Updated March 2008

Abstract

In the framework of the statistical model for parton distributions and fragmentations functions we present a comparison of the model with a large set of unpolarized and polarized experimental data, the agreement with data supports our approach.

Contents

1 Polarized Parton Distributions

We give a brief review of the parton distributions functions which are described in Refs. [1-6].

1.1 Quarks

The density functions are given by [2] :

$$xu^+(x) = \frac{AX_{0u}^+ x^b}{\exp[(x - X_{0u}^+)/\bar{x}] + 1} + \frac{\tilde{A}x^{\tilde{b}}}{\exp[\frac{x}{\bar{x}}] + 1} \tag{1}$$

$$xu^-(x) = \frac{AX_{0u}^- x^b}{\exp[(x - X_{0u}^-)/\bar{x}] + 1} + \frac{\tilde{A}x^{\tilde{b}}}{\exp[\frac{x}{\bar{x}}] + 1} \tag{2}$$

$$xd^+(x) = \frac{AX_{0d}^+ x^b}{\exp[(x - X_{0d}^+)/\bar{x}] + 1} + \frac{\tilde{A}x^{\tilde{b}}}{\exp[\frac{x}{\bar{x}}] + 1} \tag{3}$$

$$xd^-(x) = \frac{AX_{0d}^- x^b}{\exp[(x - X_{0d}^-)/\bar{x}] + 1} + \frac{\tilde{A}x^{\tilde{b}}}{\exp[\frac{x}{\bar{x}}] + 1} \tag{4}$$

$$A = 1.74938 \tag{5}$$
$$b = 0.40962 \pm 0.00438^{(*)} \tag{6}$$
$$\bar{x} = 0.09907 \pm 0.00110^{(*)} \tag{7}$$
$$X_{0u}^+ = 0.46128 \pm 0.00338^{(*)} \tag{8}$$
$$X_{0u}^- = 0.29766 \pm 0.00303^{(*)} \tag{9}$$
$$X_{0d}^+ = 0.22775 \pm 0.00294^{(*)} \tag{10}$$
$$X_{0d}^- = 0.30174 \pm 0.00239^{(*)} \tag{11}$$
$$\tilde{A} = 0.08318 \pm 0.00157 \tag{12}$$
$$\tilde{b} = -0.25347 \pm 0.00318^{(*)} \tag{13}$$

note:
The temperature $\bar{x}$ is identical for quarks, antiquarks and gluons.

[2] Values marked with an asterisk are free parameters of the model. The input scale is $Q_0^2 = 4\text{GeV}^2$, and $\Lambda(\overline{MS}) = 300\text{MeV}$. The evolution is performed at NLO.

1.2 Antiquarks

The density functions are given by:

$$x\bar{u}^{+}(x) = \frac{\bar{A}}{X_{0u}^{-}} \cdot \frac{x^{\bar{b}}}{\exp[(x+X_{0u}^{-})/\bar{x}]+1} + \frac{\tilde{A}x^{\tilde{b}}}{\exp[\frac{x}{\bar{x}}]+1} \tag{14}$$

$$x\bar{u}^{-}(x) = \frac{\bar{A}}{X_{0u}^{+}} \cdot \frac{x^{\bar{b}}}{\exp[(x+X_{0u}^{+})/\bar{x}]+1} + \frac{\tilde{A}x^{\tilde{b}}}{\exp[\frac{x}{\bar{x}}]+1} \tag{15}$$

$$x\bar{d}^{+}(x) = \frac{\bar{A}}{X_{0d}^{-}} \cdot \frac{x^{\bar{b}}}{\exp[(x+X_{0d}^{-})/\bar{x}]+1} + \frac{\tilde{A}x^{\tilde{b}}}{\exp[\frac{x}{\bar{x}}]+1} \tag{16}$$

$$x\bar{d}^{-}(x) = \frac{\bar{A}}{X_{0d}^{+}} \cdot \frac{x^{\bar{b}}}{\exp[(x+X_{0d}^{+})/\bar{x}]+1} + \frac{\tilde{A}x^{\tilde{b}}}{\exp[\frac{x}{\bar{x}}]+1} \tag{17}$$

$$\bar{A} = 1.90801 \pm 0.12627^{(*)} \tag{18}$$

$$\bar{b} = 2b = 0.81924 \tag{19}$$

$xs(x) = x\bar{s}(x) = \frac{1}{4}(x\bar{u}(x) + x\bar{d}(x))$

$x\Delta s(x) = x\Delta\bar{s}(x) = \frac{1}{3}(x\Delta\bar{d}(x) - x\Delta\bar{u}(x))$. This assumption was removed in a new version of the model, see [6].

$$xs^{h}(x,Q_0^2) = \frac{AX_{0u}^{+}x^{b_s}}{\exp[(x-X_{0s}^{h})/\bar{x}]+1} \, \frac{\ln\left(1+\exp\left[kX_{0s}^{h}/\bar{x}\right]\right)}{\ln\left(1+\exp\left[kX_{0u}^{+}/\bar{x}\right]\right)} + \frac{\tilde{A}_s x^{\tilde{b}}}{\exp(x/\bar{x})+1} \, , \tag{20}$$

$$x\bar{s}^{h}(x,Q_0^2) = \frac{\bar{A}(X_{0d}^{+})^{-1}x^{2b_s}}{\exp[(x+X_{0s}^{-h})/\bar{x}]+1} \, \frac{\ln\left(1+\exp\left[-kX_{0s}^{-h}/\bar{x}\right]\right)}{\ln\left(1+\exp\left[-kX_{0d}^{+}/\bar{x}\right]\right)} + \frac{\tilde{A}_s x^{\tilde{b}}}{\exp(x/\bar{x})+1} \, . \tag{21}$$

$$\begin{aligned} &A = 1.74938, \ \bar{A} = 1.90801, \ X_{0u}^{+} = 0.46128, \ X_{0d}^{+} = 0.22775, \\ &\bar{x} = 0.09907, \ \tilde{b} = -0.25347, \ k = 1.42 \, . \end{aligned} \tag{22}$$

1.3 Gluon

$$xG(x) = \frac{A_G x^{b_G}}{\exp[x/\bar{x}] - 1} \tag{23}$$

$$A_G = 14.27535 \tag{24}$$

$$b_G = 1 + \tilde{b} = 0.74653 \tag{25}$$

$$x\Delta G(x) = 0 \qquad \text{at} \quad Q_0^2 = 4\text{GeV}^2 \tag{26}$$

Charm
The charm is set to 0 at $Q_0^2 = 4\text{GeV}^2$

2 Parton Fragmentation Functions

We propose to parametrize the fragmentation functions of the baryons octet with a statistical model as in the case of PDF.

For the quarks $q = u, s, d$ the FF are expressed as

$$D_q^B(x, Q_0^2) = \frac{A_q^B X_q^B x^b}{\exp[(x - X_q^B)/\bar{x}] + 1}, \tag{27}$$

where X_q^B is the potential corresponding to the fragmentation $q \to B$ and Q_0^2 is an initial scale, given below in Table 1. We will ignore the antiquark FF $D_{\bar{q}}^B$, which are considered to be strongly suppressed. The heavy quark FF $D_Q^B(x, Q_0^2)$ for $Q = c, b, t$, which are expected to be large only in the small x region ($x \leq 0.1$ or so), are parametrized by a diffractive term with a vanishing potential

$$D_Q^B(x, Q_0^2) = \frac{\tilde{A}_Q^B x^{\tilde{b}}}{\exp(x/\bar{x}) + 1}. \tag{28}$$

The initial scale Q_0^2, which is flavor dependent in this case, is given below in Table 1 [3]. This FF for $Q \to B$ depends on $\tilde{b}$ and a normalization constant $\tilde{A}_B^Q$ for each baryon B. For the other quarks, we make some reasonable assumptions in order to reduce the number of parameters in addition to b, the universal power of x in Eq. (27). First we have the obvious constraints, namely, $D_u^B = D_d^B$ for $B = p, \Lambda$. Moreover we assume that we need only *four* potentials, two for the proton $X_u^p = X_d^p$ and X_s^p and two for the hyperons $X_u^Y = X_d^Y$ and X_s^Y where $Y = \Lambda, \Sigma^{\pm}, \Xi^-$. Finally for the gluon to baryon FF $D_g^B(x, Q^2)$, which is hard to determine precisely, we take a Bose-Einstein expression with a vanishing potential

$$D_g^B(x, Q_0^2) = \frac{A_g^B x^{\tilde{b}+1}}{\exp(x/\bar{x}) - 1}. \tag{29}$$

We assume it has the same small x behavior as the heavy quarks and it is the same for all baryons. The normalization constants A_q^B, A_g^B and $\tilde{A}_Q^B$ are determined by fitting the data.

[3] Due to the fact that the input scale of the t quark is above the highest energy data investigated in this work, it does not contribute to our analysis.

Table 1: Input scales Q_0 and $\Lambda(\overline{MS})$ in GeV unit.

quark	u,d,s	c	b	t
Q_0	0.632	1.4	4.5	175
$\Lambda(\overline{MS})$	0.299	0.246	0.168	0.068

Now, let us report the values of the free parameters we have obtained from the NLO fit:

$$\begin{array}{cccc} X_u^p = 0.648, & X_s^p = 0.247, & X_u^\Lambda = 0.296, & X_s^\Lambda = 0.476 \\ b = 0.200, & \tilde{b} = -0.472, & A_g^B = 0.051. & \end{array} \tag{30}$$

Table 2: Values of the normalization constants of the the octet baryons FF

Baryon	q_1	q_2	$A^B_{q_1}$	$A^B_{q_2}$	A^B_Q
$p(uud)$	$u = d$	s	0.264	1.168	2.943
$\Lambda(uds)$	$u = d$	s	0.428	1.094	0.720
$\Sigma^+(uus)$	u	s	0.033	0.462	0.180
$\Sigma^-(dds)$	d	s	0.030	0.319	0.180
$\Xi^-(dss)$	d	s	0.023	0.082	0.072

3 Parton distributions and fragmentation functions figures

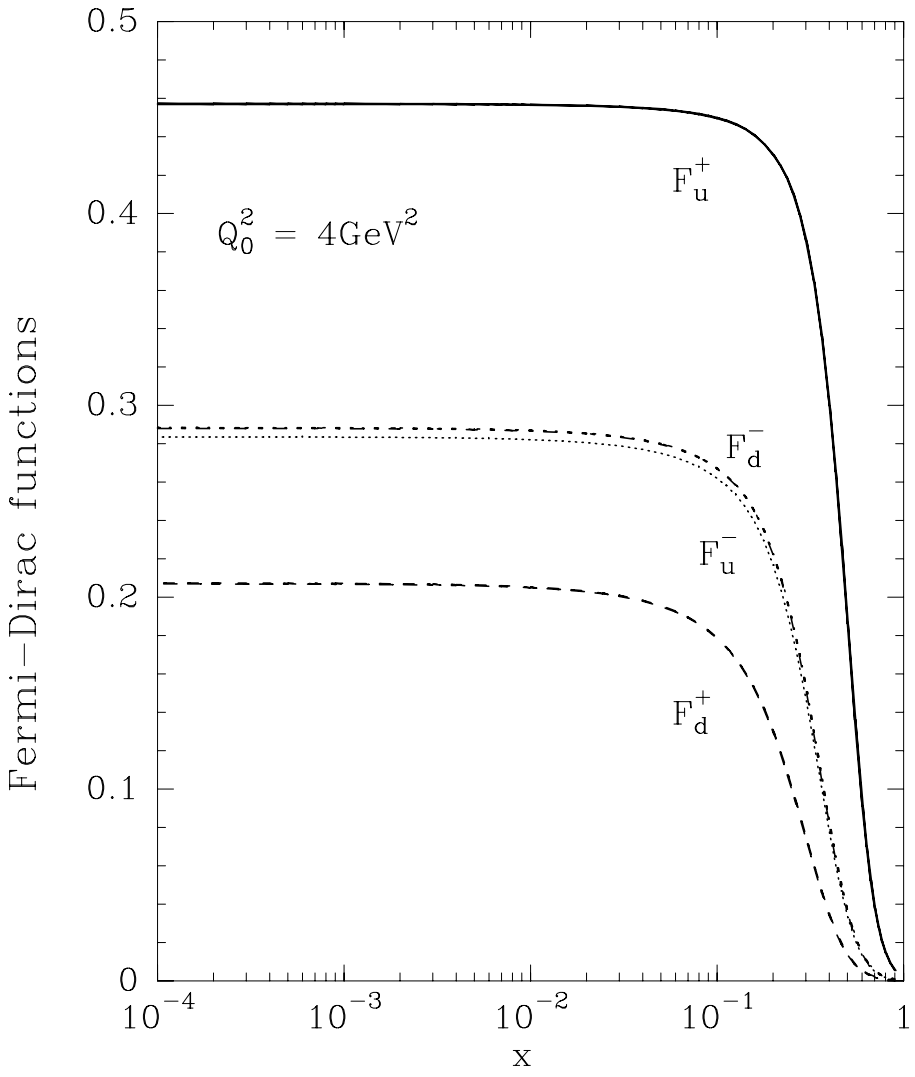

Figure 1: The Fermi-Dirac functions for quarks $F_q^h = X_{0q}^h/(\exp[(x-X_{0q}^h)/\bar{x}]+1)$ at the input energy scale $Q_0^2 = 4\mathrm{GeV}^2$, as a function of x.

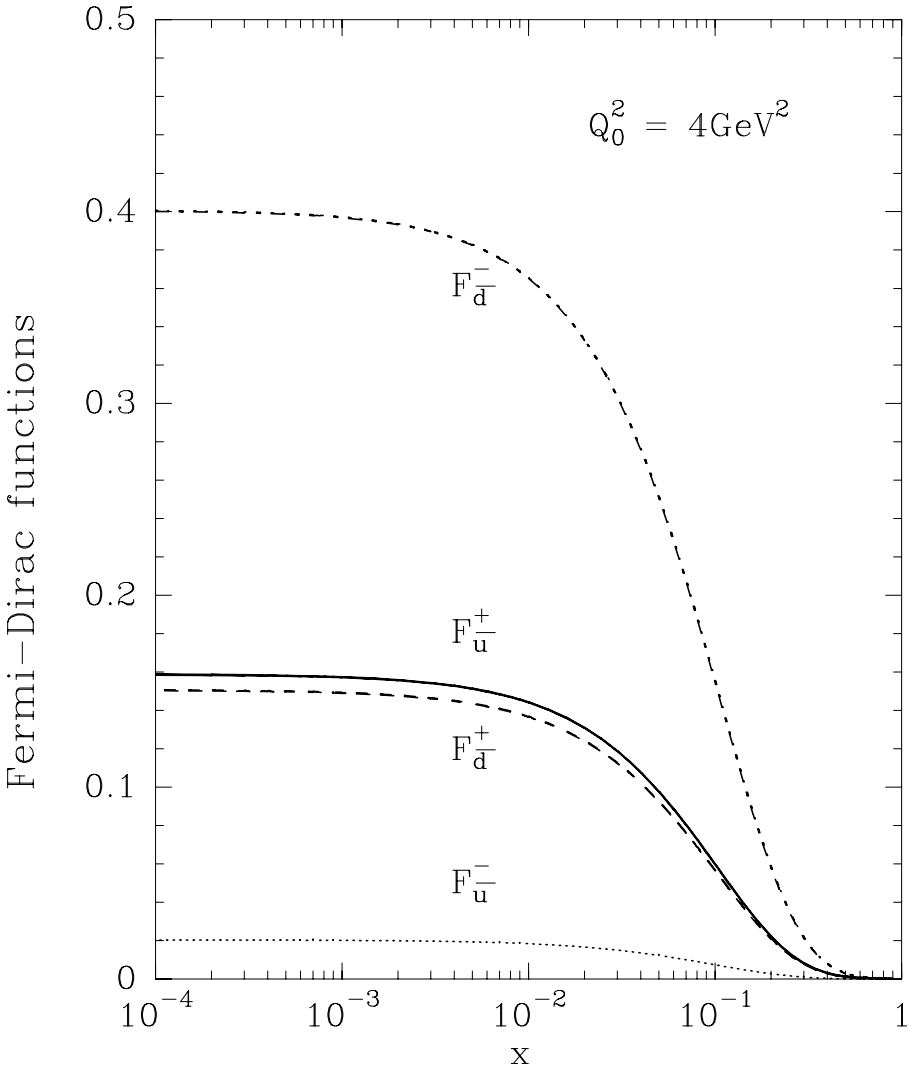

Figure 2: The Fermi-Dirac functions for antiquarks $F_{\bar{q}}^h = 1/X_{0\bar{q}}^h(\exp[(x + X_{0\bar{q}}^h)/\bar{x}] + 1)$ at the input energy scale $Q_0^2 = 4\mathrm{GeV}^2$, as a function of x.

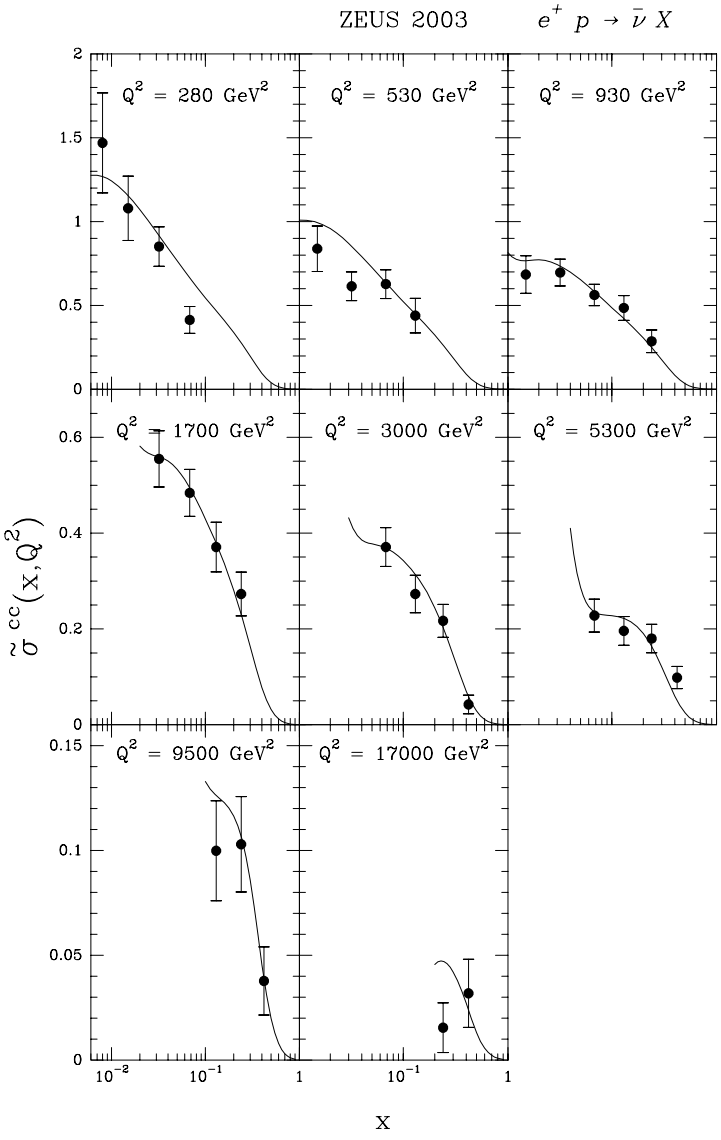

Figure 76: The reduced charged current cross section, $\tilde{\sigma}$, in e^+p reaction as a function of x, for different fixed values of Q^2. Data from ZEUS Coll. [97].

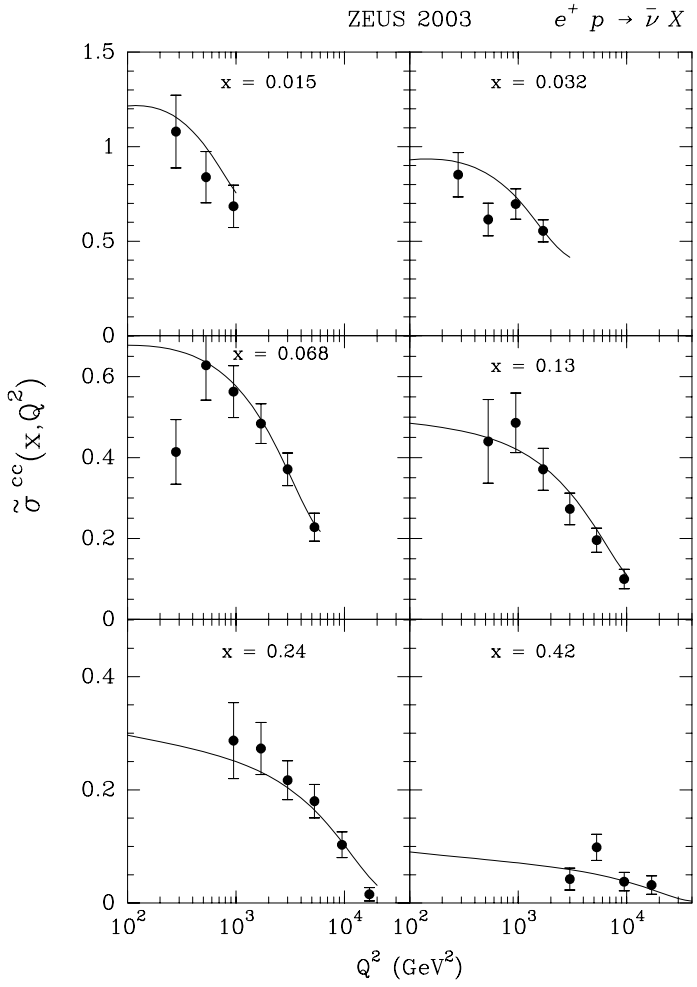

Figure 77: The reduced charged current cross section, $\tilde{\sigma}$, in e^+p reaction as a function of Q^2, for different fixed values of x. Data from ZEUS Coll. [97].

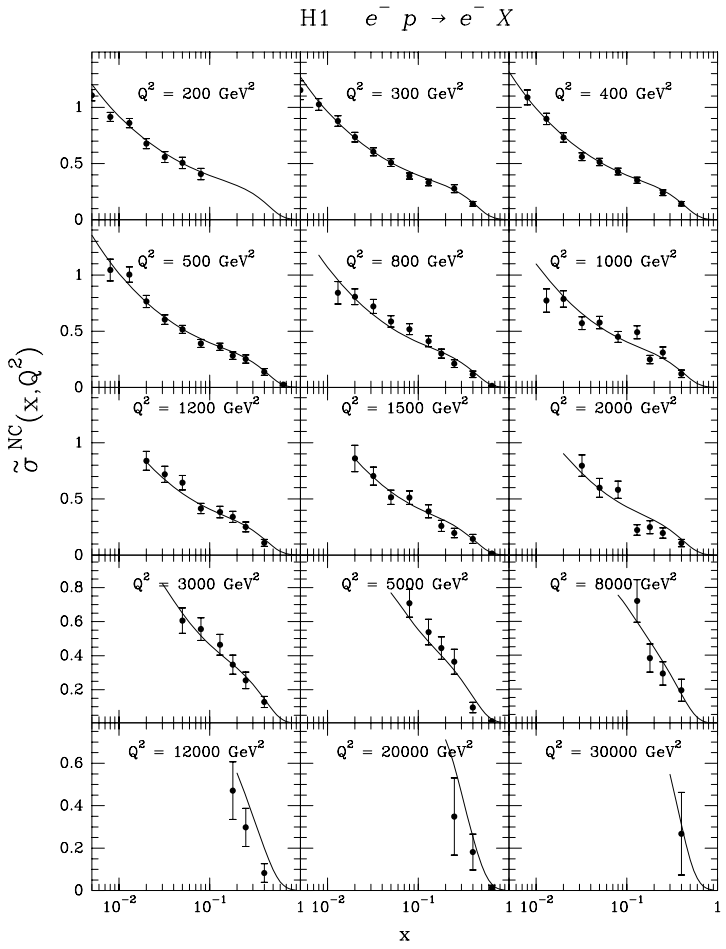

Figure 78: The reduced neutral current cross section $\tilde{\sigma}$, in $e^- p$ reaction as a function of x, for different fixed values of Q^2 and $\sqrt{s} = 320$GeV. Data from H1 Coll [40]

.

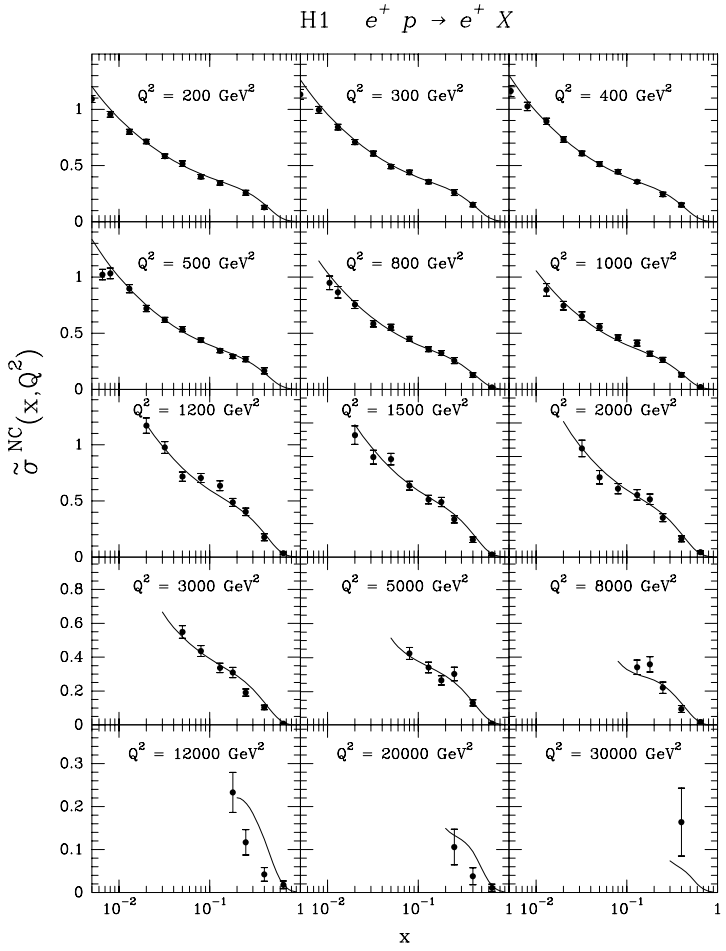

Figure 79: The reduced neutral current cross section $\tilde{\sigma}$, in e^+p reaction as a function of x, for different fixed values of Q^2 and $\sqrt{s} = 319$GeV. Data from H1 Coll [40]

.

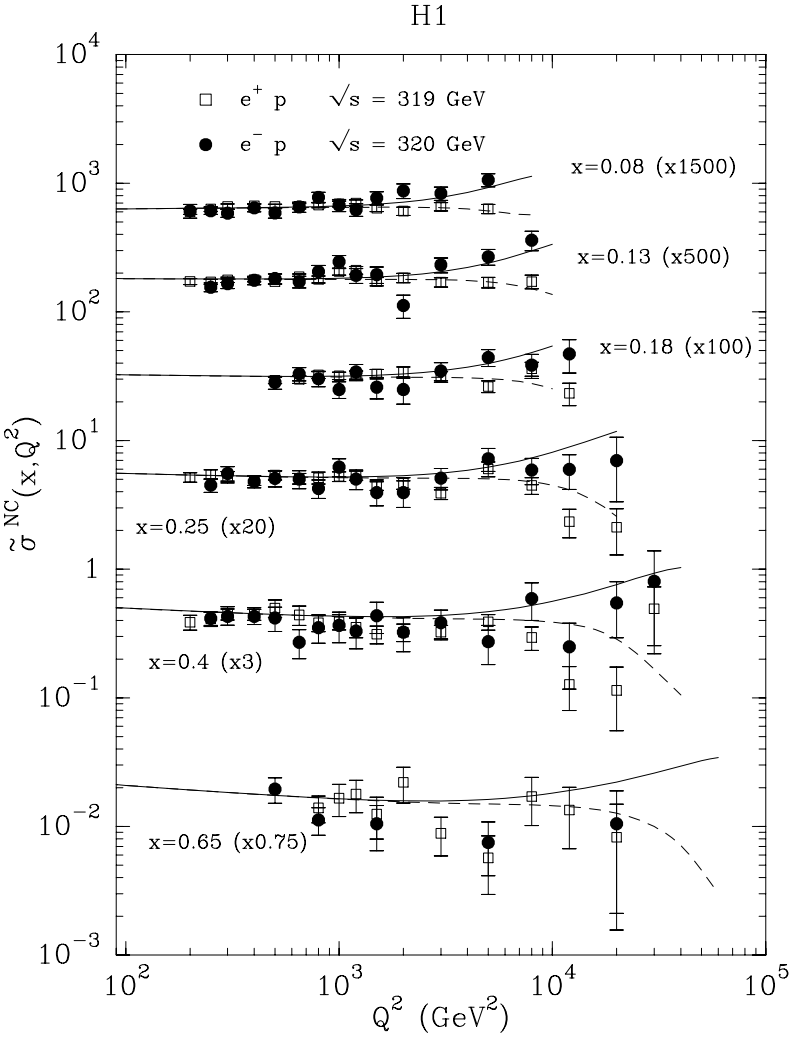

Figure 80: The reduced neutral current cross section $\tilde{\sigma}$, in $e^{\pm}p$ reaction as a function of Q^2, for different fixed values of x. Solid line $e^{-}p$, dashed line $e^{+}p$. Data from H1 Coll [40]

.

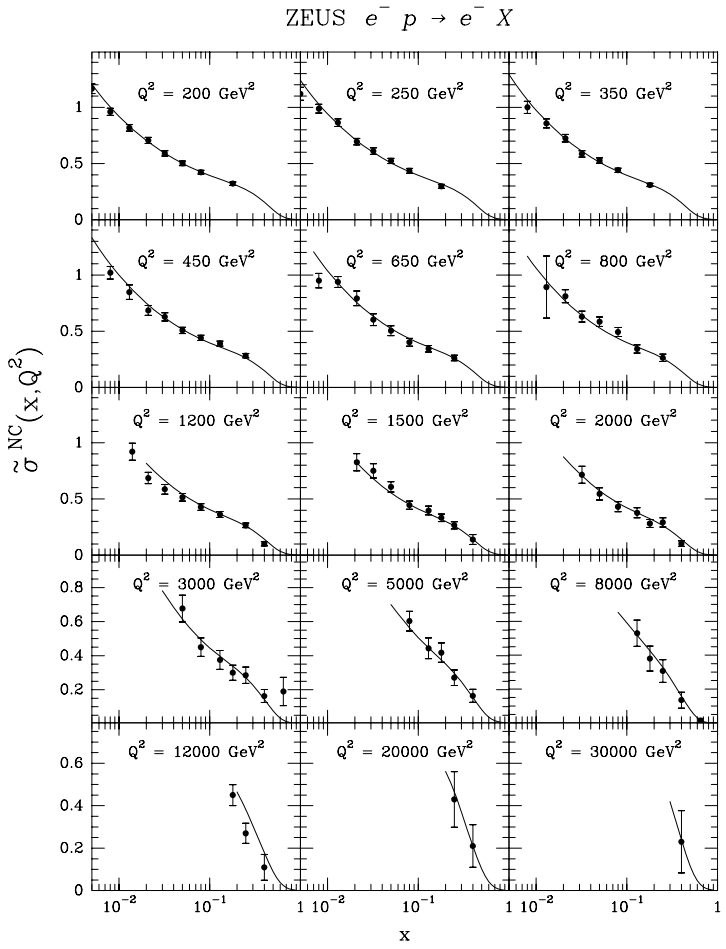

Figure 81: The reduced neutral current cross section $\tilde{\sigma}$, in $e^- p$ reaction as a function of x, for different fixed values of Q^2 and $\sqrt{s} = 318$GeV. Data from Zeus Coll [97]

.

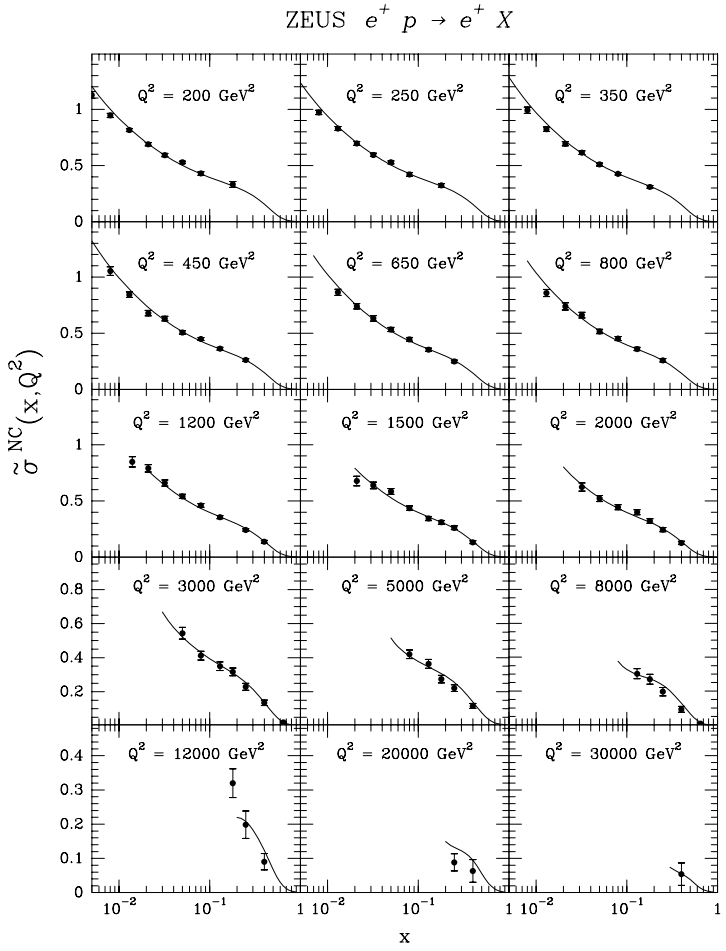

Figure 82: The reduced neutral current cross section $\tilde{\sigma}$, in e^+p reaction as a function of x, for different fixed values of Q^2 and $\sqrt{s} = 318$GeV. Data from Zeus Coll [97]

.

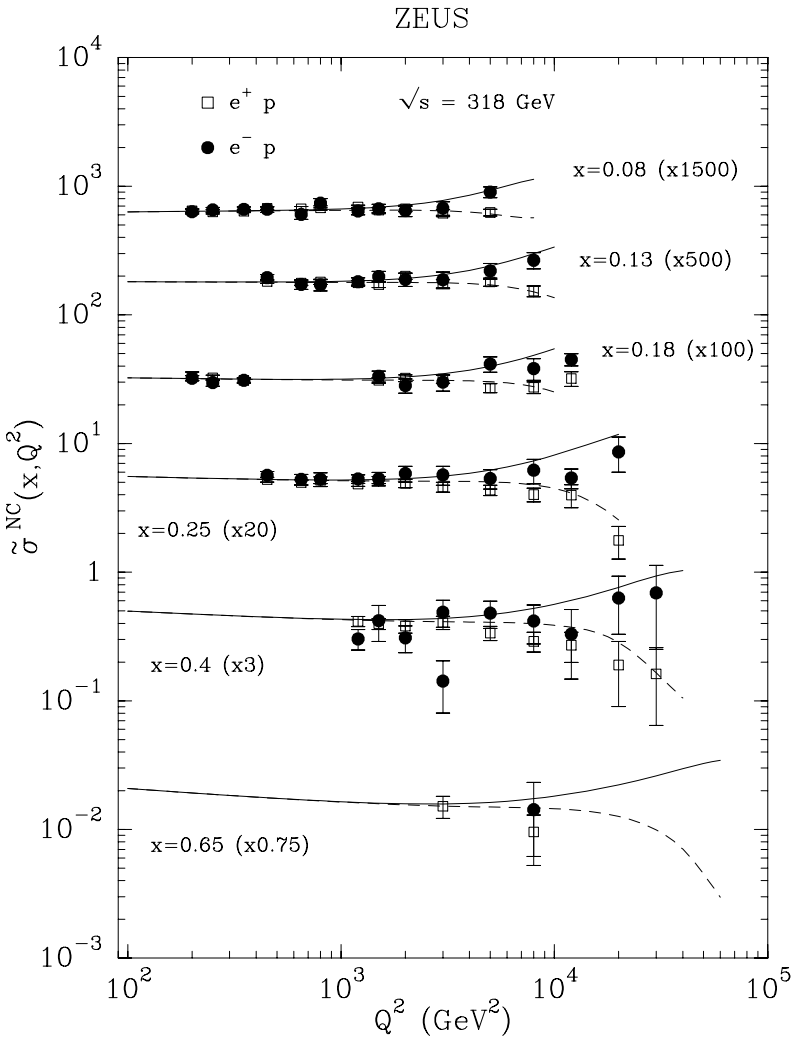

Figure 83: The reduced neutral current cross section $\tilde{\sigma}$, in $e^{\pm}p$ reaction as a function of Q^2, for different fixed values of x. Solid line $e^{-}p$, dashed line $e^{+}p$. Data from Zeus Coll [97]

.

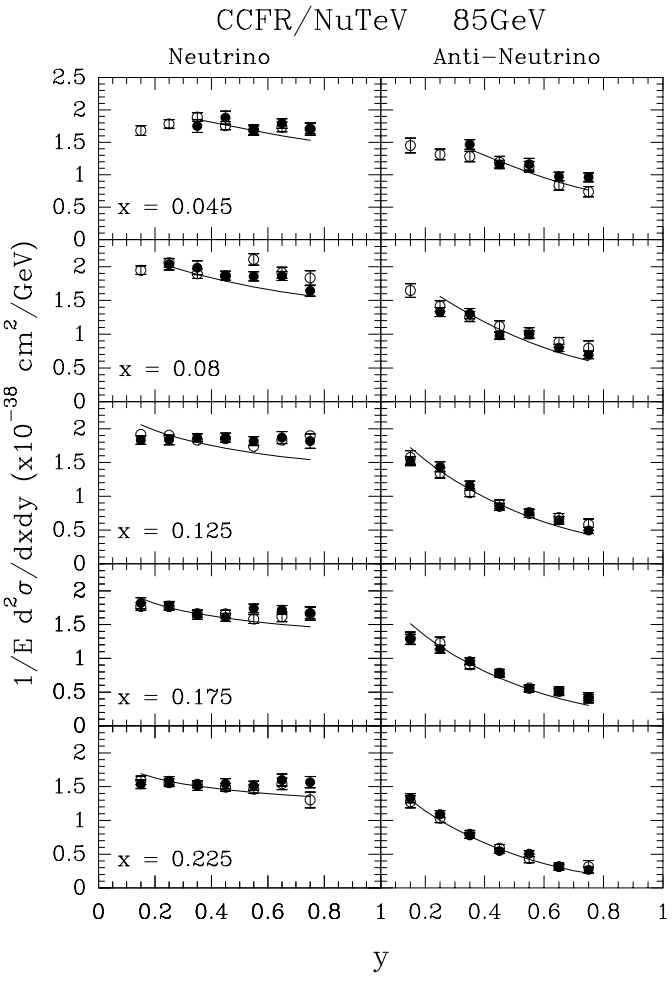

Figure 84: Differential cross section νN proton for $E_\nu = 85$GeV as a function of y for different x bins. Data from CCFR [29] and NuTeV collaboration [31, 30].

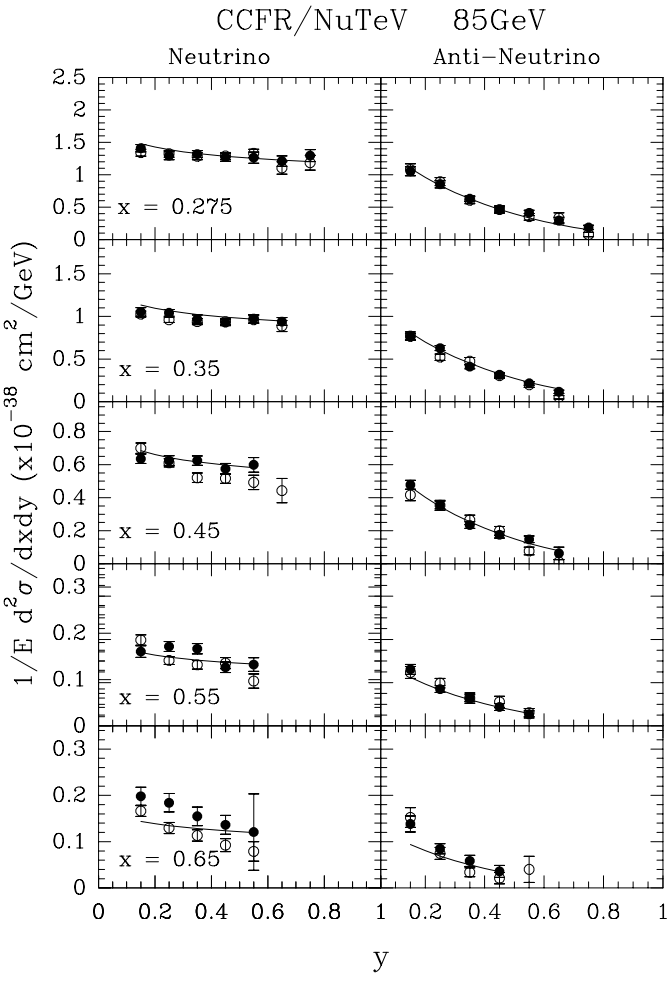

Figure 85: Differential cross section νN proton for $E_\nu = 85$GeV as a function of y for different x bins. Data from CCFR [29] and NuTeV collaboration [31, 30].

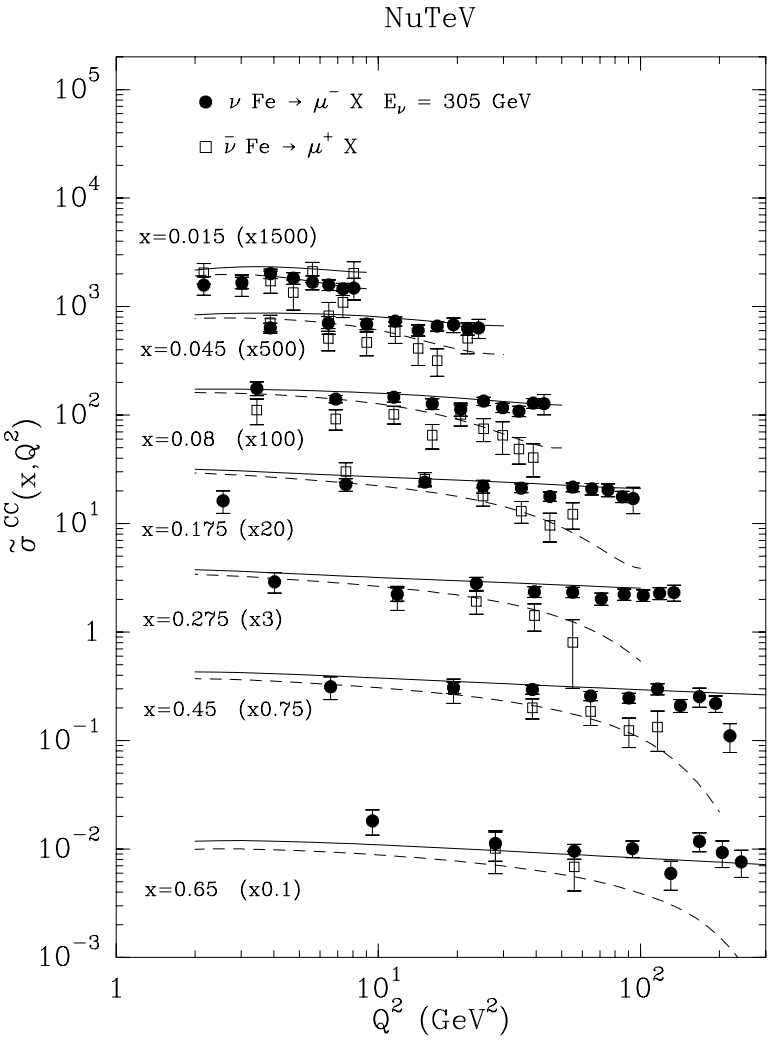

Figure 86: The reduced harged current cross section νN, for different x bins as a function of Q^2. The data points are obtained from the differential cross section [31, 30], they are not a direct measurement

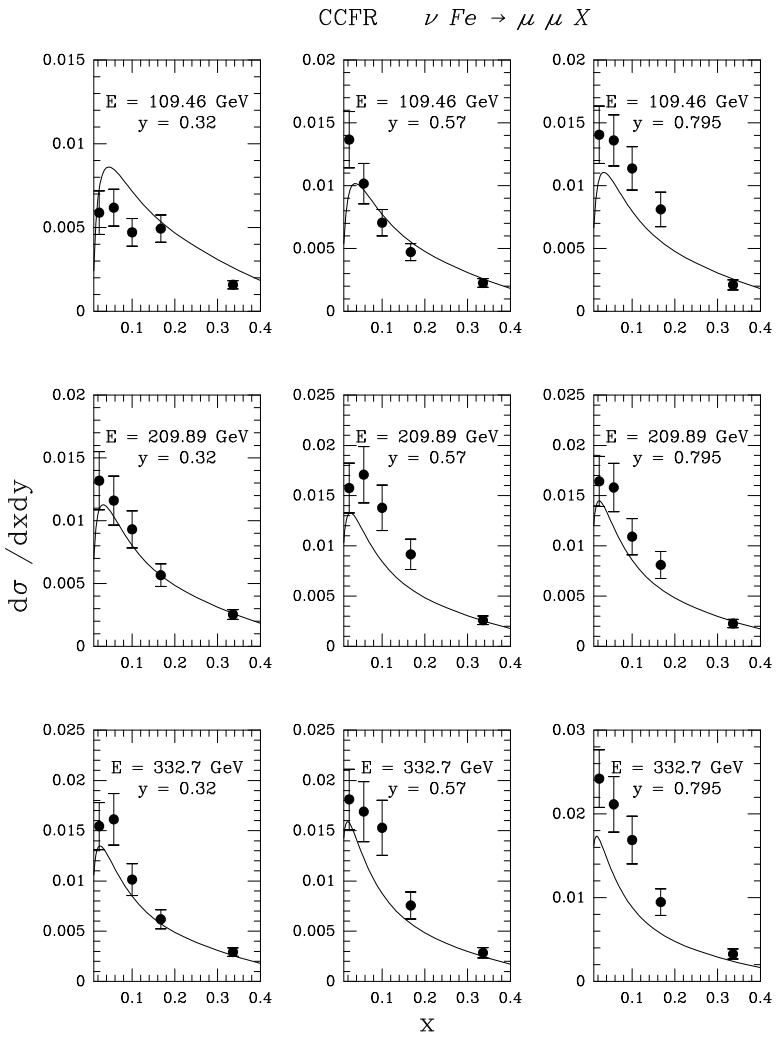

Figure 87: Comparison of the CCFR ν data [103] to the result of the fit for $d\sigma/dxdy$, in units of charged-current σ, for various kinematic ranges in energy, x and y.

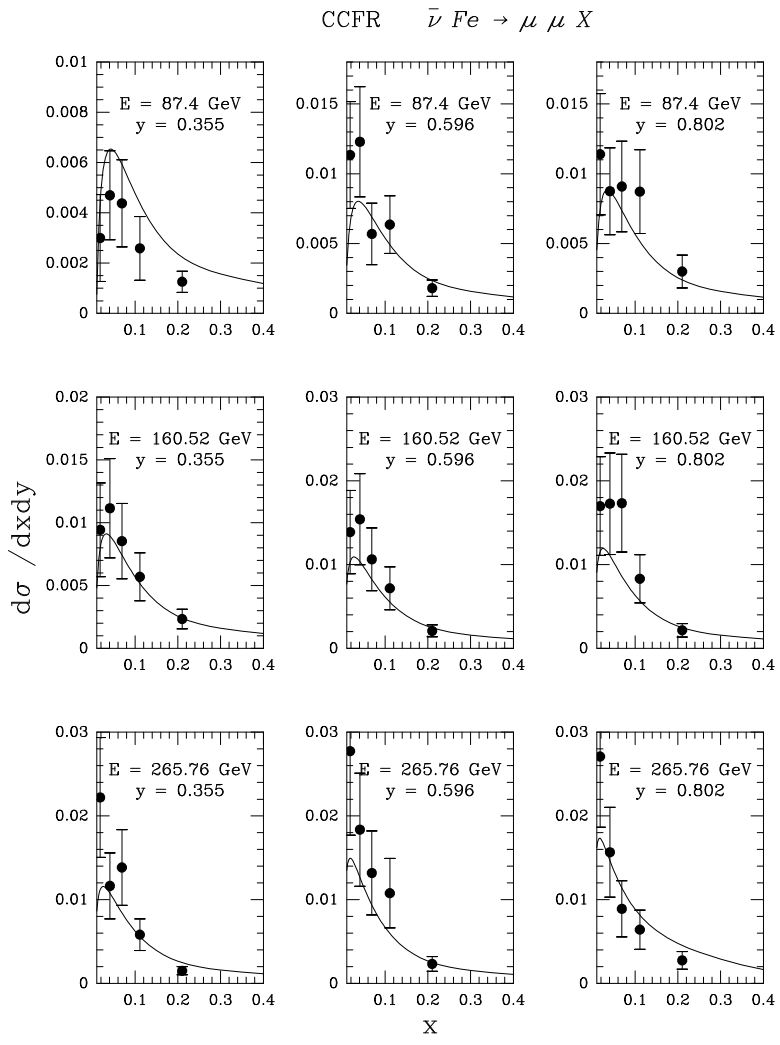

Figure 88: Comparison of the CCFR $\bar{\nu}$ data [103] to the result of the fit for $d\sigma/dxdy$ in units of charged-current σ, for various kinematic ranges in energy, x and y.

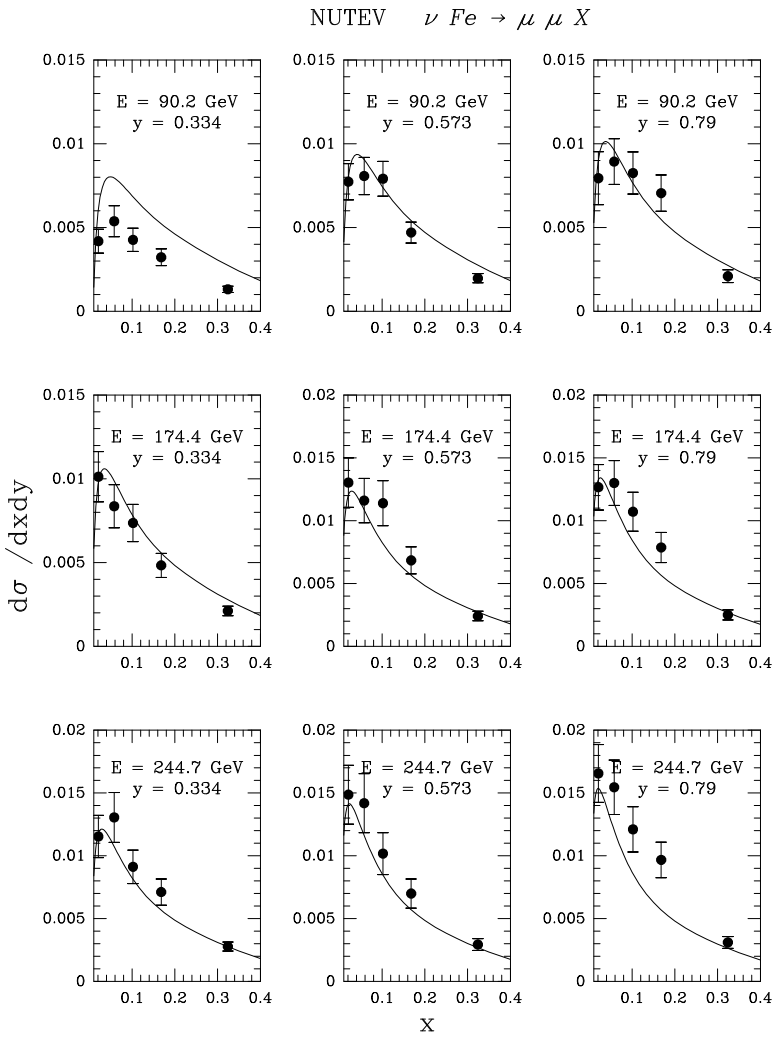

Figure 89: Comparison of the NuTeV ν data [103] to the result of the fit for $d\sigma/dxdy$, in units of charged-current σ, for various kinematic ranges in energy, x and y.

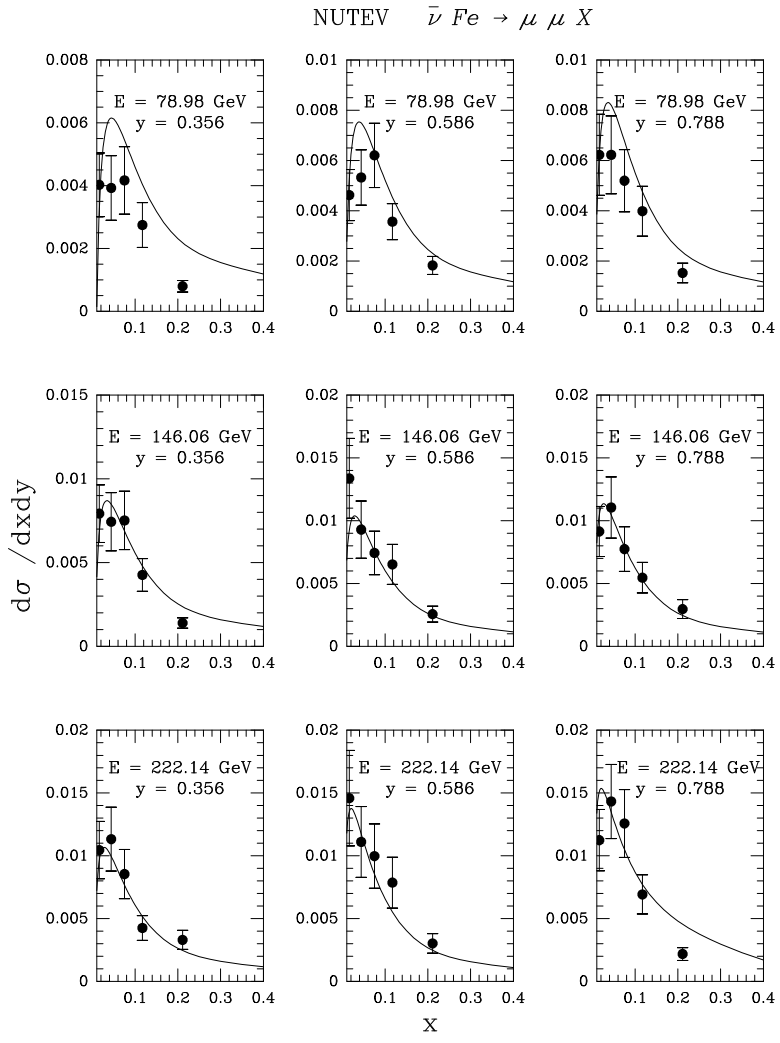

Figure 90: Comparison of the NuTeV $\bar{\nu}$ data [103] to the result of the fit for $d\sigma/dxdy$, in units of charged-current σ, for various kinematic ranges in energy, x and y.

5 Polarized experiments

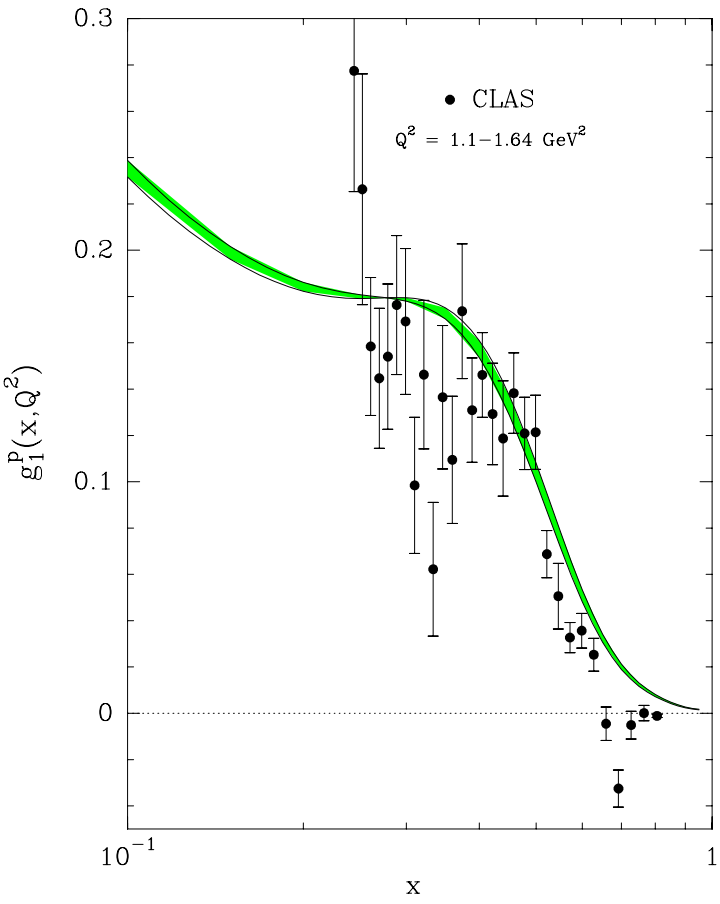

Figure 91: $g_1^p(x, Q^2)$ as function of x at for a range $1.1 \leq Q^2 \leq 1.64\text{GeV}^2$, CLAS Coll [16]. The two curves represent the extreme Q^2 values.

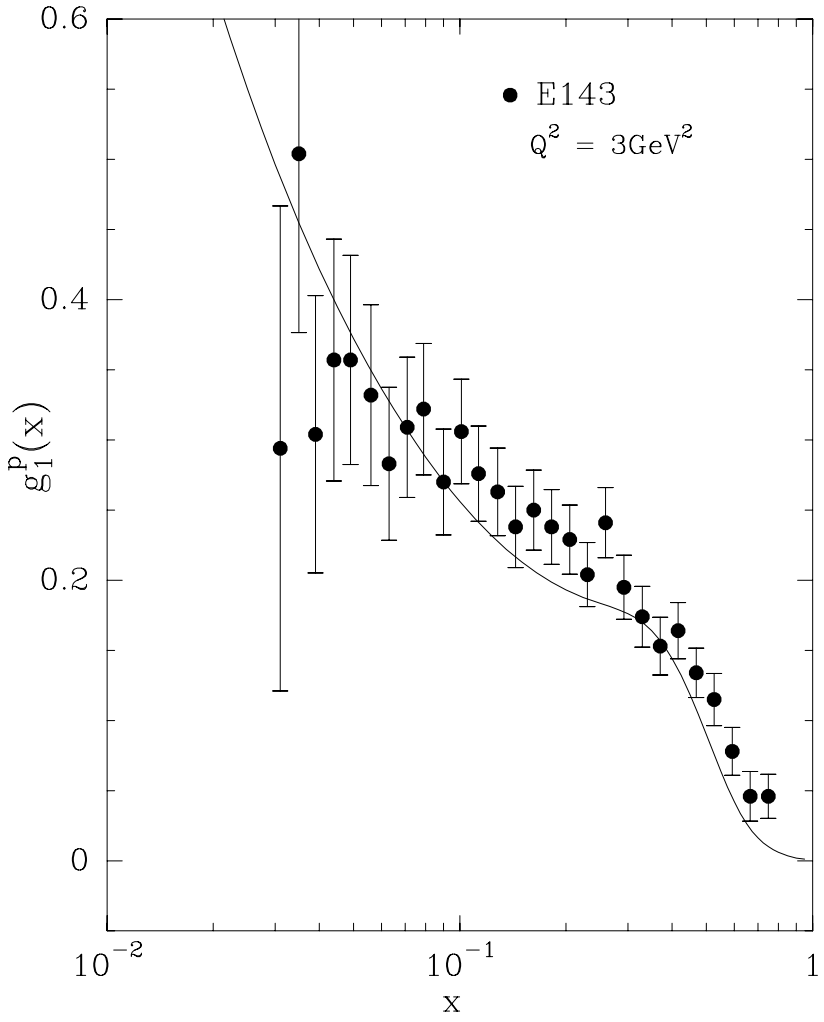

Figure 92: $g_1^p(x, Q^2)$ as function of x at fixed $Q^2 = 3\text{GeV}^2$, E143 Coll.

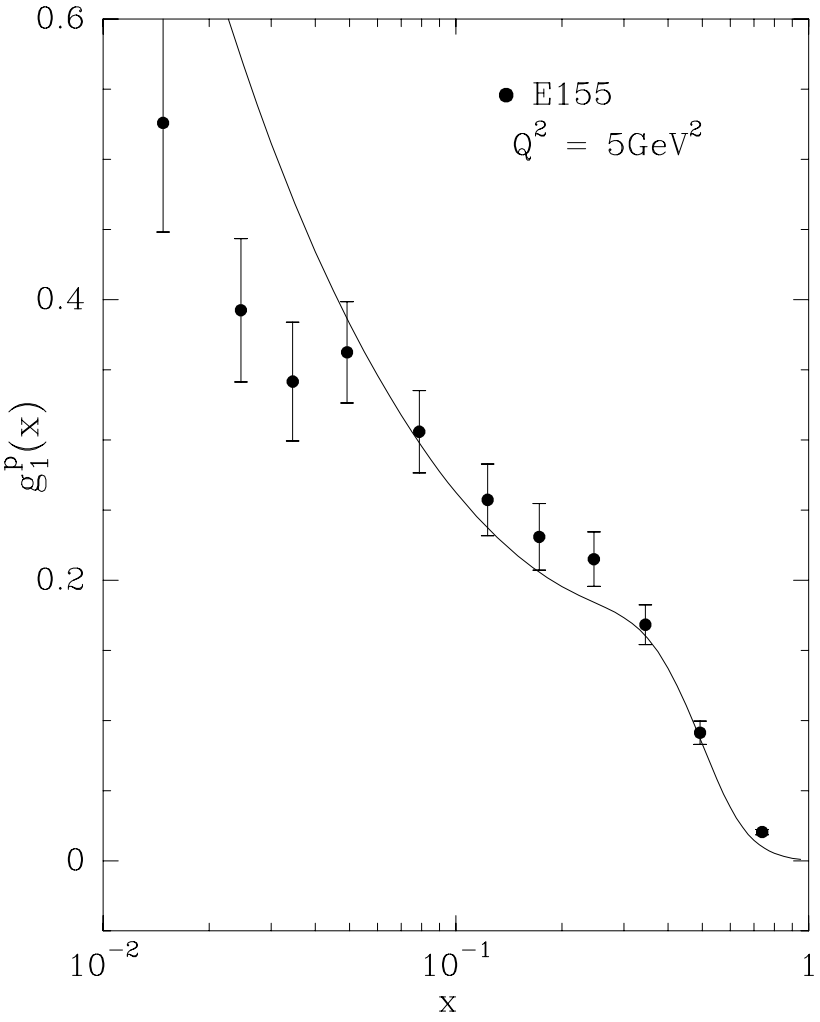

Figure 93: $g_1^p(x, Q^2)$ as function of x at fixed $Q^2 = 5\mathrm{GeV}^2$, E155 Coll.

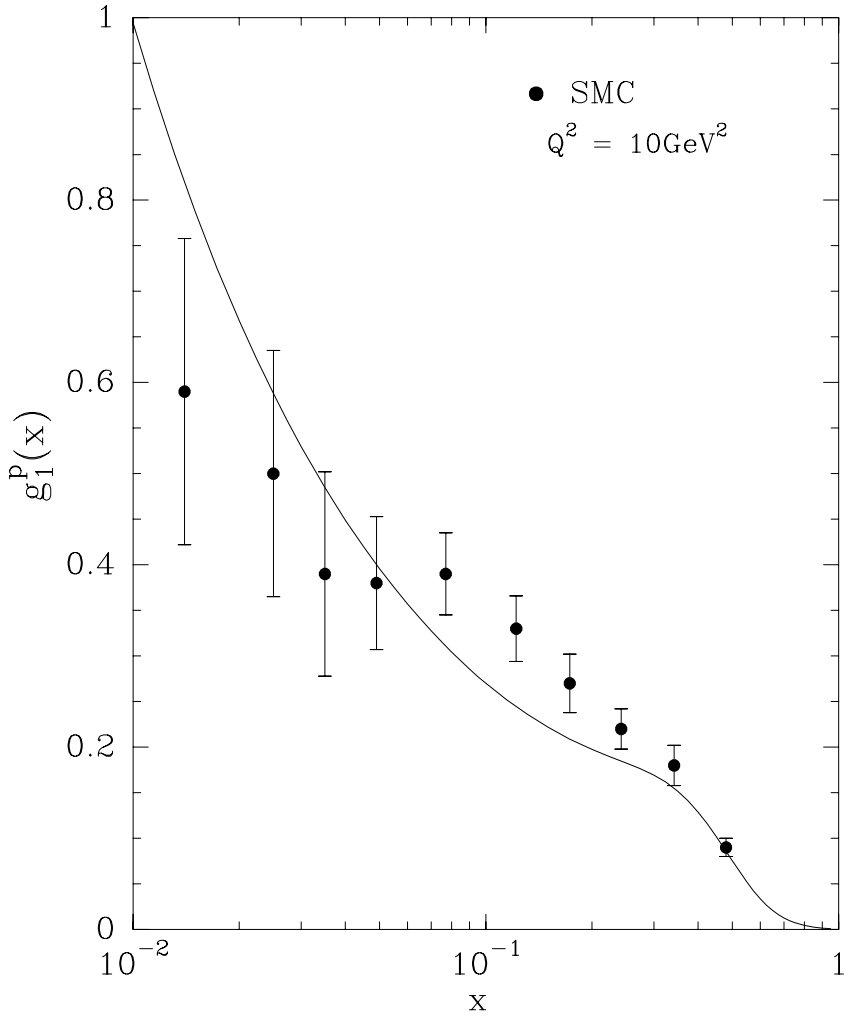

Figure 94: $g_1^p(x, Q^2)$ as function of x at fixed $Q^2 = 10\mathrm{GeV}^2$, evolved SMC data.

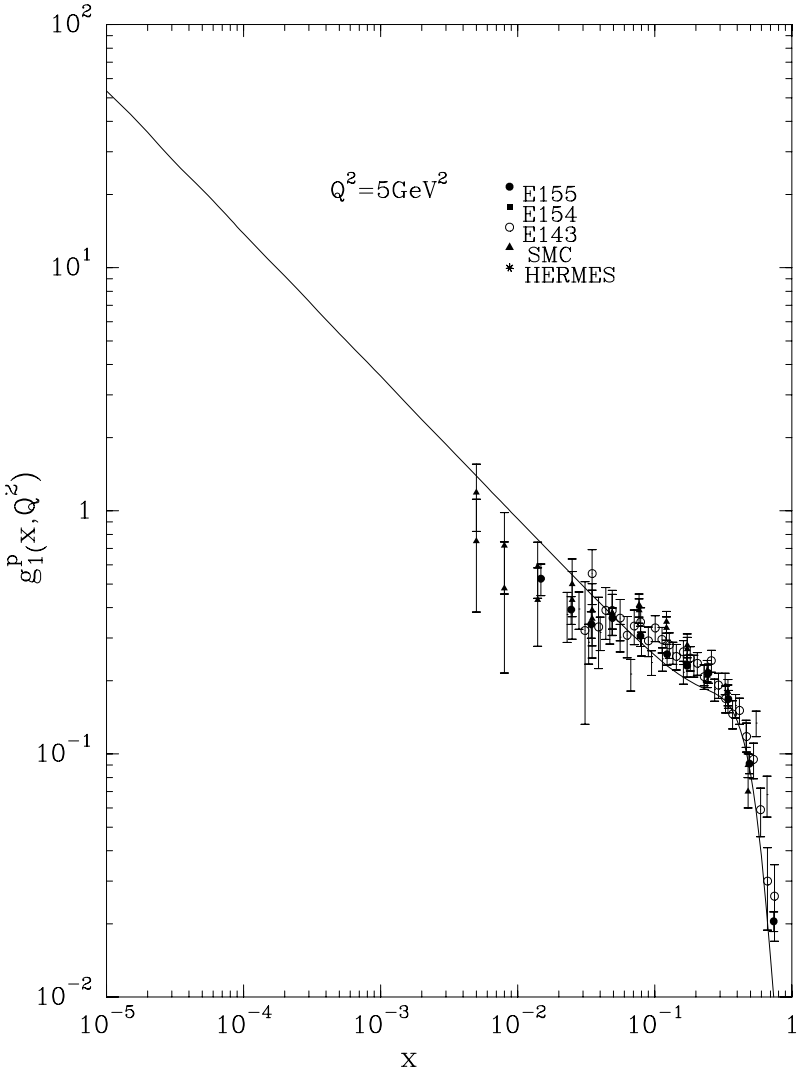

Figure 95: Behavior of $g_1^p(x, Q^2)$ at low x and fixed $Q^2 = 5\text{GeV}^2$,

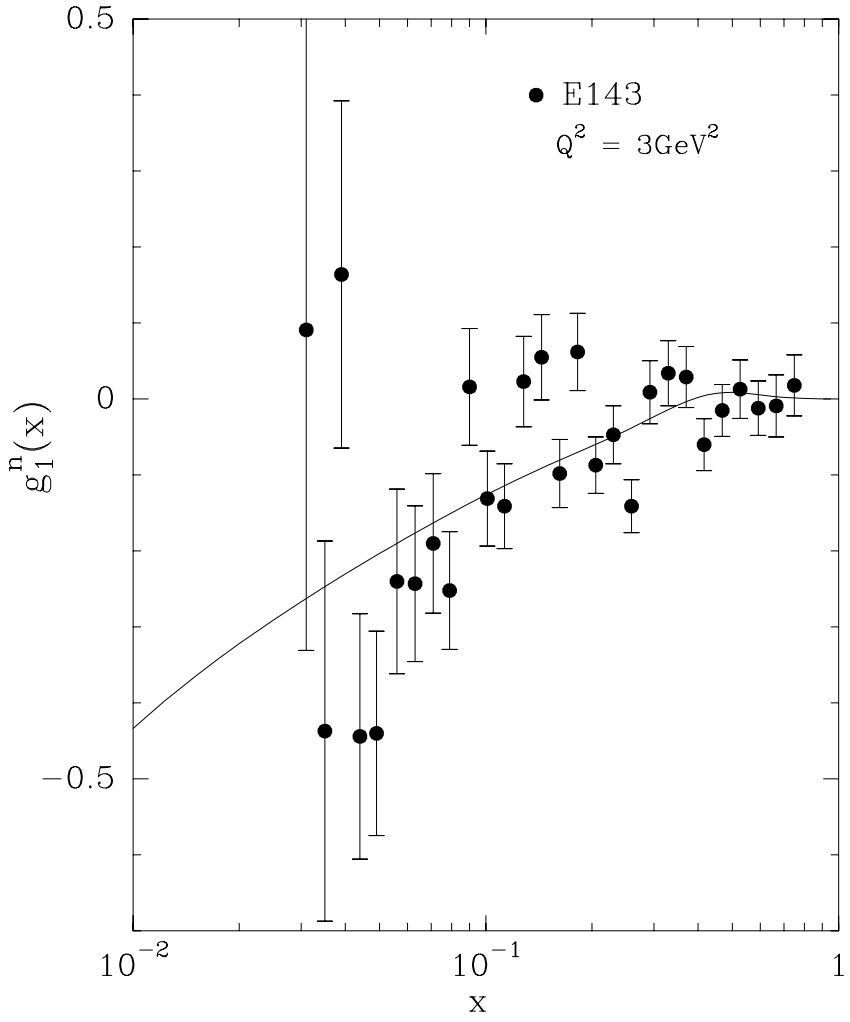

Figure 96: $g_1^n(x, Q^2)$ as function of x at fixed $Q^2 = 3\text{GeV}^2$, E143 Coll.

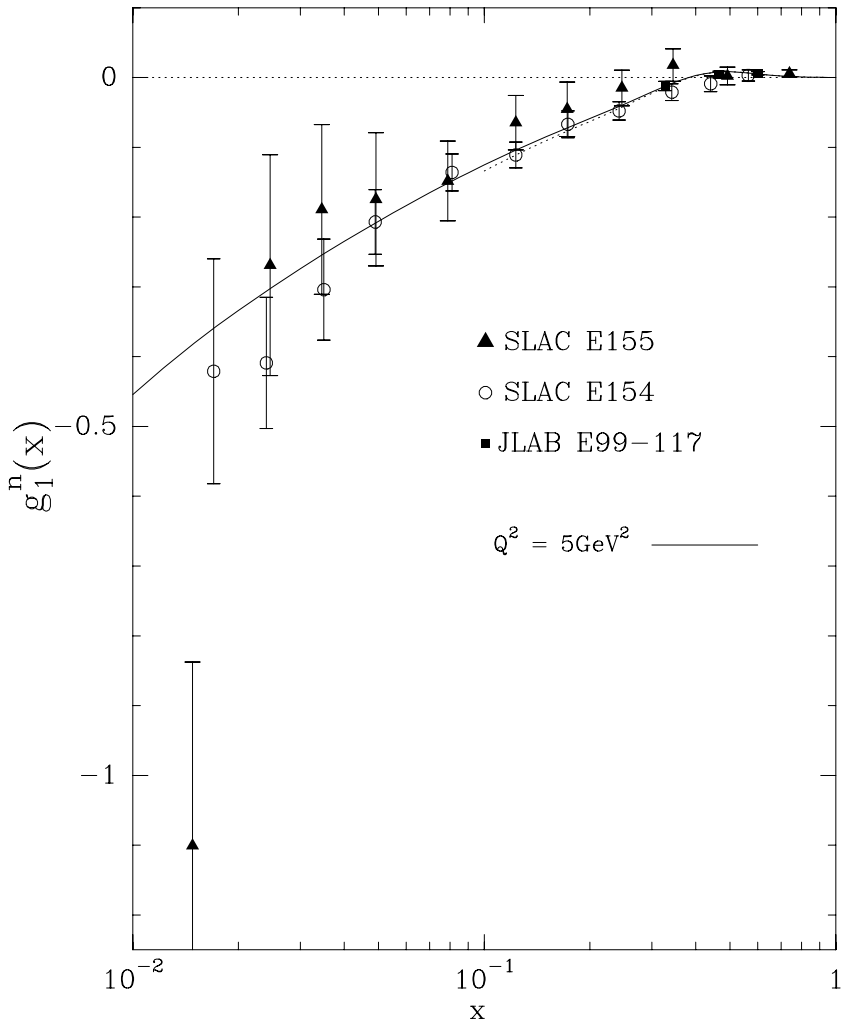

Figure 97: $g_1^n(x, Q^2)$ as function of x at fixed $Q^2 = 5\text{GeV}^2$, E154, E155, JLab Coll..

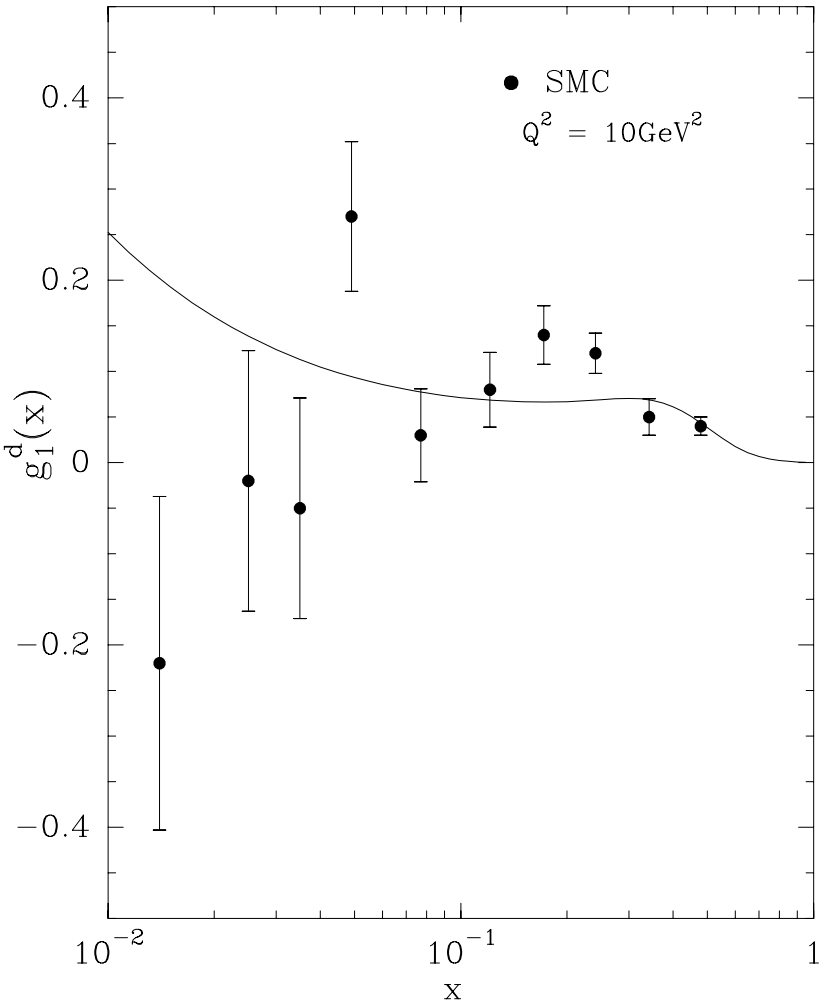

Figure 98: $g_1^d(x, Q^2)$ as function of x at fixed $Q^2 = 10\text{GeV}^2$, evolved SMC data.

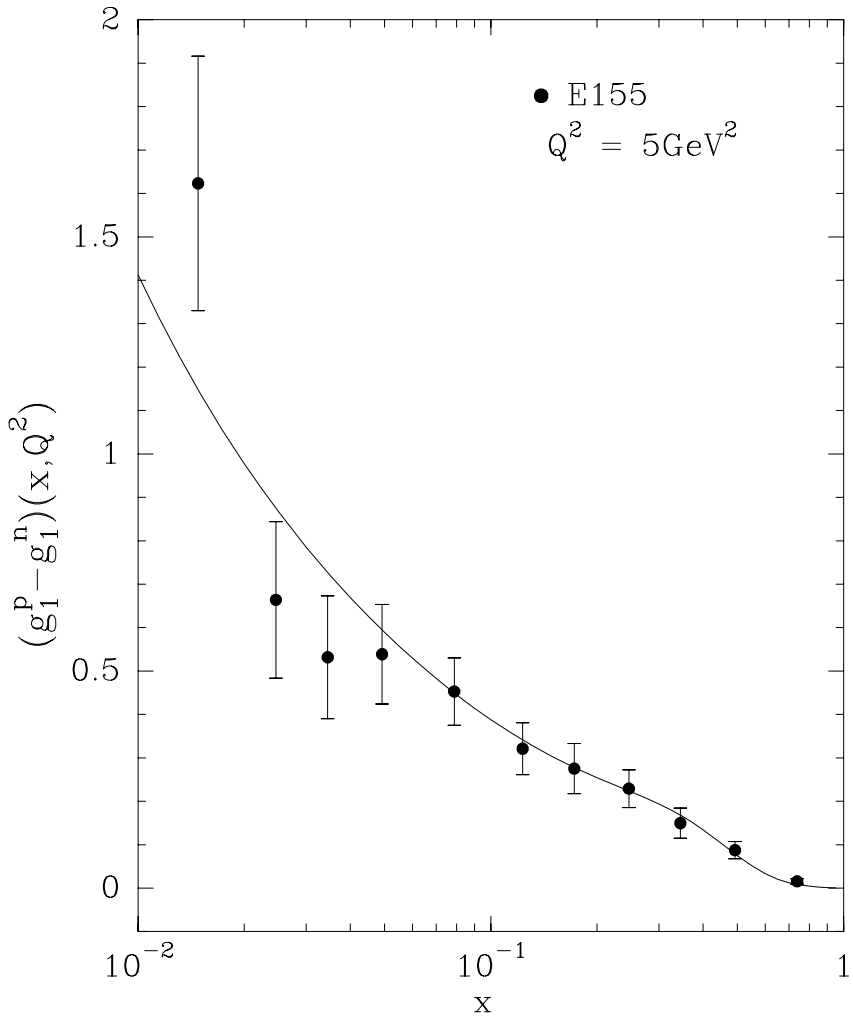

Figure 99: $g_1^p(x, Q^2) - g_1^n(x, Q^2)$ as function of x at fixed $Q^2 = 5\mathrm{GeV}^2$, E155 Coll..

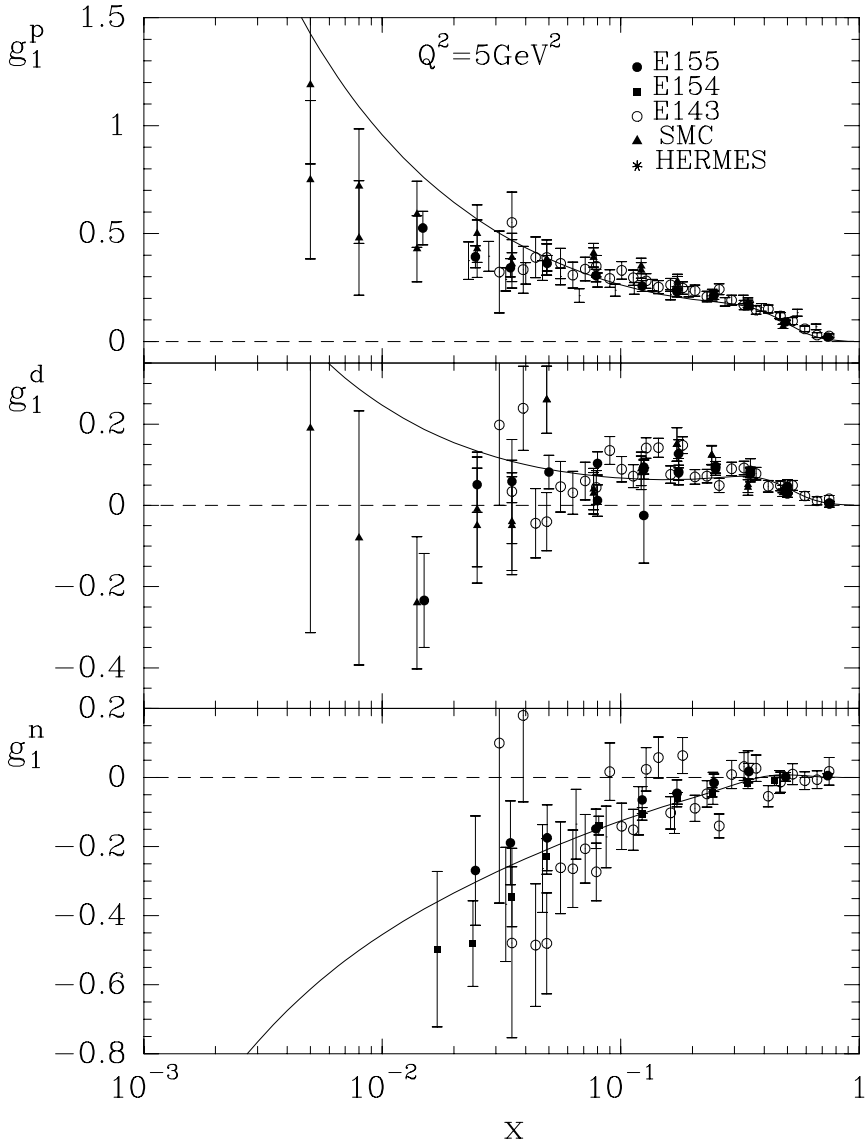

Figure 100: $g_1^{p,d,n}(x, Q^2)$ as function of x for different Q^2 values, from E155, E154, E143, SMC, HERMES experiments. The curves correspond to our model predictions at $Q^2 = 5\text{GeV}^2$.

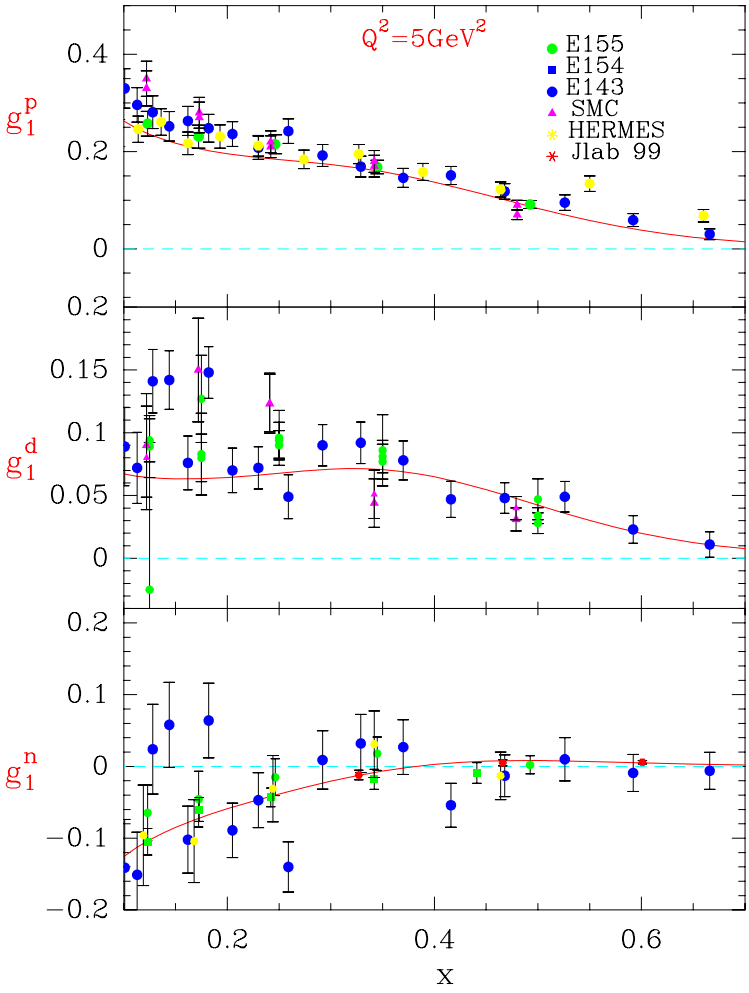

Figure 101: $g_1^{p,d,n}(x, Q^2)$ at large x values for different Q^2 values, from E155, E154, E143, SMC, HERMES, Jlab experiments. The curves correspond to our model predictions at $Q^2 = 5\text{GeV}^2$.

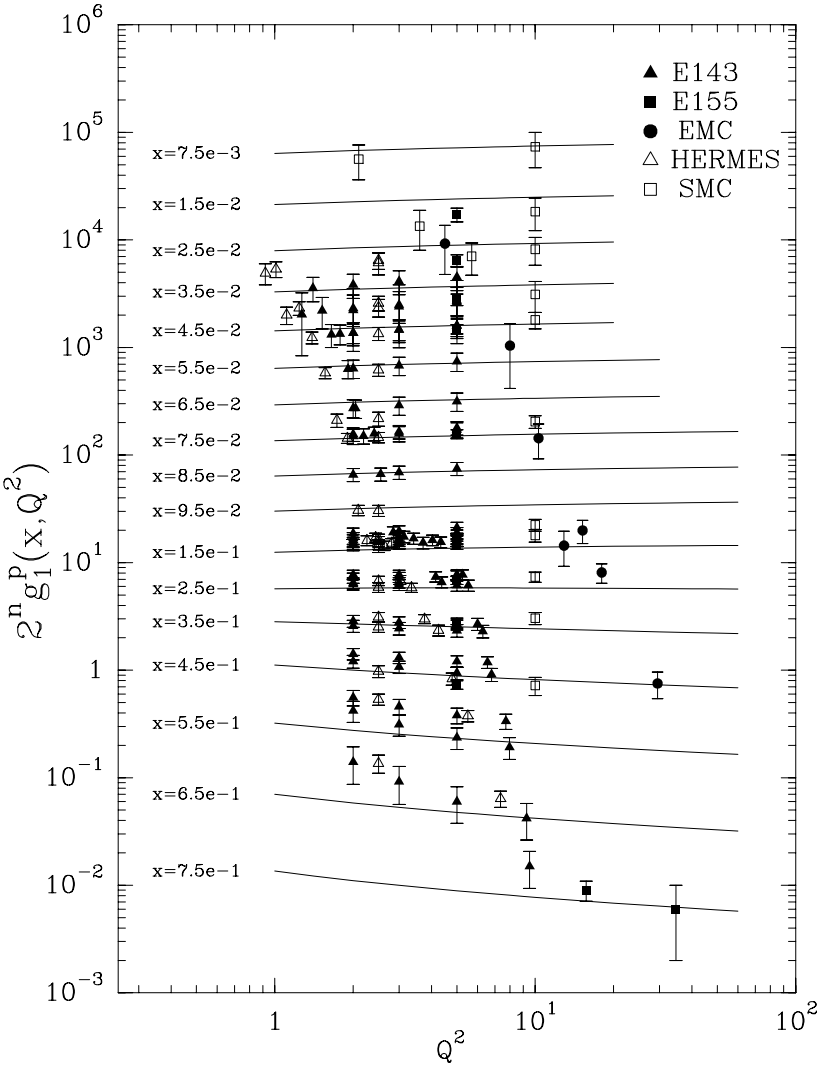

Figure 102: $2^n g_1^p(x, Q^2)$ as function of Q^2 for different x values. $n = 0$ corresponds to $x = 0.75$ and $n = 16$ to $x = 7.5\ 10^{-3}$. Experimental data are rebined to the nearest x values.

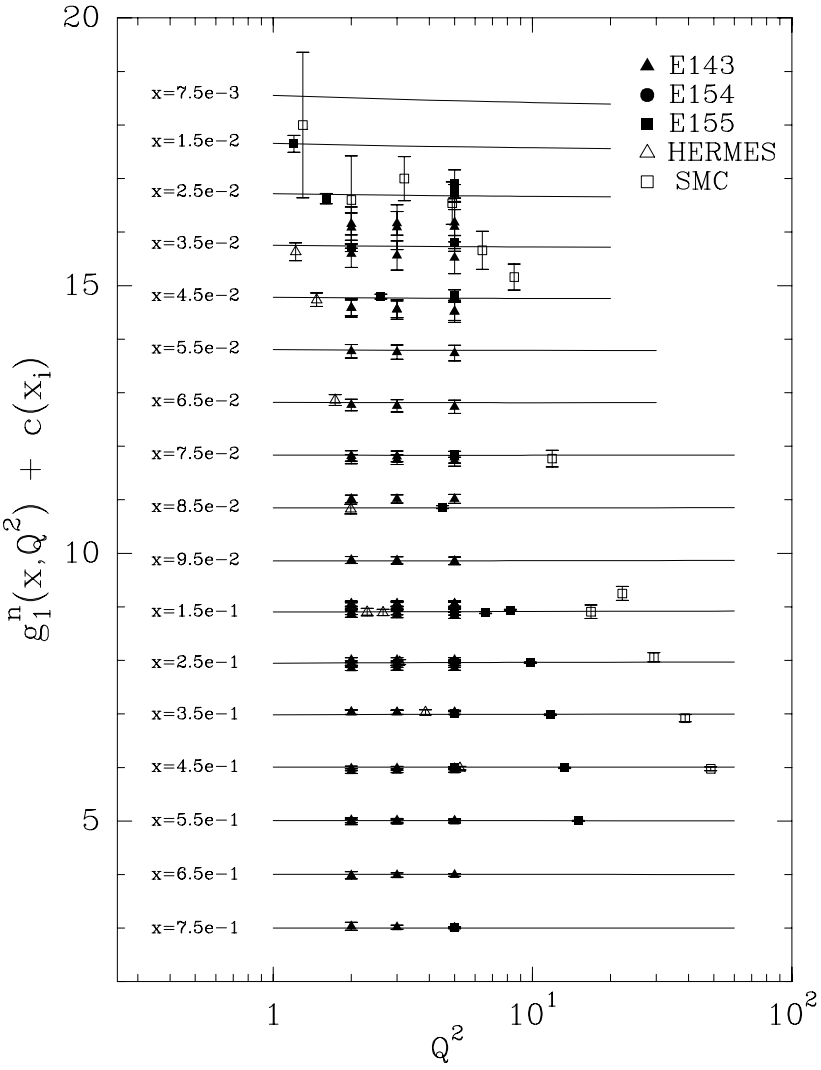

Figure 103: $g_1^n(x, Q^2)$ as function of Q^2 for different x values. The function $c(x_i) = 19 - i$, $i = 0$ corresponds to $x = 7.5\ 10^{-3}$. Experimental data are rebined to the nearest x values.

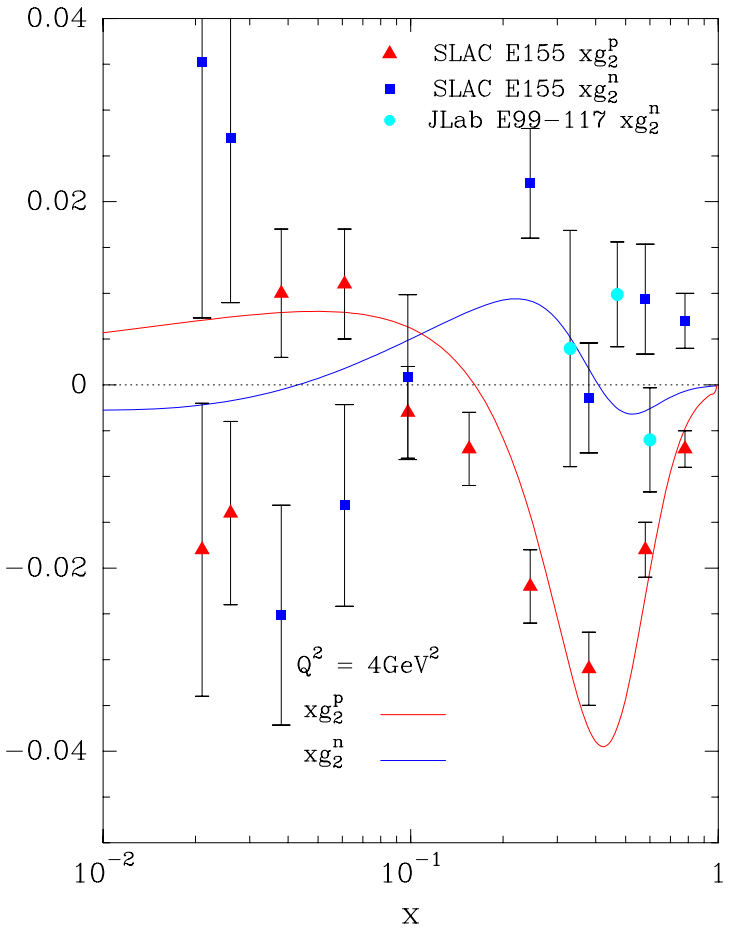

Figure 104: xg_2 for proton and neutron as a function of x, for $Q^2 = 4\text{GeV}^2$. Data from SLAC E155 [77], JLab E99-117 [54].

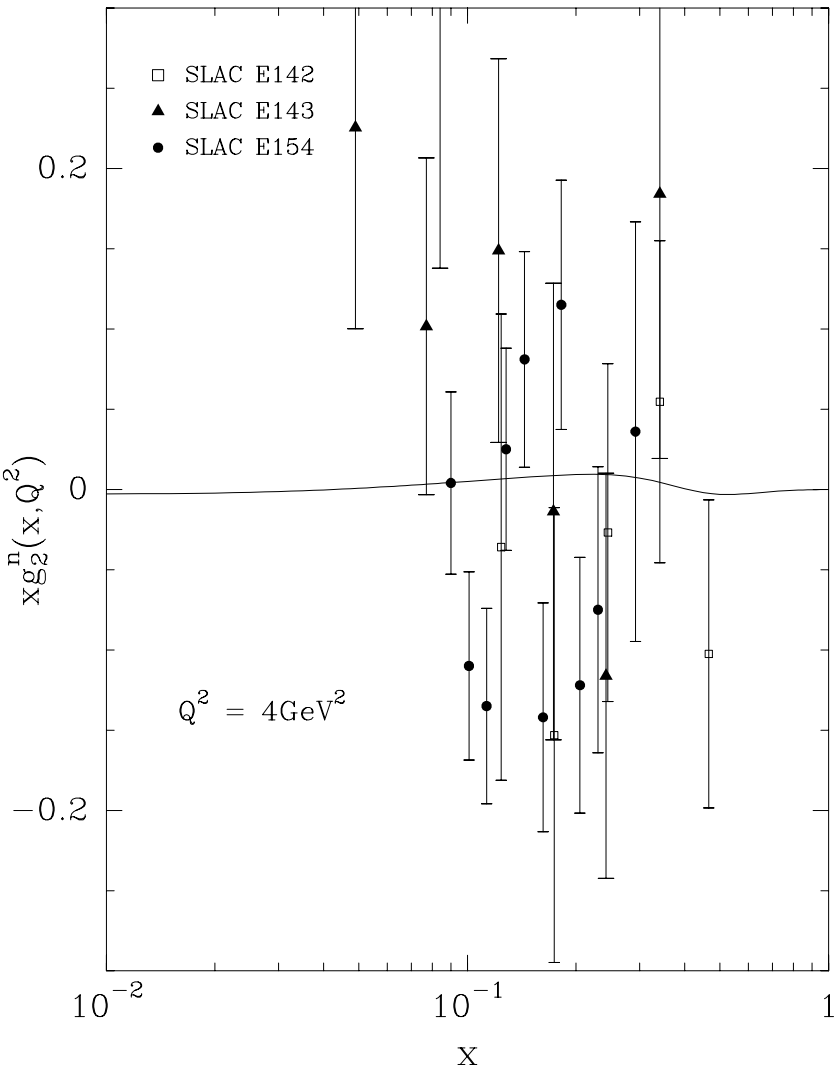

Figure 105: xg_2 for neutron as a function of x, for $Q^2 = 4\mathrm{GeV}^2$. Data from E142, E143, E154 [66]-[72].

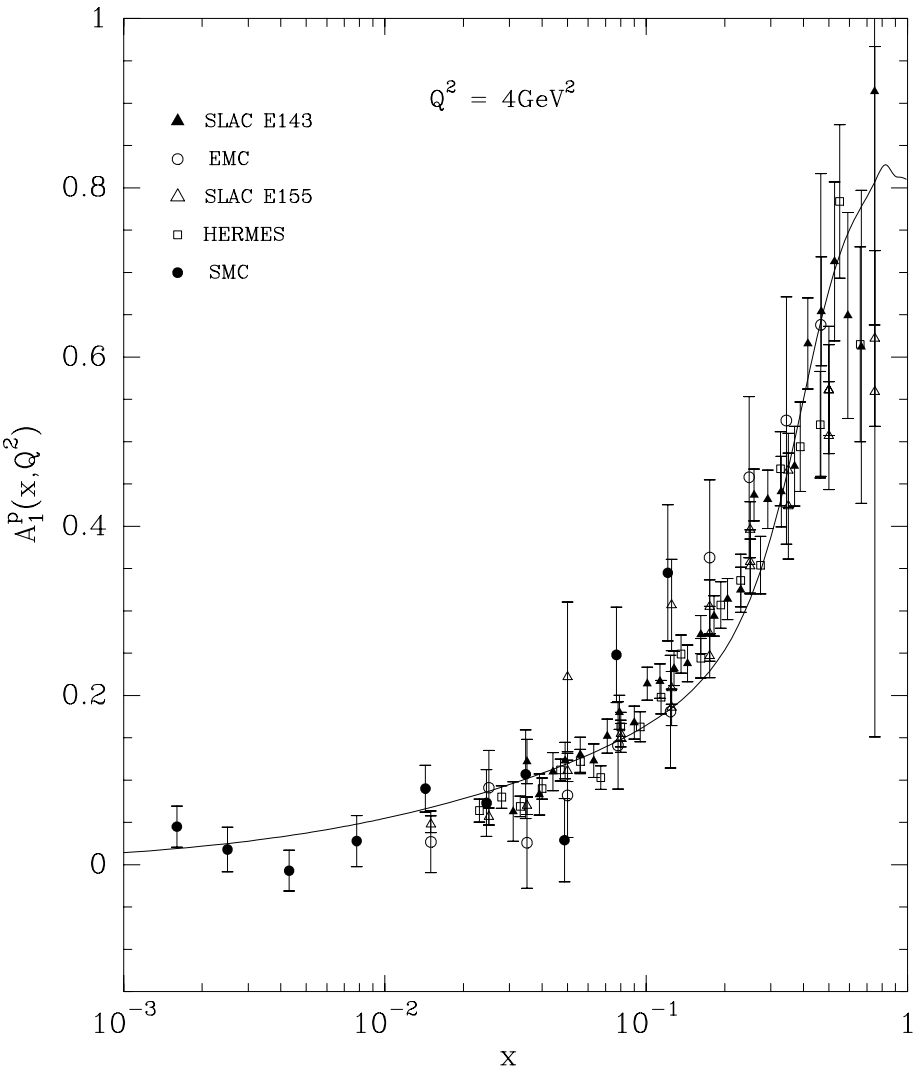

Figure 106: A_1^p as a function of x, for $Q^2 = 4\text{GeV}^2$. Data from E143[70], EMC[35], E155[76], HERMES[48], SMC[81].

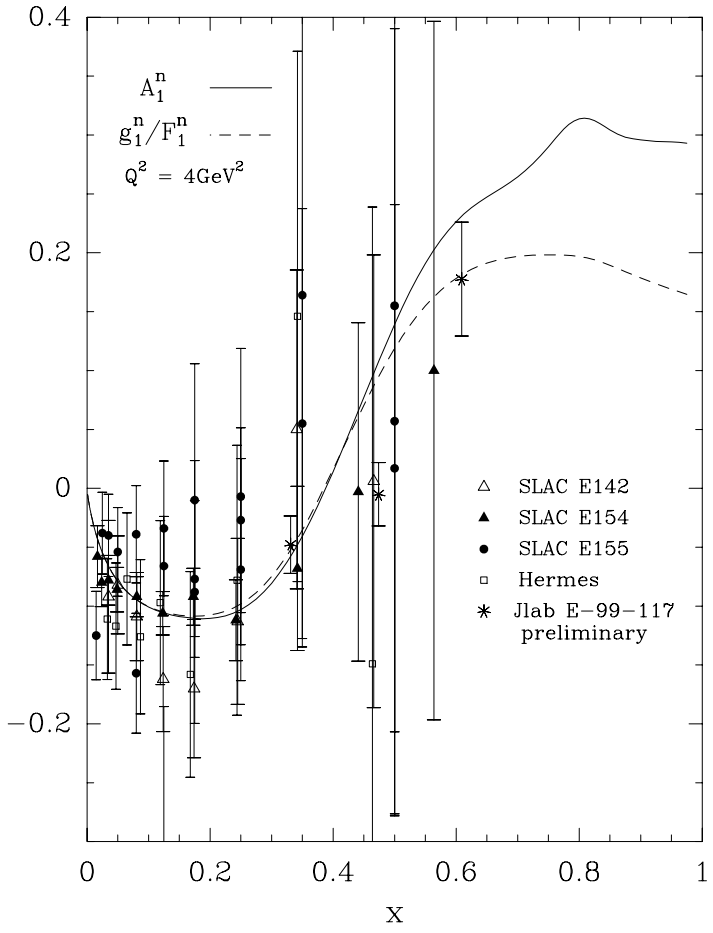

Figure 107: A_1^n as a function of x, for $Q^2 = 4\text{GeV}^2$ solid curve, g_1^n/F_1^n dashed curve. Data from E142[66], E155[76], E154[74], HERMES[49], Jlab E-99-117[53].

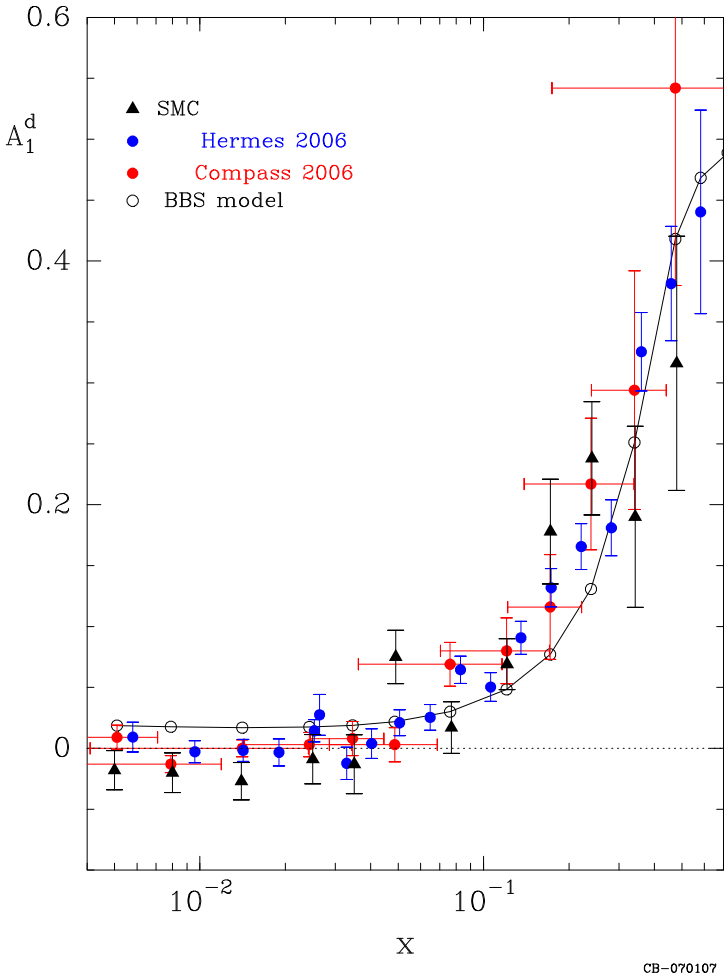

Figure 108: The longitudinal spin asymmetry A_1^d as a function of x. Data from Compass, Hermes, SMC Collaborations [113, 114, 115].

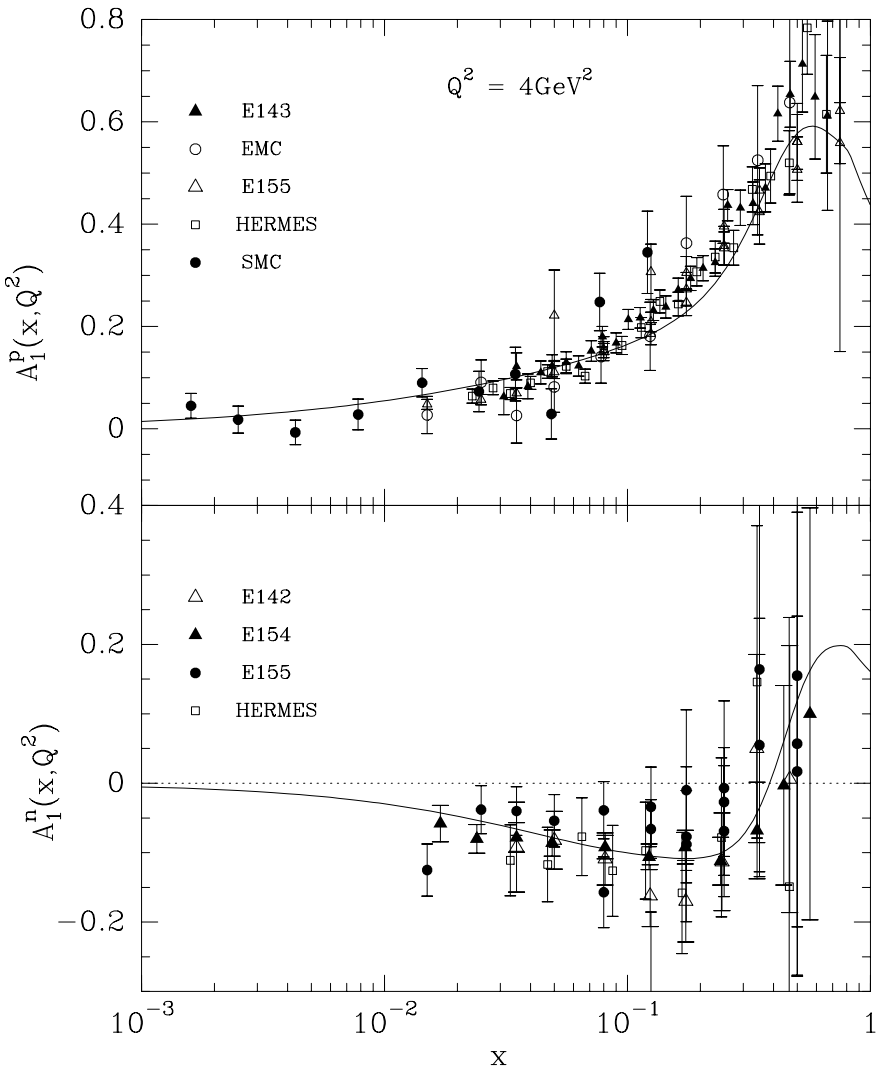

Figure 109: Compilation of the asymmetries A_1^p and A_1^n from E155, E154, E142, E143, EMC, SMC and HERMES experiments [33]-[69]. The curves correspond to our model predictions at $Q^2 = 4\text{GeV}^2$.

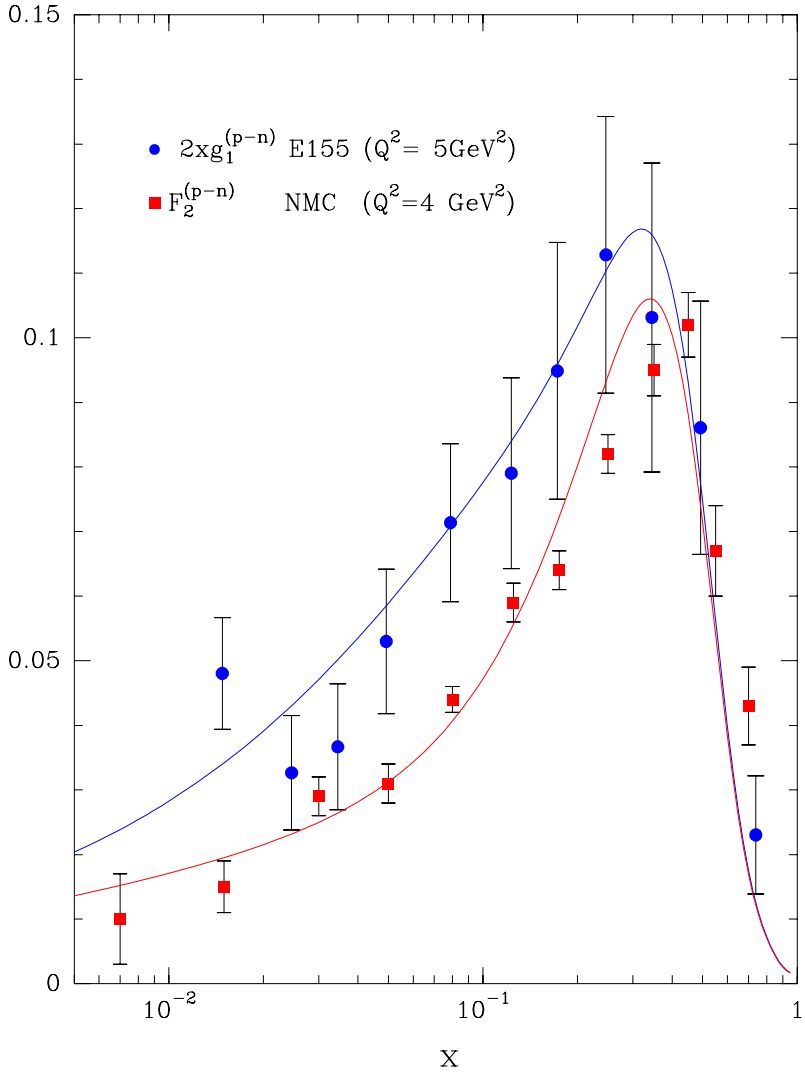

Figure 110: The quantities $2x(g_1^p - g_1^n)$ and $F_2^p - F_2^n$ as function of x at fixed $Q^2 = 4 - 5\text{GeV}^2$, calculated from E155, NMC Coll. Curves are model predictions.

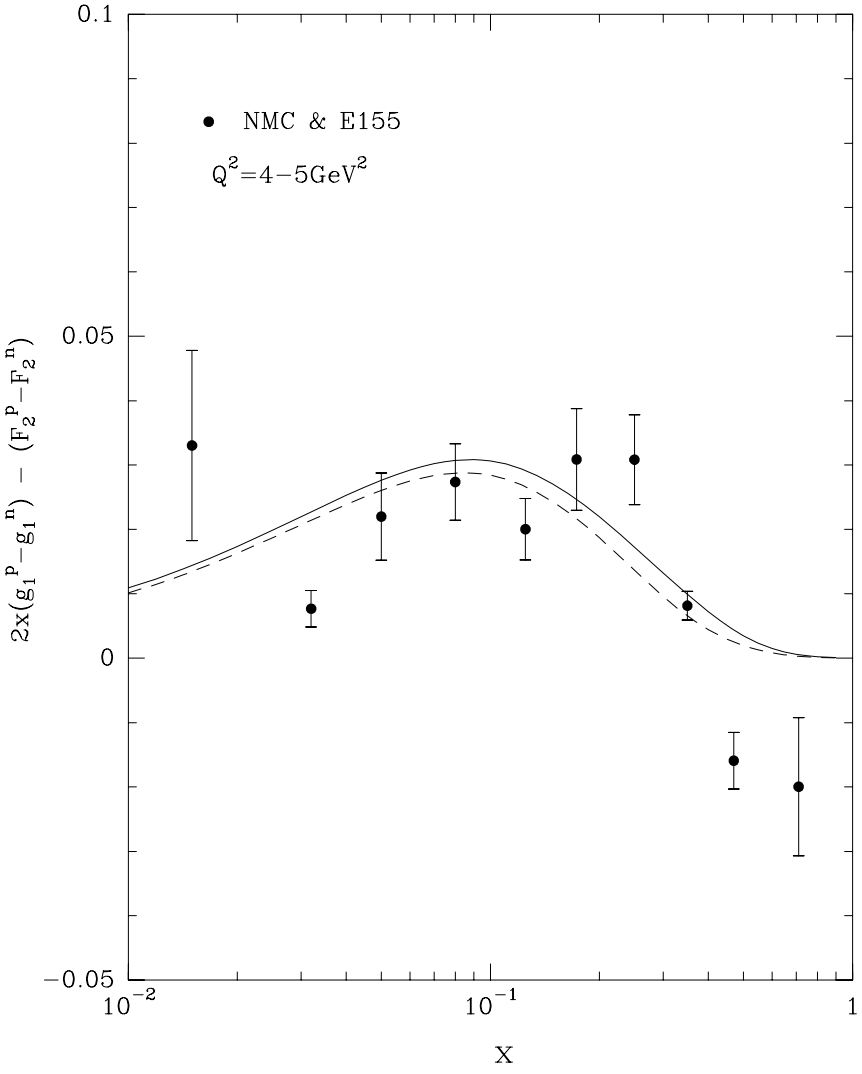

Figure 111: The quantity $2x(g_1^p - g_1^n) - (F_2^p - F_2^n)$ as function of x at fixed $Q^2 = 4 - 5\text{GeV}^2$, calculated from E155, NMC Coll. Comparison with the difference $d^- - u^-$ as a function of x, $Q^2 = 4\text{GeV}^2$. $2/3(d^- - u^- + \bar{d}^- - \bar{u}^-)$, solid curve, $2/3(\bar{d}^- - \bar{u}^-)$, dashed curve.

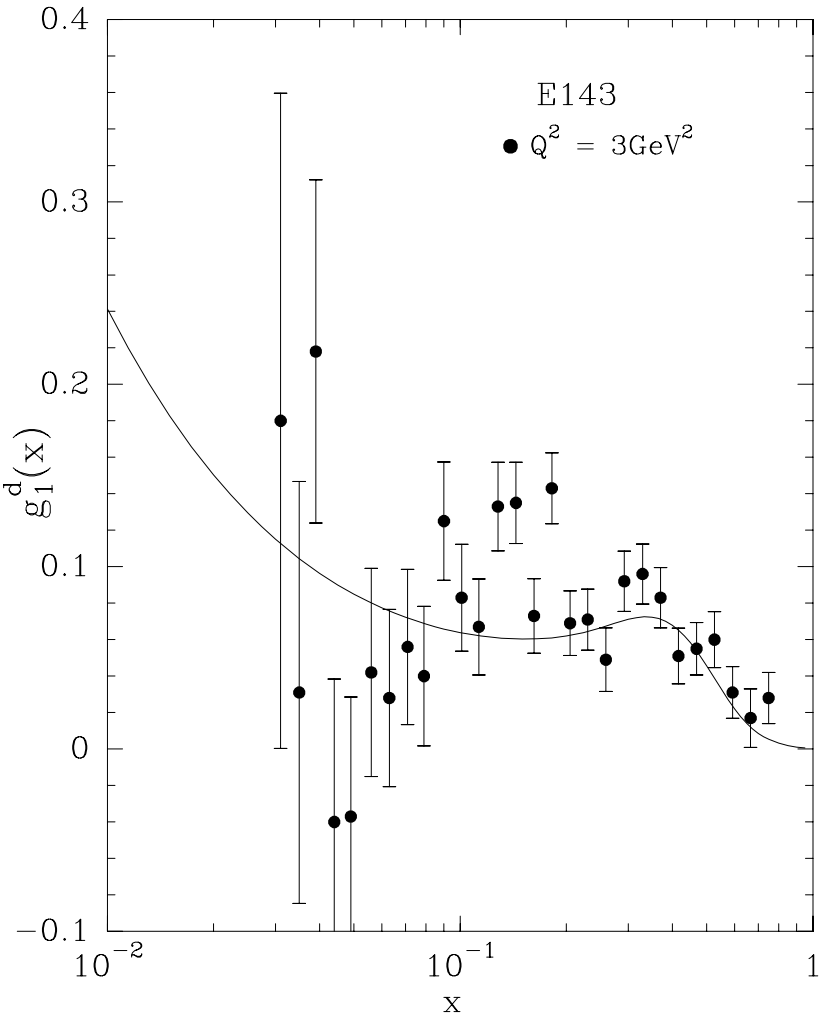

Figure 112: $g_1^d(x, Q^2)$ as function of x at fixed $Q^2 = 3\text{GeV}^2$, E143 Coll.

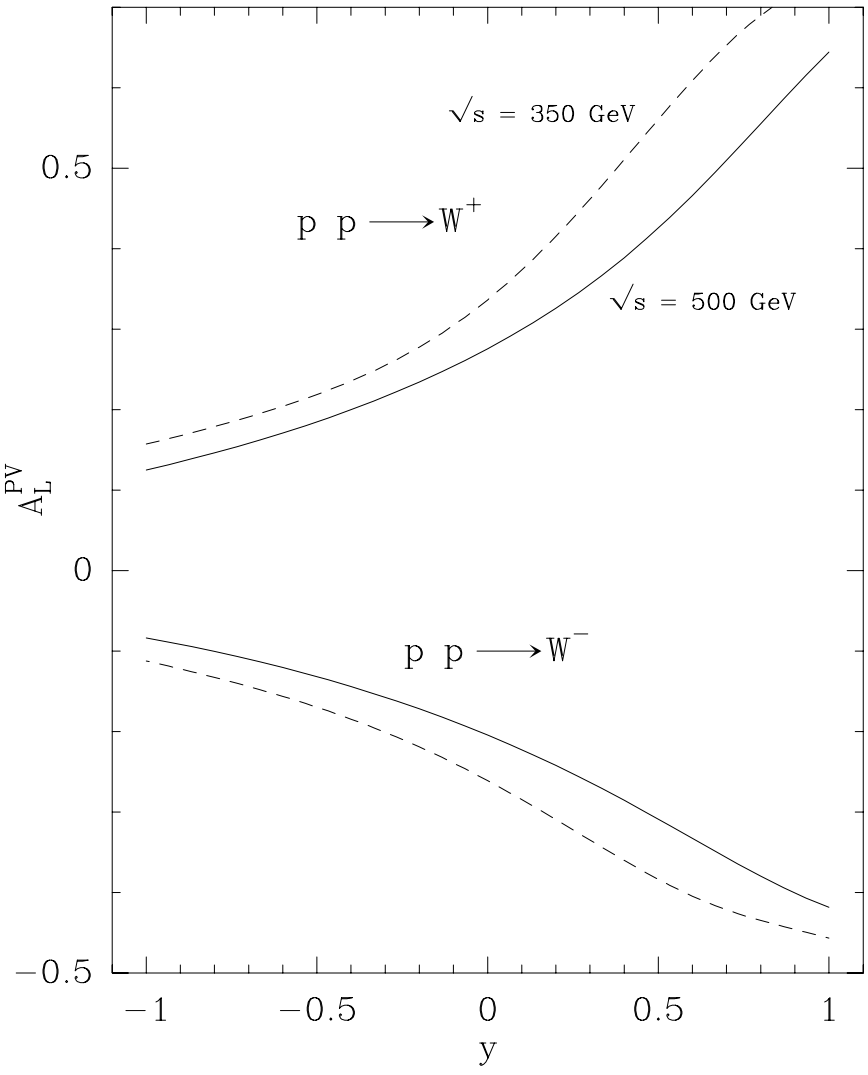

Figure 113: The parity violating asymmetry A_L^{PV} for $pp \to W^{\pm}$ production versus the rapidity y at $\sqrt{s} = 350, 500\text{GeV}$ (dashed, solid).

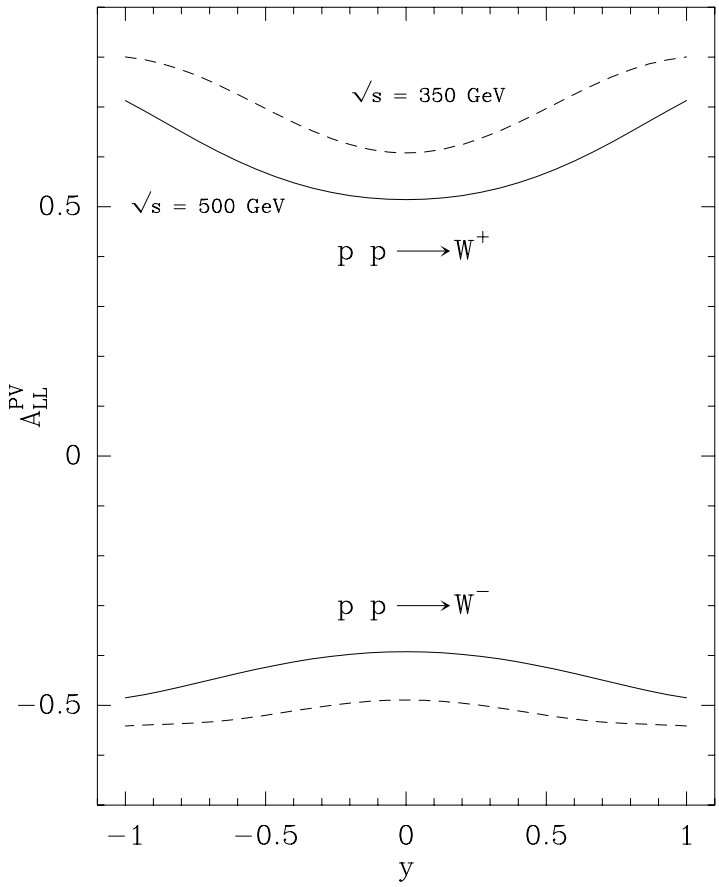

Figure 114: The parity violating asymmetry A_{LL}^{PV} versus the rapidity y for $pp \to W^{\pm}$ production at $\sqrt{s} = 350, 500\text{GeV}$ (dashed, solid).

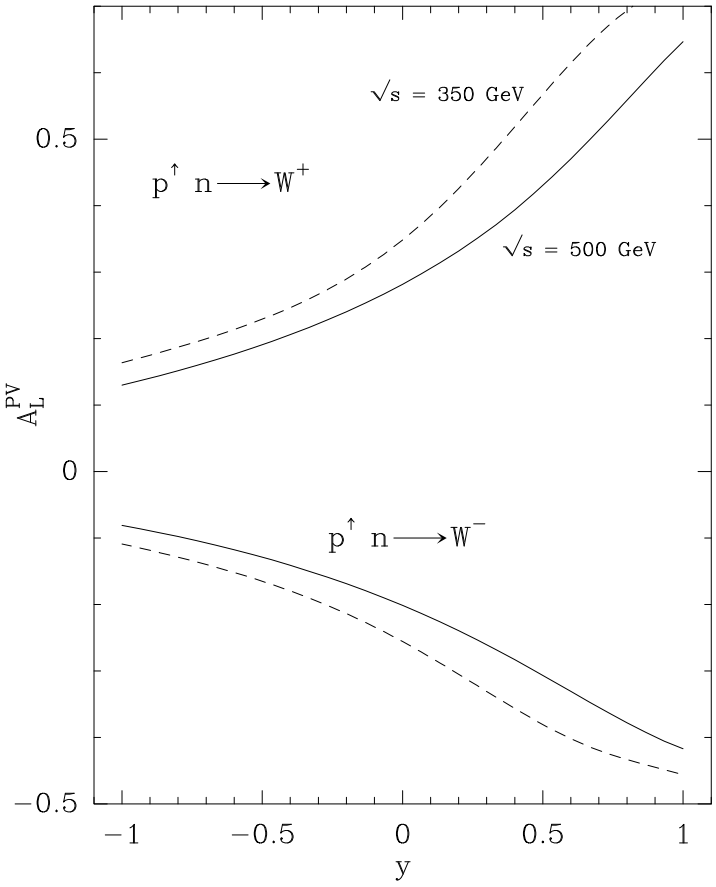

Figure 115: The parity violating asymmetry A_L^{PV} with polarized proton for $p^{\uparrow}n \to W^{\pm}$ production versus the rapidity y at $\sqrt{s} = 350, 500\text{GeV}$ (dashed, solid).

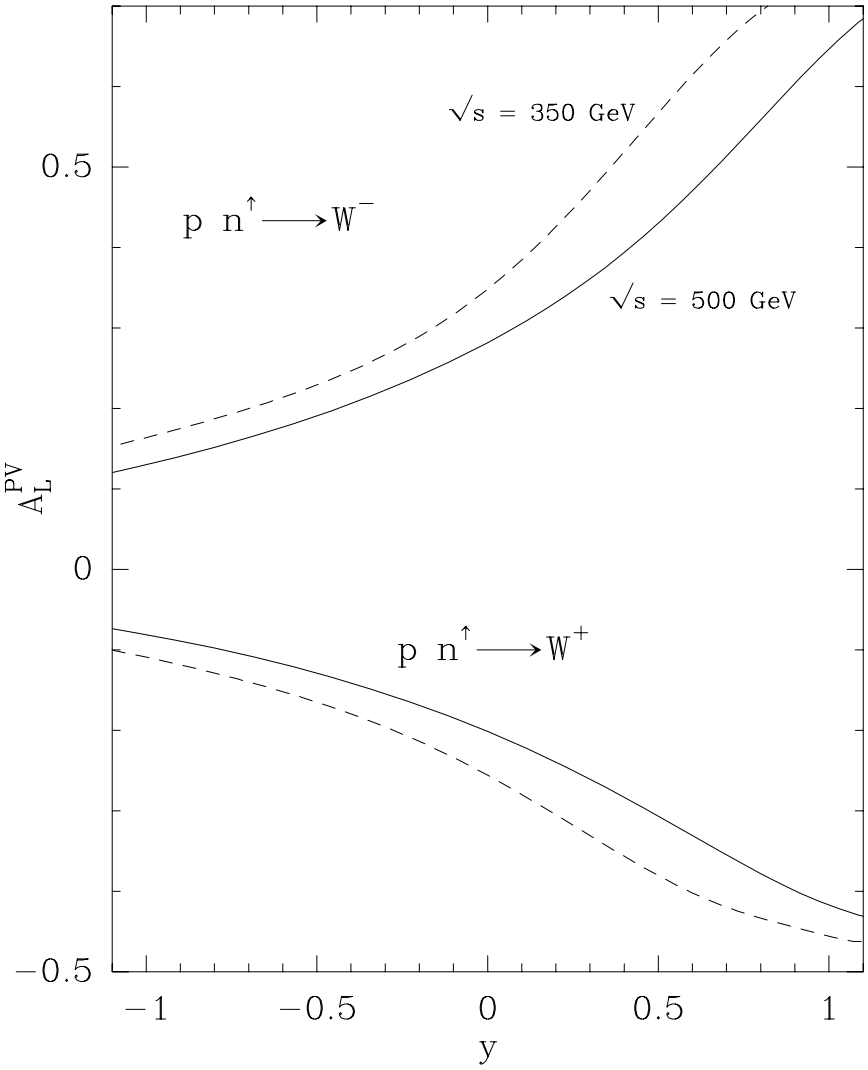

Figure 116: Parity violating asymmetry A_L^{PV} with a polarized neutron for $pn^{\uparrow} \to W^{\pm}$ production versus the rapidity y at $\sqrt{s} = 350, 500\text{GeV}$ (dashed, solid) .

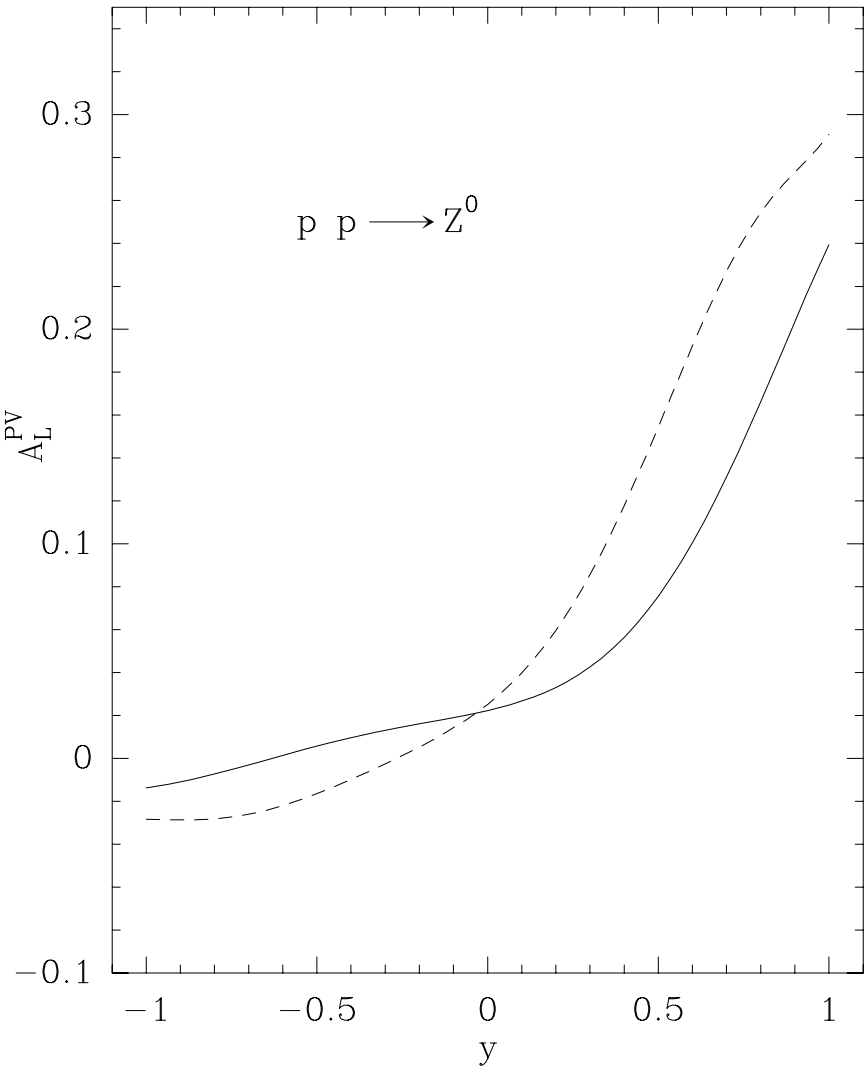

Figure 117: The parity violating asymmetry A_L^{PV} for $pp \to Z^0$ production versus the rapidity y at $\sqrt{s} = 350, 500\text{GeV}$ (dashed, solid).

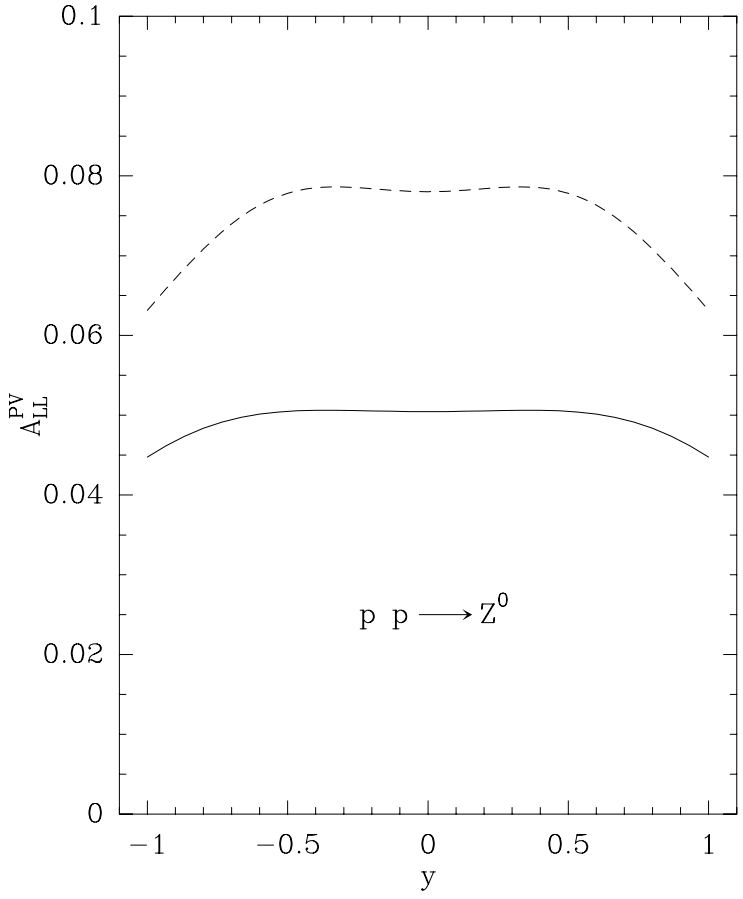

Figure 118: The parity violating asymmetry A_{LL}^{PV} versus the rapidity y for Z^0 production at $\sqrt{s} = 350, 500\text{GeV}$ (dashed, solid).

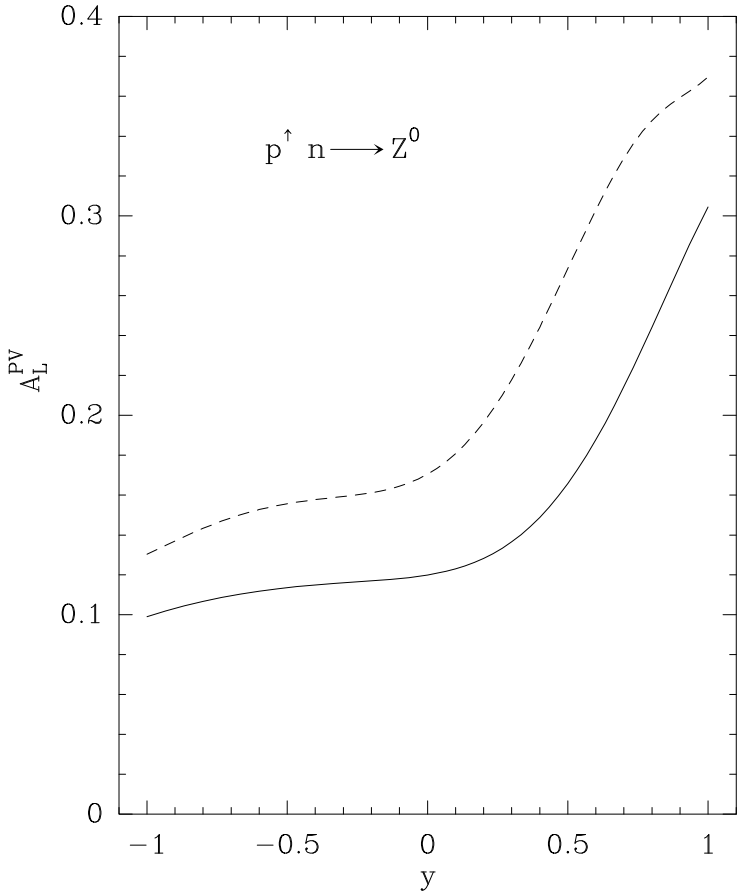

Figure 119: The parity violating asymmetry A_L^{PV} for $p^{\uparrow}n \to Z^0$ production versus the rapidity y at $\sqrt{s} = 350, 500\text{GeV}$ (dashed, solid).

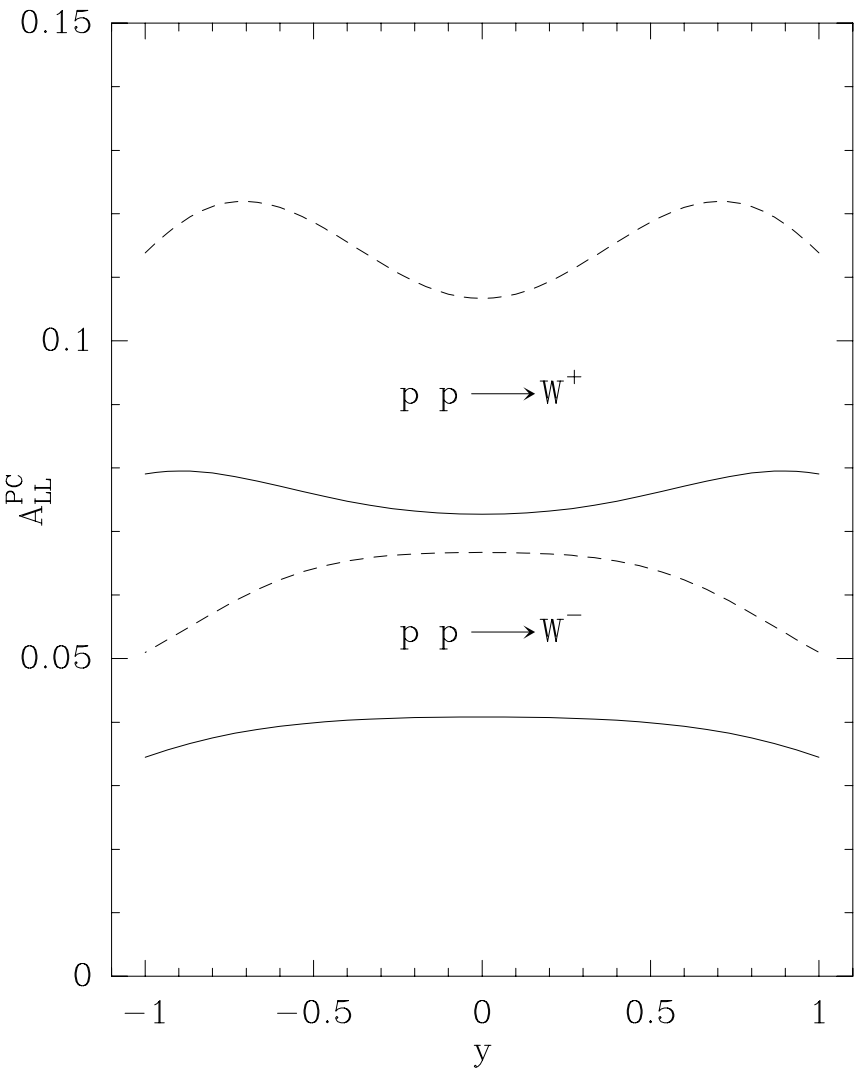

Figure 120: Parity conserving double helicity asymmetry A_{LL}^{PC} for $pp \to W^{\pm}$ production versus the rapidity y at $\sqrt{s} = 350, 500\text{GeV}$ (dashed, solid) .

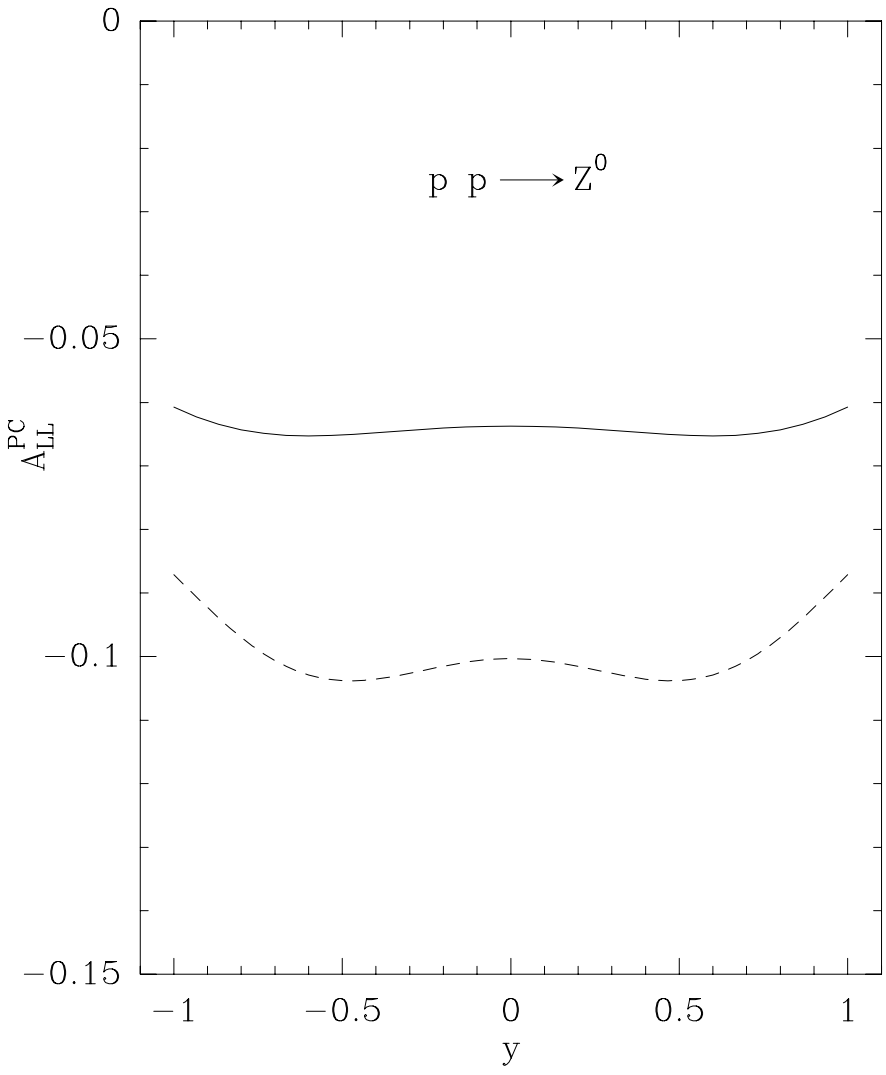

Figure 121: Parity conserving double helicity asymmetry A_{LL}^{PC} for $pp \to Z^0$ production versus the rapidity y at $\sqrt{s} = 350, 500\text{GeV}$ (dashed, solid) .

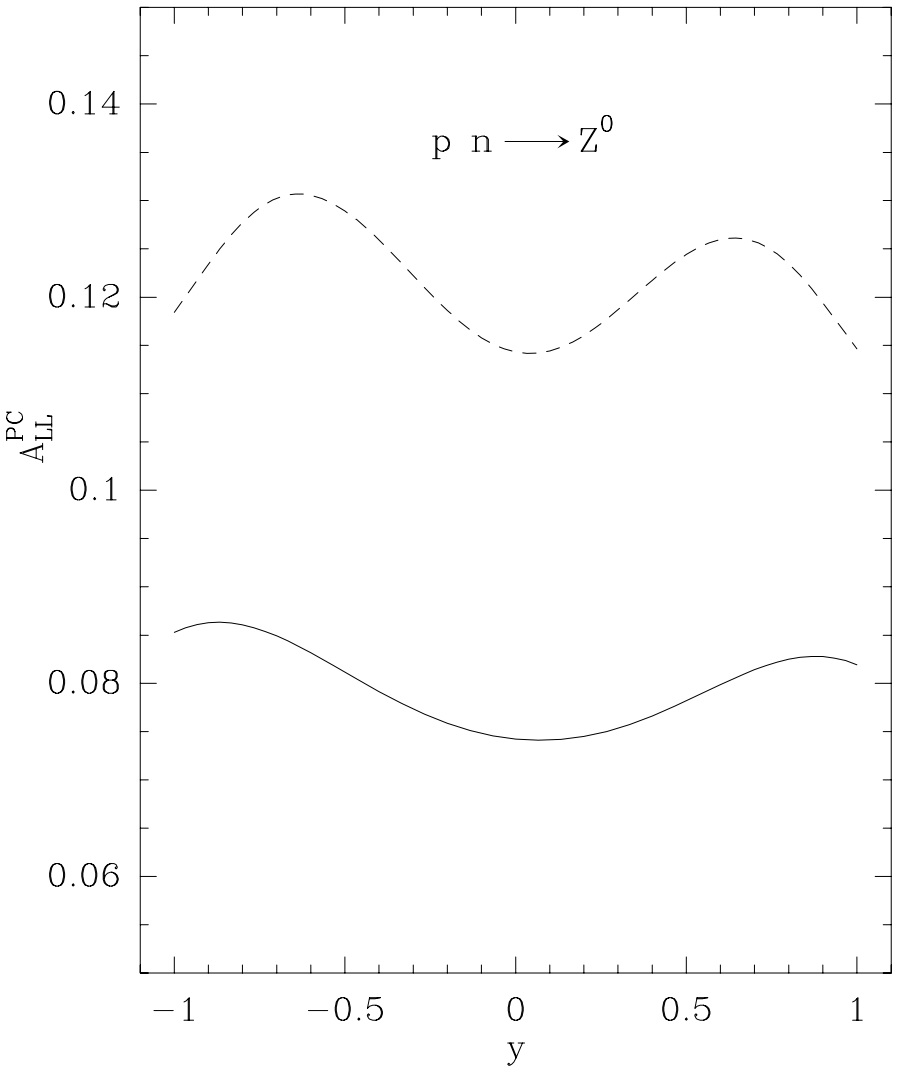

Figure 122: Parity conserving double helicity asymmetry A_{LL}^{PC} for $pn \to Z^0$ production versus the rapidity y at $\sqrt{s} = 350, 500\text{GeV}$ (dashed, solid) .
