HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

# Mixed Logic and Storage Operators 

Karim NOUR<br>LAMA - Equipe de Logique, Université de Chambéry<br>73376 Le Bourget du Lac<br>e-mail nour@univ-savoie.fr

#### Abstract

In 1990 J-L. Krivine introduced the notion of storage operators. They are $\lambda$-terms which simulate call-by-value in the call-by-name strategy and they can be used in order to modelize assignment instructions. J-L. Krivine has shown that there is a very simple second order type in $A F 2$ type system for storage operators using Gődel translation of classical to intuitionistic logic. In order to modelize the control operators, J-L. Krivine has extended the system AF2 to the classical logic. In his system the property of the unicity of integers representation is lost, but he has shown that storage operators typable in the system $A F 2$ can be used to find the values of classical integers. In this paper, we present a new classical type system based on a logical system called mixed logic. We prove that in this system we can characterize, by types, the storage operators and the control operators. We present also a similar result in the M. Parigot's $\lambda \mu$-calculus.

## 1 Introduction

In 1990, J.L. Krivine introduced the notion of storage operators (see [4]). They are closed $\lambda$-terms which allow, for a given data type (the type of integers, for example), to simulate in $\lambda$-calculus the "call by value" in a context of a "call by name" (the head reduction) and they can be used in order to modelize assignment instructions. J.L. Krivine has shown that the formula $\forall x\left\{N^{*}[x] \rightarrow \neg \neg N[x]\right\}$ is a specification for storage operators for Church integers : where $N[x]$ is the type of integers in $A F 2$ type system, and the operation $*$ is the simple Gődel translation from classical to intuitionistic logic which associates to every formula $F$ the formula $F^{*}$ obtained by replacing in $F$ every atomic formula by its negation (see [3]).

The latter result suggests many questions :

- Why do we need a Gődel translation ?
- Why do we need the type $N^{*}[x]$ which characterize a class larger than integers ?

In order to modelize the control operators, J-L. Krivine has extended the system $A F 2$ to the classical logic (see [6]). His method is very simple : it consists of adding a new constant, denoted by $C$, with the declaration $C: \forall X\{\neg \neg X \rightarrow X\}$ which axiomatizes classical logic over intuitionistic logic. For the constant $C$, he adds a new reduction rule : $\left(C t t_{1} \ldots t_{n}\right) \rightarrow\left(\begin{array}{ll}\left.t \quad \lambda x\left(\begin{array}{ll}x & t_{1} \ldots t_{n}\end{array}\right)\right) \text { which is a particular case of }\end{array}\right.$ a rule given by Felleisen for control operator (see [1]). In this system the property of the unicity of integers representation is lost, but J-L. Krivine has shown that storage operators typable in the intuitionistic system $A F 2$ can be used to find the values of classical integers ${ }^{1}$ (see [6]).

[^0]The latter result suggests also many questions :

- What is the relation between classical integers and the type $N^{*}[x]$ ?
- Why do we need intuitionistic logic to modelize the assignment instruction and classical logic to modelize the control operators?

In this paper, we present a new classical type system based on a logical system called mixed logic. This system allows essentially to distinguish between classical proofs and intuitionistic proofs. We prove that, in this system, we can characterize, by types, the storage operators and the control operators. This results give some answers to the previous questions.

We present at the end (without proof) a similar result in the M. Parigot's $\lambda \mu$-calculus.

Acknowledgement. We wish to thank J.L. Krivine, and C. Paulin for helpful discussions. We don't forget the numerous corrections and suggestions from R. David and N. Bernard.

## 2 Pure and typed $\lambda$-calculus

- Let $t, u, u_{1}, \ldots, u_{n}$ be $\lambda$-terms, the application of $t$ to $u$ is denoted by $(t) u$. In the same way we write $(t) u_{1} \ldots u_{n}$ instead of $\left(\ldots\left((t) u_{1}\right) \ldots\right) u_{n}$.
- $F v(t)$ is the set of free variables of a $\lambda$-term $t$.
- The $\beta$-reduction (resp. $\beta$-equivalence) relation is denoted by $u \rightarrow_{\beta} v$ (resp. $u \simeq_{\beta} v$ ).
- The notation $\sigma(t)$ represents the result of the simultaneous substitution $\sigma$ to the free variables of $t$ after a suitable renaming of the bounded variables of $t$.
- We denote by $(u)^{n} v$ the $\lambda$-term $(u) \ldots(u) v$ where $u$ occurs $n$ times, and $\bar{u}$ the sequence of $\lambda$-terms $u_{1}, \ldots, u_{n}$. If $\bar{u}=u_{1}, \ldots, u_{n} n \geq 0$, we denote by $(t) \bar{u}$ the $\lambda$-term $(t) u_{1} \ldots u_{n}$.
- Let us recall that a $\lambda$-term $t$ either has a head redex [i.e. $t=\lambda x_{1} \ldots \lambda x_{n}(\lambda x u) v v_{1} \ldots v_{m}$, the head redex being $(\lambda x u) v$ ], or is in head normal form [i.e. $t=\lambda x_{1} \ldots \lambda x_{n}(x) v_{1} \ldots v_{m}$ ]. The notation $u \succ v$ means that $v$ is obtained from $u$ by some head reductions. If $u \succ v$, we denote by $h(u, v)$ the length of the head reduction between $u$ and $v$.

Lemma 2.1 (see[3])

1) If $u \succ v$, then, for any substitution $\sigma, \sigma(u) \succ \sigma(v)$, and $h(\sigma(u), \sigma(v))=h(u, v)$.
2) If $u \succ v$, then, for every sequence of $\lambda$-terms $\bar{w}$, there is a $w$, such that $(u) \bar{w} \succ w,(v) \bar{w} \succ w$, and $h((u) \bar{w}, w)=h((v) \bar{w}, w)+h(u, v)$.

Remark. Lemma 2.1 shows that to make the head reduction of $\sigma(u)$ (resp. of $(u) \bar{w})$ it is equivalent same result, and same number of steps - to make some steps in the head reduction of $u$, and after make the head reduction of $\sigma(v)$ (resp. of $(v) \bar{w})$.

- The types will be formulas of second order predicate logic over a given language. The logical connectives are $\perp$ (for absurd), $\rightarrow$, and $\forall$. There are individual (or first order) variables denoted by $x, y, z, \ldots$, and predicate (or second order) variables denoted by $X, Y, Z, \ldots$.
- We do not suppose that the language has a special constant for equality. Instead, we define the formula $u=v$ (where $u, v$ are terms) to be $\forall Y(Y(u) \rightarrow Y(v))$ where $Y$ is a unary predicate variable. Such a formula will be called an equation. We denote by $a \approx b$, if $a=b$ is a consequence of a set of equations.
- The formula $F_{1} \rightarrow\left(F_{2} \rightarrow\left(\ldots \rightarrow\left(F_{n} \rightarrow G\right) \ldots\right)\right)$ is also denoted by $F_{1}, F_{2}, \ldots, F_{n} \rightarrow G$. For every formula $A$, we denote by $\neg A$ the formula $A \rightarrow \perp$. If $\bar{v}=v_{1}, \ldots, v_{n}$ is a sequence of variables, we denote by $\forall \bar{v} A$ the formula $\forall v_{1} \ldots \forall v_{n} A$.
- Let $t$ be a $\lambda$-term, $A$ a type, $\Gamma=x_{1}: A_{1}, \ldots, x_{n}: A_{n}$ a context, and $E$ a set of equations. We define by means of the following rules the notion " $t$ is of type $A$ in $\Gamma$ with respect to $E$ "; this notion is denoted by $\Gamma \vdash_{A F 2} t: A$ :
(1) $\Gamma \vdash_{A F 2} x_{i}: A_{i} 1 \leq i \leq n$.
(2) If $\Gamma, x: A \vdash_{A F 2} t: B$, then $\Gamma \vdash_{A F 2} \lambda x t: A \rightarrow B$.
(3) If $\Gamma \vdash_{A F 2} u: A \rightarrow B$, and $\Gamma \vdash_{A F 2} v: A$, then $\Gamma \vdash_{A F 2}(u) v: B$.
(4) If $\Gamma \vdash_{A F 2} t: A$, and $x$ is not free in $\Gamma$, then $\Gamma \vdash_{A F 2} t: \forall x A$.
(5) If $\Gamma \vdash_{A F 2} t: \forall x A$, then, for every term $u, \Gamma \vdash_{A F 2} t: A[u / x]$.
(6) If $\Gamma \vdash_{A F 2} t: A$, and $X$ is not free in $\Gamma$, then $\Gamma \vdash_{A F 2} t: \forall X A$.
(7) If $\Gamma \vdash_{A F 2} t: \forall X A$, then, for every formulas $G, \Gamma \vdash_{A F 2} t: A[G / X]$.
(8) If $\Gamma \vdash_{A F 2} t: A[u / x]$, and $u \approx v$, then $\Gamma \vdash_{A F 2} t: A[v / x]$.

This typed $\lambda$-calculus system is called $A F 2$ (for Arithmétique Fonctionnelle du second ordre).
Theorem 2.1 (see [2]) The AF2 type system has the following properties :

1) Type is preserved during reduction.
2) Typable $\lambda$-terms are strongly normalizable.

We present now a syntaxical property of system $A F 2$ that we will use afterwards.
Theorem 2.2 (see [8]) If in the typing we go from $\Gamma \vdash_{A F 2} t: A$ to $\Gamma \vdash_{A F 2} t$ : B, then we may assume that we begin by the $\forall$-elimination rules, then by the equationnal rule, and finally by the $\forall$-introduction rules.

- We define on the set of types the two binary relations $\triangleleft$ and $\approx$ as the least reflexive and transitive binary relations such that:
- $\forall x A \triangleleft A[u / x]$, if $u$ is a term of language ;
- $\forall X A \triangleleft A[F / X]$, if $F$ is a formula of language ;
- $A \approx B$ if and only if $A=C[u / x], B=C[v / x]$, and $u \approx v$.

## 3 Pure and typed $\lambda C$-calculus

### 3.1 The $C 2$ type system

We present in this section the J-L. Krivine's classical type system.

- We add a constant $C$ to the pure $\lambda$-calculus and we denote by $\Lambda C$ the set of new terms also called $\lambda C$-terms. We consider the following rules of reduction, called rules of head $C$-reduction.

1) $(\lambda x u) t t_{1} \ldots t_{n} \rightarrow(u[t / x]) t_{1} \ldots t_{n}$ for every $u, t, t_{1}, \ldots, t_{n} \in \Lambda C$.
2) $(C) t t_{1} \ldots t_{n} \rightarrow(t) \lambda x(x) t_{1} \ldots t_{n}$ for every $t, t_{1}, \ldots, t_{n} \in \Lambda C, x$ being a $\lambda$-variable not appearing in $t_{1}, \ldots, t_{n}$.

- For any $\lambda C$-terms $t, t^{\prime}$, we shall write $t \succ_{C} t^{\prime}$ if $t^{\prime}$ is obtained from $t$ by applying these rules finitely many times. We say that $t^{\prime}$ is obtained from $t$ by head $C$-reduction.
- A $\lambda C$-term $t$ is said $\beta$-normal if and only if $t$ does not contain a $\beta$-redex.
- A $\lambda C$-term $t$ is said $C$-solvable if and only if $t \succ_{C}(f) t_{1}, \ldots, t_{n}$ where $f$ is a variable.

It is easy to prove that: if $t \succ_{C} t^{\prime}$, then, for any substitution $\sigma, \sigma(t) \succ_{C} \sigma\left(t^{\prime}\right)$.

- We add to the $A F 2$ type system the new following rule :

$$
\text { (0) } \Gamma \vdash C: \forall X\{\neg \neg X \rightarrow X\}
$$

This rule axiomatizes the classical logic over the intuitionistic logic. We call $C 2$ the new type system, and we write $\Gamma \vdash_{C 2} t: A$ if $t$ is of type $A$ in the context $\Gamma$.

It is clear that $\Gamma \vdash_{C 2} t: A$ if and only if $\Gamma, C: \forall X\{\neg \neg X \rightarrow X\} \vdash_{A F 2} t: A$.
Theorem 3.1 (see [6])

1) If $\Gamma \vdash_{C 2} t: A$, and $t \rightarrow_{\beta} t^{\prime}$, then $\Gamma \vdash_{C 2} t^{\prime}: A$.
2) If $\Gamma \vdash_{C 2} t: \perp$, and $t \succ_{C} t^{\prime}$, then $\Gamma \vdash_{C 2} t^{\prime}: \perp$.
3) If $A$ is an atomic type, and $\Gamma \vdash_{C 2} t$ : $A$, then $t$ is $C$-solvable.

### 3.2 The $M 2$ type system

In this section, we present the system M2. This system allows essentialy to distinguish between classical proofs and intuitionistic proofs

We assume that for every integer $n$, there is a countable set of special $n$-ary second order variables denoted by $X_{C}, Y_{C}, Z_{C} \ldots$. and called classical variables.

Let $X$ be an $n$-ary predicate variable or predicate symbol. A type $A$ is said to be ending with $X$ if and only if $A$ is obtained by the following rules :

- $X\left(t_{1}, \ldots, t_{n}\right)$ ends with $X$;
- If $B$ ends with $X$, then $A \rightarrow B$ ends with $X$ for every type $A$;
- If $A$ ends with $X$, then $\forall v A$ ends with $X$ for every variable $v$.

A type $A$ is said to be a classical type if and only if $A$ ends with $\perp$ or a classical variable.

We add to the $A F 2$ type system the new following rules :
$\left(0^{\prime}\right) \Gamma \vdash C: \forall X_{C}\left\{\neg \neg X_{C} \rightarrow X_{C}\right\}$
(6') If $\Gamma \vdash t: A$, and $X_{C}$ has no free occurence in $\Gamma$, then $\Gamma \vdash t: \forall X_{C} A$.
$\left(7^{\prime}\right)$ If $\Gamma \vdash t: \forall X_{C} A$, and $G$ is a classical type, then $\Gamma \vdash t: A\left[G / X_{C}\right]$.
We call $M 2$ the new type system, and we write $\Gamma \vdash_{M 2} t: A$ if $t$ is of type $A$ in the context $\Gamma$.

We extend the definition of $\triangleleft$ by : $\forall X_{C} A \triangleleft A\left[G / X_{C}\right]$ if $G$ is a classical type.
Lemma 3.1 If $A$ is a classical type and $A \triangleleft B$ (or $A \approx B)$, then $B$ is a classical type.

## Proof Easy.

### 3.3 The logical properties of $M 2$

We denote by $L A F 2, L C 2$, and $L M 2$ the underlying logic systems of respectively $A F 2, C 2$, and $M 2$ type systems.

With each classical variable $X_{C}$, we associate a special variable $X^{*}$ of $A F 2$ having the same arity as $X_{C}$. For each formula $A$ of $L M 2$, we define the formula $A^{*}$ of $L A F 2$ in the following way :

- If $A=D\left(t_{1}, \ldots, t_{n}\right)$ where $D$ is a predicate symbol or a predicate variable, then $A^{*}=A$;
- If $A=X_{C}\left(t_{1}, \ldots, t_{n}\right)$, then $A^{*}=\neg X^{*}\left(t_{1}, \ldots, t_{n}\right)$;
- If $A=B \rightarrow C$, then $A^{*}=B^{*} \rightarrow C^{*}$;
- If $A=\forall x B$, then $A^{*}=\forall x B^{*}$.
- If $A=\forall X B$, then $A^{*}=\forall X B^{*}$.
- If $A=\forall X_{C} B$, then $A^{*}=\forall X^{*} B^{*}$.
$A^{*}$ is called the Gődel translation of $A$.
Lemma 3.2 If $G$ is a classical type of $L M 2$, then $\vdash_{L A F 2} \neg \neg G^{*} \longleftrightarrow G^{*}$.
Proof It is easy to prove that $\vdash_{L A F 2} G^{*} \rightarrow \neg \neg G^{*}$.
We prove $\vdash_{L A F 2} \neg \neg G^{*} \rightarrow G^{*}$ by induction on $G$.
- If $G=\perp$, then $G^{*}=\perp$, and $\vdash_{L A F 2}((\perp \rightarrow \perp) \rightarrow \perp) \rightarrow \perp$.
- If $G=X_{C}\left(t_{1}, \ldots, t_{n}\right)$, then $G^{*}=\neg X^{*}\left(t_{1}, \ldots, t_{n}\right)$, and $\vdash_{L A F 2} \neg \neg \neg X^{*}\left(t_{1}, \ldots, t_{n}\right) \rightarrow \neg X^{*}\left(t_{1}, \ldots, t_{n}\right)$.
- If $G=A \rightarrow B$, then $B$ is a classical type and $G^{*}=A^{*} \rightarrow B^{*}$. By the induction hypothesis, we have $\vdash_{L A F 2} \neg \neg B^{*} \rightarrow B^{*}$. Since $\vdash_{L A F 2} \neg \neg\left(A^{*} \rightarrow B^{*}\right) \rightarrow\left(\neg \neg A^{*} \rightarrow \neg \neg B^{*}\right)$, we check easily that $\vdash_{L A F 2} \neg \neg\left(A^{*} \rightarrow B^{*}\right) \rightarrow\left(A^{*} \rightarrow B^{*}\right)$.
- If $G=\forall v G^{\prime}$ where $v=x$ or $v=X$, then $G^{\prime}$ is a classical type and $G^{*}=\forall v G^{\prime *}$. By the induction hypothesis, we have $\vdash_{L A F 2} \neg \neg G^{*} \rightarrow G^{\prime *}$. Since $\vdash_{L A F 2} \neg \neg \forall v G^{\prime *} \rightarrow \forall v \neg \neg G^{\prime *}$, we check easily that $\vdash_{L A F 2} \neg \neg \forall v G^{*} \rightarrow \forall v G^{\prime *}$.
- If $G=\forall X_{C} G^{\prime}$, then $G^{\prime}$ is a classical type and $G^{*}=\forall X^{*} G^{* *}$. By the induction hypothesis, we have $\vdash_{L A F 2} \neg \neg G^{*} \rightarrow G^{*}$. Since $\vdash_{L A F 2} \neg \neg \forall X^{*} G^{*} \rightarrow \forall X^{*} \neg \neg G^{* *}$, we check easily that $\vdash_{L A F 2}$ $\neg \neg \forall X^{*} G^{*} \rightarrow \forall X^{*} G^{*}$.

Lemma 3.3 Let $A, G$ be formulas of LM2, $t$ a term, $x$ a first order variable, and $X$ a second order variable. We have :

1) $(A[t / x]) *=A^{*}[t / x]$.
2) $(A[G / X]) *=A^{*}\left[G^{*} / X\right]$.

Proof By induction on $A$.
Lemma 3.4 Let $A$ be a formula of LM2, $G$ a classical type, and $X_{C}$ a classical variable.
$\left.\vdash_{L A F 2}\left(A\left[G / X_{C}\right]\right)\right)^{*} \longleftrightarrow A^{*}\left[\neg G^{*} / X_{C}\right]$.
Proof By induction on $A$.

- If $A=D\left(t_{1}, \ldots, t_{n}\right)$ where $D$ is a predicate variable or a predicate symbol, then $A^{*}=A$, and $\vdash_{L A F 2} A \longleftrightarrow A$.
- If $A=X_{C}\left(t_{1}, \ldots, t_{n}\right)$, then $A^{*}=\neg X^{*}\left(t_{1}, \ldots, t_{n}\right)$, and, by Lemma $3.2, \vdash_{L A F 2} \neg \neg G^{*} \longleftrightarrow G^{*}$.
- If $A=B \rightarrow C$, then $A^{*}=B^{*} \rightarrow C^{*}$. By the induction hypothesis, we have $\vdash_{L A F 2}\left(B\left[G / X_{C}\right]\right)^{*} \longleftrightarrow$ $B^{*}\left[\neg G^{*} / X_{C}\right]$ and $\vdash_{L A F 2}\left(C\left[G / X_{C}\right]\right)^{*} \longleftrightarrow C^{*}\left[\neg G^{*} / X_{C}\right]$. Therefore $\vdash_{L A F 2}\left\{\left(B\left[G / X_{C}\right]\right)^{*} \rightarrow\left(B\left[G / X_{C}\right]\right)^{*}\right\} \longleftrightarrow$ $\left\{B^{*}\left[\neg G^{*} / X_{C}\right] \rightarrow C^{*}\left[\neg G^{*} / X_{C}\right]\right\}$.
- If $A=\forall v A^{\prime}$, where $v=x$ or $v=X$, then $A^{*}=\forall v A^{\prime *}$. By the induction hypothesis, we have $\left.\vdash_{L A F 2}\left(A^{\prime}\left[G / X_{C}\right]\right)\right)^{*} \longleftrightarrow A^{\prime *}\left[\neg G^{*} / X_{C}\right]$. Therefore $\vdash_{L A F 2}\left(\forall v A^{\prime}\left[G / X_{C}\right]\right) * \longleftrightarrow \forall v A^{\prime *}\left[\neg G^{*} / X_{C}\right]$.
- If $A=\forall Y_{C} A^{\prime}$, then $A^{*}=\forall Y^{*} A^{*}$. By the induction hypothesis, we have $\vdash_{L A F 2}\left(A^{\prime}\left[G / X_{C}\right]\right)^{*}$ $\longleftrightarrow A^{\prime *}\left[\neg G^{*} / X_{C}\right]$. Therefore $\vdash_{L A F 2}\left(\forall Y_{C} A^{\prime}\left[G / X_{C}\right]\right)^{*} \longleftrightarrow\left(\forall Y_{C} A^{\prime}\right)^{*}\left[\neg G^{*} / X_{C}\right]$.

Theorem 3.2 If $A_{1}, \ldots, A_{n} \vdash_{L M 2} A$, then $A_{1}{ }^{*}, \ldots, A_{n}{ }^{*} \vdash_{L A F 2} A^{*}$.
Proof By induction on the proof of $A$ and using Lemmas 3.2, 3.3, and 3.4.
Corollary 3.1 Let $A, A_{1}, \ldots, A_{n}$ be formulas of LAF2.
$A_{1}, \ldots, A_{n} \vdash_{L M 2} A$ if and only if $A_{1}, \ldots, A_{n} \vdash_{L A F 2} A$.
Proof We use Theorem 3.2.

With each predicate variable $X$ of $C 2$, we associate a classical variable $X_{C}$ having the same arity as $X$. For each formula $A$ of $L C 2$, we define the formula $A^{C}$ of $M 2$ in the following way :

- If $A=D\left(t_{1}, \ldots, t_{n}\right)$ where $D$ is a constant symbol, then $A^{C}=A$;
- If $A=X\left(t_{1}, \ldots, t_{n}\right)$ where $X$ is a predicate symbol, then $A^{C}=X_{C}\left(t_{1}, \ldots, t_{n}\right)$;
- If $A=B \rightarrow C$, then $A^{C}=B^{C} \rightarrow C^{C}$;
- If $A=\forall x B$, then $A^{C}=\forall x B^{C}$;
- If $A=\forall X B$, then $A^{C}=\forall X_{C} B^{C}$.
$A^{C}$ is called the classical translation of $A$.
Theorem 3.3 Let $A_{1}, \ldots, A_{n}, A$ be formulas of $L C 2$. $A_{1}, \ldots, A_{n} \vdash_{L C 2} A$ if and only if $A_{1}^{C}, \ldots, A_{n}^{C} \vdash_{L M 2} A^{C}$.

Proof By induction on the proof of $A$.

## 4 Properties of M2 type system

By corollary 3.1, we have that a formula is provable in system $L A F 2$ if and only if it is provable in system $L C 2$. This resultat is not longer valid if we decorate the demonstrations by terms. We will give some conditions on the formulas in order to obtain such a result.

We define two sets of types of $A F 2$ type system : $\Omega^{+}$(set of $\forall$-positive types), and $\Omega^{-}$(set of $\forall$-negative types) in the following way :

- If $A$ is an atomic type, then $A \in \Omega^{+}$, and $A \in \Omega^{-} ;$
- If $T \in \Omega^{+}$, and $T^{\prime} \in \Omega^{-}$, then, $T^{\prime} \rightarrow T \in \Omega^{+}$, and $T \rightarrow T^{\prime} \in \Omega^{-}$;
- If $T \in \Omega^{+}$, then $\forall x T \in \Omega^{+}$;
- If $T \in \Omega^{-}$, then $\forall x T \in \Omega^{-}$;
- If $T \in \Omega^{+}$, then $\forall X T \in \Omega^{+}$;
- If $T \in \Omega^{-}$, and $X$ has no free occurence in $T$, then $\forall X T \in \Omega^{-}$.

Lemma 4.1 1) If $A \in \Omega^{+}$(resp. $A \in \Omega^{-}$) and $A \approx B$, then $B \in \Omega^{+}$(resp. $B \in \Omega^{-}$).
2) If $A \in \Omega^{-}$and $A \triangleleft B \rightarrow C$, then $B \in \Omega^{+}$and $C \in \Omega^{-}$.

## Proof Easy.

Theorem 4.1 Let $A_{1}, \ldots, A_{n}$ be $\forall$-negative types, $A$ a $\forall$-positive type of $A F 2$ which does not end with $\perp$, $B_{1}, \ldots, B_{m}$ classical types, and $t$ a $\beta$-normal $\lambda C$-term.
If $\Gamma=x_{1}: A_{1}, \ldots, x_{n}: A_{n}, y_{1}: B_{1}, \ldots, y_{m}: B_{m} \vdash_{M 2} t: A$, then $t$ is a normal $\lambda$-term, and $x_{1}: A_{1}, \ldots, x_{n}:$ $A_{n} \vdash_{A F 2} t: A$.

Proof We argue by induction on $t$.

- If $t$ is a variable, we have two cases :
- If $t=x_{i} 1 \leq i \leq n$, this is clear.
- If $t=y_{j} 1 \leq j \leq m$, then $A=\forall \bar{v} B$ where $B_{j} \triangleleft B_{j}^{\prime}$ and $B_{j}^{\prime} \approx B$. Therefore, by Lemma 3.1, $A$ is a classical type. A contradiction.
- If $t=\lambda x u$, then $\Gamma, x: E \vdash_{M 2} u: F$, and $A=\forall \bar{v}\left(E^{\prime} \rightarrow F^{\prime}\right)$ where $E \approx E^{\prime}, F \approx F^{\prime}$ and $\bar{v}$ does not appear in $\Gamma$. First, by Lemma 4.1, $E \in \Omega^{-}$and $F \in \Omega^{+}$, and then, by the induction hypothesis, $u$ is a normal $\lambda$-term, and $x_{1}: A_{1}, \ldots, x_{n}: A_{n}, x: E \vdash_{A F 2} u: F$. Therefore $t$ is a normal $\lambda$-term, and $x_{1}: A_{1}, \ldots, x_{n}: A_{n} \vdash_{A F 2} t: A$.
- If $t=(x) u_{1} \ldots u_{r} r \geq 1$, we have two cases :
- If $t=x_{i} 1 \leq i \leq n$, then $A_{i} \triangleleft B_{1} \rightarrow C_{1}, C_{i}^{\prime} \triangleleft B_{i+1} \rightarrow C_{i+1} 1 \leq i \leq r-1, C_{r}^{\prime} \triangleleft D, A=\forall v D^{\prime}$, where $C_{i}^{\prime} \approx C_{i} 1 \leq i \leq r, D^{\prime} \approx D$, and $\Gamma \vdash_{M 2} u_{i}: B_{i} 1 \leq i \leq r$. Since $A_{i}$ is a $\forall$-negative types, we prove (by induction and using Lemma 4.1) that for all $1 \leq i \leq r B_{i}$ is a $\forall$-positive types. By the induction hypothesis we have $u_{i}$ is a normal $\lambda$-term, and $x_{1}: A_{1}, \ldots, x_{n}: A_{n} \vdash_{A F 2} u_{i}: B_{i}$. Therefore $t$ is a normal $\lambda$-term, and $x_{1}: A_{1}, \ldots, x_{n}: A_{n} \vdash_{A F 2} t: A$.
- If $t=y_{j} 1 \leq j \leq m$, then $B_{j} \triangleleft B_{1} \rightarrow C_{1}, C_{i}^{\prime} \triangleleft B_{i+1} \rightarrow C_{i+1} 1 \leq i \leq r-1, C_{r}^{\prime} \triangleleft D, A=\forall v D^{\prime}$, where $C_{i}^{\prime} \approx C_{i} 1 \leq i \leq r, D^{\prime} \approx D$, and $\Gamma \vdash_{M 2} u_{i}: B_{i} 1 \leq i \leq r$. Therefore, by Lemma 3.1, $A$ is a classical type. A contradiction.
- If $t=(C) u u_{1} \ldots u_{r} r \geq 0$, then there is a classical type $E$ such that $\Gamma \vdash_{M 2} u: \neg \neg E, E \triangleleft B_{1} \rightarrow C_{1}$, $C_{i}^{\prime} \triangleleft B_{i+1} \rightarrow C_{i+1} 1 \leq i \leq r-1, C_{r}^{\prime} \triangleleft D, A=\forall v D^{\prime}$, where $C_{i}^{\prime} \approx C_{i} 1 \leq i \leq r, D^{\prime} \approx D$, and $\Gamma \vdash_{M 2} u_{i}: B_{i} 1 \leq i \leq r$. Therefore, by Lemma 3.1, $A$ is a classical type. A contradiction.

Corollary 4.1 Let $A$ be $a \forall$-positive type of $A F 2$ and $t$ a $\beta$-normal $\lambda C$-term.
If $\vdash_{M 2} t: A$, then $t$ is a normal $\lambda$-term, and $\vdash_{A F 2} t: A$.
Proof We use Theorem 4.1.

As for relation betwen the systems $C 2$ and $M 2$, we have the following result.
Theorem 4.2 Let $A_{1}, \ldots, A_{n}, A$ be types of $C 2$, and $t$ a $\lambda C$-term.
$A_{1}, \ldots, A_{n} \vdash_{C 2} t: A$ if and only if $A_{1}^{C}, \ldots, A_{n}^{C} \vdash_{M 2} t: A^{C}$.
Proof By induction on the typing of $t$.

## 5 The integers

- Each data type can be defined by a second order formula. For example, the type of integers is the formula : $N[x]=\forall X\{X(0), \forall y(X(y) \rightarrow X(s y)) \rightarrow X(x)\}$ where $X$ is a unary predicate variable, 0 is a constant symbol for zero, and $s$ is a unary function symbol for successor. The formula $N[x]$ means semantically that $x$ is an integer if and only if $x$ belongs to each set $X$ containing 0 and closed under the successor function $s$.
The $\lambda$-term $\underline{0}=\lambda x \lambda f x$ is of type $N[0]$ and represents zero.
The $\lambda$-term $\underline{s}=\lambda n \lambda x \lambda f(f)((n) x) f$ is of type $\forall y(N[y] \rightarrow N[s(y)])$ and represents the successor function.
- A set of equations $E$ is said to be adequate with the type of integers if and only if :

$$
\begin{aligned}
& -s(a) \not \approx 0 \\
& \text { - If } s(a) \approx s(b), \text { then so is } a \approx b .
\end{aligned}
$$

In the rest of the paper, we assume that all sets of equations are adequate with the type of integers.

- For each integer $n$, we define the Church integer $\underline{n}$ by $\underline{n}=\lambda x \lambda f(f)^{n} x$.

### 5.1 The integers in $A F 2$

The system $A F 2$ has the property of the unicity of integers representation.
Theorem 5.1 (see [2]) Let $n$ be an integer. If $\vdash_{A F 2} t: N\left[s^{n}(0)\right]$, then $t \simeq_{\beta} \underline{n}$.
The propositional trace $N=\forall X\{X,(X \rightarrow X) \rightarrow X\}$ of $N[x]$ also defines the integers.
Theorem 5.2 (see [2]) If $\vdash_{A F 2} t: N$, then, for a certain $n, t \simeq_{\beta} \underline{n}$.
Remark A very important property of data type is the following (we express it for the type of integers) : in order to get a program for a function $f: N \rightarrow N$ it is sufficient to prove $\vdash \forall x(N[x] \rightarrow N[f(x)])$. For example a proof of $\vdash \forall x(N[x] \rightarrow N[p(x)])$ from the equations $p(0)=0, p(s(x))=x$ gives a $\lambda$-term for the predecessor in Church intergers (see [2]).

### 5.2 The integers in $C 2$

The situation in system $C 2$ is more complex. In fact, in this system the property of unicity of integers representation is lost and we have only one operational characterization of these integers.

Let $n$ be an integer. A classical integer of value $n$ is a closed $\lambda C$-term $\theta_{n}$ such that $\vdash_{C 2} \theta_{n}: N\left[s^{n}(0)\right]$.
Theorem 5.3 (see [6] and [12]) Let $n$ be an integer, and $\theta_{n}$ a classical integer of value $n$.

- if $n=0$, then, for every distinct variables $x, g, y:\left(\theta_{n}\right) x g y \succ_{C}(x) y$;
- if $n \neq 0$, then there is $m \geq 1$ and a mapping $I:\{0, \ldots, m\} \rightarrow N$, such that for every distinct variables $x, g, x_{0}, x_{1}, \ldots, x_{m}$ :

$$
\begin{aligned}
& \left(\theta_{n}\right) x g x_{0} \succ_{C}(g) t_{1} x_{r_{0}} \\
& \left(t_{i}\right) x_{i} \succ_{C}(g) t_{i+1} x_{r_{i}} 1 \leq i \leq m \\
& \left(t_{m}\right) x_{m} \succ_{C}(x) x_{r_{m}}
\end{aligned}
$$

where $I(0)=n, I\left(r_{m}\right)=0$, and $I(i+1)=I\left(r_{i}\right)-10 \leq i \leq m-1$.
We will generalize this result.

Let $O$ be a particular unary predicate symbol. The typed system $C 2_{O}$ is the typed system $C 2$ where we replace the rules (2) and (7) by :
$\left(2_{O}\right)$ If $\Gamma, x: A \vdash_{C 2_{O}} t: B, A$ and $B$ are not ending with $O$, then $\Gamma \vdash_{C 2_{O}} \lambda x t: A \rightarrow B$.
$\left(7_{O}\right)$ If $\Gamma \vdash_{C 2_{O}} t: \forall X A$, and $G$ is not ending with $O$, then $\Gamma \vdash_{C 2_{O}} t: A[G / X]$.
We define on the types of $C 2_{O}$ a binary relation $\triangleleft_{O}$ as the least reflexive and transitive binary relation such that:
$\forall x A \triangleleft_{O} A[u / x]$ if $u$ is a term of language ;
$\forall X A \triangleleft_{O} A[G / X]$ if $G$ is a type which is not ending with $O$.
Lemma 5.1 a) If $\Gamma \vdash_{C 2_{O}} t: \perp$, and $t \succ_{C} t^{\prime}$, then $\Gamma \vdash_{C 2_{O}} t^{\prime}: \perp$.
b) If $\Gamma \vdash_{C 2_{O}} t: A$, and $A$ is an atomic type, then $t$ is $C$-solvable.

Proof a) It is enough to do the proof for one step of reduction. We have two cases :

- If $t=(\lambda x u) v v_{1} \ldots v_{m}$, then $t^{\prime}=(u[v / x]) v_{1} \ldots v_{m}, \Gamma, x: F \vdash_{C 2_{O}} u: G, F$ and $G$ are not ending with $O, G^{\prime} \triangleleft_{O} F_{1} \rightarrow G_{1}, G_{j}^{\prime} \triangleleft_{O} F_{j+1} \rightarrow G_{j+1} 1 \leq j \leq m-1, G_{m} \approx \perp, G_{j} \approx G_{j}^{\prime} 1 \leq j \leq m-1$, $\Gamma \vdash_{C 2_{O}} v: F$, and $\Gamma \vdash_{C 2_{O}} v_{j}: F_{j} 1 \leq j \leq m$. It is easy to check that $\Gamma \vdash_{C 2_{O}} u[v / x]: G$, then $\Gamma \vdash_{C 2_{O}} t^{\prime}: \perp$.
- If $t=(C) v v_{1} \ldots v_{m}$, then $t^{\prime}=(v) \lambda x(x) v_{1} \ldots v_{m}$, and there is a type $A$ which is not ending with $O$ such that : $A^{\prime} \triangleleft_{O} F_{1} \rightarrow G_{1}, G_{j}^{\prime} \triangleleft_{O} F_{j+1} \rightarrow G_{j+1} 1 \leq j \leq m-1, G_{m} \approx \perp, A \approx A^{\prime}, G_{j} \approx G_{j}^{\prime} 1 \leq j \leq m$, $\Gamma \vdash_{C 2_{O}} v: \neg \neg A$, and $\Gamma \vdash_{C 2_{O}} v_{j}: F_{j} 1 \leq j \leq m$. It is easy to check that $\Gamma, x: A \vdash_{C 2_{O}}(x) v_{1} \ldots v_{m}: \perp$, but $A$ is not ending with $O$, then $\Gamma \vdash_{C 2_{O}} \lambda x(x) v_{1} \ldots v_{m}: \neg A$, and $\Gamma \vdash_{C 2_{O}} t^{\prime}: \perp$.
b) Indeed, a typing of $C 2_{O}$ may be seen as a typing of $C 2$.

Lemma 5.2 a) If $\Gamma \vdash_{C 2_{O}} t: O(a)$, and $t \succ_{C} t^{\prime}$, then $t=t^{\prime}$.
b) If $\Gamma=y_{1}: A_{1}, \ldots, y_{n}: A_{n}, x_{1}: O\left(a_{1}\right), \ldots, x_{m}: O\left(a_{m}\right) \vdash_{C 2 O} t: O(a)$, and all $A_{i} 1 \leq i \leq n$ are not ending with $O$, then $t$ is one of $x_{i}$, and $a_{i} \approx a 1 \leq i \leq n$.

Proof a) It is enough to do the proof for one step of reduction. We have two cases :

- If $t=(\lambda x u) v v_{1} \ldots v_{m}$, then $t^{\prime}=(u[v / x]) v_{1} \ldots v_{m}, \Gamma, x: F \vdash_{C 2_{O}} u: G, F$ and $G$ are not ending with $O, G^{\prime} \triangleleft_{O} F_{1} \rightarrow G_{1}, G_{j}^{\prime} \triangleleft_{O} F_{j+1} \rightarrow G_{j+1} 1 \leq j \leq m-1, G_{m} \approx O(a), G_{j} \approx G_{j}^{\prime} 1 \leq j \leq m-1$, $\Gamma \vdash_{C 2_{O}} v: F$, and $\Gamma \vdash_{C 2_{O}} v_{j}: F_{j} 1 \leq j \leq m$. Therefore $G_{j} 1 \leq j \leq m$ is not ending with $O$, which is impossible since $G_{m} \approx O(a)$.
- If $t=(C) v v_{1} \ldots v_{m}$, then $t^{\prime}=(v) \lambda x(x) v_{1} \ldots v_{m}$, and there is a type $A$ which is not ending with $O$ such that : $A^{\prime} \triangleleft_{O} F_{1} \rightarrow G_{1}, G_{j}^{\prime} \triangleleft_{O} F_{j+1} \rightarrow G_{j+1} 1 \leq j \leq m-1, G_{m} \approx O(a), A \approx A^{\prime}, G_{j} \approx G_{j}^{\prime}$ $1 \leq j \leq m, \Gamma \vdash_{C 2_{O}} v: \neg \neg A$, and $\Gamma \vdash_{C 2_{O}} v_{j}: F_{j} 1 \leq j \leq m$. $A$ is not ending with $O$, therefore $G_{j}$ $1 \leq j \leq m$ is not ending with $O$, which is impossible since $G_{m} \approx O(a)$.
b) By Lemma 5.1, we have $t \succ_{C}(f) t_{1} \ldots t_{r}$, and, by a), $t=(f) t_{1} \ldots t_{r}$. Therefore $\Gamma \vdash_{C 2_{O}}(f) t_{1} \ldots t_{r}: O(a)$.
- If $f=x_{i} 1 \leq i \leq m$, then $r=0, t=x_{i}$, and $O\left(a_{i}\right) \approx O(a)$, then $a_{i} \approx a$.
- If $f=y_{j} 1 \leq j \leq k$, then $A_{j} \triangleleft_{O} F_{1} \rightarrow G_{1}, G_{k}^{\prime} \triangleleft_{O} F_{k+1} \rightarrow G_{k+1} 1 \leq k \leq r-1, G_{r} \approx O(a)$, $G_{k} \approx G_{k}^{\prime} 1 \leq k \leq r$, and $\Gamma \vdash_{C 2_{O}} t_{k}: F_{k} 1 \leq k \leq r$. Since $A_{j}$ is not ending with $O$, then $G_{k}$ $1 \leq k \leq r$ is not ending with $O$, which is impossible since $C r \approx O(a)$.

Let $V$ be the set of variables of $\lambda C$-calculus.
Let $P$ be an infinite set of constants called stack constants 22 .
We define a set of $\lambda C$-terms $\Lambda C P$ by :

- If $x \in V$, then $x \in \Lambda C P$;
- If $t \in \Lambda C P$, and $x \in V$, then $\lambda x t \in \Lambda C P$;
- If $t \in \Lambda C P$, and $u \in \Lambda C P \bigcup P$, then $(t) u \in \Lambda C P$.

In other words, $t \in \Lambda C P$ if and only if the stack constants are in argument positions in $t$.

Let $\sigma$ be a function defined on $V \bigcup P$ such that:

- If $x \in V$, then $\sigma(x) \in \Lambda C P$;
- If $p \in P$, then $\sigma(p)=\bar{t}=t_{1}, \ldots, t_{n}, n \geq 0, t_{i} \in \Lambda C P \bigcup P 1 \leq i \leq n$.

We define $\sigma(t)$ for all $t \in \Lambda C P$ by :

$$
\begin{aligned}
& -\sigma((u) v)=(\sigma(u)) \sigma(v) \text { if } v \notin P \\
& -\sigma(\lambda x u)=\lambda x \sigma(u) \\
& -\sigma((t) p)=(t) \bar{t} \text { if } \sigma(p)=\bar{t}
\end{aligned}
$$

$\sigma$ is said to be a $P$-substitution.

We consider, on the set $\Lambda C P$, the following rules of reduction :

1) $(\lambda x u) t t_{1} \ldots t_{n} \rightarrow(u[t / x]) t_{1} \ldots t_{n}$ for all $u, t \in \Lambda C P$ and $t_{1}, \ldots, t_{n} \in \Lambda C P \bigcup P$;
2) $(C) t t_{1} \ldots t_{n} \rightarrow(t) \lambda x(x) t_{1} \ldots t_{n}$ for all $t \in \Lambda C P$ and $t_{1}, \ldots, t_{n} \in \Lambda C P \bigcup P$, and $x$ being $\lambda$-variable not appearing in $t_{1}, \ldots, t_{n}$.

For any $t, t^{\prime} \in \Lambda C P$, we shall write $t \triangleright_{C} t^{\prime}$, if $t^{\prime}$ is obtained from $t$ by applying these rules finitely many times.

Lemma 5.3 If $t \triangleright_{C} t^{\prime}$, then $\sigma(t) \triangleright_{C} \sigma\left(t^{\prime}\right)$ for all $P$-substitution $\sigma$.
Proof Easy.
Lemma 5.4 Let $t \in \Lambda C P$ such that the stack constants of $t$ are among $p_{1}, \ldots, p_{m}$. If $t \succ_{C} t^{\prime}$, and $\Gamma=\Gamma^{\prime}, p_{1}: O\left(a_{1}\right), \ldots, p_{m}: O\left(a_{m}\right) \vdash_{C 2_{O}} t: \perp$, then $t^{\prime} \in \Lambda C P$ and $t \triangleright_{C} t^{\prime}$.

Proof It is enough to do the proof for one step of reduction. We have two cases :

- If $t=(\lambda x u) v v_{1} \ldots v_{m}$, then, $t^{\prime}=(u[v / x]) v_{1} \ldots v_{m}, \Gamma, x: F \vdash_{C 2_{O}} u: G, F$ and $G$ is not ending with $O$, and $\Gamma \vdash_{C 2_{O}} v: F$. Therefore $u, v \in \Lambda C P$, and so $t^{\prime} \in \Lambda C P$ and $t \triangleright_{C} t^{\prime}$.

[^1]- If $t=(C) v v_{1} \ldots v_{m}$, then, $t^{\prime}=(v) \lambda x(x) v_{1} \ldots v_{m}$, and there is a type $A$ which is not ending with $O$ such that $\Gamma \vdash_{C 2_{O}} v: \neg \neg A$. Therefore $v \in \Lambda C P$, and so $t^{\prime} \in \Lambda C P$ and $t \triangleright_{C} t^{\prime}$.

Theorem 5.4 Let $n$ be an integer, $\theta_{n}$ a classical integer of value $n$, and $x, g$ two distinct variables.

- If $n=0$, then for every stack constant $p$, we have : $\left(\theta_{n}\right) x g p \succ_{C}(x) p$.
- If $n \neq 0$, then there is $m \geq 1$, and a mapping $I:\{0, \ldots, m\} \rightarrow N$, such that for all distinct stack constants $p_{0}, p_{1}, \ldots, p_{m}$, we have :

$$
\begin{aligned}
& \left(\theta_{n}\right) x g p_{0} \succ_{C}(g) t_{1} p_{r_{0}} ; \\
& \left(t_{i}\right) p_{i} \succ_{C}(g) t_{i+1} p_{r_{i}} 1 \leq i \leq m-1 ; \\
& \left(t_{m}\right) p_{m} \succ_{C}(x) p_{r_{m}}
\end{aligned}
$$

where $I(0)=n, I\left(r_{m}\right)=0$, and $I(i+1)=I\left(r_{i}\right)-10 \leq i \leq m-1$.
Proof We denote, in this proof, the term $s^{i}(0)$ by $i$.
If $\vdash_{C 2} \theta_{n}: N[n]$, then $\vdash_{C 2_{O}} \theta_{n}:[O(0) \rightarrow \perp], \forall y\{[O(y) \rightarrow \perp] \rightarrow[O(s y) \rightarrow \perp]\}, O(n) \rightarrow \perp$, then $\Gamma_{1}=x:$ $O(0) \rightarrow \perp, g: \forall y\{[O(y) \rightarrow \perp] \rightarrow[O(s y) \rightarrow \perp]\}, p_{0}: O(n) \vdash_{C 2_{O}}\left(\theta_{n}\right) x g p_{0}: \perp$, therefore, by Lemma 5.1, $\left(\theta_{n}\right) x g p_{0}$ is $C$-solvable, and three cases may be seen :

- If $\left(\theta_{n}\right) x g p_{0} \succ_{C}\left(p_{0}\right) t_{1} \ldots t_{r}$, then $r=0$, and there is a term $a$, such that $O(a) \approx \perp$. This is impossible.
- If $\left(\theta_{n}\right) x g p_{0} \succ_{C}(x) t_{1} \ldots t_{r}$, then $r=1$, and $\Gamma_{1} \vdash_{C 2_{O}} t_{1}: O(0)$. Therefore, by Lemma 5.2, $t_{1}=p_{0}$, and so $n=0$.
- If $\left(\theta_{n}\right) x g p_{0} \succ_{C}(g) t_{1} \ldots t_{r}$, then $r=2, \Gamma_{1} \vdash_{C 2_{O}} t_{1}: O(a) \rightarrow \perp, \Gamma_{1} \vdash_{C 2_{O}} t_{2}: O\left(s\left(a^{\prime}\right)\right)$, and $a \approx a^{\prime}$. By Lemma 5.2, we have $t_{2}=p_{0}$, and $s\left(a^{\prime}\right) \approx n$, then $a \approx n-1$. Therefore $\left(\theta_{n}\right) x g p_{0} \succ_{C}(g) t_{1} p_{0}$, and $\Gamma_{1} \vdash_{C 2_{O}} t_{1}: O(n-1) \rightarrow \perp$. Let $I(0)=n$.

We prove that : if $\Gamma_{i}=g: \forall y\{[O(y) \rightarrow \perp] \rightarrow[O(s y) \rightarrow \perp]\}, x: O(0) \rightarrow \perp, p_{0}: O(I(0)), \ldots, p_{i}:$ $O(I(i)) \vdash_{C 2_{O}}\left(t_{i}\right) p_{i}: \perp$, then :
$\left(t_{i}\right) p_{i} \succ_{C}(g) t_{i+1} p_{r_{i}}$, and $\Gamma_{i} \vdash_{C 2_{O}} t_{i+1}: O\left(I\left(r_{i}\right)-1\right) \rightarrow \perp$
or
$\left(t_{i}\right) p_{i} \succ_{C}(x) p_{r_{i}}$, and $I\left(r_{i}\right)=0$.
$\Gamma_{i} \vdash_{C 2_{O}}\left(t_{i}\right) p_{i}: \perp$, therefore, by Lemma 5.1, $\left(t_{i}\right) p_{i}$ est $C$-solvable, and three cases may be seen :

- If $\left(t_{i}\right) p_{i} \succ_{C}\left(p_{j}\right) u_{1} \ldots u_{r} 0 \leq j \leq i$, then $r=0$, and there is a term $a$, such that $O(a) \approx \perp$. This is impossible.
- If $\left(t_{i}\right) p_{i} \succ_{C}(x) u_{1} \ldots u_{r}$, then $r=1$, and $\Gamma_{i} \vdash_{C 2_{O}} u_{1}: O(0)$. Therefore, by Lemma 5.2, $u_{1}=p_{r_{i}}$, and $I\left(r_{i}\right)=0$.
- If $\left(t_{i}\right) p_{i} \succ_{C}(g) u_{1} \ldots u_{r}$, then $r=2, \Gamma_{i} \vdash_{C 2_{O}} u_{1}: O(a) \rightarrow \perp, \Gamma_{i} \vdash_{C 2_{O}} u_{2}: O\left(s\left(a^{\prime}\right)\right)$, and $a \approx a^{\prime}$. By Lemma 5.2, we have $u_{2}=p_{r_{i}}$, and $s\left(a^{\prime}\right) \approx I\left(r_{i}\right)$, then $a \approx I\left(r_{i}\right)-1$. Therefore $\left(t_{i}\right) p_{i} \succ_{C}(g) t_{i+1} p_{r_{i}}$, and $\Gamma_{i} \vdash_{C 2_{O}} t_{i+1}: O\left(I\left(r_{i}\right)-1\right) \rightarrow \perp$. Let $I(i+1)=I\left(r_{i}\right)-1$.

This construction always terminates. Indeed, if not, the $\lambda C$-term $\left(\left(\left(\theta_{n}\right) \lambda x x\right) \lambda x x\right) p_{0}$ is not $C$-solvable. This is impossible, since $p_{0}: \perp \vdash_{C 2}\left(\left(\left(\theta_{n}\right) \lambda x x\right) \lambda x x\right) p_{0}: \perp$.

Corollary 5.1 Let $n$ be an integer, $\theta_{n}$ a classical integer of value $n$, and $x, g$ two distinct variables.

- If $n=0$, then, for every stack constant $p$, we have : $\left(\theta_{n}\right) x g p \triangleright_{C}(x) p$.
- If $n \neq 0$, then there is $m \geq 1$, and a mapping $I:\{0, \ldots, m\} \rightarrow N$, such that for all distinct stack constants $p_{0}, p_{1}, \ldots, p_{m}$, we have :

$$
\begin{aligned}
& \left(\theta_{n}\right) x g p_{0} \triangleright_{C}(g) t_{1} p_{r_{0}} ; \\
& \left(t_{i}\right) p_{i} \triangleright_{C}(g) t_{i+1} p_{r_{i}} 1 \leq i \leq m-1 ; \\
& \left(t_{m}\right) p_{m} \triangleright_{C}(x) p_{r_{m}}
\end{aligned}
$$

where $I(0)=n, I\left(r_{m}\right)=0$, and $I(i+1)=I\left(r_{i}\right)-10 \leq i \leq m-1$.
Proof We use Lemma 5.4.
Corollary 5.2 Let $n$ be an integer, and $\theta_{n}$ a classical integer of value $n$.
-If $n=0$, then, for every $\lambda C$-terms $a, F, \bar{u}$, we have : $\left(\theta_{n}\right) a F \bar{u} \succ_{C}(a) \bar{u}$.

- If $n \neq 0$, then there is $m \geq 1$, and a mapping $I:\{0, \ldots, m\} \rightarrow N$, such that for all $\lambda C-$ terms $a, F, \overline{u_{0}}, \overline{u_{1}}, \ldots, \overline{u_{m}}$, we have :

$$
\begin{aligned}
& \left(\theta_{n}\right) a F \overline{u_{0}} \succ_{C}(g) t_{1} \overline{u_{r_{0}}} ; \\
& \left(t_{i}\right) \overline{u_{i}} \succ_{C}(g) t_{i+1} \overline{u_{r_{i}}} 1 \leq i \leq m-1 ; \\
& \left(t_{m}\right) \overline{u_{m}} \succ_{C}(a) \overline{u_{r_{m}}}
\end{aligned}
$$

where $I(0)=n, I\left(r_{m}\right)=0$, and $I(i+1)=I\left(r_{i}\right)-10 \leq i \leq m-1$.
Proof We use Lemma 5.3.

### 5.3 The integers in $M 2$

According to the results of section 4, we can obtain some results concerning the integers in the system M2.

Theorem 5.5 Let $n$ be an integer. If $\vdash_{M 2} t: N\left[s^{n}(0)\right]$, then, $t \simeq_{\beta} \underline{n}$.
Proof We use Theorem 4.1.

Let $n$ be an integer. By Theorem 4.2, a classical integer of value $n$ is a closed $\lambda C$-term $\theta_{n}$ such that $\vdash_{M 2} \theta_{n}: N^{C}\left[s^{n}(0)\right]$.

Theorem 5.6 Let $n$ be an integer, $\theta_{n}$ a classical integer of value $n$, and $x, g$ two distinct variables.

- If $n=0$, then, for every stack constant $p$, we have : $\left(\theta_{n}\right) x g p \triangleright_{C}(x) p$.
- If $n \neq 0$, then there is $m \geq 1$, and a mapping $I:\{0, \ldots, m\} \rightarrow N$, such that for all distinct stack constants $p_{0}, p_{1}, \ldots, p_{m}$, we have :

$$
\left(\theta_{n}\right) x g p_{0} \triangleright_{C}(g) t_{1} p_{r_{0}} ;
$$

$$
\begin{aligned}
& \left(t_{i}\right) p_{i} \triangleright_{C}(g) t_{i+1} p_{r_{i}} 1 \leq i \leq m-1 \\
& \left(t_{m}\right) p_{m} \triangleright_{C}(x) p_{r_{m}}
\end{aligned}
$$

where $I(0)=n, I\left(r_{m}\right)=0$, and $I(i+1)=I\left(r_{i}\right)-10 \leq i \leq m-1$.
Proof We use Theorem 4.2.

## 6 Storage operators

### 6.1 Storage operators for Church integers

Let $T$ be a closed $\lambda$-term. We say that $T$ is a storage operator for Church integers if and only if for every $n \geq 0$, there is a $\lambda$-term $\tau_{n} \simeq_{\beta} \underline{n}$, such that for every $\lambda$-term $\theta_{n} \simeq_{\beta} \underline{n}$, there is a substitution $\sigma$, such that $(T) \theta_{n} f \succ(f) \sigma\left(\tau_{n}\right)$.

Examples If we take :
$T_{1}=\lambda n((n) \delta) G$ where $G=\lambda x \lambda y(x) \lambda z(y)(\underline{s}) z$ and $\delta=\lambda f(f) \underline{0}$
$T_{2}=\lambda n \lambda f(((n) f) F) \underline{0}$ where $F=\lambda x \lambda y(x)(\underline{s}) y$,
then it is easy to check that : for every $\theta_{n} \simeq_{\beta} \underline{n},\left(T_{i}\right) \theta_{n} f \succ(f)(\underline{s})^{n} \underline{0}(i=1$ or 2$)$ (see [3] and [8]). Therefore $T_{1}$ and $T_{2}$ are storage operators for Church integers.

It is a remarkable fact that we can give simple types to storage operators for Church integers. We first define the simple Gődel translation $F^{*}$ of a formula $F$ : it is obtained by replacing in the formula $F$, each atomic formula $A$ by $\neg A$. For example :

$$
N^{*}[x]=\forall X\{\neg X(0), \forall y(\neg X(y) \rightarrow \neg X(s y)) \rightarrow \neg X(x)\}
$$

It is well known that, if $F$ is provable in classical logic, then $F^{*}$ is provable in intuitionistic logic.

We can check that $\vdash_{A F 2} T_{1}, T_{2}: \forall x\left\{N^{*}[x] \rightarrow \neg \neg N[x]\right\}$. And, in general, we have the following Theorem :

Theorem 6.1 (see [3] and [10]) If $\vdash_{A F 2} T: \forall x\left\{N^{*}[x] \rightarrow \neg \neg N[x]\right\}$, then $T$ is a storage operator for Church integers.

### 6.2 Storage operators for classical integers

The storage operators play an important role in classical type systems. Indeed, they can be used to find the value of a classical integer.

Theorem 6.2 (see [6] and [7]) If $\vdash_{A F 2} T: \forall x\left\{N^{*}[x] \rightarrow \neg \neg N[x]\right\}$, then for every $n \geq 0$, there is $a$ $\lambda$-term $\tau_{n} \simeq_{\beta} \underline{n}$, such that for every classical integer $\theta_{n}$ of value $n$, there is a substitution $\sigma$, such that $(T) \theta_{n} f \succ_{C}(f) \sigma\left(\tau_{n}\right)$.

Corollary 6.1 If $\vdash_{A F 2} T: \forall x\left\{N^{*}[x] \rightarrow \neg \neg N[x]\right\}$, then for every $n \geq 0$ and for every classical integer $\theta_{n}$ of value $n$, there is a $\lambda$-term $\tau_{n}$, such that $(T) \theta_{n} \lambda x x \succ_{C} \tau_{n} \rightarrow_{\beta} \underline{n}$.

Proof We use Theorem 6.2.

Remark. Theorem 6.2 cannot be generalized for the system $C 2$. Indeed, let $T=\lambda \nu \lambda f(f)(C)\left(T_{i}\right) \nu$ ( $i=1$ or 2 ).

$$
\begin{aligned}
& \nu: N^{*}[x], f: \neg N[x] \vdash_{C 2}\left(T_{i}\right) \nu: \neg \neg N[x] \Longrightarrow \\
& \nu: N^{*}[x], f: \neg N[x] \vdash_{C 2}(C)\left(T_{i}\right) \nu: N[x] \Longrightarrow \\
& \nu: N^{*}[x], f: \neg N[x] \vdash_{C 2}(f)(C)\left(T_{i}\right) \nu: \perp \Longrightarrow \\
& \vdash_{C 2} T: \forall x\left\{N^{*}[x] \rightarrow \neg \neg N[x]\right\}
\end{aligned}
$$

Since for every $\lambda C$-term $\theta,(T) \theta f \succ_{C}(f)(C)\left(T_{i}\right) \theta$, then it is easy to check that there is not a $\lambda C$ term $\tau_{n} \simeq_{\beta} \underline{n}$ such that for every classical integer $\theta_{n}$ of value $n$, there is a substitution $\sigma$, such that $(T) \theta_{n} f \succ_{C}(f) \sigma\left(\tau_{n}\right)$.

We will see that in system $M 2$ we have a similar result to Theorem 6.2.

Let $T$ be a closed $\lambda C$-term. We say that $T$ is a storage operator for classical integers if and only if for every $n \geq 0$, there is a $\lambda C$-term $\tau_{n} \simeq_{\beta} \underline{n}$, such that for every classical integers $\theta_{n}$ of value $n$, there is a substitution $\sigma$, such that $(T) \theta_{n} f \succ_{C}(f) \sigma\left(\tau_{n}\right)$.

Theorem 6.3 If $\vdash_{M 2} T: \forall x\left\{N^{C}[x] \rightarrow \neg \neg N[x]\right\}$, then $T$ is a storage operator for classical integers.
The type system $M$ is the subsystem of $M 2$ where we only have propositional variables and constants (predicate variables or predicate symbols of arity 0 ). So, first order variable, function symbols, and finite sets of equations are useless. The rules for typed are $\left.0^{\prime}\right) 1$ ), 2 ), 3$\left.), 6\right), 6^{\prime}$ ), 7 ) and $7^{\prime}$ ) restricted to propositional variables. With each predicate variable (resp. predicate symbol) $X$, we associate a predicate variable (resp. a predicate symbol) $X^{\diamond}$ of $M$ type system. For each formula $A$ of $M 2$, we define the formula $A^{\diamond}$ of $F_{C}$ obtained by forgetting in $A$ the first order part. If $\Gamma=x_{1}: A_{1}, \ldots, x_{n}: A_{n}$ is a context of $M 2$, then we denote by $\Gamma^{\diamond}$ the context $x_{1}: A_{1}^{\diamond}, \ldots, x_{n}: A_{n}^{\diamond}$ of $M$. We write $\Gamma \vdash_{M} t: A$ if $t$ is typable in $M$ of type $A$ in the context $\Gamma$.
We have obviously the following property : if $\Gamma \vdash_{M 2} t: A$, then $\Gamma^{\diamond} \vdash_{M} t: A^{\diamond}$.

Theorem 6.3 is a consequence of the following Theorem.
Theorem 6.4 If $\vdash_{M} T: N^{C} \rightarrow \neg \neg N$, then for every $n \geq 0$, there is an $m \geq 0$ and a $\lambda C$-term $\tau_{m} \simeq_{\beta} \underline{m}$, such that for every classical integer $\theta_{n}$ of value $n$, there is a substitution $\sigma$, such that $(T) \theta_{n} f \succ_{C}(f) \sigma\left(\tau_{m}\right)$.

Indeed, if $\vdash_{M 2} T: \forall x\left\{N^{C}[x] \rightarrow \neg \neg N[x]\right\}$, then $\vdash_{M} T: N^{C} \rightarrow \neg \neg N$. Therefore for every $n \geq 0$, there is an $m \geq 0$ and $\tau_{m} \simeq_{\beta} \underline{m}$, such that for every classical integer $\theta_{n}$ of value $n$, there is a substitution $\sigma$, such that $(T) \theta_{n} f \succ_{C}(f) \sigma\left(\tau_{m}\right)$. We have $\vdash_{M 2} \underline{n}: N^{C}\left[s^{n}(0)\right]$, then $f: \neg N\left[s^{n}(0)\right] \vdash_{M 2}(T) \underline{n} f: \perp$, therefore $f: \neg N\left[s^{n}(0)\right] \vdash_{M 2}(f) \underline{m}: \perp$ and $\vdash_{M 2} \underline{m}: N\left[s^{n}(0)\right]$. Therefore $n=m$. and $T$ is a storage operator for classical integers.

In order to prove Theorem 6.4, we shall need some Lemmas.

Lemma 6.1 If $\Gamma, \nu: N^{C} \vdash_{M}(\nu) \bar{d}: \perp$, then $\bar{d}=a, b, d_{1}, \ldots, d_{r}$ and there is a classical type $F$, such that: $\Gamma, \nu: N^{C} \vdash_{M} a: F ; \Gamma, \nu: N^{C} \vdash_{M} b: F \rightarrow F ; F \triangleleft E_{1} \rightarrow F_{1}, F_{i} \triangleleft E_{i+1} \rightarrow F_{i+1} 1 \leq i \leq r-1 ; F_{r} \triangleleft \perp ;$ and $\Gamma, \nu: N^{C} \vdash_{M} c_{i}: E_{i} 1 \leq i \leq r$.

Proof We use Theorem 2.2.
Lemma 6.2 If $F$ is a classical type and $\Gamma, x: F \vdash_{M}(x) \bar{d}: \perp$, then $\bar{d}=d_{1}, \ldots, d_{r} ; F \triangleleft E_{1} \rightarrow F_{1}$; $F_{i} \triangleleft E_{i+1} \rightarrow F_{i+1} 1 \leq i \leq r-1 ; F_{r} \triangleleft \perp ;$ and $\Gamma, x: F \vdash_{M} c_{i}: E_{i} 1 \leq i \leq r$.

Proof We use Theorem 2.2.
Lemma 6.3 Let $t$ be a $\beta$-normal $\lambda C$-term, and $A_{1}, \ldots, A_{n}$ a sequence of classical types. If $x_{1}: A_{1}, \ldots, x_{n}: A_{n} \vdash_{M} t: N$, then there is an $m \geq 0$ such that $t=\underline{m}$.
Proof We use Theorems 4.1 and 5.2.

Let $\nu$ and $f$ be two fixed variables.
We denote by $x_{n, a, b, \bar{c}}$ (where $n$ is an integer, $a, b$ two $\lambda$-terms, and $\bar{c}$ a finite sequence of $\lambda$-terms) a variable which does not appear in $a, b, \bar{c}$.

Theorem 6.5 Let $n$ be an integer. There is an integer $m$ and a finite sequence of head reductions $\left\{U_{i} \succ_{C} V_{i}\right\}_{1 \leq i \leq r}$ such that :

1) $U_{1}=(T) \nu f$ and $V_{r}=(f) \tau_{m}$ where $\tau_{m} \simeq_{\beta} \underline{\mathrm{m}}$;
2) $V_{i}=(\nu) a b \bar{c}$ or $V_{i}=\left(x_{l, a, b, \bar{c}}\right) \bar{d} 0 \leq l \leq n-1$;
3) If $V_{i}=(\nu) a b \bar{c}$, then $U_{i+1}=(a) \bar{c}$ if $n=0$ and $U_{i+1}=\left((b) x_{n-1, a, b, \bar{c}}\right) \bar{c}$ if $n \neq 0$;
4) If $V_{i}=\left(x_{l, a, b, \bar{c}}\right) \bar{d} 0 \leq l \leq n-1$, then $U_{i+1}=(a) \bar{d}$ if $l=0$ and $U_{i+1}=\left((b) x_{l-1, a, b, \bar{d}}\right) \bar{d}$ if $l \neq 0$.

Proof A good context $\Gamma$ is a context of the form $\nu: N^{C}, f: \neg N, x_{n_{1}, a_{1}, b_{1}, \overline{c_{1}}}: F_{1}, \ldots, x_{n_{p}, a_{p}, b_{p}, \overline{c_{p}}}: F_{p}$ where $F_{i}$ is a classical type, $0 \leq n_{i} \leq n-1$, and $1 \leq i \leq p$.
We will prove that there is an integer $m$ and a finite sequence of head reductions $\left\{U_{i} \succ_{C} V_{i}\right\}_{1 \leq i \leq r}$ such that we have 1), 2), 3), 4), and there is a good context $\Gamma$ such that $\Gamma \vdash_{M} V_{i}: \perp 1 \leq i \leq r$.

We have $\vdash_{M} T: N^{C} \rightarrow \neg \neg N$, then $\nu: N^{C}, f: \neg N \vdash_{M}(T) \nu f: \perp$, and by Lemmas 6.1 and 6.2 , $(T) \nu f \succ_{C} V_{1}$ where $V_{1}=(f) \tau$ or $V_{1}=(\nu) a b \bar{c}$.
Assume that we have the head reduction $U_{k} \succ_{C} V_{k}$ and $V_{k} \neq(f) \tau$.

- If $V_{k}=(\nu) a b \bar{c}$, then, by the induction hypothesis, there is a good context $\Gamma$ such that $\Gamma \vdash_{M}$ $(\nu) a b \bar{c}: \perp$. By Lemma 6.1, there is a classical type $F$, such that $\Gamma \vdash_{M} a: F ; \Gamma \vdash_{M} b: F \rightarrow F$; $\bar{c}=c_{1}, \ldots, c_{s} ; F \triangleleft E_{1} \rightarrow F_{1} ; F_{i} \triangleleft E_{i+1} \rightarrow F_{i+1} 1 \leq i \leq s-1 ; F_{s} \triangleleft \perp ;$ and $\Gamma \vdash_{M} c_{i}: E_{i} 1 \leq i \leq s$.
- If $n=0$, let $U_{k+1}=(a) \bar{c}$. We have $\Gamma \vdash_{M} U_{k+1}: \perp$.
- If $n \neq 0$, let $U_{k+1}=\left((b) x_{n-1, a, b, \bar{c}}\right) \bar{c}$. The variable $x_{n-1, a, b, \bar{c}}$ is not used before. Indeed, if it is, we check easily that the $\lambda C$-term $(T) \underline{n} f$ is not solvable; but that is impossible because $f: \neg N \vdash_{M}(T) \underline{n} f: \perp$. Therefore $\Gamma^{\prime}=\Gamma, x_{n-1, a, b, \bar{c}}: F$ is a good context and $\Gamma^{\prime} \vdash_{M} U_{k+1}: \perp$.
- If $V_{k}=\left(x_{l, a, b, \bar{c}}\right) \bar{d}$, then, by the induction hypothesis, there is a good context $\Gamma$ such that $\Gamma \vdash_{M}$ $\left(x_{l, a, b, \bar{c}}\right) \bar{d}: \perp$. Then there is a classical type $F$ such that $x_{l, a, b, \bar{c}}: F$ is in the context $\Gamma$. By Lemma $6.2, \bar{c}=d_{1}, \ldots, d_{s} ; F \triangleleft E_{1} \rightarrow F_{1} ; F_{i} \triangleleft E_{i+1} \rightarrow F_{i+1} 1 \leq i \leq s-1 ; F_{s} \triangleleft \perp ;$ and $\Gamma \vdash_{M} c_{i}: E_{i}$ $1 \leq i \leq s$.
- If $l=0$, let $U_{k+1}=(a) \bar{c}$. We have $\Gamma \vdash_{M} U_{k+1}: \perp$.
- If $l \neq 0$, Let $U_{k+1}=\left((b) x_{l-1, a, b, \bar{d}}\right) \bar{d}$. The variable $x_{l-1, a, b, \bar{d}}$ is not used before. Indeed, if it is, we check that the $\lambda C$-term $(T) \underline{n} f$ is not solvable; but this is impossible because $f: \neg N \vdash_{M}(T) \underline{n} f: \perp$. Then $\Gamma^{\prime}=\Gamma, x_{l-1, a, b, \bar{d}}: F$ is a good context and $\Gamma^{\prime} \vdash_{M} U_{k+1}: \perp$.

Therefore there is a good context $\Gamma^{\prime}$ such that $\Gamma^{\prime} \vdash_{M} U_{k+1}: \perp$. Then, by Lemmas 6.1 and 6.2, $U_{k+1} \succ_{C} V_{k+1}$ where $V_{k+1}=(f) \tau$ or $V_{k+1}=(\nu) a b \bar{c}$ or $V_{k+1}=\left(x_{l, a, b, \bar{c}}\right) \bar{d} 0 \leq l \leq n-1$.
This construction always terminates. Indeed, if not, we check that the $\lambda C$-term $(T) \underline{n} f$ is not solvable; but this is impossible because $f: \neg N \vdash_{M}(T) \underline{n} f: \perp$.
Therefore there is $r \geq 0$ and a good context $\Gamma$ such that $\Gamma \vdash_{M} V_{r}=(f) \tau: \perp$, and $\Gamma \vdash_{M} \tau: N$. Therefore, by Lemma 6.3 , there is an $m \geq 0$ such that $\tau \simeq_{\beta} \underline{m}$.

Let $T$ be a $\lambda C$-term such that $\vdash_{M} T: N^{C} \rightarrow \neg \neg N$. By Theorem 6.5, there is an integer $s$ and a finite sequence of head reductions $\left\{U_{i} \succ_{C} V_{i}\right\}_{1 \leq i \leq r}$ such that:

1) $U_{1}=(T) \nu f$ and $V_{r}=(f) \tau_{s}$ where $\tau_{s} \simeq_{\beta} \underline{s}$;
2) $V_{i}=(\nu) a b \bar{c}$ or $V_{i}=\left(x_{l, a, b, \bar{c}}\right) \bar{d} 0 \leq l \leq n-1$;
3) If $V_{i}=(\nu) a b \bar{c}$, then $U_{i+1}=(a) \bar{c}$ if $n=0$ and $U_{i+1}=\left((b) x_{n-1, a, b, \bar{c}}\right) \bar{c}$ if $n \neq 0$;
4) If $V_{i}=\left(x_{l, a, b, \bar{c}}\right) \bar{d} 0 \leq l \leq n-1$, then $U_{i+1}=(a) \bar{d}$ if $l=0$ and $U_{i+1}=\left((b) x_{l-1, a, b, \bar{d}} \bar{d}\right.$ if $l \neq 0$.

Let $\theta_{n}$ be a classical integer of value $n$, and $x, g$ two distinct variables. By Theorem 5.6 we have :
If $n=0$, then for every stack constant $p$, we have : $\left(\theta_{n}\right) x g p \triangleright_{C}(x) p$.
If $n \neq 0$, then there is $m \geq 1$, and a mapping $I:\{0, \ldots, m\} \rightarrow N$, such that for all distinct stack constants $p_{0}, p_{1}, \ldots, p_{m}$, we have :
$\left(\theta_{n}\right) x g p_{0} \triangleright_{C}(g) t_{1} p_{r_{0}}$;
$\left(t_{i}\right) p_{i} \triangleright_{C}(g) t_{i+1} p_{r_{i}} 1 \leq i \leq m-1 ;$
$\left(t_{m}\right) p_{m} \triangleright_{C}(x) p_{r_{m}}$
where $I(0)=n, I\left(r_{m}\right)=0$, and $I(i+1)=I\left(r_{i}\right)-10 \leq i \leq m-1$.

Lemma 6.4 If $n=0$, then $(T) \theta_{n} f \succ_{C}(f) \tau\left[\theta_{n} / \nu\right]$.
Proof We prove by induction that for every $1 \leq i \leq r$, we have $(T) \theta_{n} f \succ_{C} V_{i}\left[\theta_{n} / \nu\right]$.
For $i=1,(T) \theta_{n} f=\{(T) \nu f\}\left[\theta_{n} / \nu\right]=U_{1}\left[\theta_{n} / \nu\right] \succ_{C} V_{1}\left[\theta_{n} / \nu\right]$.
Assume it is true for $i$, and prove it for $i+1$.
$(T) \theta_{n} f \succ_{C} V_{i}\left[\theta_{n} / \nu\right]=\{(\nu) a b \bar{c}\}\left[\theta_{n} / \nu\right]=\left\{\left(\theta_{n}\right) a b \bar{c}\right\}\left[\theta_{n} / \nu\right]=\left\{\left(\theta_{n}\right) x g p\right\}[a / x, b / g, \bar{c} / p]\left[\theta_{n} / \nu\right]$. Since $\left(\theta_{n}\right) x g p \succ_{C}$ $(x) p$, then $(T) \theta_{n} f \succ_{C}\{(a) \bar{c}\}\left[\theta_{n} / \nu\right]=U_{i+1}\left[\theta_{n} / \nu\right] \succ_{C} V_{i+1}\left[\theta_{n} / \nu\right]$.
So, for $i=r$, we have $(T) \theta_{n} f \succ_{C} V_{r}\left[\theta_{n} / \nu\right]=\{(f) \tau\}\left[\theta_{n} / \nu\right]=(f) \tau\left[\theta_{n} / \nu\right]$.

We assume now that $n \geq 1$.

A $k-\lambda C$-term is a $\lambda C$-term of the forme $V_{k}\left[\tau_{1} / y_{1}\right] \ldots\left[\tau_{p} / y_{p}\right]\left[\theta_{n} / \nu\right]$ such that:

- $F v\left(V_{k}\right) \subseteq\left\{\nu, f, y_{1}, \ldots, y_{p}\right\}$
- for every $1 \leq i \leq p, y_{i}=x_{n_{i}, a_{i}, b_{i}, \bar{c}_{i}}$ and $\tau_{i}=t_{m_{i}}\left[a_{i} / x, b_{i} / g, \overline{d_{0}} / p_{0}, \ldots, \overline{d_{m_{i}-1}} / p_{m_{i}-1}\right]$ where $I\left(m_{i}\right)=n_{i}$
- for every $0 \leq k \leq m_{i}-1$, there is $1 \leq l \leq r$ such that $U_{l}=\left(a_{i}\right) \overline{d_{k}}$ if $I(k)=0$ and $U_{r}=$
$\left(b_{i}\right) x_{I(k)-1, a_{i}, b_{i}, \overline{d_{k}}} \overline{d_{k}}$ if $I(k)>0$.
To simplify, a $k-\lambda C$-term is denoted by $V_{k}[]$.
Lemma 6.5 Let $1 \leq i \leq r-1$ and $V_{i}[]$ an $i-\lambda C$-term. If $(T) \theta_{n} f \succ_{C} V_{i}[]$, then there is $1 \leq j \leq r$ and a $j-\lambda C$-term $V_{j}[]$ such that $V_{j}[] \succ_{C} V_{j}[]$ and either $V_{i}[] \neq V_{j}[]$ or $i<j$

Proof There are only two possibilities. 1) $\left.V_{i}=(\nu) a b \bar{c} ; 2\right) V_{i}=\left(x_{\alpha, a, b, \bar{c}} \bar{d}\right.$.
We now examine each of this cases.

1) If $V_{i}=(\nu) a b \bar{c}$, then $V_{i}[]=\left\{\left(\theta_{n}\right) a b \bar{c}\right\}[]=\left\{\left(\theta_{n}\right) x g p_{0}\right\}\left[a / x, b / g, \bar{c} / p_{0}\right][]$. Since $\left(\theta_{n}\right) x g p_{0} \triangleright_{C}(g) t_{1} p_{r_{0}}=$ $(g) t_{1} p_{0}$, then $V_{i}[] \succ_{C}\left\{(b) t_{1}\left[a / x, b / g, \bar{c} / p_{0}\right] \bar{c}\right\}[]=$
$\left\{(b) x_{n-1, a, b, \bar{c}} \bar{c}\right\}\left[t_{1}\left[a / x, b / g, \bar{c} / p_{0} / x_{n-1, a, b, \bar{c}][]}=U_{i+1}[] \succ_{c} V_{i+1}[]\right.\right.$. Let $j=i+1$. We have $i<j$ and $I(1)=I\left(r_{0}\right)-1=I(0)-1=n-1$.
2) If $V_{i}=\left(x_{\alpha, a, b, \bar{c}} \bar{d}\right.$, then $V_{i}[]=\left\{\left(t_{\beta}\left[a / x, b / g, \overline{d_{0}} / p_{0}, \ldots, \overline{d_{\beta-1}} / p_{\beta-1}\right]\right) \bar{d}\right\}[]$ where $I(\beta)=\alpha$.

If $I(\beta)=\alpha \neq 0$, then $U_{i+1}=(b) x_{\alpha-1, a, b, \bar{d}} \bar{d}=(b) x_{I(\beta)-1, a, b, \bar{d}} \bar{d}$, and if $I(\beta)=\alpha \neq 0$, then $U_{i+1}=(a) \bar{d}$.
We consider the following two cases.

$$
\begin{aligned}
& \text { - If } \beta \leq m \text {, then }\left(t_{\beta}\right) p_{\beta} \triangleright_{C}(g) t_{\beta+1} p_{r_{\beta}} \text {, so that } \\
& V_{i}[] \succ_{C}\left\{(g) t_{\beta+1} p_{r_{\beta}}\right\}\left[a / x, b / g, \overline{d_{0}} / p_{0}, \ldots, \overline{d_{\beta-1}} / p_{\beta-1}, \bar{d} / p_{\beta}\right][]= \\
& \left\{(b) t_{\beta+1} \overline{d_{r_{\beta}}}\right\}\left[a / x, b / g, \overline{d_{0}} / p_{0}, \ldots, \overline{d_{\beta-1}} / p_{\beta-1}, \bar{d} / p_{\beta}\right][] .
\end{aligned}
$$

Since $\beta \neq m$, then $I\left(r_{\beta}\right) \neq 0$. By the hypothesis there is $1 \leq j \leq r$ such that $U_{j}=(b) x_{I\left(r_{\beta}\right)-1, a, b, \overline{d_{\beta}}} \overline{d_{r_{\beta}}}$. Therefore
$V_{i}[] \succ_{C} U_{j}\left[t_{\beta+1}\left[a / x, b / g, \overline{d_{0}} / p_{0}, \ldots, \overline{d_{\beta-1}} / p_{\beta-1}, \bar{d} / p_{\beta}\right] / x_{I\left(r_{\beta}\right)-1, a, b, \overline{d_{r_{\beta}}}}\right][]=U_{j}[] \succ_{C} V_{j}[]$.
If $V_{i}[]=V_{j}[]$, then the head $C$-reduction $\left(t_{\beta}\right) p_{\beta} \triangleright_{C}(g) t_{\beta+1} p_{r_{\beta}}$ must be an identity, in other words $\left(t_{\beta}\right) p_{\beta}=(g) t_{\beta+1} p_{r_{\beta}}$ and therefore $\beta=r_{\beta}$. And so $j=i+1>i$.

- If $\beta=m$, then $\left(t_{\beta}\right) p_{\beta}=\left(t_{m}\right) p_{m} \triangleright_{C}(x) p_{r_{m}}$, so that
$\left.V_{i}[] \succ_{C}\left\{(x) p_{r_{m}}\right\}\left[a / x, b / g, \overline{d_{0}} / p_{0}, \ldots, \overline{d_{m-1}} / p_{m-1}\right][]=(a) t_{r_{m}}\right\}[]$.
Since $I\left(r_{m}\right)=0$, then by the hypothesis there is $1 \leq j \leq r$ such that $U_{j}=(a) t_{r_{m}}$. Therefore $V_{i}[] \succ_{C} U_{j}[] \succ_{C} V_{j}[]$.
If $V_{i}[]=V_{j}[]$, then the head $C$-reduction $\left(t_{m}\right) p_{m} \triangleright_{C}(x) p_{r_{m}}$ must be an identity, in other words $\left(t_{m}\right) p_{m} \triangleright_{C}(x) p_{r_{m}}$ and therefore $m=r_{m}$. And so $j=i+1>i$.

Corollary 6.2 There is a substitution $\sigma$ such that $(T) \theta_{n} f \succ_{C}(f) \sigma(\tau)$.
Proof $(T) \theta_{n} f=\{(T) \nu f\}\left[\theta_{n} / \nu\right]=U_{1}\left[\theta_{n} / \nu\right] \succ_{C} V_{1}\left[\theta_{n} / \nu\right]$. By Lemma 6.5 we obtaine a sequence $V_{i_{1}}[]$, $V_{i_{2}}[], \ldots, V_{i_{k}}[], \ldots$ such that $(T) \theta_{n} f \succ_{C} V_{i_{s}}[]$ and if $V_{i_{s}}[] \neq V_{i_{s+1}}[]$ then $i_{s} \leq i_{s+1}$. This sequence is necessarily finite, indeed $f: \neg N \vdash_{M}(T) \theta_{n} f: \perp$. If $V_{i_{s}}[]=V_{i_{s+1}}[]=\ldots=V_{i_{s+\alpha}}[]$, then $i_{s}<i_{s+1}<\ldots<i_{s+\alpha}$ and $\alpha \leq r$. Therefore there is $s$ such that $V_{i_{s}}=(f) \tau$, then $(T) \theta_{n} f \succ_{C} V_{i_{s}}[]=\{(f) \tau\}[]=(f) \tau[]$.

Then, by Lemma 6.4 and Corollary $6.2, T$ is a storage operator for classical integers.

### 6.3 General Theorem

In this subsection, we give (without proof) a generalization of Theorem 6.3.

Let $T$ be a closed $\lambda C$-term, and $D, E$ two closed types of $A F 2$ type system. We say that $T$ is a storage operator for the pair of types $(D, E)$ iff for every $\lambda$-term $\vdash_{A F 2} t: D$, there is $\lambda$-term $\tau_{t}^{\prime}$ and $\lambda C$-term $\tau_{t}$, such that $\tau_{t}^{\prime} \simeq_{\beta} \tau_{t}, \vdash_{A F 2} \tau_{t}^{\prime}: E$, and for every $\vdash_{C 2} \theta_{t}: D$, there is a substitution $\sigma$, such that $(T) \theta_{t} f \succ_{C}(f) \sigma\left(\tau_{t}\right)$.

Theorem 6.6 Let $D, E$ two $\forall$-positive closed types of $A F 2$ type system, such that $E$ does not contain $\perp$. If $\vdash_{M 2} T: D^{C} \rightarrow \neg \neg E$, then $T$ is a storage operator for the pair $(D, E)$.

## 7 Operational characterization of $\lambda C$-terms of type $\forall X_{C}\{\perp \rightarrow$ $\left.X_{C}\right\}$ and $\forall X_{C}\left\{\neg \neg X_{C} \rightarrow X_{C}\right\}$

Let $\mathbf{A}$ (for Abort) the $\lambda C$-term $\lambda x(C) \lambda y x$.

## Behaviour of A :

$$
(\mathbf{A}) t t_{1} \ldots t_{n} \succ_{C}((C) \lambda y t) t_{1} \ldots t_{n} \succ_{C}(\lambda y t) \lambda x(x) t_{1} \ldots t_{n} \succ_{C} t
$$

## Typing of A :

$$
x: \perp \vdash_{M 2} \lambda y x: \neg \neg X_{C} \Longrightarrow x: \perp \vdash_{M 2}(C) \lambda y x: X_{C} \Longrightarrow \vdash_{M 2} \mathbf{A}: \forall X_{C}\left\{\perp \rightarrow X_{C}\right\}
$$

Theorem 7.1 If $\vdash_{M 2} T: \forall X_{C}\left\{\perp \rightarrow X_{C}\right\}$, then for every integer $n$, and for all $\lambda C-$ terms $t, t_{1}, \ldots, t_{n}$, $(T) t t_{1} \ldots t_{n} \succ_{C} t$.

Proof. Let $O_{1}, \ldots, O_{n}$ be new predicate symbols of arity 0 different from $\perp$. Let $A=O_{1}, \ldots, O_{n} \rightarrow \perp$. If $\vdash_{M 2} T: \forall X_{C}\left\{\perp \rightarrow X_{C}\right\}$, then $\vdash_{M 2} T: \perp \rightarrow A$, and $\Gamma=x: \perp, x_{1}: O_{1}, \ldots, x_{n}: O_{n} \vdash_{M 2}(T) x x_{1} \ldots x_{n}: \perp$. Therefore $(T) x x_{1} \ldots x_{n} \succ_{C}(f) u_{1} \ldots u_{r}$ and $\Gamma \vdash_{M 2}(f) u_{1} \ldots u_{r}: \perp$.

- If $f=x_{i} 1 \leq i \leq n$, then $r=0$, and $O_{i}=\perp$. A contradiction.
- If $f=x$, then $r=0$, and $(T) x x_{1} \ldots x_{n} \succ_{C} x$, therefore, for every integer $n$, and for all $\lambda C$-terms $t, t_{1}, \ldots, t_{n},(T) t t_{1} \ldots t_{n} \succ_{C} t$.

The constant $C$ satisfies the following relations :
$(C) t t_{1} \ldots t_{n} \succ_{C}(t) U$ and
$(U) y \succ_{C}(y) t_{1} \ldots t_{n}$ where $y$ is a new variable.

Let $C^{\prime}=\lambda x(C) \lambda d(x) \lambda y(x) \lambda z(d) y$.
$x: \neg \neg X_{C}, y: X_{C}, z: X_{C}, d: \neg X_{C} \vdash_{M 2}(d) y: \perp \Longrightarrow$
$x: \neg \neg X_{C}, y: X_{C}, d: \neg X_{C} \vdash_{M 2}(x) \lambda z(d) y: \perp \Longrightarrow$
$x: \neg \neg X_{C}, d: \neg X_{C} \vdash_{M 2}(x) \lambda y(x) \lambda z(d) y: \perp \Longrightarrow$
$x: \neg \neg X_{C} \vdash_{M 2}(C) \lambda d(x) \lambda y(x) \lambda z(d) y: X_{C} \Longrightarrow$
$\vdash_{M 2} C^{\prime}: \forall X_{C}\left\{\neg \neg X_{C} \rightarrow X_{C}\right\}$.

The $\lambda C$-term $C^{\prime}$ satisfies the following relations :
$\left(C^{\prime}\right) t t_{1} \ldots t_{n} \succ_{C}(t) U$,
$(U) y \succ_{C}(t) V$, and
$(V) z \succ_{C}(y) t_{1} \ldots t_{n}$ where $y, z$ are new variables.

In general, we have the following characterization.
Theorem 7.2 If $\vdash_{M 2} T: \forall X_{C}\left\{\neg \neg X_{C} \rightarrow X_{C}\right\}$, then there is an integer $m$, such that, for every integer $n$, and for all $\lambda C$-terms $t, t_{1}, \ldots, t_{n}$ :

$$
\begin{aligned}
& (T) t t_{1} \ldots t_{n} \succ_{C}(t) V_{1}, \\
& \left(V_{i}\right) y_{i} \succ_{C}(t) V_{i+1} 1 \leq i \leq m-1, \text { and } \\
& \left(V_{m}\right) y_{m} \succ_{C}\left(y_{i}\right) t_{1} \ldots t_{n} \text { where } y_{1}, \ldots, y_{m} \text { are new variables. }
\end{aligned}
$$

Proof Let $O$ be a new predicate symbol of arity 0 different from $\perp$. We define as in section 3 , the system $M 2_{O}$. And we check easily that this system has the same results as Lemmas 5.1, 5.2, 5.3 and 5.4.
Let $p$ be a stack constant and $A=O \rightarrow \perp$. If $\vdash_{M 2} T: \forall X_{C}\left\{\neg \neg X_{C} \rightarrow X_{C}\right\}$, then $\vdash_{M 2_{O}} T: \neg \neg A \rightarrow A$, and $\Gamma=x: \neg \neg A, p: O \vdash_{M 2_{O}}(T) x p: \perp$. Therefore $(T) x p \succ_{C}(f) u_{1} \ldots u_{r}$, and $\Gamma \vdash_{M 2_{O}}(f) u_{1} \ldots u_{r}: \perp$.

- If $f=p$, then $r=0$, and $O=\perp$. A contradiction.
- If $f=x$, then, $(T) x p \triangleright_{C}(x) U_{1}$, and $\Gamma \vdash_{M 2_{O}} U_{1}: \neg A$.

We prove (by induction) that if $\Gamma, y_{1}: A, \ldots, y_{i-1}: A \vdash_{M_{2}} U_{i}: \neg A$, then $\left[\left(U_{i}\right) y_{i} \triangleright_{C}(x) U_{i+1}\right.$, and $\left.\Gamma, y_{1}: A, \ldots, y_{i}: A \vdash_{M 2_{O}} U_{i+1}: \neg A\right]$ or $\left[\left(U_{i}\right) y_{i} \triangleright_{C}\left(y_{j}\right) p 1 \leq j \leq i\right]$.
The sequence $\left(U_{i}\right)_{i \geq 0}$ is not infinite. Indeed, if it is, the $\lambda C$-term $((T) \lambda x(x) z) p$ is not $C$-solvable; but this is impossible, because $z: A, p: O \vdash_{M 2}((T) \lambda x(x) z) p: \perp$.
To obtain the Theorem, we replace the constant $p$ by the sequence $\bar{t}=t_{1}, \ldots, t_{n}$ and we put $V_{i}=U_{i}[\bar{t} / p]$.

## 8 The $\lambda \mu$-calculus

In this section, we give a similar version to Theorem 6.3 in the M. Parigot's $\lambda \mu$-calculus.

### 8.1 Pure and typed $\lambda \mu$-calculus

$\lambda \mu$-calculus has two distinct alphabets of variables : the set of $\lambda$-variables $x, y, z, \ldots$, and the set of $\mu$-variables $\alpha, \beta, \gamma, \ldots$. Terms are defined by the following grammar :

$$
t:=x|\lambda x t|(t) t \mid \mu \alpha[\beta] t
$$

Terms of $\lambda \mu$-calculus are called $\lambda \mu$-terms.

The reduction relation of $\lambda \mu$-calculus is induced by fives different notions of reduction :

## The computation rules

$$
\left(C_{1}\right)(\lambda x u) v \rightarrow u[v / x]
$$

$\left(C_{2}\right)(\mu \alpha u) v \rightarrow \mu \alpha u[v / * \alpha]$
where $u\left[\bar{v} / *^{*} \alpha\right]$ is obtained from $u$ by replacing inductively each subterm of the form $[\alpha] w$ by $[\alpha](w) \bar{v}$.

## The simplification rules

$\left(S_{1}\right)[\alpha] \mu \beta u \rightarrow u[\alpha / \beta]$
$\left(S_{2}\right) \mu \alpha[\alpha] u \rightarrow u$, if $\alpha$ has no free occurence in $u$
$\left(S_{3}\right) \mu \alpha u \rightarrow \lambda x \mu \alpha u\left[x /{ }^{*} \alpha\right]$, if $u$ contains a subterm of the form $[\alpha] \lambda y w$.
Theorem 8.1 (see [18]) In $\lambda \mu$-calculus, reduction is confluent.
The notation $u \succ_{\mu} v$ means that $v$ is obtained from $u$ by some head reductions.
The head equivalence relation is denoted by : $u \sim_{\mu} v$ if and only if there is a $w$, such that $u \succ_{\mu} w$ and $v \succ_{\mu} w$.

Proofs are written in a natural deduction system with several conclusions, presented with sequents. One deals with sequents such that:

- Formulas to the left of $\vdash$ are labelled with $\lambda$-variables;
- Formulas to the right of $\vdash$ are labelled with $\mu$-variables, except one formula which is labelled with a $\lambda \mu$-term ;
- Distinct formulas never have the same label.

The right and the left parts of the sequents are considered as sets and therefore contraction of formulas is done implicitly.

Let $t$ be a $\lambda \mu$-term, $A$ a type, $\Gamma=x_{1}: A_{1}, \ldots, x_{n}: A_{n}$, and $\triangle=\alpha_{1}: B_{1}, \ldots, \alpha_{m}: B_{m}$. We define by means of the following rules the notion " $t$ is of type $A$ in $\Gamma$ and $\triangle$ ". This notion is denoted by $\Gamma \vdash_{F D 2} t: A, \triangle$.

The rules (1), $\ldots,(8)$ of $A F 2$ type system.
(9) If $\Gamma \vdash_{F D 2} t: A, \beta: B, \triangle$, then $\Gamma \vdash_{F D 2} \mu \beta[\alpha] t: B, \alpha: A, \triangle$.

Weakenings are included in the rules (2) and (9).

As in typed $\lambda$-calculus on can define $\neg A$ as $\rightarrow \perp$ and use the previous rules with the following special interpretation of naming for $\perp$ : for $\alpha$ a $\mu$-variable, $\alpha: \perp$ is not mentioned.

Example Let $\mathbf{C}=\lambda x \mu \alpha[\phi](x) \lambda y \mu \beta[\alpha] y$.
$x: \neg \neg X, y: X \vdash_{F D 2} y: X \Longrightarrow$
$x: \neg \neg X, y: X \vdash_{F D 2} \mu \beta[\alpha] y: \perp, \alpha: X \Longrightarrow$
$x: \neg \neg X \vdash_{F D 2} \lambda y \mu \beta[\alpha] y: \neg X, \alpha: X \Longrightarrow$
$x: \neg \neg X \vdash_{F D 2} \mu \alpha[\phi](x) \lambda y \beta[\alpha] y: X \Longrightarrow$
$\vdash_{F D 2} \mathbf{C}: \forall X\{\neg \neg X \rightarrow X\}$.
Theorem 8.2 (see [18] and [20]) The FD2 type system has the following properties :

1) Type is preserved during reduction.
2) Typable $\lambda \mu$-terms are strongly normalizable.

### 8.2 Classical integers

Let $n$ be an integer. A classical integer of value $n$ is a closed $\lambda \mu$-term $\theta_{n}$ such that $\vdash_{F D 2} \theta_{n}: N\left[s^{n}(0)\right]$.

Let $x$ and $f$ fixed variables, and $N_{x, f}$ be the set of $\lambda \mu$-terms defined by the following grammar :

$$
u:=x|(f) u| \mu \alpha[\beta] x \mid \mu \alpha[\beta] u
$$

We define, for each $u \in N_{x, f}$ the set $\operatorname{rep}(u)$, which is intuitively the set of integers potentially repesented by $u$ :

$$
\begin{aligned}
& -\operatorname{rep}(x)=\{0\} \\
& -\operatorname{rep}((f) u)=\{n+1 \text { if } n \in \operatorname{rep}(u)\} \\
& -\operatorname{rep}(\mu \alpha[\beta] u)=\bigcap \operatorname{rep}(v) \text { for each subterm }[\alpha] v \text { of }[\beta] u
\end{aligned}
$$

The following Theorem characterizes the normal forms of classical integers.
Theorem 8.3 (see [19]) The normal classical integers of value $n$ are exactly the $\lambda \mu$-terms of the form $\lambda x \lambda f u$ with $u \in N_{x, f}$ without free $\mu$-variable and such that rep $(u)=\{n\}$.

### 8.3 General Theorem

In order to define, in this framework, the equivalent of system $M 2$, the demonstration of $\neg \neg A \rightarrow A$ should not be allowed for all formulas A, and thus we should prevent the occurrence of some formulas on the right. Thus the following definition.

Let $t$ be a $\lambda \mu$-term, $A$ a type, $\Gamma=x_{1}: A_{1}, \ldots, x_{n}: A_{n}$, and $\triangle=\alpha_{1}: B_{1}, \ldots, \alpha_{m}: B_{m}$ where $B_{i} 1 \leq i \leq m$ is a classical type. We define by means of the following rules the notion " $t$ is of type $A$ in $\Gamma$ and $\triangle$ ", this notion is denoted by $\Gamma \vdash_{M 2} t: A, \triangle$.

The rules of $D L 2$ type system.
(6') If $\Gamma \vdash t: A, \triangle$, and $X_{C}$ has no free occurence in $\Gamma$, then $\Gamma \vdash t: \forall X_{C} A, \triangle$.
( $7^{\prime}$ ) If $\Gamma \vdash t: \forall X_{C} A, \triangle$, and $G$ is a classical type, then $\Gamma \vdash t: A\left[G / X_{C}\right], \triangle$.
Let $T$ be a closed $\lambda \mu$-term. We say that $T$ is a storage operator for classical integers if and only if for every $n \geq 0$, there is $\lambda \mu$-term $\tau_{n} \simeq_{\beta} \underline{n}$, such that for every classical integers $\theta_{n}$ of value $n$, there is a substitution $\sigma$, such that $(T) \theta_{n} f \sim_{\mu} \mu \alpha[\alpha](f) \sigma\left(\tau_{n}\right)$.

Theorem 8.4 If $\vdash_{M 2} T: \forall x\left\{N^{C}[x] \rightarrow \neg \neg N[x]\right\}$, then $T$ is a storage operator for classical integers.
