# Almost Sure Convergence of Stochastic Gradient Processes with Matrix Step Sizes 

by<br>Jean-Marie Monnez<br>Université Henri Poincaré<br>IECN Laboratoire de Mathématiques<br>B.P. 239 - F 54506 Vandoeuvre lès Nancy Cedex

#### Abstract

We consider a stochastic gradient process, which is a special case of stochastic approximation process, where the positive real step size $a_{n}$ is replaced by a random $\operatorname{matrix} A_{n}: X_{n+1}=X_{n}-A_{n} \nabla g\left(X_{n}\right)-A_{n} V_{n}$. We give two theorems of almost sure convergence in the case where the equation $\nabla g=0$ has a set of solutions.

Key Words and Phrases: Stochastic approximation, stochastic gradient AMS 1991 Subject Classifications. Primary: 62; Secondary: L20.

## 1 Introduction

Let $g$ be a function from $\mathbb{R}^{p}$ into $\mathbb{R}$. Note $\nabla g$ the gradient of $g$. Suppose that the equation $\nabla g=0$ has a set of solutions. Suppose further that for any real $x$, one cannot observe $\nabla g(x)$ but only $\nabla g(x)+V_{x}, V_{x}$ being a random error. In order to estimate a solution, one can use a stochastic gradient process $\left(X_{n}\right)$, defined recursively by

$$
\begin{equation*}
X_{n+1}=X_{n}-a_{n} \nabla g\left(X_{n}\right)-a_{n} V_{n} . \tag{1}
\end{equation*}
$$

The sequence of positive gains $\left(a_{n}\right)$ verifies $\sum_{n=1}^{\infty} a_{n}=\infty, \sum_{n=1}^{\infty} a_{n}^{2}<\infty$. (1) is a particular case of stochastic approximation process, whose convergence has been studied by different methods; see inter alia Ljung, Pflug, Walk (1992) for an overview.

Several applications can be found particularly in the field of statistics. In some of them, the gain $a_{n}$ is replaced by a random matrix $A_{n}$, for instance to obtain an asymptotically efficient estimation of a parameter or to accelerate the convergence; the process is then defined by

$$
\begin{equation*}
X_{n+1}=X_{n}-A_{n} \nabla g\left(X_{n}\right)-A_{n} V_{n} . \tag{2}
\end{equation*}
$$

It was supposed in most cases for this type of process that the equation $\nabla g=0$ has a unique solution (see inter alia Nevel'son and Has'minskii, 1973, Spall, 2003). We consider here the case where it has a set of solutions and we give two theorems of almost sure convergence. The first one can be directly applied for instance to the
proof of the convergence of an extension of the k-means process of MacQueen (1967), which was the first motivation for this study.

All random variables are defined on a probability space $(\Omega, \mathcal{A}, P)$. Let $\left(T_{n}\right)$ be a nondecreasing sequence of sub- $\sigma$-algebras of $\mathcal{A}$ such that $X_{1}, V_{j}, j \leq n-1$ and $A_{j}, j \leq n$, are $T_{n}$-measurable; then $X_{n}$ is $T_{n}$-measurable.

In the following, $\langle.,$.$\rangle and \|$.$\| are respectively the usual inner product and norm$ in $\mathbb{R}^{p}$; for a squared matrix $A,\|A\|$ is the spectral norm, $\lambda_{\max }(A)$ and $\lambda_{\min }(A)$ are respectively the greatest and the lowest eigenvalue of $A ; I$ is the identity matrix; the abbreviation a.s. means almost surely.

## 2 First almost sure convergence theorem

### 2.1 Assumptions and theorem

Denote $F_{n}\left(X_{n}\right)=\frac{\left\|A_{n}^{\frac{1}{2}} \nabla g\left(X_{n}\right)\right\|^{2}}{\left\|A_{n}\right\|}$ and suppose:
(H1a) $g$ is a non negative function.
(H1b) There exists $L>0$ such that, for all $A, B \in \mathbb{R}^{p}$,
$g(B)-g(A) \leq\langle B-A, \nabla g(A)\rangle+L\|B-A\|^{2}$.
H1b is verified if $\nabla g$ is Lipschitz continuous. H1b is used for $B=X_{n+1}$ and $A=X_{n}$; if the sequence $\left(X_{n}\right)$ is bounded and $g$ has second order partial derivatives which are continuous in the compact set containing it, then H1b can be omitted.
(H1c) There exists a set $A$ such that $P(A)=1$ and for all fixed $\omega \in A, \forall \epsilon>0$,

$$
\exists \delta>0, \exists N \in \mathbb{N}, \exists K>0: \forall p>n>N,\left(\left\|X_{p}-X_{n}\right\|<\delta\right) \Longrightarrow\left(F_{p}\left(X_{p}\right) \leq\right.
$$

$$
\left.K F_{n}\left(X_{n}\right)+\epsilon\right)
$$

This assumption is verified if $\nabla g$ is uniformly continuous, particularly if the sequence $\left(X_{n}\right)$ is bounded and $\nabla g$ is continuous in the compact set containing it, and if the following assumption H4d holds. The sequence $\left(X_{n}\right)$ is bounded if $g\left(X_{n}\right)$ converges, which is proved without H1c, and if $\lim _{\|x\| \rightarrow \infty} g(x)=\infty$ (if $g$ is $C^{1}$, then $g$ is a Liapunov function).
(H2) There exist four sequences of random variables $\left(B_{n}\right),\left(C_{n}\right),\left(D_{n}\right)$ and $\left(E_{n}\right)$ in $\mathbb{R}^{+}$adapted to the sequence of $\sigma$-algebras $\left(T_{n}\right)$ such that a.s.
(H2a) $\left\|A_{n}^{\frac{1}{2}} E\left[V_{n} \mid T_{n}\right]\right\|^{2} \leq B_{n} g\left(X_{n}\right)+C_{n}, \sum_{1}^{\infty}\left(B_{n}+C_{n}\right)<\infty ;$
(H2b) $E\left[\left\|A_{n} V_{n}\right\|^{2} \mid T_{n}\right] \leq D_{n} g\left(X_{n}\right)+E_{n}, \sum_{1}^{\infty}\left(D_{n}+E_{n}\right)<\infty$.
H2a and H2b are extensions of classical assumptions in the field of stochastic approximation. They are satisfied particularly in the case where $V_{n}=V_{n}^{1}+V_{n}^{2}$, $E\left[V_{n}^{1} \mid T_{n}\right]=0$ a.s., $V_{n}^{2} T_{n}$-measurable and, if the following assumptions H4a, b hold, $\left\|A_{n}^{\frac{1}{2}} V_{n}^{2}\right\|^{2} \leq B_{n} g\left(X_{n}\right)+C_{n}$.
(H4a) For $n \geq 1, A_{n}$ is a.s. a positive definite symmetrical matrix.
$(\mathrm{H} 4 \mathrm{~b}) \sup _{n} \lambda_{\max }\left(A_{n}\right)<\min \left(\frac{1}{2}, \frac{1}{4 L}\right)$ a.s.
(H4c) $\sum_{1}^{\infty} \lambda_{\max }\left(A_{n}\right)=\infty$ a.s.
(H4d) $\sup _{n} \frac{\lambda_{\max }\left(A_{n}\right)}{\lambda_{\min }\left(A_{n}\right)}<\infty$ a.s.
In the case where $A_{n}=a_{n} I, a_{n} \in \mathbb{R}, \mathrm{H} 4$ gives $0<a_{n}<\min \left(\frac{1}{2}, \frac{1}{4 L}\right), \sum_{1}^{\infty} a_{n}=\infty$.

H 4 holds in the case where $A_{n}$ is a diagonal matrix with diagonal elements $a_{n}^{1}, \ldots, a_{n}^{p}$ such that $\frac{a}{n} \leq a_{n}^{i}<\min \left(\frac{1}{2}, \frac{1}{4 L}\right), i=1, \ldots, p, a>0$ and $\sup _{n} \frac{\max a_{n}^{i}}{\min a_{n}^{2}}<\infty$ a.s.; this can be applied to the study of the convergence of the k-means process of Mac Queen (1967). H4 holds too for $A_{n}=\frac{1}{n} A\left(X_{n}\right)$ with suitable conditions on the matrices $A\left(X_{n}\right)$.

Theorem 1 (a) Assume H1a, b, H2a, b and H4a, b hold; then $g\left(X_{n}\right)$ and $\sum_{1}^{\infty}\left\|A_{n}^{\frac{1}{2}} \nabla g\left(X_{n}\right)\right\|^{2}$ converge a.s.
(b) Under the assumptions of (a), if moreover H1c, H4c, d hold, then $F_{n}\left(X_{n}\right)$ and $\nabla g\left(X_{n}\right)$ converge a.s. to 0 ; if the sequence $\left(X_{n}\right)$ is contained in a compact set $C$ and $\nabla g$ is continuous in $C$, the distance of $X_{n}$ to the set of stationary points of $g$ converges a.s. to 0 .

In the case where $A_{n}=a_{n} I$, this theorem can be compared to theorem 1 of Dippon (1998), who supposes yet that $\nabla g$ is Lipschitz continuous and $E\left[V_{n} \mid T_{n}\right]=0$.

### 2.2 Lemma

We use the following lemma in the proof of the theorem. Define the recursive process $\left(W_{n}\right)$ in $\mathbb{R}^{p}$ and make assumption H3a:

$$
\begin{equation*}
W_{n+1}=\left(I-A_{n}\right) W_{n}+A_{n} V_{n}, W_{1}=0 \tag{3}
\end{equation*}
$$

If $A_{n}=\frac{1}{n} I$, then $W_{n+1}=\frac{1}{n} \sum_{1}^{n} V_{i}$.
(H3a) $W_{n} \longrightarrow 0$ a.s.
Lemma 2 Assume H1c, H3a and H4a, b, c hold; then, if $\sum_{1}^{\infty}\left\|A_{n}^{\frac{1}{2}} \nabla g\left(X_{n}\right)\right\|^{2}$ converges a.s., $F_{n}\left(X_{n}\right)$ converges a.s.to 0 ; if furthermore $H_{4} d$ holds, $\nabla g\left(X_{n}\right)$ converges a.s. to 0 ; if moreover the sequence $\left(X_{n}\right)$ is contained in a compact set $C$ and $\nabla g$ is continuous in $C$, the distance of $X_{n}$ to the set of stationary points of $g$ converges a.s. to 0 .

Proof. $\omega \in \Omega$ is fixed throughout the proof, belonging to the intersection of the defined a.s. convergence sets. Let $\epsilon>0, \epsilon^{\prime}=\min \left(\frac{\epsilon}{2 K}, \frac{\epsilon}{2}\right)$. By H1c, $\exists \delta>0, \exists N_{1} \in$ $\mathbb{N}, \exists K>0: \forall p>n>N_{1},\left(\left\|X_{p}-X_{n}\right\|<\delta\right) \Longrightarrow\left(F_{p}\left(X_{p}\right) \leq K F_{n}\left(X_{n}\right)+\frac{\epsilon}{2}\right)$.
$\sum_{1}^{\infty}\left\|A_{n}\right\| F_{n}\left(X_{n}\right)=\sum_{1}^{\infty}\left\|A_{n}^{\frac{1}{2}} \nabla g\left(X_{n}\right)\right\|^{2}<\infty$. Then, by H4a, c, there exists a sequence $\left(n_{l}\right)$ such that $F_{n_{l}}\left(X_{n_{l}}\right) \longrightarrow 0$. Let $N_{2} \geq N_{1}$ such that $F_{N_{2}}\left(X_{N_{2}}\right)<\epsilon^{\prime}$. Let $N_{2} \leq n<p$ such that for $k \in\left[N_{2}, n\right], F_{k}\left(X_{k}\right)<\epsilon^{\prime}$ and for $k \in[n+1, p], F_{k}\left(X_{k}\right) \geq \epsilon^{\prime} ;$ let us prove that $F_{p}\left(X_{p}\right)<\epsilon$.

We define $I_{k}\left(\epsilon^{\prime}\right)=1$ if $F_{k}\left(X_{k}\right) \geq \epsilon^{\prime}, 0$ if not.
Let $Y_{n}=X_{n}+W_{n}$; we have $Y_{n+1}=Y_{n}-A_{n} \nabla g\left(X_{n}\right)-A_{n} W_{n}$.
$Y_{p}-Y_{n}=-A_{n} \nabla g\left(X_{n}\right)-A_{n} W_{n}-\sum_{n+1}^{p-1} A_{k}^{\frac{1}{2}}\left(A_{k}^{\frac{1}{2}} \nabla g\left(X_{k}\right)+A_{k}^{\frac{1}{2}} W_{k}\right) I_{k}\left(\epsilon^{\prime}\right)$.
$\sum_{1}^{\infty}\left\|A_{k}^{\frac{1}{2}}\right\|\left\|A_{k}^{\frac{1}{2}} \nabla g\left(X_{k}\right)+A_{k}^{\frac{1}{2}} W_{k}\right\| I_{k}\left(\epsilon^{\prime}\right)$
$\leq \frac{1}{2} \sum_{1}^{\infty} I_{k}\left(\epsilon^{\prime}\right)\left\|A_{k}\right\|+\frac{1}{2} \sum_{1}^{\infty}\left\|A_{k}^{\frac{1}{2}} \nabla g\left(X_{k}\right)+A_{k}^{\frac{1}{2}} W_{k}\right\|^{2} I_{k}\left(\epsilon^{\prime}\right)$
$\leq \frac{1}{2} \sum_{1}^{\infty} I_{k}\left(\epsilon^{\prime}\right) \frac{\left\|A_{k}^{\frac{1}{2}} \nabla g\left(X_{k}\right)\right\|^{2}}{F_{k}\left(X_{k}\right)}+\sum_{1}^{\infty}\left\|A_{k}^{\frac{1}{2}} \nabla g\left(X_{k}\right)\right\|^{2}+\sum_{1}^{\infty}\left\|A_{k}\right\|\left\|W_{k}\right\|^{2} I_{k}\left(\epsilon^{\prime}\right)<\infty$ by
H3a.

Furthermore by H4b and H3a, $A_{n} \nabla g\left(X_{n}\right)+A_{n} W_{n} \longrightarrow 0, W_{n} \longrightarrow 0$. Then for $n$ sufficiently large $\left\|Y_{p}-Y_{n}\right\|<\frac{\delta}{2},\left\|X_{p}-X_{n}\right\|<\delta$; therefore $F_{p}\left(X_{p}\right) \leq K F_{n}\left(X_{n}\right)+\frac{\epsilon}{2}<$ $K \epsilon^{\prime}+\frac{\epsilon}{2} \leq \epsilon$.

If $F_{p+1}\left(X_{p+1}\right) \geq \epsilon^{\prime}$, then for $k \in[n+1, p+1], F_{k}\left(X_{k}\right) \geq \epsilon^{\prime}$; thus by the preceding argument $F_{p+1}\left(X_{p+1}\right)<\epsilon$; if $F_{p+1}\left(X_{p+1}\right)<\epsilon^{\prime}$, replace $N_{2}$ by $p+1$ and use again the preceding argument; it follows that whatever $q \geq N_{2}, F_{q}\left(X_{q}\right)<\epsilon$; thus $F_{q}\left(X_{q}\right) \longrightarrow 0$ as $q \longrightarrow \infty$.

Let $a=\sup _{n} \frac{\lambda_{\max }\left(A_{n}\right)}{\lambda_{\min }\left(A_{n}\right)}$.

$$
\left\|\nabla g\left(X_{n}\right)\right\|^{2} \leq a \frac{\lambda_{\min }\left(A_{n}\right)}{\lambda_{\max }\left(A_{n}\right)}\left\|\nabla g\left(X_{n}\right)\right\|^{2} \leq a \frac{\left\|A_{n}^{\frac{1}{2}} \nabla g\left(X_{n}\right)\right\|^{2}}{\left\|A_{n}\right\|}=a F_{n}\left(X_{n}\right)
$$

By H4d, $\nabla g\left(X_{n}\right) \longrightarrow 0$ as $n \longrightarrow \infty$.
Let $d\left(X_{n}, S\right)$ be the distance of $X_{n}$ to the set $S$ of stationary points of $g$. Suppose that $d\left(X_{n}, S\right) \nrightarrow 0$. If the sequence $\left(X_{n}\right)$ is contained in $C$, there exist $\epsilon>0$, a subsequence $\left(X_{n^{\prime}}\right)$ and $\theta \in \mathbb{R}^{p}$ such that $X_{n^{\prime}} \longrightarrow \theta$ and $d(\theta, S)>\epsilon$; now if $\nabla g$ is continuous in $C, \nabla g\left(X_{n^{\prime}}\right) \longrightarrow \nabla g(\theta)=0$, a contradiction; thus $d\left(X_{n}, S\right) \longrightarrow 0$.

### 2.3 Proof of the theorem

Proof. By H1b and H4a, as $\left\|A_{n}^{\frac{1}{2}} \nabla g\left(X_{n}\right)\right\|^{2}=\left\langle A_{n} \nabla g\left(X_{n}\right), \nabla g\left(X_{n}\right)\right\rangle$, we have:
$g\left(X_{n+1}\right)-g\left(X_{n}\right) \leq-\left\|A_{n}^{\frac{1}{2}} \nabla g\left(X_{n}\right)\right\|^{2}-\left\langle A_{n} V_{n}, \nabla g\left(X_{n}\right)\right\rangle+2 L\left\|A_{n} \nabla g\left(X_{n}\right)\right\|^{2}+2 L\left\|A_{n} V_{n}\right\|^{2}$.
By H2a, b, as $\left\langle A_{n} E\left[V_{n} \mid T_{n}\right], \nabla g\left(X_{n}\right)\right\rangle \leq \frac{1}{2}\left\|A_{n}^{\frac{1}{2}} E\left[V_{n} \mid T_{n}\right]\right\|^{2}+\frac{1}{2}\left\|A_{n}^{\frac{1}{2}} \nabla g\left(X_{n}\right)\right\|^{2}$
a.s. and $\left\|A_{n} \nabla g\left(X_{n}\right)\right\|^{2} \leq\left\|A_{n}\right\|\left\|A_{n}^{\frac{1}{2}} \nabla g\left(X_{n}\right)\right\|^{2}$, we have a.s.:
$\mathrm{E}\left[g\left(X_{n+1}\right) \mid T_{n}\right] \leq g\left(X_{n}\right)\left(1+\frac{1}{2} B_{n}+2 L D_{n}\right)+\frac{1}{2} C_{n}+2 L E_{n}-\left(\frac{1}{2}-2 L\left\|A_{n}\right\|\right)\left\|A_{n}^{\frac{1}{2}} \nabla g\left(X_{n}\right)\right\|^{2}$
Applying the Robbins-Siegmund lemma (1971) gives the conclusion of (a).
By H2a, b, since $g\left(X_{n}\right)$ converges a.s., we have $\sum_{1}^{\infty}\left\|A_{n}^{\frac{1}{2}} E\left[V_{n} \mid T_{n}\right]\right\|^{2}<\infty$ and $\sum_{1}^{\infty} E\left[\left\|A_{n} V_{n}\right\|^{2} \mid T_{n}\right]<\infty$ a.s. Apply part (a) of the theorem to the process $\left(W_{n}\right)$, with $g\left(W_{n}\right)=\frac{1}{2}\left\|W_{n}\right\|^{2}, \nabla g\left(W_{n}\right)=W_{n}$ and $L=\frac{1}{2}$; it follows that $\left\|W_{n}\right\|$ and $\sum_{1}^{\infty}\left\|A_{n}^{\frac{1}{2}} W_{n}\right\|^{2}$ converge a.s. By $\mathrm{H} 4 \mathrm{c}, \mathrm{d}$ and given that $\left\|A_{n}^{\frac{1}{2}} W_{n}\right\|^{2} \geq \lambda_{\min }\left(A_{n}\right)\left\|W_{n}\right\|^{2}$, it follows that $W_{n}$ converges a.s. to 0 . We apply then lemma 2 to obtain (b).

## 3 Second almost sure convergence theorem

Let $Y_{n}=X_{n}+W_{n}$; we have $Y_{n+1}=Y_{n}-A_{n} \nabla g\left(X_{n}\right)-A_{n} W_{n}$. Suppose:
(H3b) $\sum_{1}^{\infty}\left\|A_{n}^{\frac{1}{2}} W_{n}\right\|^{2}<\infty$ a.s.
We give another theorem where assumptions H 2 on $\left(V_{n}\right)$ are replaced by assumptions H3a, b on $\left(W_{n}\right)$, but where assumption H 1 b on $g$ is replaced by
(H1b') $\nabla g$ is L-Lipschitz continuous $\left(\forall x_{1}, x_{2},\left\|\nabla g\left(x_{1}\right)-\nabla g\left(x_{2}\right)\right\| \leq L\left\|x_{1}-x_{2}\right\|\right)$.

Theorem 3 (a) Assume H1a, b, H3b and H4 $a$, b, d hold; then $g\left(Y_{n}\right), \sum_{1}^{\infty}\left\|A_{n}^{\frac{1}{2}} \nabla g\left(Y_{n}\right)\right\|^{2}$ and $\sum_{1}^{\infty}\left\|A_{n}^{\frac{1}{2}} \nabla g\left(X_{n}\right)\right\|^{2}$ converge a.s.
(b) Under the assumptions of (a), if moreover H3a, H4c hold, then we have the same conclusions as in part (b) of theorem 1.

We give in section 4 sufficient conditions to ensure H3a such as $V_{n} \longrightarrow 0$ a.s. or $\sum_{1}^{\infty} A_{n} V_{n}$ converges $a . s$. The preceding theorem can be used particularly in cases where the random errors $V_{n}$ are correlated. See among others the remarks 1.3 and 1.13b of Walk (Ljung, Pflug, Walk, 1992) for $A_{n}=a_{n} I$.

Proof. By H1b' and H4a, we have

$$
\begin{aligned}
g\left(Y_{n+1}\right)-g\left(Y_{n}\right) \leq & L\left\|A_{n} \nabla g\left(X_{n}\right)+A_{n} W_{n}\right\|^{2} \\
& -\left\langle A_{n}^{\frac{1}{2}}\left(\nabla g\left(X_{n}\right)-\nabla g\left(Y_{n}\right)\right)+A_{n}^{\frac{1}{2}} W_{n}, A_{n}^{\frac{1}{2}} \nabla g\left(Y_{n}\right)\right\rangle-\left\|A_{n}^{\frac{1}{2}} \nabla g\left(Y_{n}\right)\right\|^{2}
\end{aligned}
$$

The first term on the right-hand of the inequality is bounded up by

$$
\begin{aligned}
& L\left(\left\|A_{n}\left(\nabla g\left(X_{n}\right)-\nabla g\left(Y_{n}\right)\right)\right\|+\left\|A_{n} W_{n}\right\|+\left\|A_{n} \nabla g\left(Y_{n}\right)\right\|\right)^{2} \\
& \leq 2 L(L+1)^{2}\left\|A_{n}\right\|^{2}\left\|W_{n}\right\|^{2}+2 L\left\|A_{n}\right\|\left\|A_{n}^{\frac{1}{2}} \nabla g\left(Y_{n}\right)\right\|^{2} .
\end{aligned}
$$

The second term is bounded up by $(L+1)^{2}\left\|A_{n}\right\|\left\|W_{n}\right\|^{2}+\frac{1}{2}\left\|A_{n}^{\frac{1}{2}} \nabla g\left(Y_{n}\right)\right\|^{2}$.
It follows that a.s.:
$E\left[g\left(Y_{n+1}\right) \mid T_{n}\right] \leq g\left(Y_{n}\right)+(L+1)^{2}\left\|A_{n}\right\|\left(2 L\left\|A_{n}\right\|+1\right)\left\|W_{n}\right\|^{2}-\left(\frac{1}{2}-2 L\left\|A_{n}\right\|\right)\left\|A_{n}^{\frac{1}{2}} \nabla g\left(Y_{n}\right)\right\|^{2}$
By H3b and H4a, d, as $\left\|A_{n}^{\frac{1}{2}} W_{n}\right\|^{2} \geq \lambda_{\text {min }}\left(A_{n}\right)\left\|W_{n}\right\|^{2}$, we have $\sum_{1}^{\infty}\left\|A_{n}\right\|\left\|W_{n}\right\|^{2}<$ $\infty$ a.s.

By H1a and H4b, we may then apply the Robbins-Siegmund lemma: $g\left(Y_{n}\right)$ and $\sum_{1}^{\infty}\left\|A_{n}^{\frac{1}{2}} \nabla g\left(Y_{n}\right)\right\|^{2}$ converge a.s. We deduce that $\sum_{1}^{\infty}\left\|A_{n}^{\frac{1}{2}} \nabla g\left(X_{n}\right)\right\|^{2}$ converges a.s.

By H1b' and H4d, H1c holds. We may then apply lemma 2 and obtain part (b) of the theorem.

## 4 Convergence lemma of $W_{n}$

Suppose:
(H2a') $\sum_{1}^{\infty}\left\|A_{n}^{\frac{1}{2}} E\left[V_{n} \mid T_{n}\right]\right\|^{2}<\infty$ a.s.
(H2b') $\sum_{1}^{\infty} E\left[\left\|A_{n} V_{n}\right\|^{2} \mid T_{n}\right]<\infty$ a.s.
$(\mathrm{H} 2 \mathrm{c}) V_{n} \longrightarrow 0$ a.s.
(H2d) $\sum_{1}^{\infty} A_{n} V_{n}$ converges a.s.
(H4b') There exists $l>0$ such that $\sup _{n} \lambda_{\max }\left(A_{n}\right)<l$ a.s.

Lemma 4 (a) Assume H2a', $b^{\prime}$ and $H_{4} a, b^{\prime}$ with $l=\frac{1}{2}, c$, $d$ hold; then $W_{n}$ converges a.s. to 0 and $\sum_{1}^{\infty}\left\|A_{n}^{\frac{1}{2}} W_{n}\right\|^{2}$ converges a.s.
(b) Assume H2c, or H2d, and H4a, b' with $l=1, c$, d hold; then $W_{n}$ converges a.s. to 0 .

Proof. The part (a) has been already proved in the proof of theorem 1.
For the part (b), $\omega \in \Omega$ is fixed throughout the proof, belonging to the intersection of the defined a.s. convergence sets. Denote $C_{l}=I-A_{l}$. We have:

$$
W_{n+1}=C_{n} W_{n}+A_{n} V_{n}=\sum_{j=1}^{n} \prod_{l=j+1}^{n} C_{l} A_{j} V_{j}, \text { with } \prod_{l=n+1}^{n} C_{l}=I
$$

Denote $a_{n j}=\prod_{l=j+1}^{n}\left\|C_{l}\right\|\left\|A_{j}\right\|, j=1, \ldots, n-1, a_{n n}=\left\|A_{n}\right\|$.
By H4a, b', c, d, $a_{n j}<\prod_{l=j+1}^{n}\left(1-\lambda_{\min }\left(A_{l}\right)\right)$ and

$$
\ln a_{n j}<-\sum_{l=j+1}^{n} \lambda_{\min }\left(A_{l}\right) \longrightarrow-\infty, a_{n j} \longrightarrow 0 \text { as } n \longrightarrow \infty .
$$

Furthermore, there exists $a>0$ such that
$a_{n j} \leq a \prod_{l=j+1}^{n}\left(1-\lambda_{\min }\left(A_{l}\right)\right) \lambda_{\min }\left(A_{j}\right)=a\left(\prod_{l=j+1}^{n}\left(1-\lambda_{\min }\left(A_{l}\right)\right)-\prod_{l=j}^{n}\left(1-\lambda_{\min }\left(A_{l}\right)\right)\right)$.

Then $\sum_{j=1}^{n} a_{n j} \leq a$.

1) $\left\|W_{n+1}\right\| \leq \sum_{j=1}^{n} a_{n j}\left\|V_{j}\right\|$. By H2c, $W_{n} \longrightarrow 0$.
2) Denote $S_{n}=\sum_{j=1}^{n} A_{j} V_{j}, S_{0}=0, B_{j}=\left(\prod_{l=1}^{j} C_{l}\right)^{-1}$.

$$
\begin{aligned}
W_{n+1} & =B_{n}^{-1} \sum_{j=1}^{n} B_{j} A_{j} V_{j}=B_{n}^{-1} \sum_{j=1}^{n} B_{j}\left(S_{j}-S_{j-1}\right) \\
& =S_{n}+B_{n}^{-1} \sum_{j=2}^{n}\left(B_{j-1}-B_{j}\right) S_{j-1}=S_{n}-\sum_{j=2}^{n} \prod_{l=j+1}^{n} C_{l} A_{j} S_{j-1}
\end{aligned}
$$

By H2d, let $S=\lim _{n \longrightarrow \infty} S_{n}$. As $\sum_{j=2}^{n} \prod_{l=j+1}^{n} C_{l} A_{j}=I-\prod_{l=2}^{n} C_{l}$, we have:

$$
\begin{gathered}
W_{n+1}=S_{n}-S-\sum_{j=2}^{n} \prod_{l=j+1}^{n} C_{l} A_{j}\left(S_{j-1}-S\right)+\prod_{l=2}^{n} C_{l} S . \\
\left\|W_{n+1}\right\| \leq\left\|S_{n}-S\right\|+\sum_{j=2}^{n} a_{n j}\left\|S_{j-1}-S\right\|+\prod_{l=2}^{n}\left\|C_{l}\right\|\|S\|
\end{gathered}
$$

By H4a, b', c, d, $\prod_{l=2}^{n}\left\|C_{l}\right\| \longrightarrow 0$ as $n \longrightarrow \infty$; by H2d, $W_{n} \longrightarrow 0$.

## 5 Corollary

Suppose $V_{n}=V_{n}^{1}+V_{n}^{2}+V_{n}^{3}+V_{n}^{4}$. Define for $\mathrm{i}=1,2,3,4, W_{n}^{i}$ such that $W_{n+1}^{i}=$ $\left(I-A_{n}\right) W_{n}^{i}+A_{n} V_{n}^{i}$ and $W_{n}=\sum_{i=1}^{4} W_{n}^{i}$.

Corollary 5 Assume that H2a', b' hold for $V_{n}^{1}$, H2c for $V_{n}^{2}$, H2d for $V_{n}^{3}$ and H3a for $V_{n}^{4}$; assume furthermore H1a, b, H3b, H4a,b, $c$, d hold; then $\nabla g\left(X_{n}\right)$ converges a.s. to 0 .

In the case where $A_{n}=a_{n} I$, this corollary can be compared to theorem 1.2a of Walk (Ljung, Pflug, Walk, 1992) who makes a more restrictive assumption, $\sum_{1}^{\infty} a_{n}\left\|V_{n}^{1}\right\|^{2}$ $<\infty$, than H2a', b'.
