1, \ldots, 1,-1,1, \ldots, 1)$ of $n$, where the -1 term is in position $i$. Then:

$$
\begin{equation*}
a^{n-1}=\sum_{i=1}^{n}(-1)^{i}\binom{n-1}{i-1} x_{C_{i}} . \tag{5}
\end{equation*}
$$

Proof of (5). If $1 \leqslant j \leqslant n$ and if $1 \leqslant i \leqslant n+1-j$, we denote by $C_{i, j}$ the signed composition $(-1, \ldots,-1, j,-1, \ldots,-1)$, where $j$ appears in the $i$-th position (for instance, $C_{i, 1}=C_{i}$ ). For simplification, we set $s_{i, j}=x_{C_{i, j}}$. We have in particular $a=s_{1, n-1}-s_{2, n-1}$. We want to show by induction on $k \in\{1,2, \ldots, n-1\}$ that

$$
\begin{equation*}
a^{k}=\sum_{i=1}^{k+1}(-1)^{i}\binom{k}{i-1} s_{i, n-k} \tag{+}
\end{equation*}
$$

Note that the formula (5) is obtained by specialising $k$ to $n-1$ in the formula $\left(5^{+}\right)$. For proving $\left(5^{+}\right)$by induction, it is sufficient to show that

$$
s_{1, n-1} s_{i, j}=\alpha_{i, j} s_{i, j}+s_{i, j-1} \quad \text { and } \quad s_{2, n-1} s_{i, j}=\alpha_{i, j} s_{i, j}+s_{i+1, j-1}
$$

for some $\alpha_{i, j} \in \mathbb{N}$. The first equality is easily checked using the description of $X_{n-1,-1}$ given in the proof of Proposition 5.7. The second one follows from a similar argument.

The statement (5) above shows that $l_{p}(n) \geqslant n$. By (3) and (4), the proof of the Theorem is complete.

Remark 7.3 - Keep the notation of the proof of the previous Theorem. It is probable that $l_{2}(n)=2 n-1$ whenever $n \geqslant 2$ (note that $l_{2}(1)=2, l_{2}(2)=3, l_{2}(3)=5, l_{2}(4)=7$ and $\left.l_{2}(5)=9\right)$. In fact, it is probable that the element $a$ defined in the above proof lies in $\left(\operatorname{Rad} \mathbb{F}_{2} \Sigma^{\prime}\left(W_{n}\right)\right)^{2}$ (it has been checked for $\left.n \leqslant 5\right)$ : this would imply that $l_{2}(n)=2 n-1$ for $n \geqslant 2$ (see the statement (5) of the above proof).

## 8. Projective modules, Cartan matrix

8.A. Projective modules. If $\lambda \in \operatorname{Bip}(n)$, we denote by $e_{\lambda}^{\mathbb{Q}}: W_{n} \rightarrow \mathbb{Q}$ the characteristic function of $\mathcal{C}(\lambda)$. We may, and we will, view it as an element of $\mathbb{Q} \operatorname{Irr} W_{n}$ : we have

$$
\begin{equation*}
e_{\lambda}^{\mathbb{Q}}=\frac{|\mathcal{C}(\lambda)|}{\left|W_{n}\right|} \sum_{\chi \in \operatorname{Irr} W_{n}} \chi\left(\operatorname{cox}_{\lambda}\right) \chi . \tag{8.1}
\end{equation*}
$$

Then $\left(e_{\lambda}^{\mathbb{Q}}\right)_{\lambda \in \operatorname{Bip}(n)}$ is a family of orthogonal primitive idempotents of $\mathbb{Q} \operatorname{Irr} W_{n}$ such that $\sum_{\lambda \in \operatorname{Bip}(n)} e_{\lambda}^{\mathbb{Q}}=1_{n}$. Since the morphism $\theta_{n}^{\mathbb{Q}}$ is surjective, there exists [T, Theorem 3.1 (f)] a family $\left(E_{\lambda}^{\mathbb{Q}}\right)_{\lambda \in \operatorname{Bip}(n)}$ of primitive idempotents of $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$ such that
(1) $\forall \lambda \in \operatorname{Bip}(n), \theta_{n}^{\mathbb{Q}}\left(E_{\lambda}^{\mathbb{Q}}\right)=e_{\lambda}^{\mathbb{Q}}$.
(2) $\forall \lambda, \mu \in \operatorname{Bip}(n), E_{\lambda}^{\mathbb{Q}} E_{\mu}^{\mathbb{Q}}=E_{\mu}^{\mathbb{Q}} E_{\lambda}^{\mathbb{Q}}=\delta_{\lambda \mu} E_{\lambda}^{\mathbb{Q}}$.
(3) $\sum_{\lambda \in \operatorname{Bip}(n)} E_{\lambda}^{\mathbb{Q}}=1$.

Let $\mathcal{P}_{\lambda}^{\mathbb{Q}}=\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right) E_{\lambda}^{\mathbb{Q}}$. It is an indecomposable projective $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$-module: this is the projective cover of $\mathcal{D}_{\lambda}^{\mathbb{Q}}$. Moreover,

$$
\begin{equation*}
\underset{\lambda \in \operatorname{Bip}(n)}{\oplus} \mathcal{P}_{\lambda}^{\mathbb{Q}}=\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right) . \tag{8.2}
\end{equation*}
$$

If $p=0$, then $\mathbb{Q} \subset K$ and we set $E_{\lambda}^{K}=E_{\lambda}^{\mathbb{Q}}$. Note that, if $p=0$, then $\left(E_{\lambda}^{K}\right)_{\lambda \in \operatorname{Bip}(n)}$ is still a family of orthogonal primitive idempotents of $K \Sigma^{\prime}\left(W_{n}\right)$ (since $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$ is split).

Example 8.3 - We keep the notation introduced in Example 4.7. If $I \subset I_{n}^{+}$, then

$$
\boldsymbol{\lambda}(\mathbf{C}(I))=((\underbrace{1,1, \ldots, 1}_{|I| \text { times }}),(\underbrace{1,1, \ldots, 1}_{n-|I| \text { times }})) .
$$

Then
the idempotent $x_{\mathbf{C}(I)}^{\prime} /\left(2^{n-|I|}\left|\mathfrak{S}_{n}(I)\right|\right)$ is conjugate to $E_{\boldsymbol{\lambda}(\mathbf{C}(I))}^{\mathbb{Q}}$.
Let us prove this result. Since $x_{\mathbf{C}(I)}^{\prime} /\left(2^{n-|I|}\left|\mathfrak{S}_{n}(I)\right|\right)$ is an idempotent (see 4.9), it is sufficient to show that $\theta_{n}^{\mathbb{Q}}\left(x_{\mathbf{C}(I)}^{\prime} /\left(2^{n-|I|}\left|\mathfrak{S}_{n}(I)\right|\right)\right)=\theta_{n}^{\mathbb{Q}}\left(E_{\boldsymbol{\lambda}(\mathbf{C}(I))}^{\mathbb{Q}}\right)$ (see [T, Theorem 3.1 (e)]). In other words, it is sufficient to show that $\theta_{n}^{\mathbb{Q}}\left(x_{\mathbf{C}(I)}^{\prime}\right)$ is a multiple of $e_{\boldsymbol{\lambda}(\mathbf{C}(I)}^{\mathbb{Q}}$.

If $J \subset I_{n}^{+}$, let $\mathfrak{T}_{J}$ denote the subgroup of $\mathfrak{T}_{n}$ generated by $\left(t_{i}\right)_{i \in J}$ and let $t_{J}=\prod_{i \in J} t_{i}$. Then $t_{J} \in \mathcal{C}(\boldsymbol{\lambda}(\mathbf{C}(J)))$ and

$$
\theta_{n}^{\mathbb{Q}}\left(x_{\mathbf{C}(I)}^{\prime}\right)=\operatorname{Ind}_{\mathfrak{T}_{I}}^{W_{n}} f_{I}, \quad \text { where } \quad f_{I}=\sum_{J \subset I}\left(-\frac{1}{2}\right)^{|I|-|J|} 1_{J}
$$

Here, $1_{J}$ denotes the trivial character of $\mathfrak{T}_{J}$. It is now sufficient to show that $f_{I}$ is the characteristic function of $\left\{t_{I}\right\}$ in $\mathfrak{T}_{I}$ : since $\mathfrak{T}_{I}$ is an elementary abelian 2-group, this is easily reduced, by direct products, to the case where $|I|=1$ (for which it is obvious).

Let us now assume that $p>0$. For each $\lambda \in \operatorname{Bip}_{p^{\prime}}(n)$, we denote by $\mathcal{C}_{p^{\prime}}(\lambda)$ the set of elements $w$ in $W_{n}$ such that $w_{p^{\prime}}$ belongs to $\mathcal{C}(\lambda)$. It is a union of conjugacy classes of $W_{n}$. We set

$$
e_{\lambda, p^{\prime}}^{\mathbb{Q}}=\sum_{\substack{\mu \in \operatorname{Bip}(n) \\ \mu_{p^{\prime}}=\mu}} e_{\mu}^{\mathbb{Q}}
$$

This is the characteristic function of $\mathcal{C}_{p^{\prime}}(\lambda)$. It is an idempotent of $\mathbb{Q} \operatorname{Irr} W_{n}$ and, by $[\mathrm{B} 2$, Corollary 2.21], it is a primitive idempotent of $\mathbb{Z}_{(p)} \operatorname{Irr} W_{n}$. We denote by $e_{\lambda}^{K}$ its image in $K \operatorname{Irr} W_{n}$ : it is still a primitive idempotent of $K \operatorname{Irr} W_{n}$. Then $\left(e_{\lambda}^{K}\right)_{\lambda \in \operatorname{Bip}_{p^{\prime}}(n)}$ is a family of orthogonal primitive idempotents of $K \operatorname{Irr} W_{n}$ such that $\sum_{\lambda \in \operatorname{Bip}_{p^{\prime}}(n)} e_{\lambda}^{K}=1_{n}$. Since the morphism $\theta_{n}^{K}$ is surjective, there exists $[\mathrm{T}$, Theorem $3.1(\mathrm{f})]$ a family $\left(E_{\lambda}^{K}\right)_{\lambda \in \operatorname{Bip}_{p^{\prime}}(n)}$ of primitive idempotents of $K \Sigma^{\prime}\left(W_{n}\right)$ such that
(1) $\forall \lambda \in \operatorname{Bip}_{p^{\prime}}(n), \theta_{n}^{K}\left(E_{\lambda}^{K}\right)=e_{\lambda}^{K}$.
(2) $\forall \lambda, \mu \in \operatorname{Bip}_{p^{\prime}}(n), E_{\lambda}^{K} E_{\mu}^{K}=E_{\mu}^{K} E_{\lambda}^{K}=\delta_{\lambda \mu} E_{\lambda}^{K}$.
(3) $\sum_{\lambda \in \operatorname{Bip}(n)} E_{\lambda}^{K}=1$.

Let $\mathcal{P}_{\lambda}^{K}=K \Sigma^{\prime}\left(W_{n}\right) E_{\lambda}^{K}$. It is an indecomposable projective $K \Sigma^{\prime}\left(W_{n}\right)$-module: this is the projective cover of $\mathcal{D}_{\lambda}^{K}$. Moreover,

$$
\begin{equation*}
\underset{\lambda \in \operatorname{Bip}_{p^{\prime}}(n)}{\oplus} \mathcal{P}_{\lambda}^{K}=K \Sigma^{\prime}\left(W_{n}\right) \tag{8.5}
\end{equation*}
$$

We conclude this section by a useful remark on the idempotents $E_{\lambda}^{\mathbb{Q}}$ : this will be used for proving the unitriangularity of the Cartan matrix of $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$.

Proposition 8.6. Let $D \in \operatorname{Comp}(n)$, let $\lambda=\boldsymbol{\lambda}(D)$ and let $D^{\prime}$ be a semi-positive signed composition of $n$ such that $D \subset D^{\prime}$. Then there exists a primitive idempotent $E$ of $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$ satisfying the following two conditions:
(a) $\theta_{n}^{\mathbb{Q}}(E)=e_{\lambda}^{\mathbb{Q}}$.
(b) $E \in \mathbb{Q} \Sigma^{\prime}\left(W_{n}\right) x_{D^{\prime}}$.

In particular, $E$ is conjugate to $E_{\lambda}^{\mathbb{Q}}$.
Remark 8.7 - In the above Proposition, one can choose $D^{\prime}=D^{+}$.
Proof. For simplification, let $\mathcal{K}=\operatorname{Ker}\left(\operatorname{Res}_{D^{\prime}}\right)$ and $\mathcal{I}=\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right) x_{D^{\prime}}$. By Proposition 5.4 (b), we have

$$
\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)=\mathcal{K} \oplus \mathcal{I}
$$

In particular, the restriction of $\operatorname{Res}_{D^{\prime}}$ to the left ideal $\mathcal{I}$ is injective. Moreover, as a direct consequence of the hypothesis, we get that $\operatorname{Res}_{W_{D^{\prime}}}^{W_{n}} \Theta_{\lambda}^{\mathbb{Q}} \neq 0$, so in particular $\operatorname{Res}_{D^{\prime}} E_{\lambda}^{\mathbb{Q}} \neq 0$ (see also Proposition 5.1 (d)). Let us write $E_{\lambda}^{\mathbb{Q}}=A+E$, with $A \in \mathcal{K}$ and $E \in \mathcal{I}$. Then $E^{2}-E \in \mathcal{I}$ and $\operatorname{Res}_{D^{\prime}}\left(E^{2}-E\right)=\operatorname{Res}_{D^{\prime}}\left(\left(E_{\lambda}^{\mathbb{Q}}\right)^{2}-E_{\lambda}^{\mathbb{Q}}\right)=0$. Therefore, $E^{2}=E$. Moreover, $A E \in \mathcal{K} \cap \mathcal{I}$, so $A E=0$. In other words, $E_{\lambda}^{\mathbb{Q}} E=E^{2}=E$. This shows in particular that

$$
\begin{equation*}
\operatorname{dim}_{\mathbb{Q}} \mathbb{Q} \Sigma^{\prime}\left(W_{n}\right) E=\operatorname{dim}_{\mathbb{Q}} \mathbb{Q} \Sigma^{\prime}\left(W_{n}\right) E_{\lambda}^{\mathbb{Q}} E \leqslant \operatorname{dim}_{\mathbb{Q}} \mathbb{Q} \Sigma^{\prime}\left(W_{n}\right) E_{\lambda}^{\mathbb{Q}} . \tag{*}
\end{equation*}
$$

Now, $\operatorname{Res}_{D^{\prime}}\left(E_{\lambda}^{\mathbb{Q}}\right)=\operatorname{Res}_{D^{\prime}}(E)$. Since $E_{\lambda}^{\mathbb{Q}}$ is primitive, this implies that $E=\mathcal{E}_{\lambda}+F$, where $\mathcal{E}_{\lambda}$ and $F$ are orthogonal idempotent and $\mathcal{E}_{\lambda}$ is conjugate to $E_{\lambda}^{\mathbb{Q}}$ (see [T, Theorem 3.2 (c)]). But, by (*), we get that $F=0$, so that $\theta_{n}^{\mathbb{Q}}(E)=e_{\lambda}^{\mathbb{Q}}$. This shows the proposition.
8.B. About the structure of $\boldsymbol{K} \boldsymbol{W}_{\boldsymbol{n}}$ as a left $\boldsymbol{K} \boldsymbol{\Sigma}^{\prime}\left(\boldsymbol{W}_{\boldsymbol{n}}\right)$. The next result is the analogue of [BBHT, Theorem 7.15]:

Proposition 8.8. If $p=0$ and if $\lambda \in \operatorname{Bip}(n)$, then $\operatorname{dim}_{K} K W_{n} E_{\lambda}^{K}=|\mathcal{C}(\lambda)|$.
Proof. We may assume that $K=\mathbb{Q}$. Let $\mathcal{I}_{n}: \mathbb{Q} W_{n} \rightarrow \mathbb{Q}$ denote the unique linear map such that $\mathcal{T}_{n}(1)=1$ and $\mathcal{T}_{n}(w)=0$ for every $w \in W_{n}$ which is different from 1. Then $\mathcal{T}_{n}$ is the canonical symmetrizing form on $\mathbb{Q} W_{n}$. Now, if $x \in \mathbb{Q} W_{n}$, then the trace of the multiplication by $x$ on $\mathbb{Q} W_{n}$ (on the left or on the right) is equal to $\left|W_{n}\right| \mathcal{T}_{n}(x)$. Therefore, since $E_{\lambda}^{\mathbb{Q}}$ is an idempotent, $\operatorname{dim}_{\mathbb{Q}} \mathbb{Q} W_{n} E_{\lambda}^{\mathbb{Q}}=\left|W_{n}\right| \mathcal{T}_{n}\left(E_{\lambda}^{\mathbb{Q}}\right)$. But, by [BH, Proposition 3.8], we have

$$
\mathcal{T}_{n}\left(E_{\lambda}^{\mathbb{Q}}\right)=\left\langle\theta_{n}^{\mathbb{Q}}\left(E_{\lambda}^{\mathbb{Q}}\right), \theta_{n}^{\mathbb{Q}}(1)\right\rangle_{W_{n}}=\left\langle e_{\lambda}^{\mathbb{Q}}, 1_{n}\right\rangle_{W_{n}}=\frac{|\mathcal{C}(\lambda)|}{\left|W_{n}\right|},
$$

as expected.
In the same spirit, we have the following result:
Proposition 8.9. The character of the $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$-module $\mathbb{Q} W_{n}$ is $\sum_{\lambda \in \operatorname{Bip}(n)}|\mathcal{C}(\lambda)| \pi_{\lambda}^{\mathbb{Q}}$.

Proof. If $C \in \operatorname{Comp}(n)$, the trace of $x_{C}$ in its left action on $\mathbb{Q} W_{n}$ is equal to $\left|W_{n}\right| \mathcal{T}_{n}\left(x_{C}\right)=$ $\left|W_{n}\right|$. On the other hand,

$$
\begin{aligned}
\sum_{\lambda \in \operatorname{Bip}(n)}|\mathcal{C}(\lambda)| \pi_{\lambda}^{\mathbb{Q}}\left(x_{C}\right) & =\sum_{\lambda \in \operatorname{Bip}(n)}|\mathcal{C}(\lambda)| \theta_{n}^{\mathbb{Q}}\left(x_{C}\right)\left(\operatorname{cox}_{\lambda}\right) \\
& =\sum_{\lambda \in \operatorname{Bip}(n)}\left|W_{n}\right|\left\langle\theta_{n}^{\mathbb{Q}}\left(x_{C}\right), e_{\lambda}^{\mathbb{Q}}\right\rangle W_{n} \\
& =\left|W_{n}\right|\left\langle\theta_{n}^{\mathbb{Q}}\left(x_{C}\right), 1_{n}\right\rangle_{W_{n}} \\
& =\left|W_{n}\right|,
\end{aligned}
$$

as desired.
Proposition 8.10. If $p>0$ and if $\lambda \in \operatorname{Bip}_{p^{\prime}}(n)$, then $\operatorname{dim}_{K} K W_{n} E_{\lambda}^{K}=\left|\mathcal{C}_{p^{\prime}}(\lambda)\right|$.
Proof. We may, and we will, assume that $K=\mathbb{F}_{p}$. The idempotent $E_{\lambda}^{\mathbb{F}_{p}}$ can be lifted to an idempotent $E_{\lambda}^{\mathbb{Z}_{p}}$ of $\mathbb{Z}_{p} \Sigma^{\prime}\left(W_{n}\right)$, where $\mathbb{Z}_{p}$ denotes the ring of $p$-adic integers [ T , Theorem 3.2 (b)]. It is sufficient to show that

$$
\begin{equation*}
\operatorname{dim}_{\mathbb{Q}_{p}} \mathbb{Q}_{p} \Sigma^{\prime}\left(W_{n}\right) E_{\lambda}^{\mathbb{Z}_{p}}=\left|\mathcal{C}_{p^{\prime}}(\lambda)\right| \tag{?}
\end{equation*}
$$

Now, $\theta_{n}\left(E_{\lambda}^{\mathbb{Z}_{p}}\right)$ is an idempotent of $\mathbb{Z}_{p} \operatorname{Irr} W_{n}$ that lifts $e_{\lambda}^{K}$. Therefore, $\theta_{n}\left(E_{\lambda}^{\mathbb{Z}_{p}}\right)=e_{\lambda, p^{\prime}}^{\mathbb{Q}}$ by the unicity of liftings in commutative algebras [T, Theorem 3.2 (d)]. Therefore, $E_{\lambda}^{\mathbb{Z}_{p}}$ is conjugate to the idempotent $\sum_{\mu \in \operatorname{Bip}(n), \mu_{p^{\prime}}=\lambda} E_{\mu}^{\mathbb{Q}}$ (see [T, Theorem 3.2 (d)]). So the result follows from Proposition 8.8.
8.C. Cartan matrix. We return to the general situation, namely we assume that $K$ is a field of characteristic $p \geqslant 0$. We denote by $\operatorname{Cartan}\left(K \Sigma^{\prime}\left(W_{n}\right)\right)$ the Cartan matrix of $K \Sigma^{\prime}\left(W_{n}\right)$. It is the square matrix $\left(\left[\mathcal{P}_{\lambda}^{K}: \mathcal{D}_{\mu}^{K}\right]\right)_{\lambda, \mu \in \operatorname{Bip}_{p^{\prime}}(n)}$, where $\left[\mathcal{P}_{\lambda}^{K}: \mathcal{D}_{\mu}^{K}\right]$ denotes the multiplicity of $\mathcal{D}_{\mu}^{K}$ as a chief factor in a Jordan-Hölder series of $\mathcal{P}_{\lambda}^{K}$. Recall that

$$
\begin{equation*}
\left[\mathcal{P}_{\lambda}^{K}: \mathcal{D}_{\mu}^{K}\right]=\operatorname{dim}_{K} \operatorname{Hom}_{K \Sigma^{\prime}\left(W_{n}\right)}\left(\mathcal{P}_{\mu}^{K}, \mathcal{P}_{\lambda}^{K}\right) \tag{8.11}
\end{equation*}
$$

and that we have a canonical isomorphism of vector spaces

$$
\begin{equation*}
\operatorname{Hom}_{K \Sigma^{\prime}\left(W_{n}\right)}\left(\mathcal{P}_{\mu}^{K}, \mathcal{P}_{\lambda}^{K}\right) \simeq E_{\mu}^{K} K \Sigma^{\prime}\left(W_{n}\right) E_{\lambda}^{K} . \tag{8.12}
\end{equation*}
$$

Moreover, the isomorphism 8.12 is an isomorphism of algebras whenever $\lambda=\mu$.
Let $D_{n}^{K}=\left(\delta_{\lambda_{p^{\prime}}, \mu}\right)_{\lambda \in \operatorname{Bip}(n), \mu \in \operatorname{Bip}_{p^{\prime}}(n)}$, where $\delta_{!\text {? }}$ ? is the Kronecker symbol. If $p$ does not divide the order of $\left|W_{n}\right|$, this is just the identity matrix. In general, it may be seen as the decomposition matrix from $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$ to $K \Sigma^{\prime}\left(W_{n}\right)$ (see [GP, §7.4] for the general definition of a decomposition matrix). The next lemma reduces the computation of $\operatorname{Cartan}\left(K \Sigma^{\prime}\left(W_{n}\right)\right)$ to the computation of $\operatorname{Cartan}\left(\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)\right)$ by making use of the decomposition matrix $D_{n}^{K}$ (see [APVW, Theorem 8] for the analogue of the next result for Solomon descent algebras).

Lemma 8.13. We have $\operatorname{Cartan}\left(K \Sigma^{\prime}\left(W_{n}\right)\right)={ }^{t} D_{n}^{K} \operatorname{Cartan}\left(\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)\right) D_{n}^{K}$.

Proof. This follows from $[\mathrm{GR}, \S 2.3]$.
The next result is a first decomposition of the Cartan matrix of $K \Sigma^{\prime}\left(W_{n}\right)$ into diagonal blocks (whenever $p \neq 2$ ), according to the action of $w_{n}$ on simple modules.

Lemma 8.14. Assume that $p \neq 2$. Let $\lambda, \mu \in \operatorname{Bip}_{p^{\prime}}(n)$. If $\left[\mathcal{P}_{\lambda}^{K}: \mathcal{D}_{\mu}^{K}\right] \neq 0$, then

$$
\lg ^{-}(\lambda) \equiv \lg ^{-}(\mu) \quad \bmod 2
$$

Proof. Let $\lambda, \mu \in \operatorname{Bip}_{p^{\prime}}(n)$ be such that $\left[\mathcal{P}_{\lambda}^{K}: \mathcal{D}_{\mu}^{K}\right] \neq 0$ and let $? \in\{+,-\}$. First, note that $e_{n}^{?} \mathcal{P}_{\lambda}^{K}=\mathcal{P}_{\lambda}^{K}$ if and only if $e_{n}^{?} \mathcal{D}_{\lambda}^{K}$ because $\mathcal{P}_{\lambda}^{K}$ is indecomposable. On the other hand, if $e_{n}^{?} \mathcal{P}_{\lambda}^{K}=\mathcal{P}_{\lambda}^{K}$, then $e_{n}^{?} \mathcal{D}_{\mu}^{K}=\mathcal{D}_{\mu}^{K}$. So the result follows from 4.2.

The main result of this section is the following:
Theorem 8.15. The Cartan matrix $\operatorname{Cartan}\left(\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)\right)$ is unitriangular. More precisely, if $\lambda$ and $\mu$ are two distinct bipartitions of $n$, then:
(a) $\left[\mathcal{P}_{\lambda}^{\mathbb{Q}}: \mathcal{D}_{\lambda}^{\mathbb{Q}}\right]=1$.
(b) If $\left[\mathcal{P}_{\lambda}^{\mathbb{Q}}: \mathcal{D}_{\mu}^{\mathbb{Q}}\right] \neq 0$, then $\lg (\mu)>\lg (\lambda)$.

Proof. Let $\mathcal{F}=\{C \in \operatorname{Comp}(n) \mid \lg (C)>\lg (\lambda)\}$. Then $\mathcal{F}$ is saturated so $\mathcal{I}=\mathbb{Q} \Sigma_{\mathcal{F}}^{\prime}\left(W_{n}\right)$ is a two-sided ideal of $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$. The theorem follows from the fact that $\mathcal{P}_{\lambda}^{\mathbb{Q}} \subset \mathbb{Q} E_{\lambda}^{\mathbb{Q}}+\mathcal{I}$, which is an immediate consequence of the statement (2) in the proof of the Theorem 7.2.

We shall give at the end of this paper the Cartan matrices of $\mathbb{Q} \Sigma^{\prime}\left(W_{2}\right), \mathbb{Q} \Sigma^{\prime}\left(W_{3}\right)$ and $\mathbb{Q} \Sigma^{\prime}\left(W_{4}\right)$.

Corollary 8.16. If $p$ does not divide the order of $W_{n}$ (i.e. if $p=0$ or $p>\max (2, n)$ ), then the centre of $K \Sigma^{\prime}\left(W_{n}\right)$ is split semisimple.

Proof. Note that $\operatorname{Bip}(n)=\operatorname{Bip}_{p^{\prime}}(n)$. Let $Z$ be the centre of $K \Sigma^{\prime}\left(W_{n}\right)$. Then the map $Z \rightarrow$ $\operatorname{End}_{K}\left(K \Sigma^{\prime}\left(W_{n}\right)\right)$ sending $z \in Z$ to the left multiplication by $z$ is injective. Moreover, the image is contained in $\oplus_{\lambda \in \operatorname{Bip}_{p^{\prime}}(n)} \operatorname{End}_{K \Sigma^{\prime}\left(W_{n}\right)} \mathcal{P}_{\lambda}^{K}$. But, by 8.11 , by Lemma 8.13 (and the fact that the matrix $D_{n}^{K}$ is the identity) and by Theorem 8.15 (a), we have an isomorphism of $K$-algebras

$$
\operatorname{End}_{K \Sigma^{\prime}\left(W_{n}\right)} \mathcal{P}_{\lambda}^{K} \simeq K
$$

So $Z$ is a subalgebra of $K \times \cdots \times K(|\operatorname{Bip}(n)|$ times $)$. The proof of the corollary is complete.

EXAMPLE 8.17 - If $p$ divides the order of $W_{n}$, then the centre of $K \Sigma^{\prime}\left(W_{n}\right)$ is not semisimple. Indeed, the element $x_{(-1,-1, \ldots,-1)}$ is central in $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$ and $\left(x_{(-1,-1, \ldots,-1)}\right)^{2}=$ $\left|W_{n}\right| x_{(-1,-1, \ldots,-1)}$.
Corollary 8.18. Let $Z_{n}^{R}$ denote the centre of $R \Sigma^{\prime}\left(W_{n}\right)$. If $p$ does not divide the order of $W_{n}$, then the natural map $K \otimes_{\mathbb{Z}} Z_{n}^{\mathbb{Z}} \rightarrow Z_{n}^{K}$ is an isomorphism of algebras.

Proof. It is sufficient to show that $\operatorname{dim}_{K} Z_{n}^{K}=\operatorname{dim}_{\mathbb{Q}} Z_{n}^{\mathbb{Q}}$. But, since $Z_{n}^{K}$ is split semisimple (see Corollary 8.16), its dimension is equal to the number of blocks of $K \Sigma^{\prime}\left(W_{n}\right)$. This number is determined by the Cartan matrix of $K \Sigma^{\prime}\left(W_{n}\right)$. Since the Cartan matrices of $K \Sigma^{\prime}\left(W_{n}\right)$ and $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$ coincide by Lemma 8.13, the result follows.

The next example shows that the Corollary 8.18 does not hold for any $p$ and any $n$.

Example 8.19 - It would be interesting to determine the centre of $K \Sigma^{\prime}\left(W_{n}\right)$. Note that this dimension is always $\geqslant 4$. Indeed, if $p \neq 2$, then $x_{n}=1, w_{n}, x_{\varnothing}$ and $x_{1,1, \ldots, 1}^{\prime}$ are linearly independent central elements (see 4.10). If $p=2$, then $x_{1,1, \ldots, 1}^{\prime}$ must me replaced by the image of $2^{n-1} x_{1,1, \ldots, 1}^{\prime}-x_{\varnothing} / 2 \in \mathbb{Z} \Sigma^{\prime}\left(W_{n}\right)$ in $K \Sigma^{\prime}\left(W_{n}\right)$.

The next table, obtained using CHEVIE [Chevie], provides the dimension of this centre for $n \leqslant 5$ : it depends on the characteristic $p$ of $K$.

| $n \backslash p$ | 0 | 2 | $\geqslant 3$ |
| :---: | :---: | :---: | :---: |
| 1 | 2 | 2 | 2 |
| 2 | 4 | 4 | 4 |
| 3 | 4 | 4 | 4 |
| 4 | 5 | 6 | 5 |
| 5 | 4 | 4 | 4 |

Note that the case $p>n$ has been handled by using the Lemma 8.18. It would also be interesting to determine for which pairs $(p, n)$ does the Lemma 8.18 hold. For instance, does it hold if $p$ is odd?

We conclude this section by proving that the Cartan matrix of $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$ is a submatrix of the Cartan matrix of $\mathbb{Q} \Sigma^{\prime}\left(W_{n+1}\right)$. We identify $\operatorname{Bip}(n,-1)$ with $\operatorname{Bip}(n)$ and the map $\tau_{(n,-1)}: \operatorname{Bip}(n) \rightarrow \operatorname{Bip}(n+1)$ defined in $\S 5$.A will be denoted simply by $\tau_{n}$. Then:

Theorem 8.20. Let $\lambda$ and $\mu$ be two bipartitions of $n$. Then

$$
\left[\mathcal{P}_{\tau_{n}(\lambda)}^{\mathbb{Q}}: \mathcal{D}_{\tau_{n}(\mu)}^{\mathbb{Q}}\right]=\left[\mathcal{P}_{\lambda}^{\mathbb{Q}}: \mathcal{D}_{\mu}^{\mathbb{Q}}\right]
$$

Proof. By Proposition 8.6, we may, and we will, assume that $E_{\tau_{n}(\lambda)}^{\mathbb{Q}}$ and $E_{\tau_{n}(\mu)}^{\mathbb{Q}}$ belong to $\mathbb{Q} \Sigma^{\prime}\left(W_{n+1}\right) x_{n,-1}$. In particular, by Proposition $5.4(\mathrm{~b}), E_{\tau_{n}(\mu)}^{\mathbb{Q}} \mathbb{Q} \Sigma^{\prime}\left(W_{n+1}\right) E_{\tau_{n}(\lambda)}^{\mathbb{Q}}$ is mapped isomorphically to $\mathcal{E}_{\lambda} \mathbb{Q} \Sigma^{\prime}\left(W_{n}\right) \mathcal{E}_{\mu}$ through the map $\operatorname{Res}_{n}^{n+1}$, where $\mathcal{E}_{\lambda}=\operatorname{Res}_{n}^{n+1}\left(E_{\lambda}^{\mathbb{Q}}\right)$ and $\mathcal{E}_{\mu}=\operatorname{Res}_{n}^{n+1}\left(E_{\mu}^{\mathbb{Q}}\right)$. So it remains to show that $\mathcal{E}_{\lambda}$ and $\mathcal{E}_{\mu}$ are conjugate to $E_{\lambda}^{\mathbb{Q}}$ and $E_{\mu}^{\mathbb{Q}}$ respectively (see 8.11 and 8.12 ).

Let us prove it for $\lambda$ (this is sufficient). By Proposition 5.1 (d), we have

$$
\theta_{n}^{\mathbb{Q}}\left(\mathcal{E}_{\lambda}\right)=\operatorname{Res}_{W_{n}}^{W_{n+1}} e_{\tau_{n}(\lambda)}^{\mathbb{Q}}=e_{\lambda}^{\mathbb{Q}}
$$

But, $\mathcal{E}_{\lambda}$ is a primitive idempotent in the image of $\operatorname{Res}_{n}^{n+1}$ (see [T, Theorem 3.2 (d)]) and since $\operatorname{Res}_{n}^{n+1}$ is surjective (see Proposition 5.7), we get that $\mathcal{E}_{\lambda}$ is a primitive idempotent of $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$. So $\mathcal{E}_{\lambda}$ and $E_{\lambda}^{\mathbb{Q}}$ are conjugate $[\mathrm{T}$, Theorem 3.2 (c)].

## 9. Numerical Results

For simplification, a bipartition $\left(\left(\lambda_{1}^{+}, \ldots, \lambda_{r}^{+}\right),\left(\lambda_{1}^{-}, \ldots, \lambda_{s}^{-}\right)\right)$will be denoted in a compact way $\lambda_{1}^{+} \ldots \lambda_{r}^{+} ; \lambda_{1}^{-} \ldots \lambda_{s}^{-}$. For instance, $31 ; 411$ stands for $((3,1),(4,1,1))$ and $\varnothing ; 221$ stands for $((),(2,2,1))$. If $i \geqslant 1$, the number $-i$ will be denoted by $\bar{i}$ : for instance, the signed composition $(2,-3,-1,1,-2)$ will be denoted by $(2, \overline{3}, \overline{1}, 1, \overline{2})$.

We shall give here the Cartan matrix and the primitive central idempotents of the algebras $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$ for $n \in\{2,3,4\}$. For $n \in\{2,3\}$, we also give the character table and an example of a family $\left(E_{\lambda}^{\mathbb{Q}}\right)_{\lambda \in \operatorname{Bip}(n)}$. Note that they are obtained by lifting the idempotents $\left(e_{\lambda}^{\mathbb{Q}}\right)_{\lambda \in \operatorname{Bip}(n)}$ by using CHEVIE [Chevie] and the algorithm described in [T, Theorem 3.1 (b) and (f)]. In the next tables, we have replaced zeroes by dots. Note also that, for simplicity, the idempotents will be expressed in the basis $\left(x_{C}^{\prime}\right)_{C \in \operatorname{Comp}(n)}$ constructed in Section 4.
9. $\boldsymbol{A}$. The case $\boldsymbol{n}=\mathbf{2}$. The character table of $\mathbb{Q} \Sigma^{\prime}\left(W_{2}\right)$ is:

|  | $x_{2}$ | $x_{\overline{2}}$ | $x_{1,1}$ | $x_{1, \overline{1}}$ | $x_{\overline{1}, \overline{1}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\pi_{2 ; \varnothing}^{\mathbb{Q}}$ | 1 | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| $\pi_{\varnothing ; 2}^{\mathbb{Q}}$ | 1 | 2 | $\cdot$ | $\cdot$ | $\cdot$ |
| $\pi_{11 ; \varnothing}^{\mathbb{Q}}$ | 1 | $\cdot$ | 2 | $\cdot$ | $\cdot$ |
| $\pi_{1 ; 1}^{\mathbb{Q}}$ | 1 | $\cdot$ | 2 | 2 | $\cdot$ |
| $\pi_{\varnothing ; 11}^{\mathbb{Q}}$ | 1 | 4 | 2 | 4 | 8 |

We can take for the family $\left(E_{\lambda}^{\mathbb{Q}}\right)_{\lambda \in \operatorname{Bip}(2)}$ the following idempotents:

$$
\begin{aligned}
E_{2 ; \varnothing}^{\mathbb{Q}} & =x_{2}^{\prime}-\frac{1}{2} x_{1,1}^{\prime}+\frac{1}{8} x_{\overline{1}, \overline{1}}^{\prime} \\
E_{\varnothing ; 2}^{\mathbb{Q}} & =\frac{1}{2} x_{\overline{2}}^{\prime}+\frac{1}{4}\left(x_{1, \overline{1}}^{\prime}-x_{\overline{1}, 1}^{\prime}\right) \\
E_{11 ; \varnothing}^{\mathbb{Q}} & =\frac{1}{2} x_{1,1}^{\prime} \\
E_{1 ; 1}^{\mathbb{Q}} & =\frac{1}{4}\left(x_{1, \overline{1}}^{\prime}+x_{\overline{1}, 1}^{\prime}\right) \\
E_{\varnothing ; 11}^{\mathbb{Q}} & =\frac{1}{8} x_{\overline{1}, \overline{1}}^{\prime} .
\end{aligned}
$$

The Cartan matrix of $\mathbb{Q} \Sigma^{\prime}\left(W_{2}\right)$ is given by:

|  | $\mathcal{D}_{2 ; \varnothing}^{\mathbb{Q}}$ | $\mathcal{D}_{\varnothing ; 2}^{\mathbb{Q}}$ | $\mathcal{D}_{1 ; 1}^{\mathbb{Q}}$ | $\mathcal{D}_{11 ; \varnothing}^{\mathbb{Q}}$ | $\mathcal{D}_{\varnothing ; 11}^{\mathbb{Q}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathcal{P}_{2 ; \varnothing}^{\mathbb{Q}}$ | 1 | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| $\mathcal{P}_{\varnothing ; 2}^{\mathbb{Q}}$ | $\cdot$ | 1 | 1 | $\cdot$ | $\cdot$ |
| $\mathcal{P}_{1 ; 1}^{\mathbb{Q}}$ | $\cdot$ | $\cdot$ | 1 | $\cdot$ | $\cdot$ |
| $\mathcal{P}_{11 ; \varnothing}^{\mathbb{Q}}$ | $\cdot$ | $\cdot$ | $\cdot$ | 1 | $\cdot$ |
| $\mathcal{P}_{\varnothing ; 11}^{\mathbb{Q}}$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | 1 |

The primitive central idempotents of $\mathbb{Q} \Sigma^{\prime}\left(W_{2}\right)$ are

$$
\begin{aligned}
F_{1} & =x_{2}^{\prime}-\frac{1}{2} x_{1,1}^{\prime}+\frac{1}{8} x_{\overline{1}, \overline{1}}^{\prime} \\
F_{2} & =\frac{1}{2}\left(x_{\overline{2}}^{\prime}+x_{1, \overline{1}}^{\prime}\right) \\
F_{3} & =\frac{1}{2} x_{1,1}^{\prime} \\
F_{4} & =\frac{1}{8} x_{\overline{1}, \overline{1}}^{\prime}
\end{aligned}
$$

If we denote by $A_{i}$ the block $\mathbb{Q} \Sigma^{\prime}\left(W_{2}\right) F_{i}$, then $A_{i} \simeq \mathbb{Q}$ if $i \in\{1,3,4\}$ and $A_{2}$ is isomorphic to the algebra to upper triangular $2 \times 2$-matrices (see $[\mathrm{BH}, \S 6]$ ). In particular, $\mathbb{Q} \Sigma^{\prime}\left(W_{2}\right)$ is hereditary.

For information, we provide the dimensions of the left ideal, right ideal, two-sided ideal generated by $x_{C}$ (for $\left.C \in \operatorname{Comp}(2)\right)$ and also the dimension of the centralizer of $x_{C}$. In this table, $A$ denotes the algebra $\mathbb{Q} \Sigma^{\prime}\left(W_{2}\right)$.

| $x$ | $x_{2}$ | $x_{\overline{2}}$ | $x_{1,1}$ | $x_{1, \overline{1}}$ | $x_{\overline{1}, 1}$ | $x_{\overline{1}, \overline{1}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\operatorname{dim}_{\mathbb{Q}} A x$ | 6 | 3 | 3 | 2 | 2 | 1 |
| $\operatorname{dim}_{\mathbb{Q}} x A$ | 6 | 2 | 4 | 3 | 3 | 1 |
| $\operatorname{dim}_{\mathbb{Q}} A x A$ | 6 | 3 | 4 | 3 | 3 | 1 |
| $\operatorname{dim}_{\mathbb{Q}} Z_{A}(x)$ | 6 | 5 | 5 | 5 | 5 | 6 |

9.B. The case $\boldsymbol{n}=\mathbf{3}$. The character table of $\mathbb{Q} \Sigma^{\prime}\left(W_{3}\right)$ is:

|  | $x_{3}$ | $x_{\overline{3}}$ | $x_{2,1}$ | $x_{2, \overline{1}}$ | $x_{1, \overline{2}}$ | $x_{\overline{2}, \overline{1}}$ | $x_{1,1,1}$ | $x_{1,1, \overline{1}}$ | $x_{1, \overline{1}, \overline{1}}$ | $x_{\overline{1}, \overline{1}, \overline{1}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\pi_{3 ; \varnothing}^{\mathbb{Q}}$ | 1 | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| $\pi_{\varnothing ; 3}^{\mathbb{Q}}$ | 1 | 2 | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| $\pi_{21 ; \varnothing}^{\mathbb{Q}}$ | 1 | $\cdot$ | 1 | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| $\pi_{2 ; 1}^{\mathbb{Q}}$ | 1 | $\cdot$ | 1 | 2 | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| $\pi_{1 ; 2}^{\mathbb{Q}}$ | 1 | $\cdot$ | 1 | $\cdot$ | 2 | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| $\pi_{\varnothing ; 21}^{\mathbb{Q}}$ | 1 | 4 | 1 | 2 | 2 | 4 | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| $\pi_{111 ; \varnothing}^{\mathbb{Q}}$ | 1 | $\cdot$ | 3 | $\cdot$ | $\cdot$ | $\cdot$ | 6 | $\cdot$ | $\cdot$ | $\cdot$ |
| $\pi_{11 ; 1}^{\mathbb{Q}}$ | 1 | $\cdot$ | 3 | 2 | $\cdot$ | $\cdot$ | 6 | 4 | $\cdot$ | $\cdot$ |
| $\pi_{1 ; 11}^{\mathbb{Q}}$ | 1 | $\cdot$ | 3 | 4 | 4 | $\cdot$ | 6 | 8 | 8 | $\cdot$ |
| $\pi_{\varnothing ; 111}^{\mathbb{Q}}$ | 1 | 8 | 3 | 6 | 12 | 24 | 6 | 12 | 24 | 48 |

We can take for the family $\left(E_{\lambda}^{\mathbb{Q}}\right)_{\lambda \in \operatorname{Bip}(3)}$ the following idempotents:

$$
\begin{aligned}
E_{3 ; \varnothing}^{\mathbb{Q}} & =x_{3}^{\prime}-x_{1,2}^{\prime}+\frac{1}{4} x_{\overline{1}, \overline{2}}^{\prime}+\frac{1}{3} x_{1,1,1}^{\prime}-\frac{1}{6} x_{\overline{1}, 1, \overline{1}}^{\prime}+\frac{1}{12}\left(x_{1, \overline{1}, \overline{1}}^{\prime}+x_{\overline{1}, \overline{1}, 1}^{\prime}\right) \\
E_{\varnothing ; 3}^{\mathbb{Q}} & =\frac{1}{2}\left(x_{\overline{3}}^{\prime}+x_{2, \overline{1}}^{\prime}-x_{\overline{1}, 2}^{\prime}\right)-\frac{1}{3} x_{1,1, \overline{1}}^{\prime}+\frac{1}{6}\left(x_{1, \overline{1}, 1}^{\prime}+x_{\overline{1}, 1,1,}^{\prime}\right) \\
E_{21 ; \varnothing}^{\mathbb{Q}} & =x_{1,2}^{\prime}-\frac{1}{2} x_{1,1,1}^{\prime}+\frac{1}{8} x_{1, \overline{1}, \overline{1}}^{\prime} \\
E_{2 ; 1}^{\mathbb{Q}} & =\frac{1}{2} x_{\overline{1}, 2}^{\prime}-\frac{1}{4} x_{\overline{1}, 1,1}^{\prime}+\frac{1}{16} x_{\overline{1}, \overline{1}, \overline{1}}^{\prime} \\
E_{1 ; 2}^{\mathbb{Q}} & =\frac{1}{2} x_{1, \overline{2}}^{\prime}+\frac{1}{4}\left(x_{1,1, \overline{1}}^{\prime}-x_{1, \overline{1}, 1}^{\prime}\right) \\
E_{\varnothing ; 21}^{\mathbb{Q}} & =\frac{1}{4} x_{\overline{2}, \overline{1}}^{\prime}+\frac{1}{8}\left(x_{1, \overline{1}, 1}^{\prime}-x_{\overline{1}, 1, \overline{1}}^{\prime}\right) \\
E_{111 ; \varnothing}^{\mathbb{Q}} & =\frac{1}{6} x_{1,1,1}^{\prime} \\
E_{11 ; 1}^{\mathbb{Q}} & =\frac{1}{12}\left(x_{1,1, \overline{1}}^{\prime}+x_{1, \overline{1}, 1}^{\prime}+x_{\overline{1}, 1,1}^{\prime}\right) \\
E_{1 ; 11}^{\mathbb{Q}} & =-\frac{1}{12} x_{1, \overline{1}, \overline{1}}^{\prime}+\frac{7}{24} x_{\overline{1}, 1, \overline{1}}^{\prime}-\frac{1}{12} x_{\overline{1}, \overline{1}, 1}^{\prime} \\
E_{\varnothing ; 111}^{\mathbb{Q}} & =\frac{1}{48} x_{\overline{1}, \overline{1}, \overline{1}}^{\prime}
\end{aligned}
$$

The Cartan matrix of $\mathbb{Q} \Sigma^{\prime}\left(W_{3}\right)$ is given by

|  | $\mathcal{D}_{3 ; \varnothing}^{\mathbb{Q}}$ | $\mathcal{D}_{21 ; \varnothing}^{\mathbb{Q}}$ | $\mathcal{D}_{\varnothing, 21}^{\mathbb{Q}}$ | $\mathcal{D}_{1 ; 11}^{\mathbb{Q}}$ | $\mathcal{D}_{\varnothing ; 3}^{\mathbb{Q}}$ | $\mathcal{D}_{2 ; 1}^{\mathbb{Q}}$ | $\mathcal{D}_{1 ; 2}^{\mathbb{Q}}$ | $\mathcal{D}_{11 ; 1}^{\mathbb{Q}}$ | $\mathcal{D}_{111 ; \varnothing}^{\mathbb{Q}}$ | $\mathcal{D}_{\varnothing \subset ; 111}^{@}$ |

The primitive central idempotents of $\mathbb{Q} \Sigma^{\prime}\left(W_{4}\right)$ are

$$
\begin{aligned}
F_{1}= & x_{4}^{\prime}-\frac{1}{2} x_{2,2}^{\prime}+\frac{1}{4}\left(x_{\overline{3}, \overline{1}}+x_{\overline{1}, \overline{3}}^{\prime}+x_{2,1,1}^{\prime}+x_{1,1,2}^{\prime}+x_{\overline{\overline{2}, \overline{2}}}^{\prime}+x_{1, \overline{1}, \overline{2}}^{\prime}+x_{1, \overline{2}, \overline{1}}^{\prime}\right) \\
& +\frac{1}{6} x_{1,1,1,1}^{\prime}+\frac{3}{16} x_{2, \overline{1}, \overline{1}}^{\prime}-\frac{1}{16} x_{\overline{1}, \overline{1}, 2}^{\prime}+\frac{1}{32}\left(x_{1,1, \overline{1}, \overline{1}}^{\prime}+x_{\overline{1}, \overline{1}, 1,1}^{\prime}\right)+\frac{5}{96} x_{\overline{1}, \overline{1}, \overline{1}, \overline{1}}^{\prime} \\
F_{2}= & \frac{1}{2}\left(x_{\overline{4}}^{\prime}+x_{3, \overline{1}}^{\prime}+x_{1, \overline{3}}^{\prime}+x_{2, \overline{2}}^{\prime}\right)+\frac{1}{8}\left(x_{\overline{2}, \overline{1}, \overline{1}}^{\prime}+x_{\overline{1}, \overline{2}, \overline{1}}^{\prime}+x_{\overline{1}, \overline{1}, \overline{2}}^{\prime}+x_{1, \overline{1}, \overline{1}, \overline{1}}^{\prime}\right) \\
F_{3}= & \frac{1}{2} x_{2,2}^{\prime}-\frac{1}{4}\left(x_{2,1,1}^{\prime}+x_{1,1,2}^{\prime}\right)+\frac{1}{8} x_{1,1,1,1}^{\prime}+\frac{1}{16}\left(x_{2, \overline{1}, \overline{1}}^{\prime}+x_{\overline{1}, \overline{1}, 2}^{\prime}\right) \\
& -\frac{1}{32}\left(x_{1,1, \overline{1}, \overline{1}}^{\prime}+x_{\overline{1}, \overline{1}, 1,1}^{\prime}\right)+\frac{1}{128} x_{\overline{1}, \overline{1}, \overline{1}, \overline{1}}^{\prime} \\
F_{4}= & \frac{1}{24} x_{1,1,1,1}^{\prime} \\
F_{5}= & \frac{1}{384} x_{\overline{1}, \overline{1}, \overline{1}, \overline{1}}^{\prime}
\end{aligned}
$$

## 10. Questions

Let us raise here some questions about the representation theory of the MantaciReutenauer algebra $K \Sigma^{\prime}\left(W_{n}\right)$ :
(1) Determine the centre of $K \Sigma^{\prime}\left(W_{n}\right)$, or at least its dimension (in characteristic zero, its dimension determines its structure because it is split semisimple by Corollary 8.16).
(2) Compute the Cartan matrix of $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$. Note that the Theorem 8.20 provides a first induction argument.
$\left(2^{+}\right)$Determine the Loewy series of the projective indecomposable $K \Sigma^{\prime}\left(W_{n}\right)$-modules. Determine the Loewy length of $\mathbb{F}_{2} \Sigma^{\prime}\left(W_{n}\right)$ (see Remark 7.3: it is probably equal to $2 n-1$ if $n \geqslant 2$ ).
(3) For which values of $n$ is the algebra $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$ hereditary? It is reasonable to expect that it is hereditary if and only if $n \in\{1,2,3\}$. Note that it is not hereditary for $n \in\{4,5\}$.
$\left(3^{+}\right)$Compute the path algebra of $\mathbb{Q} \Sigma^{\prime}\left(W_{n}\right)$.
(4) Is the inclusion (4) in the proof of Proposition 7.1 always an equality? For the analogous statement for the symmetric group, we have an equality [B1, Theorem A].
(5) Is the morphism $\operatorname{Res}_{k}^{n}: \mathbb{Z} \Sigma^{\prime}\left(W_{n}\right) \rightarrow \mathbb{Z} \Sigma^{\prime}\left(W_{k}\right)$ surjective? Compare with Proposition 5.7. Note that the morphism $\operatorname{Res}_{W_{k}}^{W_{n}}: \mathbb{Z} \operatorname{Irr} W_{n} \rightarrow \mathbb{Z} \operatorname{Irr} W_{k}$ is surjective.
(6) The Corollary 8.8 suggests, by analogy with the case of the symmetric group, the following question: if $\lambda \in \operatorname{Bip}(n)$, does there exist a linear character $\zeta_{\lambda}$ of $C_{W_{n}}\left(\operatorname{cox}_{\lambda}\right)$ such that $\mathbb{C} W_{n} E_{\lambda}^{\mathbb{C}}$ affords the character $\operatorname{Ind}_{C_{W_{n}\left(c o x_{\lambda}\right)}}^{W_{n}} \zeta_{\lambda}$ ? In fact, the answer to this question is negative in general, even for $n=2$ (take $\lambda=((2) ; \varnothing)$ ). Computations using CHEVIE (for $n \leqslant 4)$ suggests that the following slight modification of the previous question could have a positive answer: if $\lambda \in \operatorname{Bip}(n)$, does there exist a linear character $\zeta_{\lambda}$ of $C_{W_{n}}\left(\operatorname{cox}_{\lambda \text { opp }}\right)$
such that $\mathbb{C} W_{n} E_{\lambda}^{\mathbb{C}}$ affords the character $\operatorname{Ind}_{C_{W_{n}}\left(\operatorname{cox}_{\lambda} \mathrm{opp}\right)}^{W_{n}} \zeta_{\lambda}$ ? Here, if $\lambda=\left(\lambda^{+}, \lambda^{-}\right)$, we have denoted by $\lambda^{\mathrm{opp}}$ the bipartition $\left(\lambda^{-}, \lambda^{+}\right)$.

REMARK - It is readily seen that $\left|C_{W_{n}}\left(w_{\lambda}\right)\right|=\left|C_{W_{n}}\left(w_{\lambda^{\mathrm{opp}}}\right)\right|$.
Example 10.1 - We keep here the notation of Example 4.7. Let $r \in\{0,1,2, \ldots, n\}$. Then

$$
\mathbf{C}\left(I_{r}^{+}\right)=(\underbrace{1,1, \ldots, 1}_{r \text { times }}, \underbrace{-1,-1, \ldots,-1}_{n-r \text { times }})
$$

and, if we set $\lambda(r)=\boldsymbol{\lambda}\left(\mathbf{C}\left(I_{r}^{+}\right)\right)$, then

$$
\lambda(r)=(\underbrace{(1,1, \ldots, 1)}_{r \text { times }}, \underbrace{(1,1, \ldots, 1)}_{n-r \text { times }})
$$

We shall prove that the answer to question 6 is positive whenever $\lambda=\lambda(r)$.
Let us make this statement more precise. We may choose for $\operatorname{cox}_{\lambda(r)^{\text {opp }}}$ the element $\operatorname{cox}_{\mathbf{C}\left(I_{r}^{+}\right)}=t_{r+1} t_{r+2} \ldots t_{n}$. Then

$$
C_{W_{n}}\left(\operatorname{cox}_{\lambda(r) \operatorname{opp}}\right)=W_{r, n-r}
$$

Let $\gamma_{r} \boxtimes 1_{n-r}$ denote the linear character of $W_{r, n-r} \simeq W_{r} \times W_{n-r}$ which is equal to $\gamma_{r}$ on the component $W_{r}$ and which is trivial on $W_{n-r}$ (recall that the linear character $\gamma_{r}$ of $W_{r}$ has been defined in Example 4.7). Then:

$$
\begin{equation*}
\text { The } \mathbb{Q} W_{n} \text {-module } \mathbb{Q} W_{n} E_{\lambda(r)} \text { affords the character } \operatorname{Ind}_{W_{r, n-r}}^{W_{n}}\left(\gamma_{r} \boxtimes 1_{n-r}\right) \text {. } \tag{10.2}
\end{equation*}
$$

Let us prove 10.2. First, note that $\gamma_{r} \boxtimes 1_{n-r}$ is just the restriction of the map $\gamma_{I_{r}^{+}}: W_{n} \rightarrow$ $\{1,-1\}$ to $W_{r, n-r}$ defined in Example 4.7. By Example 8.3, we may take for $E_{\lambda(r)}^{\mathbb{Q}}$ the idempotent $x_{I_{r}^{+}}^{\prime} /\left(2^{n-r} r!(n-r)!\right)$. Let $e_{\mathfrak{S}_{n}}=(1 / n!) \sum_{\sigma \in \mathfrak{S}_{n}} \sigma$ and let

$$
E(r)=\frac{1}{\left|W_{r, n-r}\right|} \sum_{\sigma \in W_{r, n-r}}\left(\gamma_{r} \boxtimes 1_{n-r}\right)(\sigma) \sigma
$$

Then the module $\mathbb{Q} W_{n} E(r)$ affords the character $\operatorname{Ind}_{W_{r, n-r}}^{W_{n}}\left(\gamma_{r} \boxtimes 1_{n-r}\right)$ and, by Example 8.3, we have $E_{\lambda(r)}=\left(\left|W_{n}\right| / \mid W_{r, n-r}\right) e_{\mathfrak{S}_{n}} E(r)$. Therefore, $\mathbb{Q} W_{n} E_{\lambda(r)} \subset \mathbb{Q} W_{n} E(r)$. But $\operatorname{dim}_{\mathbb{Q}} \mathbb{Q} W_{n} E(r)=\left|W_{n}\right| /\left|W_{r, n-r}\right|$ and $\operatorname{dim}_{\mathbb{Q}} \mathbb{Q} W_{n} E_{\lambda(r)}=|\mathcal{C}(\lambda(r))|=\left|W_{n}\right| /\left|W_{r, n-r}\right|$, so we get that $\mathbb{Q} W_{n} E_{\lambda(r)}=\mathbb{Q} W_{n} E(r)$.
