#### Abstract

Let $\boldsymbol{\Gamma}$ be a Borel class, or a Wadge class of Borel sets, and $2 \leq d \leq \omega$ a cardinal. We study the Borel subsets of $\mathbb{R}^{d}$ that can be made $\boldsymbol{\Gamma}$ by refining the Polish topology on the real line. These sets are called potentially $\boldsymbol{\Gamma}$. We give a test to recognize potentially $\boldsymbol{\Gamma}$ sets.

[^0]
## 1 Introduction

The reader should see $[\mathrm{K}]$ for the descriptive set theoretic notation used in this paper. The standard way of comparing the topological complexity of subsets of 0 -dimensional Polish spaces is the Wadge reducibility quasi-order $\leq_{W}$. Recall that if $X$ (resp., $Y$ ) is a 0 -dimensional Polish space and $A$ (resp., $B$ ) a subset of $X$ (resp., $Y$ ), then

$$
(X, A) \leq_{W}(Y, B) \Leftrightarrow \exists f: X \rightarrow Y \text { continuous such that } A=f^{-1}(B) \text {. }
$$

This is a very natural definition since the continuous functions are the morphisms for the topological structure. So the scheme is as follows:

The " 0 -dimensional" condition is here to ensure the existence of enough continuous functions (the only continuous functions from $\mathbb{R}$ into $\omega^{\omega}$ are the constant functions, for example). In the sequel, $\boldsymbol{\Gamma}$ will be a class of Borel subsets of 0 -dimensional Polish spaces. We denote by $\check{\Gamma}:=\{\neg A \mid A \in \Gamma\}$ the class of complements of elements of $\boldsymbol{\Gamma}$. We say that $\boldsymbol{\Gamma}$ is sel $f$-dual if $\boldsymbol{\Gamma}=\check{\Gamma}$. We also set $\Delta(\boldsymbol{\Gamma}):=\boldsymbol{\Gamma} \cap \boldsymbol{\Gamma}$. Following 4.1 in [Lo-SR2], we give the following definition:

Definition 1.1 We say that $\boldsymbol{\Gamma}$ is a Wadge class of Borel sets if there is a Borel subset $A_{0}$ of $\omega^{\omega}$ such that for each 0 -dimensional Polish space $X$, and for each $A \subseteq X, A$ is in $\boldsymbol{\Gamma}$ if and only if $(X, A) \leq_{W}\left(\omega^{\omega}, A_{0}\right)$. We say that $A_{0}$ is $\boldsymbol{\Gamma}$-complete.

The Wadge hierarchy defined by $\leq_{W}$, i.e., the inclusion of Wadge classes, is the finest hierarchy of topological complexity in descriptive set theory. The goal of this paper is to study the descriptive complexity of the Borel subsets of products of Polish spaces. More specifically, we are looking for a dichotomy of the following form, quite standard in descriptive set theory: either a set is simple, or it is more complicated than a well-known complicated set. Of course, we have to specify the notions of complexity and comparison we are considering. The two things are actually very much related. The usual notion of comparison between analytic equivalence relations is the Borel reducibility quasiorder $\leq_{B}$. Recall that if $X$ (resp., $Y$ ) is a Polish space and $E$ (resp., $F$ ) an equivalence relation on $X$ (resp., $Y$ ), then $(X, E) \leq_{B}(Y, F) \Leftrightarrow \exists f: X \rightarrow Y$ Borel such that $E=(f \times f)^{-1}(F)$. Note that this makes sense even if $E$ and $F$ are not equivalence relations. The notion of complexity we are considering is a natural invariant for $\leq_{B}$ in dimension 2. Its definition generalizes Definition 3.3 in [Lo3] to any dimension $d$ making sense in the context of descriptive set theory, and also to any class $\Gamma$. So in the sequel $d$ will be a cardinal, and we will have $2 \leq d \leq \omega$ since $2^{\omega_{1}}$ is not metrizable.

Definition 1.2 Let $\left(X_{i}\right)_{i \in d}$ be a sequence of Polish spaces, and $B$ a Borel subset of $\Pi_{i \in d} X_{i}$. We say that $B$ is potentially in $\boldsymbol{\Gamma}($ denoted $B \in \operatorname{pot}(\boldsymbol{\Gamma}))$ if, for each $i \in d$, there is a finer 0 -dimensional Polish topology $\tau_{i}$ on $X_{i}$ such that $B \in \boldsymbol{\Gamma}\left(\Pi_{i \in d}\left(X_{i}, \tau_{i}\right)\right)$.

One should emphasize the fact that the point of this definition is to consider product topologies. Indeed, if $B$ is a Borel subset of a Polish space $X$, then there is a finer Polish topology $\tau$ on $X$ such that $B$ is a clopen subset of $(X, \tau)$ (see 13.1 in $[\mathrm{K}]$ ). This is not the case in products: if for example $\Gamma$ is a non self-dual Wadge class of Borel sets, then there are sets in $\boldsymbol{\Gamma}\left(\left(\omega^{\omega}\right)^{2}\right)$ that are not pot $(\check{\boldsymbol{\Gamma}})$ (see Theorem 3.3 in [L1]). For example, the diagonal of $\omega^{\omega}$ is not potentially open.

Note also that since we work up to finer Polish topologies, the " 0 -dimensional" condition is not a restriction. Indeed, if $X$ is a Polish space, then there is a finer 0-dimensional Polish topology on $X$ (see 13.5 in $[\mathrm{K}]$ ). The notion of potential complexity is an invariant for $\leq_{B}$ in the sense that if $(X, E) \leq_{B}(Y, F)$ and $F$ is $\operatorname{pot}(\boldsymbol{\Gamma})$, then $E$ is $\operatorname{pot}(\boldsymbol{\Gamma})$ too.

The good notion of comparison is not the rectangular version of $\leq_{B}$. Instead of considering a Borel set $E$ and its complement, we have to consider pairs of disjoint analytic sets. This leads to the following notation. Let $\left(X_{i}\right)_{i \in d},\left(Y_{i}\right)_{i \in d}$ be sequences of Polish spaces, and $A_{0}, A_{1}$ (resp., $B_{0}, B_{1}$ ) disjoint analytic subsets of $\Pi_{i \in d} X_{i}$ (resp., $\Pi_{i \in d} Y_{i}$ ). Then
$\left(\left(X_{i}\right)_{i \in d}, A_{0}, A_{1}\right) \leq\left(\left(Y_{i}\right)_{i \in d}, B_{0}, B_{1}\right) \Leftrightarrow \forall i \in d \exists f_{i}: X_{i} \rightarrow Y_{i}$ continuous such that

$$
\forall \varepsilon \in 2 \quad A_{\varepsilon} \subseteq\left(\Pi_{i \in d} f_{i}\right)^{-1}\left(B_{\varepsilon}\right)
$$

So the good scheme of comparison is as follows:

The notion of potential complexity was studied in [L1]-[L7] for $d=2$ and the non self-dual Borel classes. The main question of this long study was asked by A. Louveau to the author in 1990. A. Louveau wanted to know whether Hurewicz's characterization of $G_{\delta}$ sets could be extended to pot $(\boldsymbol{\Gamma})$ sets when $\boldsymbol{\Gamma}$ is a Wadge class of Borel sets. The main result of this paper gives a complete and positive answer to this question:

Theorem 1.3 Let $\boldsymbol{\Gamma}$ be a Wadge class of Borel sets, or the class $\Delta_{\xi}^{0}$ for some $1 \leq \xi<\omega_{1}$. Then there are Borel subsets $\mathbb{S}^{0}, \mathbb{S}^{1}$ of $\left(d^{\omega}\right)^{d}$ such that for any sequence of Polish spaces $\left(X_{i}\right)_{i \in d}$, and for any disjoint analytic subsets $A_{0}, A_{1}$ of $\Pi_{i \in d} X_{i}$, exactly one of the following holds:
(a) The set $A_{0}$ is separable from $A_{1}$ by a $\operatorname{pot}(\boldsymbol{\Gamma})$ set.
(b) The inequality $\left(\left(d^{\omega}\right)_{i \in d}, \mathbb{S}^{0}, \mathbb{S}^{1}\right) \leq\left(\left(X_{i}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds.

It is natural to try to prove Theorem 1.3 since it is a result of continuous reduction, which appears in the very definition of a Wadge class. So it goes beyond a simple generalization. The work in this paper is the continuation of the article [L7], that was announced in [L6]. We generalize the main results of [L7]. The generalization goes in different directions:

- It works in any dimension $d$.
- It works for the self-dual Borel classes $\Delta_{\xi}^{0}$.
- It works for any Wadge class of Borel sets, which is the hardest part.

We generalize, and also in fact give a new proof of the dimension 1 version of Theorem 1.3 obtained by A. Louveau and J. Saint Raymond (see [Lo-SR1]), which itself was a generalization of Hurewicz's result. The new proof is without games, and gives a new approach to the study of Wadge classes. Note that A. Louveau and J. Saint Raymond proved that if $\Gamma$ is not self-dual, then the reduction map in (b) can be one-to-one (see Theorem 5.2 in [Lo-SR2]). We will see that there is no injectivity in general in Theorem 1.3. However, G. Debs proved that we can have the $f_{i}$ 's one-to-one when $d=2, \boldsymbol{\Gamma} \in\left\{\boldsymbol{\Pi}_{\xi}^{0}, \boldsymbol{\Sigma}_{\xi}^{0}\right\}$ and $\xi \geq 3$. Some injectivity details will be given in the last section.

We introduce the following notation and definition in order to specify Theorem 1.3. One can prove that a reduction on the whole product is not possible, for acyclicity reasons (see [L5]-[L7]). We now specify this. We emphasize the fact that in this paper, there will be a constant identification between $\left(d^{d}\right)^{l}$ and $\left(d^{l}\right)^{d}$, for $l \leq \omega$, to avoid as much as possible heavy notation.

Notation. If $\mathcal{X}$ is a set, then $\vec{x}:=\left(x_{i}\right)_{i \in d}$ is an arbitrary element of $\mathcal{X}^{d}$. If $\mathcal{T} \subseteq \mathcal{X}^{d}$, then we denote by $G^{\mathcal{T}}$ the graph with set of vertices $\mathcal{T}$, and with set of edges $\left\{\{\vec{x}, \vec{y}\} \subseteq \mathcal{T} \mid \vec{x} \neq \vec{y}\right.$ and $\left.\exists i \in d x_{i}=y_{i}\right\}$ (see [B] for the basic notions about graphs). So $\vec{x} \neq \vec{y} \in \mathcal{T}$ are $G^{\mathcal{T}}$-related if they have at least one coordinate in common.

Definition 1.4 (a) We say that $\mathcal{T}$ is one-sided if the following holds:

$$
\forall \vec{x} \neq \vec{y} \in \mathcal{T} \quad \forall i \neq j \in d \quad\left(x_{i} \neq y_{i} \vee x_{j} \neq y_{j}\right)
$$

This means that if $\vec{x} \neq \vec{y} \in \mathcal{T}$, then they have at most one coordinate in common.
(b) We say that $\mathcal{T}$ is almost acyclic iffor every $G^{\mathcal{T}}$-cycle $\left(\overrightarrow{x^{n}}\right)_{n \leq L}$ there are $i \in d$ and $k<m<n<L$ such that $x_{i}^{k}=x_{i}^{m}=x_{i}^{n}$. This means that every $G^{\mathcal{T}}$-cycle contains a "flat" subcycle, i.e., a subcycle in a single direction $i \in d$.
(c) We say that a tree $T$ on $d^{d}$ is a tree with suitable levels if the set $\mathcal{T}^{l}:=T \cap\left(d^{d}\right)^{l} \subseteq\left(d^{l}\right)^{d}$ is finite, one-sided and almost acyclic for each integer $l$.

We do not really need the finiteness of the levels, but it makes the proof of Theorem 1.3 much simpler. The following classical property will be crucial in the sequel:

Definition 1.5 We say that $\boldsymbol{\Gamma}$ has the separation property if for each $A, B \in \boldsymbol{\Gamma}\left(\omega^{\omega}\right)$ disjoint, there is $C \in \Delta(\boldsymbol{\Gamma})\left(\omega^{\omega}\right)$ separating $A$ from $B$.

The separation property has been studied in $[\mathrm{S}]$ and $[\mathrm{vW}]$, where the following is proved:
Theorem 1.6 (Steel-van Wesep) Let $\boldsymbol{\Gamma}$ be a non self-dual Wadge class of Borel sets. Then exactly one of the two classes $\boldsymbol{\Gamma}, \check{\Gamma}$ has the separation property.

We now specify Theorem 1.3.
Theorem 1.7 We can find a tree $T_{d}$ with suitable levels, together with, for each non self-dual Wadge class of Borel sets $\boldsymbol{\Gamma}$,
(1) Some set $\mathbb{S}_{\boldsymbol{\Gamma}}^{d} \in \boldsymbol{\Gamma}\left(\left\lceil T_{d}\right\rceil\right)$ not separable from $\left\lceil T_{d}\right\rceil \backslash \mathbb{S}_{\boldsymbol{\Gamma}}^{d}$ by a pot $(\check{\boldsymbol{\Gamma}})$ set.
(2) If moreover $\boldsymbol{\Gamma}$ does not have the separation property, and $\boldsymbol{\Gamma}=\boldsymbol{\Sigma}_{\xi}^{0}$ or $\Delta(\boldsymbol{\Gamma})$ is a Wadge class, some disjoint sets $\mathbb{S}_{\boldsymbol{\Gamma}}^{0}, \mathbb{S}_{\boldsymbol{\Gamma}}^{1} \in \boldsymbol{\Gamma}\left(\left\lceil T_{d}\right\rceil\right)$ not separable by a pot $(\Delta(\boldsymbol{\Gamma}))$ set.

Theorem 1.8 Let $T_{d}$ be a tree with suitable levels, $\Gamma$ a non self-dual Wadge class of Borel sets, $\left(X_{i}\right)_{i \in d}$ a sequence of Polish spaces, and $A_{0}, A_{1}$ disjoint analytic subsets of $\Pi_{i \in d} X_{i}$.
(1) Let $S \in \boldsymbol{\Gamma}\left(\left\lceil T_{d}\right\rceil\right)$ not separable from $\left\lceil T_{d}\right\rceil \backslash S$ by a $\operatorname{pot}(\check{\boldsymbol{\Gamma}})$ set. Then exactly one of the following holds:
(a) The set $A_{0}$ is separable from $A_{1}$ by a $\operatorname{pot}(\check{\boldsymbol{\Gamma}})$ set.
(b) The inequality $\left(\left(d^{\omega}\right)_{i \in d}, S,\left\lceil T_{d}\right\rceil \backslash S\right) \leq\left(\left(X_{i}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds.
(2) Assume moreover that $\boldsymbol{\Gamma}$ does not have the separation property, and that $\boldsymbol{\Gamma}=\boldsymbol{\Sigma}_{\xi}^{0}$ or $\Delta(\boldsymbol{\Gamma})$ is a Wadge class. Let $S^{0}, S^{1} \in \boldsymbol{\Gamma}\left(\left\lceil T_{d}\right\rceil\right)$ disjoint not separable by a $\operatorname{pot}(\Delta(\boldsymbol{\Gamma}))$ set. Then exactly one of the following holds:
(a) The set $A_{0}$ is separable from $A_{1}$ by a $\operatorname{pot}(\Delta(\boldsymbol{\Gamma}))$ set.
(b) The inequality $\left(\left(d^{\omega}\right)_{i \in d}, S^{0}, S^{1}\right) \leq\left(\left(X_{i}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds.

We now come back to the new approach to the study of Wadge classes mentioned earlier. There are a lot of dichotomy results in descriptive set theory about equivalence relations, quasi-orders or even arbitrary Borel or analytic sets. So it is natural to ask for common points to these dichotomies. B. Miller's recent work goes in this direction. He proved many known dichotomies without effective descriptive set theory, using variants of the Kechris-Solecki-Todorčević dichotomy about analytic graphs (see [K-S-T]). Here we want to point out another common point, of effective nature. In these dichotomies, the first possibility of the dichotomy is equivalent to the emptyness of some $\Sigma_{1}^{1}$ set. For example, in the Kechris-Solecki-Todorčevic dichotomy, the $\Sigma_{1}^{1}$ set is the complement of the union of the $\Delta_{1}^{1}$ subsets discrete with respect to the $\Sigma_{1}^{1}$ graph considered. We prove a strengthening of Theorem 1.8 in which such a $\Sigma_{1}^{1}$ set appears. We will state in Case (1), unformally. Before that, we need the following notation.

Notation. Let $X$ be a recursively presented Polish space. We denote by $\Delta_{X}$ the topology on $X$ generated by $\Delta_{1}^{1}(X)$. This topology is Polish (see (iii) $\Rightarrow$ (i) in the proof of Theorem 3.4 in [Lo3]). The topology $\tau_{1}$ on $\left(\omega^{\omega}\right)^{d}$ will be the product topology $\Delta_{\omega^{\omega}}^{d}$.

Theorem 1.9 Let $T_{d}$ be a tree with $\Delta_{1}^{1}$ suitable levels, $\Gamma$ a non self-dual Wadge class of Borel sets with a $\Delta_{1}^{1}$ code, $A_{0}, A_{1}$ disjoint $\Sigma_{1}^{1}$ subsets of $\left(\omega^{\omega}\right)^{d}$, and $S \in \boldsymbol{\Gamma}\left(\left\lceil T_{d}\right\rceil\right)$ not separable from $\left\lceil T_{d}\right\rceil \backslash S$ by a pot $(\check{\boldsymbol{\Gamma}})$ set. Then there is a $\Sigma_{1}^{1}$ subset $R$ of $\left(\omega^{\omega}\right)^{d}$ such that the following are equivalent:
(a) The set $A_{0}$ is not separable from $A_{1}$ by a $\operatorname{pot}(\check{\boldsymbol{\Gamma}})$ set.
(b) The set $A_{0}$ is not separable from $A_{1}$ by a $\Delta_{1}^{1} \cap \operatorname{pot}(\check{\boldsymbol{\Gamma}})$ set.
(c) The set $A_{0}$ is not separable from $A_{1}$ by a $\check{\Gamma}\left(\tau_{1}\right)$ set.
(d) $R \neq \emptyset$.
(e) The inequality $\left(\left(d^{\omega}\right)_{i \in d}, S,\left\lceil T_{d}\right\rceil \backslash S\right) \leq\left(\left(\omega^{\omega}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds.

This $\Sigma_{1}^{1}$ set $R$ is build with topologies based on $\tau_{1}$. The use of the $\Sigma_{1}^{1}$ set $R$ is the new approach to the study of Wadge classes.

We first prove Theorems 1.7 and 1.8 for the Borel classes, self-dual or not. Then we consider the case of the Wadge classes. In Section 2, we start proving Theorem 1.7. We construct a concrete example of a tree with suitable levels, and we give a general condition to get some complicated sets as in the statement of Theorem 1.7. We actually reduce the problem to a problem in dimension one. In Section 3, we prove Theorem 1.7 for the Borel classes. In Section 4, we prove Theorem 1.8 for the Borel classes, using some tools of effective descriptive set theory and the representation theorem of Borel sets proved in [D-SR]. In Section 5, we prove Theorem 1.7, using the description of Wadge classes in [Lo-SR2]. In Section 6, we prove Theorems 1.3, 1.8 and 1.9. Finally, in Section 7, we give some injectivity complements.

## 2 A general condition to get some complicated sets

We now build an example of a tree with suitable levels. This tree has to be small enough since we cannot have a reduction on the whole product. But as the same time it has to be big enough to ensure the existence of complicated sets, as in Theorem 1.7.

Notation. Let $b: \omega \rightarrow \omega^{2}$ be the natural bijection. More precisely, we set, for $l \in \omega$,

$$
M(l):=\max \left\{m \in \omega \mid \Sigma_{k \leq m} k \leq l\right\} .
$$

Then we define $b(l)=\left((l)_{0},(l)_{1}\right):=\left(M(l)-l+\left(\Sigma_{k \leq M(l)} k\right), l-\left(\Sigma_{k \leq M(l)} k\right)\right)$. One can check that $\langle n, p\rangle:=b^{-1}(n, p)=\left(\Sigma_{k \leq n+p} k\right)+p$. More concretely, we get

$$
b[\omega]=\{(0,0),(1,0),(0,1),(2,0),(1,1),(0,2), \ldots\} .
$$

In the introduction, we mentionned the idenfication between $\left(d^{l}\right)^{d}$ and $\left(d^{d}\right)^{l}$, for $l \leq \omega$. More specifically, the bijection we use is given by $\vec{\alpha} \mapsto\left(\left(\alpha_{i}(j)\right)_{i \in d}\right)_{j \in l}$.

Definition 2.1 We say that $E \subseteq \bigcup_{l \in \omega}\left(d^{l}\right)^{d}$ is an effective frame if
(a) $\forall l \in \omega \exists!\left(s_{l}^{i}\right)_{i \in d} \in E \cap\left(d^{l}\right)^{d}$.
(b) $\forall p, q, r \in \omega \forall t \in d^{<\omega} \exists N \in \omega\left(s_{q}^{i} i t 0^{N}\right)_{i \in d} \in E$, $\left(\left|s_{q}^{0} 0 t 0^{N}\right|-1\right)_{0}=p$ and $\left(\left(\left|s_{q}^{0} 0 t 0^{N}\right|-1\right)_{1}\right)_{0}=r$.
(c) $\forall l>0 \exists q<l \exists t \in d^{<\omega} \forall i \in d s_{l}^{i}=s_{q}^{i} i t$.
(d) The map $l \mapsto\left(s_{l}^{i}\right)_{i \in d}$ can be coded by a recursive map from $\omega$ into $\omega^{d}$.

We will call $T_{d}$ the tree on $d^{d}$ associated with an effective frame $E=\left\{\left(s_{l}^{i}\right)_{i \in d} \mid l \in \omega\right\}$ :

$$
T_{d}:=\left\{\vec{s} \in\left(d^{d}\right)^{<\omega} \mid\left(\forall i \in d \quad s_{i}=\emptyset\right) \vee\left(\exists l \in \omega \exists t \in d^{<\omega} \forall i \in d \quad s_{i}=s_{l}^{i} i t \wedge \forall n<\left|s_{0}\right| s_{0}(n) \leq n\right)\right\} .
$$

The uniqueness condition in (a) and Condition (c) ensure that $T_{d}$ is small enough, and also the almost acyclicity. The definition of $T_{d}$ ensures that $T_{d}$ has finite levels. Note that $\mathcal{T}^{l}=T_{d} \cap\left(d^{d}\right)^{l}$ can be coded by a $\Pi_{1}^{0}$ subset of $\left(\omega^{\omega}\right)^{l}$ when $d=\omega$. The existence condition in (a) and Condition (b) ensure that $T_{d}$ is big enough. More specifically, if $(X, \tau)$ is a Polish space and $\sigma$ a finer Polish topology on $X$, then there is a dense $G_{\delta}$ subset of $(X, \tau)$ on which $\tau$ and $\sigma$ coincide. The first part of Condition (b) ensures the possibility to get inside products of dense $G_{\delta}$ sets. The examples in Theorem 1.7 are build using the examples in [Lo-SR1] and [Lo-SR2]. Conditions on verticals are involved, and the second part of Condition (b) gives a control on the choice of verticals. The very last part of Condition (b) is not necessary to get Theorem 1.7 for the Borel classes, but is useful to get Theorem 1.7 for the Wadge classes of Borel sets. Definition 2.1 strengthens Definition 3.1 in [L7], with this very last part of Condition (b), with Condition (d) (ensuring the regularity of the levels of the tree), and also with the last part of the definition of the tree (ensuring the finiteness of the levels of the tree).

Proposition 2.2 The tree $T_{d}$ associated with an effective frame is a tree with $\Delta_{1}^{1}$ suitable levels. In particular, $\left\lceil T_{d}\right\rceil$ is compact.

Proof. Let $l \in \omega$. Let us prove that $\mathcal{T}^{l}$ is $\Delta_{1}^{1}$ and finite. We argue by induction on $l$. The result is clear for $l \leq 1$ since $\mathcal{T}^{0}=\{\vec{\emptyset}\}$ and $\mathcal{T}^{1}=\left\{(i)_{i \in d}\right\}$. If $l \geq 1$ and $\vec{s} \in\left(d^{d}\right)^{<\omega}$, then

$$
\vec{s} \in \mathcal{T}^{l} \Leftrightarrow\left|s_{0}\right|=l \wedge \exists q<l \exists t \in d^{<\omega} \forall i \in d s_{i}=s_{q}^{i} i t \wedge \forall n<l \quad s_{0}(n) \leq n
$$

But there are only finitely many possibilities for $t$ since $s_{0}(n) \leq n$ for each $n<l$, which implies that $t(m) \leq q+1+m<l+1+l$ if $m<|t|$. This implies that $\mathcal{T}^{l}$ is $\Delta_{1}^{1}$ and finite.

- Let $\tilde{T}_{d}$ be the tree generated by the effective frame:

$$
\tilde{T}_{d}:=\left\{\vec{s} \in\left(d^{d}\right)^{<\omega} \mid\left(\forall i \in d s_{i}=\emptyset\right) \vee\left(\exists l \in \omega \exists t \in d^{<\omega} \forall i \in d \quad s_{i}=s_{l}^{i} i t\right)\right\} .
$$

As $T_{d} \subseteq \tilde{T}_{d}$, we get, with obvious notation, $\mathcal{T}^{l} \subseteq \tilde{\mathcal{T}}^{l}$ for each integer $l$. So it is enough to prove that $\tilde{\mathcal{T}}^{l}$ is one-sided and almost acyclic since these properties are hereditary.

- Let us prove that $\tilde{\mathcal{T}}^{l}$ is almost acyclic. We argue by induction on $l$. The result is clear for $l \leq 1$. So assume that $l \geq 1$. We set, for $j \in d$,

$$
C_{j}:=\left\{\left(s_{q}^{i} i t\right)_{i \in d} \in \tilde{\mathcal{T}}^{l+1} \mid t \neq \emptyset \wedge t(|t|-1)=j\right\}
$$

We have $\tilde{\mathcal{T}}^{l+1}=\left\{\left(s_{l}^{i} i\right)_{i \in d}\right\} \cup \bigcup_{j \in d} C_{j}$, and this union is disjoint.
The restriction of $G^{\tilde{\mathcal{T}}^{l+1}}$ to each $C_{j}$ is isomorphic to $G^{\tilde{\mathcal{T}}^{l}}$. The other possible $G^{\tilde{\mathcal{T}}^{l+1}}$-edges are between $\left(s_{l}^{i} i\right)_{i \in d}$ and some vertices in some $C_{j}$ 's. If a $G^{\tilde{\mathcal{T}}^{l+1}}$-cycle exists, we may assume that it involves only $\left(s_{l}^{i} i\right)_{i \in d}$ and members of some fixed $C_{j_{0}}$. But if $\vec{s} \in C_{j_{0}}$ is $G^{\tilde{\mathcal{T}}^{l+1}}$-related to $\left(s_{l}^{i} i\right)_{i \in d}$, then we must have $s_{l}^{j_{0}} j_{0}=s_{j_{0}}$. This implies the existence of $k<m<n$ showing that $\tilde{\mathcal{T}}^{l+1}$ is almost acyclic.

- Now assume that $\vec{x} \neq \vec{y} \in \tilde{\mathcal{T}}^{l}, i, j \in d, x_{i}=y_{i}$ and $x_{j}=y_{j}$. Then we can write $\vec{x}=\left(s_{q}^{i} i t\right)_{i \in d}$ and $\vec{y}=\left(s_{q^{\prime}}^{i} i t^{\prime}\right)_{i \in d}$ since $\vec{x} \neq \vec{y}$. As $x_{i}=y_{i}$, the reverses $t^{-1}$ and $\left(t^{\prime}\right)^{-1}$ of $t$ and $t^{\prime}$ are compatible. If $t=t^{\prime}$, then $q=\left|s_{q}^{i}\right|=l-1-|t|=l-1-\left|t^{\prime}\right|=\left|s_{q^{\prime}}^{i}\right|=q^{\prime}$ and $\vec{x}=\vec{y}$, which is absurd. Thus $t \neq t^{\prime}$, for example $\left|t^{\prime}\right|<|t|$, and $t^{-1}\left(\left|t^{\prime}\right|\right)=i$. This proves that $i=j$ and $\tilde{\mathcal{T}}^{l}$ is one-sided.
- Let $\pi_{l}: \mathcal{T}^{l+1} \rightarrow d^{d}$ defined by $\pi_{l}(\vec{s}):=\left(s_{i}(l)\right)_{i \in d}$. As $\mathcal{T}^{l+1}$ is finite, the range $c_{l}$ of $\pi_{l}$ is also finite. Thus $\left\lceil T_{d}\right\rceil$ is compact since $\left\lceil T_{d}\right\rceil \subseteq \Pi_{l \in \omega} c_{l}$.

We now give an example of an effective frame.
Notation. Let $b_{d}: \omega \rightarrow d^{<\omega}$ be the natural bijection. More specifically,

- If $d<\omega$, then $b_{d}(0):=\emptyset$ is the sequence of length $0, b_{d}(1):=0, \ldots, b_{d}(d):=d-1$ are the sequences of length 1 in the lexicographical ordering, and so on.
- If $d=\omega$, then let $\left(p_{n}\right)_{n \in \omega}$ be the sequence of prime numbers, and $\mathcal{I}: \omega^{<\omega} \rightarrow \omega$ defined by $\mathcal{I}(\emptyset):=1$, and $\mathcal{I}(s):=p_{0}^{s(0)+1} \ldots p_{|s|-1}^{s(|s|-1)+1}$ if $s \neq \emptyset$. Note that $\mathcal{I}$ is one-to-one, so that there is an increasing bijection $\imath:$ Seq $:=\mathcal{I}\left[\omega^{<\omega}\right] \rightarrow \omega$. We set $b_{\omega}:=(\imath \circ \mathcal{I})^{-1}: \omega \rightarrow \omega^{<\omega}$.

Note that $\left|b_{d}(n)\right| \leq n$ if $n \in \omega$. Indeed, this is clear if $d<\omega$. If $d=\omega$, then

$$
\mathcal{I}\left(b_{\omega}(n) \mid 0\right)<\mathcal{I}\left(b_{\omega}(n) \mid 1\right)<\ldots<\mathcal{I}\left(b_{\omega}(n)\right)
$$

so that $(\imath \circ \mathcal{I})\left(b_{\omega}(n) \mid 0\right)<(\imath \circ \mathcal{I})\left(b_{\omega}(n) \mid 1\right)<\ldots<(\imath \circ \mathcal{I})\left(b_{\omega}(n)\right)=n$. This implies that $\left|b_{\omega}(n)\right| \leq n$.
Lemma 2.3 There is a concrete example of an effective frame.
Proof. Fix $i \in d$. We set $s_{0}^{i}=\emptyset$, and $s_{l+1}^{i}:=s_{\left(\left((l)_{1}\right)_{1}\right)_{0}}^{i} i b_{d}\left(\left(\left((l)_{1}\right)_{1}\right)_{1}\right) 0^{l-\left(\left((l)_{1}\right)_{1}\right)_{0}-\left|b_{d}\left(\left(\left((l)_{1}\right)_{1}\right)_{1}\right)\right|}$. Note that $(l)_{0}+(l)_{1}=M(l) \leq \Sigma_{k \leq M(l)} k \leq l$, so that $s_{l}^{i}$ is well defined and $\left|s_{l}^{i}\right|=l$, by induction on $l$. It remains to check that Condition (b) in the definition of an effective frame is fullfilled. Set $n:=b_{d}^{-1}(t)$, $s:=\langle r,<q, n>\rangle$ and $l:=<p, s>$. It remains to put $N:=l-q-|t|:\left(s_{q}^{i} i t 0^{N}\right)_{i \in d}=\left(s_{l+1}^{i}\right)_{i \in d}$.

The previous lemma is essentially identical to Lemma 3.3 in [L7]. Now we come to the lemma crucial for the proof of Theorem 1.7. It strengthens Lemma 3.4 in [L7], even if the proof is essentially the same.

Notation. If $s \in \omega^{<\omega}$ and $q \leq|s|$, then $s-s \mid q$ is defined by $s=(s \mid q)(s-s \mid q)$. We extend this definition to the case $s \in \omega^{\omega}$ when $q<\omega$. In particular, we denote $s^{*}:=s-s \mid 1$ when $\emptyset \neq s \in \omega \leq \omega$. If $\emptyset \neq s \in \omega^{<\omega}$, then we define $s^{-}:=s \mid(|s|-1)$.

- We now define $p: \omega^{<\omega} \backslash\{\emptyset\} \rightarrow \omega$. The definition of $p(s)$ is by induction on $|s|$ :

$$
p(s):=\left\{\begin{array}{l}
s(0) \text { if }|s|=1 \\
<p\left(s^{-}\right), s(|s|-1)>\text { otherwise }
\end{array}\right.
$$

Note that $p_{\mid \omega^{n}}: \omega^{n} \rightarrow \omega$ is a bijection, for each $n \geq 1$.
$\bullet$ Let $l \leq \omega$ be an ordinal. The map $\Delta: d^{l} \times d^{l} \rightarrow 2^{l}$ is the symmetric difference. So, for $m \in l$,

$$
(s \Delta t)(m):=\Delta(s, t)(m)=1 \Leftrightarrow s(m) \neq t(m)
$$

- By convention, $\omega-1:=\omega$.

Lemma 2.4 Let $T_{d}$ be the tree associated with an effective frame and, for each $i \in d, G_{i}$ a dense $G_{\delta}$ subset of $\Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil$. Then there are $\alpha_{0} \in G_{0}$ and $F: 2^{\omega} \rightarrow \Pi_{0<i<d} G_{i}$ continuous such that, for $\alpha \in 2^{\omega}$,
(a) $\left(\alpha_{0}, F(\alpha)\right) \in\left\lceil T_{d}\right\rceil$.
(b) For each $s \in \omega^{<\omega}$, and each $m \in \omega$,
(i) $\alpha(p(s m))=1 \Rightarrow \exists m^{\prime} \in \omega\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\left(p\left(s m^{\prime}\right)+1\right)=1$.
(ii) $\left(\alpha_{0} \Delta F_{0}(\alpha)\right)(p(s m)+1)=1 \Rightarrow \exists m^{\prime} \in \omega \alpha\left(p\left(s m^{\prime}\right)\right)=1$.

Moreover, there is an increasing bijection

$$
B_{\alpha}:\{m \in \omega \mid \alpha(m)=1\} \rightarrow\left\{m^{\prime} \in \omega \mid\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\left(m^{\prime}+1\right)=1\right\}
$$

such that $(m)_{0}=\left(B_{\alpha}(m)\right)_{0}$ and $\left((m)_{1}\right)_{0}=\left(\left(B_{\alpha}(m)\right)_{1}\right)_{0}$ if $\alpha(m)=1$.

Proof. Let $\left(O_{q}^{i}\right)_{q \in \omega}$ be a non-increasing sequence of dense open subsets of $\Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil$ whose intersection is $G_{i}$. We construct finite approximations of $\alpha_{0}$ and $F$. The idea is to linearize the binary tree $2^{<\omega}$. So we will use the bijection $b_{2}$ defined before Lemma 2.3. To construct $F(\alpha)$ we have to imagine, for each length $l$, the different possibilities for $\alpha \mid l$. More precisely, we construct a map $l: 2^{<\omega} \rightarrow \omega \backslash\{0\}$ satisfying the following conditions:

$$
\begin{aligned}
& \text { (1) } \forall t \in 2^{<\omega} \forall i \in d \quad\left(i \leq|t| \Rightarrow \emptyset \neq N_{s_{l(t)}^{i}} \cap \Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil \subseteq O_{|t|}^{i}\right), \\
& \text { (2) } \exists v_{\emptyset} \in d^{<\omega} \quad \forall i \in d \quad s_{l(\emptyset)}^{i}=i v_{\emptyset}, \\
& \text { (3) } \forall t \in 2^{<\omega} \quad \forall \varepsilon \in 2 \quad \exists v_{t \varepsilon} \in d^{<\omega} \forall i \in d s_{l(t \varepsilon)}^{i}=s_{l(t)}^{i}(i \cdot \varepsilon) v_{t \varepsilon}, \\
& \text { (4) } \forall r \in \omega s_{l\left(b_{2}(r)\right)}^{0} 0 \subseteq s_{l\left(b_{2}(r+1)\right)}^{0} \wedge \forall t \in 2^{<\omega} \forall n<l(t) s_{l(t)}^{0}(n) \leq n \text {, } \\
& \text { (5) } \forall t \in 2^{<\omega}(l(t)-1)_{0}=(|t|)_{0} \wedge\left((l(t)-1)_{1}\right)_{0}=\left((|t|)_{1}\right)_{0} .
\end{aligned}
$$

- Assume that this construction is done. As $s_{l\left(0^{q}\right)}^{0} \subset_{\neq} s_{l\left(0^{q+1}\right)}^{0}$ for each integer $q$, we can define $\alpha_{0}:=\sup _{q \in \omega} s_{l\left(0^{q}\right)}^{0}$. Similarly, as $s_{l(\alpha \mid q)}^{i+1} \subset_{\neq} s_{l(\alpha \mid(q+1))}^{i+1}$, we can define, for $\alpha \in 2^{\omega}$ and $i<d-1$,

$$
F_{i}(\alpha):=\sup _{q \in \omega} s_{l(\alpha \mid q)}^{i+1}
$$

and $F$ is continuous.
(a) Fix $q \in \omega$. We have to see that $\left(\alpha_{0}, F(\alpha)\right) \mid q \in T_{d}$. Note first that $l(t) \geq|t|$ since $l(t \varepsilon)>l(t)$. Then note that $s_{l(t)}^{0} \subseteq \alpha_{0}$ since $s_{l\left(0^{|t|}\right)}^{0} \subseteq s_{l(t)}^{0} \subseteq s_{l\left(0^{|t|+1}\right)}^{0}$. Thus $\left(\alpha_{0}, F(\alpha)\right) \mid l(\alpha \mid q)=\left(s_{l(\alpha \mid q)}^{i}\right)_{i \in d} \in E$. This implies that $\left(\alpha_{0}, F(\alpha)\right) \mid l(\alpha \mid q) \in T_{d}$ since $s_{l(\alpha \mid q)}^{0}(n) \leq n$ if $n<l(\alpha \mid q)$. We are done since $l(\alpha \mid q) \geq q$.

Moreover, $\alpha_{0} \in \bigcap_{q \in \omega} N_{s_{l\left(0^{q}\right)}^{0}} \cap \Pi_{0}^{\prime \prime}\left\lceil T_{d}\right\rceil \subseteq \bigcap_{q \in \omega} O_{q}^{0}=G_{0}$. Similarly,

$$
F_{i}(\alpha) \in \bigcap_{q \in \omega} N_{s_{l(\alpha \mid q)}^{i+1}} \cap \Pi_{i+1}^{\prime \prime}\left\lceil T_{d}\right\rceil \subseteq \bigcap_{q \geq i+1} O_{q}^{i+1}=G_{i+1}
$$

(b).(i) We set $t:=\alpha \mid p(s m)$, so that $s_{l(t)}^{1} 1 \subseteq s_{l(t 1)}^{1}=s_{l(\alpha \mid(p(s m)+1))}^{1} \subseteq F_{0}(\alpha)$. As $(l(t)-1)_{0}=p(s)$ (or $(m)_{0}$ if $\left.s=\emptyset\right)$, there is $m^{\prime}$ with $l(t)=p\left(s m^{\prime}\right)+1\left(\right.$ or $l(t)=m^{\prime}+1$ and $\left(m^{\prime}\right)_{0}=(m)_{0}$ if $\left.s=\emptyset\right)$. But $s_{l(t)}^{0} 0 \subseteq s_{l(\alpha \mid(p(s m)+1))}^{0} \subseteq \alpha_{0}$, so that $\alpha_{0}(l(t)) \neq F_{0}(\alpha)(l(t))$.
(ii) First notice that the only coordinates where $\alpha_{0}$ and $F_{0}(\alpha)$ can differ are 0 and the $l(\alpha \mid q)$ 's. Therefore there is an integer $q$ with $p(s m)+1=l(\alpha \mid q)$. In particular, $(q)_{0}=(l(\alpha \mid q)-1)_{0}=p(s)$ (or $(m)_{0}$ if $\left.s=\emptyset\right)$. Thus there is $m^{\prime}$ with $q=p\left(s m^{\prime}\right)$ (or $q=m^{\prime}$ and $\left(m^{\prime}\right)_{0}=(m)_{0}$ if $\left.s=\emptyset\right)$. We have $\alpha_{0}(l(\alpha \mid q))=s_{l(\alpha \mid(q+1))}^{0}(l(\alpha \mid q))=0 \neq F_{0}(\alpha)(l(\alpha \mid q))=s_{l(\alpha \mid(q+1))}^{1}(l(\alpha \mid q))=\alpha(q)$. So $\alpha(q)=1$ and $\alpha\left(p\left(s m^{\prime}\right)\right)=1$.

Now it is clear that the formula $B_{\alpha}(m):=l(\alpha \mid m)-1$ defines the bijection we are looking for.

- So let us prove that the construction is possible. We construct $l(t)$ by induction on $b_{2}^{-1}(t)$.

As $\left(i 0^{\infty}\right)_{i \in d} \in\left\lceil T_{d}\right\rceil, 0^{\infty} \in \Pi_{0}^{\prime \prime}\left\lceil T_{d}\right\rceil$ and $O_{0}^{0}$ is not empty. Thus there is $u_{0}^{0} \in d^{<\omega} \backslash\{\emptyset\}$ such that $\emptyset \neq N_{u_{0}^{0}} \cap \Pi_{0}^{\prime \prime}\left\lceil T_{d}\right\rceil \subseteq O_{0}^{0}$. Choose $\beta_{0} \in N_{u_{0}^{0}} \cap \Pi_{0}^{\prime \prime}\left\lceil T_{d}\right\rceil$, and $\vec{\alpha} \in\left\lceil T_{d}\right\rceil$ such that $\alpha_{0}=\beta_{0}$. Then $\vec{\alpha} \| u_{0}^{0} \mid \in T_{d}$ and $u_{0}^{0}(n) \leq n$ for each $n<\left|u_{0}^{0}\right|$. Note that $u_{0}^{0}(0)=0$ and $\left(u_{0}^{0}-u_{0}^{0} \mid 1\right)(n)=u_{0}^{0}(n+1) \leq 1+n$ for each $n<\left|u_{0}^{0}\right|-1$. We choose $N_{\emptyset} \in \omega$ with $\left(i\left(u_{0}^{0}-u_{0}^{0} \mid 1\right) 0^{N_{\emptyset}}\right)_{i \in d} \in E$, $\left(\left|0\left(u_{0}^{0}-u_{0}^{0} \mid 1\right) 0^{N_{\emptyset}}\right|-1\right)_{0}=(0)_{0}$ and $\left(\left(\left|0\left(u_{0}^{0}-u_{0}^{0} \mid 1\right) 0^{N_{\emptyset}}\right|-1\right)_{1}\right)_{0}=\left((0)_{1}\right)_{0}$. We put $v_{\emptyset}:=\left(u_{0}^{0}-u_{0}^{0} \mid 1\right) 0^{N_{\emptyset}}$ and $l(\emptyset):=\left|0\left(u_{0}^{0}-u_{0}^{0} \mid 1\right) 0^{N_{\emptyset}}\right|$.

As $\left(i v_{\emptyset} 0^{\infty}\right)_{i \in d} \in\left\lceil T_{d}\right\rceil, N_{0 v_{0} 0} \cap \Pi_{0}^{\prime \prime}\left\lceil T_{d}\right\rceil$ is a nonempty open subset of $\Pi_{0}^{\prime \prime}\left\lceil T_{d}\right\rceil$. Thus there is $u_{1}^{0} \in d^{<\omega}$ such that $\emptyset \neq N_{0 v_{\emptyset} 0 u_{1}^{0}} \cap \Pi_{0}^{\prime \prime}\left\lceil T_{d}\right\rceil \subseteq O_{1}^{0}$. As before we see that $u_{1}^{0}(n) \leq 1+\left|v_{\emptyset}\right|+1+n$ for each $n<\left|u_{1}^{0}\right|$. This implies that $\left(i v_{\emptyset} 0 u_{1}^{0} 0^{\infty}\right)_{i \in d} \in\left\lceil T_{d}\right\rceil$. Thus $N_{1 v_{\emptyset} 0 u_{1}^{0}} \cap \Pi_{1}^{\prime \prime}\left\lceil T_{d}\right\rceil$ is a nonempty open subset of $\Pi_{1}^{\prime \prime}\left\lceil T_{d}\right\rceil$. So there is $u_{1}^{1} \in d^{<\omega}$ such that $\emptyset \neq N_{1 v_{0} 0 u_{1}^{0} u_{1}^{1}} \cap \Pi_{1}^{\prime \prime}\left\lceil T_{d}\right\rceil \subseteq O_{1}^{1}$. Choose $\beta_{1} \in N_{1 v_{\emptyset} 0 u_{1}^{0} u_{1}^{1}} \cap \Pi_{1}^{\prime \prime}\left\lceil T_{d}\right\rceil$, and $\vec{\gamma} \in\left\lceil T_{d}\right\rceil$ such that $\gamma_{1}=\beta_{1}$. Then $\vec{\gamma} \|\left|v_{\emptyset} 0 u_{1}^{0} u_{1}^{1}\right| \in T_{d}$ and $\gamma_{0}(n) \leq n$ for each $n<\left|1 v_{\emptyset} 0 u_{1}^{0} u_{1}^{1}\right|$. This implies that $\gamma_{0}\left(\left|1 v_{\emptyset} 0 u_{1}^{0}\right|+n\right) \leq\left|1 v_{\emptyset} 0 u_{1}^{0}\right|+n$ for each $n<\left|u_{1}^{1}\right|$. But $u_{1}^{1}(n)$ is either 1 , or $\gamma_{0}\left(\left|1 v_{\emptyset} 0 u_{1}^{0}\right|+n\right)$. Thus $u_{1}^{1}(n) \leq\left|1 v_{\emptyset} 0 u_{1}^{0}\right|+n$ if $n<\left|u_{1}^{1}\right|$. We choose $N_{0} \in \omega$ such that $\left.\left(s_{l(\emptyset)}^{i}\right) 0 u_{1}^{0} u_{1}^{1} 0^{N_{0}}\right)_{i \in d} \in E,\left(l(\emptyset)+\left|u_{1}^{0} u_{1}^{1}\right|+N_{0}\right)_{0}=(1)_{0}$ and $\left(\left(l(\emptyset)+\left|u_{1}^{0} u_{1}^{1}\right|+N_{0}\right)_{1}\right)_{0}=\left((1)_{1}\right)_{0} . \mathrm{We}$ put $v_{0}:=u_{1}^{0} u_{1}^{1} 0^{N_{0}}$ and $l(0):=l(\emptyset)+1+\left|v_{0}\right|$.

Assume that $(l(t))_{b_{2}^{-1}(t) \leq r}$ satisfying (1)-(5) have been constructed, which is the case for $r=1$. Fix $t \in 2^{<\omega}$ and $\varepsilon \in 2$ such that $b_{2}(r+1)=t \varepsilon$, with $r \geq 1$. Note that $b_{2}^{-1}(t)<r$, so that $l(t)<l\left(b_{2}(r)\right)$, by induction assumption.

As $N_{s_{l\left(b_{2}(r)\right)}^{0}} \cap \Pi_{0}^{\prime \prime}\left\lceil T_{d}\right\rceil$ is nonempty, $N_{s_{l\left(b_{2}(r)\right)}^{0}} \cap \Pi_{0}^{\prime \prime}\left\lceil T_{d}\right\rceil$ is nonempty too. Thus there is $u_{|t|+1}^{0}$ in $d^{<\omega}$ such that $\emptyset \neq N_{s_{l\left(b_{2}(r)\right.}^{0}} 0 u_{|t|+1}^{0} \cap \Pi_{0}^{\prime \prime}\left\lceil T_{d}\right\rceil \subseteq O_{|t|+1}^{0}$. As before we see that $u_{|t|+1}^{0}(n) \leq l\left(b_{2}(r)\right)+1+n$ for each $n<\left|u_{|t|+1}^{0}\right|$. Arguing as in the case $r=1$, we prove, for each $1 \leq i \leq|t|+1$, the existence of $u_{|t|+1}^{i} \in d^{<\omega}$ such that $\left.\left.\emptyset \neq N_{s_{l(t)}^{i}(i \cdot \varepsilon)\left(s_{l\left(b_{2}(r)\right)}^{0}-s_{l\left(b_{2}(r)\right)}^{0}\right)}(l(t)+1)\right)\right) u_{|t|+1}^{0} \ldots u_{|t|+1}^{i} \cap \Pi_{i}^{\prime \prime}\left[T_{d}\right\rceil \subseteq O_{|t|+1}^{i}$ and $u_{|t|+1}^{i}(n) \leq l\left(b_{2}(r)\right)+1+\left|u_{|t|+1}^{0} \ldots u_{|t|+1}^{i-1}\right|+n$ for each $n<\left|u_{|t|+1}^{i}\right|\left(u_{|t|+1}^{i}(n)\right.$ can be $i$, in which case we use the fact that $l(t) \geq|t|)$. We choose $N_{t \varepsilon} \in \omega$ such that

$$
\begin{gathered}
\left(s_{l(t)}^{i}(i \cdot \varepsilon)\left(s_{l\left(b_{2}(r)\right)}^{0}-s_{l\left(b_{2}(r)\right)}^{0} \mid(l(t)+1)\right) 0 u_{|t|+1}^{0} \ldots u_{|t|+1}^{|t|+1} 0^{N_{t \varepsilon}}\right)_{i \in d} \in E, \\
\left(l\left(b_{2}(r)\right)+\left|u_{|t|+1}^{0} \ldots u_{|t|+1}^{|t|+1}\right|+N_{t \varepsilon}\right)_{0}=(|t|+1)_{0} \text { and } \\
\left(\left(l\left(b_{2}(r)\right)+\left|u_{|t|+1}^{0} \ldots u_{|t|+1}^{|t|+1}\right|+N_{t \varepsilon}\right)_{1}\right)_{0}=\left((|t|+1)_{1}\right)_{0} .
\end{gathered}
$$

We put $l(t \varepsilon):=l(t)+1+\left|v_{t \varepsilon}\right|$, where by definition

$$
v_{t \varepsilon}:=\left(s_{l\left(b_{2}(r)\right)}^{0}-s_{l\left(b_{2}(r)\right)}^{0} \mid(l(t)+1)\right) 0 u_{|t|+1}^{0} \ldots u_{|t|+1}^{|t|+1} 0^{N_{t \varepsilon}} .
$$

This finishes the proof.

Now we come to the general condition to get some complicated sets as in the statement of Theorem 1.7 announced in the introduction.

Notation. The map $\mathcal{S}: 2^{\omega} \rightarrow 2^{\omega}$ is the shift map: $\mathcal{S}(\alpha)(m):=\alpha(m+1)$.
Definition 2.5 We say that $C \subseteq 2^{\omega}$ is compatible with comeager sets (ccs for short) if

$$
\alpha \in C \Leftrightarrow \mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right) \in C
$$

for each $\alpha_{0} \in d^{\omega}$ and $F: 2^{\omega} \rightarrow\left(d^{\omega}\right)^{d-1}$ satisfying the conclusion of Lemma 2.4.(b).
Notation. Let $T_{d}$ be the tree associated with an effective frame, and $C \subseteq 2^{\omega}$. We put

$$
S_{C}^{d}:=\left\{\vec{\alpha} \in\left\lceil T_{d}\right\rceil \mid \mathcal{S}\left(\alpha_{0} \Delta \alpha_{1}\right) \in C\right\} .
$$

Lemma 2.6 Let $T_{d}$ be the tree associated with an effective frame, and $\boldsymbol{\Gamma}$ a non self-dual Wadge class of Borel sets.
(1) Assume that $C$ is a $\boldsymbol{\Gamma}$-complete ccs set. Then $S_{C}^{d} \in \boldsymbol{\Gamma}\left(\left\lceil T_{d}\right\rceil\right)$ is a Borel subset of $\left(d^{\omega}\right)^{d}$, and is not separable from $\left\lceil T_{d}\right\rceil \backslash S_{C}^{d}$ by a $\operatorname{pot}(\check{\boldsymbol{\Gamma}})$ set.
(2) Assume that $C^{0}, C^{1} \in \boldsymbol{\Gamma}$ are disjoint, ccs, and not separable by a $\Delta(\boldsymbol{\Gamma})$ set. Then $S_{C^{0}}^{d}, S_{C^{1}}^{d}$ are in $\boldsymbol{\Gamma}\left(\left\lceil T_{d}\right\rceil\right)$, disjoint Borel subsets of $\left(d^{\omega}\right)^{d}$, and not separable by a pot $(\Delta(\boldsymbol{\Gamma}))$ set.

Proof. (1) It is clear that $S_{C}^{d} \in \boldsymbol{\Gamma}\left(\left\lceil T_{d}\right\rceil\right)$ since $\mathcal{S}$ and $\Delta$ are continuous. So $S_{C}^{d}$ is a Borel subset of $\left(d^{\omega}\right)^{d}$ since $\left\lceil T_{d}\right\rceil$ is a closed subset of $\left(d^{\omega}\right)^{d}$. Indeed, $\left\lceil T_{\omega}\right\rceil$ is closed:

$$
\vec{\alpha} \in\left\lceil T_{\omega}\right\rceil \Leftrightarrow \forall n \in \omega \backslash\{0\} \quad \exists l<n \forall i \in \omega s_{l}^{i} i \subseteq \alpha_{i} \wedge\left(\alpha_{i} \mid n-s_{l}^{i} i\right)=\left(\alpha_{0} \mid n-s_{l}^{0} 0\right) \wedge \alpha_{0}(n) \leq n
$$

We argue by contradiction to see that $S_{C}^{d}$ is not separable from $\left\lceil T_{d}\right\rceil \backslash S_{C}^{d}$ by a $\operatorname{pot}(\check{\boldsymbol{\Gamma}})$ set: this gives $P \in \operatorname{pot}(\check{\boldsymbol{\Gamma}})$. For each $i \in d$ there is a dense $G_{\delta}$ subset $G_{i}$ of the compact space $\Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil$ such that $P \cap\left(\Pi_{i \in d} G_{i}\right) \in \check{\Gamma}\left(\Pi_{i \in d} G_{i}\right)$, and $S_{C}^{d} \cap\left(\Pi_{i \in d} G_{i}\right) \subseteq P \cap\left(\Pi_{i \in d} G_{i}\right) \subseteq\left(\Pi_{i \in d} G_{i}\right) \backslash\left(\left\lceil T_{d}\right\rceil \backslash S_{C}^{d}\right)$.

Lemma 2.4 provides $\alpha_{0} \in G_{0}$ and $F: 2^{\omega} \rightarrow \Pi_{0<i<d} G_{i}$ continuous. Let

$$
D:=\left\{\alpha \in 2^{\omega} \mid\left(\alpha_{0}, F(\alpha)\right) \in P \cap\left(\Pi_{i \in d} G_{i}\right)\right\} .
$$

Then $D \in \check{\Gamma}$. Let us prove that $C=D$, which will contradict the fact that $C \notin \check{\Gamma}$. As $C$ is ccs, $\alpha \in C$ is equivalent to $\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right) \in C$. Thus

$$
\alpha \in C \Rightarrow \mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right) \in C \Rightarrow\left(\alpha_{0}, F(\alpha)\right) \in S_{C}^{d} \cap\left(\Pi_{i \in d} G_{i}\right) \subseteq P \cap\left(\Pi_{i \in d} G_{i}\right) \Rightarrow \alpha \in D
$$

Similarly, $\alpha \notin C \Rightarrow \alpha \notin D$, and $C=D$.
(2) We argue as in (1).

This lemma reduces the problem of finding some complicated sets as in the statement of Theorem 1.7 to a problem in dimension 1.

## 3 The proof of Theorem 1.7 for the Borel classes

The full version of Theorem 1.7 for the Borel classes is as follows:
Theorem 3.1 We can find concrete examples of a tree $T_{d}$ with $\Delta_{1}^{1}$ suitable levels, together with, for each $1 \leq \xi<\omega_{1}$,
(1) Some set $\mathbb{S}_{\xi}^{d} \in \boldsymbol{\Sigma}_{\xi}^{0}\left(\left\lceil T_{d}\right\rceil\right)$ not separable from $\left\lceil T_{d}\right\rceil \backslash \mathbb{S}_{\xi}^{d}$ by a pot $\left(\boldsymbol{\Pi}_{\xi}^{0}\right)$ set.
(2) Some disjoint sets $\mathbb{S}_{\xi}^{0}, \mathbb{S}_{\xi}^{1} \in \boldsymbol{\Sigma}_{\xi}^{0}\left(\left\lceil T_{d}\right\rceil\right)$ not separable by a $\operatorname{pot}\left(\boldsymbol{\Delta}_{\xi}^{0}\right)$ set.

This is an application of Lemma 2.6. We now introduce the objects useful to define the suitable sets $C$ 's of this lemma. These objects will also be useful in the general case. The following definition can be found in [Lo-SR2] (see Definition 2.2).

Definition 3.2 A set $H \subseteq 2^{\omega}$ is $\boldsymbol{\Gamma}$-strategically complete if
(a) $H \in \boldsymbol{\Gamma}\left(2^{\omega}\right)$.
(b) If $A \in \boldsymbol{\Gamma}\left(\omega^{\omega}\right)$, then Player 2 wins the Wadge game $G(A, H)$ (where Player 1 plays $\alpha \in \omega^{\omega}$, Player 2 plays $\beta \in 2^{\omega}$ and Player 2 wins if $\left.\alpha \in A \Leftrightarrow \beta \in H\right)$.

The following definition can essentially be found in [Lo-SR1] (see Section 3) and [Lo-SR2] (see Definition 2.3).

Definition 3.3 Let $\eta<\omega_{1}$. A function $\rho: 2^{\omega} \rightarrow 2^{\omega}$ is an independent $\eta$-function if
(a) For some function $\pi: \omega \rightarrow \omega$, the value $\rho(\alpha)(m)$, for each $\alpha \in 2^{\omega}$ and each integer $m$, depends only on the values of $\alpha$ on $\pi^{-1}(\{m\})$.
(b) For each integer $m$, we set $\mathcal{C}_{m}:=\left\{\alpha \in 2^{\omega} \mid \rho(\alpha)(m)=1\right\}$.
(1) If $\eta=0$, then for each integer $m$ the set $\mathcal{C}_{m}$ is a $\Delta_{1}^{0}$-complete set.
(2) If $\eta=\theta+1$ is successor, then for each integer $m$ the set $\mathcal{C}_{m}$ is a $\boldsymbol{\Pi}_{1+\theta^{-}}^{0}$-strategically complete set.
(3) If $\eta$ limit, then for some sequence $\left(\theta_{m}\right)_{m \in \omega}$ with $\theta_{m}<\eta$ and $\sup _{p \geq 1} \theta_{m_{p}}=\eta$ for each one-to-one sequence $\left(m_{p}\right)_{p \geq 1}$ of integers, and for each integer $m$ the set $\mathcal{C}_{m}$ is a $\boldsymbol{\Pi}_{1+\theta_{m}}^{0}$-strategically complete set.

Note that we added a condition when $\eta=0$. Moreover, we do not ask the sequence $\left(\theta_{m}\right)_{m \in \omega}$ to be increasing, unlike in [Lo-SR2], Definition 2.3. Note also that an independent $\eta$-function has to be $\boldsymbol{\Sigma}_{1+\eta}^{0}$-measurable. Moreover, if $\rho$ is an independent $\eta$-function, then $\pi$ has to be onto.

Examples. In [Lo-SR1], Lemma 3.3, the map $\rho_{0}: 2^{\omega} \rightarrow 2^{\omega}$ defined as follows is introduced:

$$
\rho_{0}(\alpha)(m):=\left\{\begin{array}{l}
1 \text { if } \alpha(<m, n>)=0, \text { for each } n \in \omega \\
0 \text { otherwise }
\end{array}\right.
$$

Then $\rho_{0}$ is clearly an independent 1-function, with $\pi(k)=(k)_{0}$. In this paper, $\rho_{0}^{\eta}: 2^{\omega} \rightarrow 2^{\omega}$ is also defined for $\eta<\omega_{1}$ as follows, by induction on $\eta$ (see the proof of Theorem 3.2).

We put
$-\rho_{0}^{0}:=\operatorname{Id}_{2} \omega$.
$-\rho_{0}^{\theta+1}:=\rho_{0} \circ \rho_{0}^{\theta}$.

- If $\eta>0$ is limit, then fix a sequence $\left(\theta_{m}^{\eta}\right)_{m \in \omega} \subseteq \eta$ of successor ordinals with $\Sigma_{m \in \omega} \theta_{m}^{\eta}=\eta$. We define $\rho_{0}^{(m, m+1)}: 2^{\omega} \rightarrow 2^{\omega}$ by

$$
\rho_{0}^{(m, m+1)}(\alpha)(i):=\left\{\begin{array}{l}
\alpha(i) \text { if } i<m, \\
\rho_{0}^{\theta_{m}^{\eta}}\left(\mathcal{S}^{m}(\alpha)\right)(i-m) \text { if } i \geq m
\end{array}\right.
$$

We set $\rho_{0}^{(0, m+1)}:=\rho_{0}^{(m, m+1)} \circ \rho_{0}^{(m-1, m)} \circ \ldots \circ \rho_{0}^{(0,1)}$ and $\rho_{0}^{\eta}(\alpha)(m):=\rho_{0}^{(0, m+1)}(\alpha)(m)$. The authors prove that $\rho_{0}^{\eta}$ is an independent $\eta$-function (see the proof of Theorem 3.2). In this paper, the set $H_{1+\eta}:=\left(\rho_{0}^{\eta}\right)^{-1}\left(\left\{0^{\infty}\right\}\right)$ is also introduced, and the authors prove that $H_{1+\eta}$ is $\boldsymbol{\Pi}_{1+\eta}^{0}$-complete (see Theorem 3.2).

Notation. Let $1 \leq \xi:=1+\eta<\omega_{1}$. We set $C_{\xi}:=\neg H_{\xi}$. If moreover $\varepsilon \in 2$, then we set

$$
C_{\xi}^{\varepsilon}:=\left\{\alpha \in 2^{\omega} \mid \exists m \in \omega \rho_{0}^{\eta}(\alpha)(m)=1 \wedge \forall l<m \rho_{0}^{\eta}(\alpha)(l)=0 \wedge(m)_{0} \equiv \varepsilon(\bmod 2)\right\} .
$$

Then we set $\mathbb{S}_{\xi}^{d}:=S_{C_{\xi}}^{d}$ and $\mathbb{S}_{\xi}^{\varepsilon}:=S_{C_{\xi}^{\varepsilon}}^{d}$.
Theorem 3.1 is a corollary of Proposition 2.2, Lemmas 2.3 and 2.6, and of the following lemma.

## Lemma 3.4 Let $1 \leq \xi<\omega_{1}$.

(1) The set $C_{\xi}$ is a $\Sigma_{\xi}^{0}$-complete ccs set.
(2) The sets $C_{\xi}^{0}, C_{\xi}^{1} \in \boldsymbol{\Sigma}_{\xi}^{0}$, are disjoint, ccs, and not separable by a $\Delta_{\xi}^{0}$ set.

Proof. (1) $C_{\xi}$ is $\boldsymbol{\Sigma}_{\xi}^{0}$-complete since $H_{\xi}$ is $\boldsymbol{\Pi}_{\xi}^{0}$-complete.

- Assume that $\alpha_{0}, F$ satisfy the conclusion of Lemma 2.4.(b). Let us prove that

$$
\rho_{0}^{\eta}(\alpha)=\rho_{0}^{\eta}\left(\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\right)
$$

for each $1 \leq \eta<\omega_{1}$ and $\alpha \in 2^{\omega}$. For $\eta=1$ we apply the conclusion of Lemma 2.4.(b) to $s \in \omega$. Then we have, by induction, $\rho_{0}^{\theta+1}(\alpha)=\rho_{0}\left(\rho_{0}^{\theta}(\alpha)\right)=\rho_{0}\left(\rho_{0}^{\theta}\left(\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\right)\right)=\rho_{0}^{\theta+1}\left(\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\right)$.
From this we deduce, for $\lambda>0$ limit, by induction again, that

$$
\rho_{0}^{(0,1)}(\alpha)=\rho_{0}^{\theta_{0}^{\lambda}}(\alpha)=\rho_{0}^{\theta_{0}^{\lambda}}\left(\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\right)=\rho_{0}^{(0,1)}\left(\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\right)
$$

Thus $\rho_{0}^{(0, m+1)}(\alpha)=\rho_{0}^{(0, m+1)}\left(\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\right)$, and

$$
\rho_{0}^{\lambda}(\alpha)(m)=\rho_{0}^{(0, m+1)}(\alpha)(m)=\rho_{0}^{(0, m+1)}\left(\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\right)(m)=\rho_{0}^{\lambda}\left(\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\right)(m)
$$

- If we apply the previous point, or the conclusion of Lemma 2.4.(b) to $s:=\emptyset$, then we get

$$
\alpha \in C_{\xi} \Leftrightarrow \exists m \in \omega \rho_{0}^{\eta}(\alpha)(m)=1 \Leftrightarrow \exists m^{\prime} \in \omega \rho_{0}^{\eta}\left(\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\right)\left(m^{\prime}\right)=1 \Leftrightarrow \mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right) \in C_{\xi}
$$

Thus $C_{\xi}$ is ccs.
(2) Note first that $C_{\xi}^{0}, C_{\xi}^{1} \in \boldsymbol{\Sigma}_{\xi}^{0}$ since $\rho_{0}^{\eta}$ is $\boldsymbol{\Sigma}_{1+\eta}^{0}$-measurable, are clearly disjoint, and are ccs as in (1) since $(m)_{0}=\left(B_{\alpha}(m)\right)_{0}$ in Lemma 2.4.(b).

- We set, for $\varepsilon \in 2, V_{\varepsilon}:=\left\{\alpha \in 2^{\omega} \mid \exists m \in \omega \quad \rho_{0}^{\eta}(\alpha)(m)=1\right.$ and $\left.(m)_{0} \equiv \varepsilon(\bmod 2)\right\}$. Then $V_{\varepsilon}$ is a $\boldsymbol{\Sigma}_{\xi}^{0}$ set since $\rho_{0}^{\eta}$ is $\boldsymbol{\Sigma}_{1+\eta}^{0}$-measurable. Let us prove that $V_{\varepsilon}$ is $\boldsymbol{\Sigma}_{\xi}^{0}$-complete.
- If $\eta=0$, then $0^{\infty} \in \overline{V_{\varepsilon}} \backslash V_{\varepsilon}$, so that $V_{\varepsilon}$ is $\boldsymbol{\Sigma}_{1}^{0}$-complete.
- If $\eta=\theta+1$, then $\rho_{0}^{\eta}$ is an independent $\eta$-function. Let $\left(A_{m}\right)_{m \in \omega}$ be a sequence of $\boldsymbol{\Pi}_{1+\theta}^{0}\left(2^{\omega}\right)$ sets. Choose a continuous map $f_{m}: 2^{\omega} \rightarrow 2^{\omega}$ such that $A_{m}=f_{m}^{-1}\left(\mathcal{C}_{m}\right)$. We define $f: 2^{\omega} \rightarrow 2^{\omega}$ by $f(\alpha)(k):=f_{m}(\alpha)(k)$ if $\pi_{\eta}(k)=m$, and $f$ is continuous. Moreover,

$$
\alpha \in A_{m} \Leftrightarrow f_{m}(\alpha) \in \mathcal{C}_{n} \Leftrightarrow f(\alpha) \in \mathcal{C}_{m}
$$

so that $\bigcup_{m \in \omega,(m)_{0} \equiv \varepsilon(\bmod 2)} A_{m}=f^{-1}\left(V_{\varepsilon}\right)$. Thus $V_{\varepsilon}$ is $\boldsymbol{\Sigma}_{\xi}^{0}$-complete.

- If $\eta$ is the limit of the $\theta_{m}$ 's, then $\rho_{0}^{\eta}$ is an independent $\eta$-function. We argue as in the successor case to see that $V_{\varepsilon}$ is $\boldsymbol{\Sigma}_{\xi}^{0}$-complete.
- We argue by contradiction, which gives $D \in \boldsymbol{\Delta}_{\xi}^{0}$ separating $C_{\xi}^{0}$ from $C_{\xi}^{1}$. Let $v_{0}$, $v_{1}$ be disjoint $\boldsymbol{\Sigma}_{\xi}^{0}$ subsets of $2^{\omega}$. Then we can find a continuous map $f_{\varepsilon}: 2^{\omega} \rightarrow 2^{\omega}$ such that $v_{\varepsilon}=f_{\varepsilon}^{-1}\left(V_{\varepsilon}\right)$. As $\rho_{0}^{\eta}$ is an independent $\eta$-function, we get $\pi_{\eta}: \omega \rightarrow \omega$. We define a map $f: 2^{\omega} \rightarrow 2^{\omega}$ by $f(\alpha)(k):=f_{\varepsilon}(\alpha)(k)$ if $\left(\pi_{\eta}(k)\right)_{0} \equiv \varepsilon(\bmod 2)$, and $f$ is continuous. Note that $\alpha \in v_{\varepsilon} \Leftrightarrow f_{\varepsilon}(\alpha) \in V_{\varepsilon} \Leftrightarrow f(\alpha) \in V_{\varepsilon}$, so that $v_{\varepsilon}=f^{-1}\left(V_{\varepsilon}\right)$. Thus $\alpha \in v_{0} \Leftrightarrow f(\alpha) \in V_{0} \Leftrightarrow f(\alpha) \in V_{0} \backslash V_{1} \subseteq C_{\xi}^{0} \subseteq D$ since $v_{0}$ is disjoint from $v_{1}$. Similarly, $\alpha \in v_{1} \Leftrightarrow f(\alpha) \in V_{1} \backslash V_{0} \subseteq C_{\xi}^{1} \subseteq \neg D$. Thus $f^{-1}(D)$ separates $v_{0}$ from $v_{1}$. As $f^{-1}(D) \in \Delta_{\xi}^{0}$, this implies that $\Sigma_{\xi}^{0}$ has the separation property, which contradicts 22.C in [K].

## 4 The proof of Theorem 1.8 for the Borel classes

The full versions of Theorem 1.8 and Corollary 1.9 for the Borel classes are as follows:
Theorem 4.1 Let $T_{d}$ be a tree with suitable levels, $1 \leq \xi<\omega_{1},\left(X_{i}\right)_{i \in d}$ a sequence of Polish spaces, and $A_{0}, A_{1}$ disjoint analytic subsets of $\Pi_{i \in d} X_{i}$.
(1) Let $S \in \boldsymbol{\Sigma}_{\xi}^{0}\left(\left\lceil T_{d}\right\rceil\right)$. Then one of the following holds:
(a) The set $A_{0}$ is separable from $A_{1}$ by a pot $\left(\boldsymbol{\Pi}_{\xi}^{0}\right)$ set.
(b) The inequality $\left(\left(d^{\omega}\right)_{i \in d}, S,\left\lceil T_{d}\right\rceil \backslash S\right) \leq\left(\left(X_{i}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds.

If we moreover assume that $S$ is not separable from $\left\lceil T_{d}\right\rceil \backslash S$ by a pot $\left(\boldsymbol{\Pi}_{\xi}^{0}\right)$ set, then this is a dichotomy.
(2) Let $S^{0}, S^{1} \in \boldsymbol{\Sigma}_{\xi}^{0}\left(\left\lceil T_{d}\right\rceil\right)$ disjoint. Then one of the following holds:
(a) The set $A_{0}$ is separable from $A_{1}$ by $\operatorname{apot}\left(\Delta_{\xi}^{0}\right)$ set.
(b) The inequality $\left(\left(d^{\omega}\right)_{i \in d}, S^{0}, S^{1}\right) \leq\left(\left(X_{i}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds. If we moreover assume that $S^{0}$ is not separable from $S^{1}$ by a pot $\left(\Delta_{\xi}^{0}\right)$ set, then this is a dichotomy.

Corollary 4.2 Let $\boldsymbol{\Gamma}$ be Borel class. Then there are Borel subsets $\mathbb{S}^{0}, \mathbb{S}^{1}$ of $\left(d^{\omega}\right)^{d}$ such that for any sequence of Polish spaces $\left(X_{i}\right)_{i \in d}$, and for any disjoint analytic subsets $A_{0}, A_{1}$ of $\Pi_{i \in d} X_{i}$, exactly one of the following holds:
(a) The set $A_{0}$ is separable from $A_{1}$ by a pot $(\boldsymbol{\Gamma})$ set.
(b) The inequality $\left(\left(d^{\omega}\right)_{i \in d}, \mathbb{S}^{0}, \mathbb{S}^{1}\right) \leq\left(\left(X_{i}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds.

### 4.1 Acyclicity

In this subsection we prove a result that will be used later to show Theorem 4.1. This is the place where the essence of the notion of a finite one-sided almost acyclic set is really used.

Lemma 4.1.1 Assume that $\mathcal{T} \subseteq \mathcal{X}^{d}$ is finite. Then the following are equivalent:
(a) The set $\mathcal{T}$ is one-sided and almost acyclic.
(b) For each $\overrightarrow{x^{0}} \in \mathcal{T}$, there is an integer $0 \neq \mathcal{L}<d+2$ and a partition $\left(M_{j}\right)_{j \in \mathcal{L}}$ of $\mathcal{T} \backslash\left\{\overrightarrow{x^{\overrightarrow{0}}}\right\}$ with
(1) $\forall i \in d \forall j \neq k \in \mathcal{L} \quad \Pi_{i}\left[M_{j}\right] \cap \Pi_{i}\left[M_{k}\right]=\emptyset$.
(2) $\forall i \in d \forall j \in \mathcal{L} \forall \vec{x} \in M_{j} x_{i}=x_{i}^{0} \Rightarrow i=j$.

Proof. (a) $\Rightarrow$ (b) If $\vec{y} \neq \vec{z} \in \mathcal{T}$ and $\left(\overrightarrow{y^{j}}\right)_{j \leq l}$ is a walk in $G^{\mathcal{T}}$ with $\overrightarrow{y^{0}}=\vec{y}$ and $\overrightarrow{y^{l}}=\vec{z}$, then we choose such a walk of minimal length, and we call it $w_{\vec{y}, \vec{z}}$. We will define a partition of $\mathcal{T}$. We put, for $j \in d$,

$$
\begin{aligned}
N & :=\left\{\vec{x} \in \mathcal{T} \mid \vec{x} \neq \overrightarrow{x^{0}} \wedge w_{\vec{x}, \overrightarrow{x^{0}}} \text { does not exist }\right\}, \\
L_{j} & \left.:=\left\{\vec{x} \in \mathcal{T} \mid \vec{x} \neq \overrightarrow{x^{0}} \wedge\left(w_{\vec{x}, \overrightarrow{x^{0}}}\left|w_{\vec{x}, x^{0}}\right|-2\right)\right)_{j}=x_{j}^{0}\right\} .
\end{aligned}
$$

So we defined a partition $\left(N,\left(L_{j}\right)_{j \in d}\right)$ of $\mathcal{T} \backslash\left\{\overrightarrow{x^{6}}\right\}$ since $\mathcal{T}$ is one-sided. As $\mathcal{T}$ is finite, there is $j_{0} \in d$ minimal such that $L_{j}=\emptyset$ if $j>j_{0}$. We set $M_{j}:=L_{j}$ if $j \leq j_{0}, M_{j_{0}+1}:=N$ and $\mathcal{L}:=j_{0}+2$.
(1) Let us prove that $\Pi_{i}\left[L_{j}\right] \cap \Pi_{i}[N]=\emptyset$, for each $i, j \in d$. We argue by contradiction. This gives $x_{i} \in \Pi_{i}\left[L_{j}\right] \cap \Pi_{i}[N], \vec{x} \in L_{j}$, and also $\vec{y} \in N$ such that $x_{i}=y_{i}$. As $\vec{x}, \vec{y} \in \mathcal{T}$ and $L_{j} \cap N=\emptyset, \vec{x} \neq \vec{y}$ and $\vec{x}, \vec{y}$ are $G^{\mathcal{T}}$-related. Note that $w_{\vec{y}, \overrightarrow{x^{0}}}$ does not exist, and that $w_{\vec{x}, \vec{x}^{\text {b }}}$ exists. Now the sequence $\left(\vec{y}, \vec{x}, \ldots, \overrightarrow{x^{0}}\right)$ shows the existence of $w_{\vec{y}, \overrightarrow{x^{0}}}$, which is absurd.

It remains to see that $\Pi_{i}\left[L_{j}\right] \cap \Pi_{i}\left[L_{k}\right]=\emptyset$, for each $i, j, k \in d$ with $j \neq k$. We argue by contradiction. This gives $x_{i} \in \Pi_{i}\left[L_{j}\right] \cap \Pi_{i}\left[L_{k}\right], \vec{x} \in L_{j}$, and also $\vec{y} \in L_{k}$ such that $x_{i}=y_{i}$. As $\vec{x}, \vec{y} \in \mathcal{T}$ and $j \neq k$, $\vec{x} \neq \vec{y}$ and $\vec{x}, \vec{y}$ are $G^{\mathcal{T}}$-related. Let us denote $w_{\vec{x}, \overrightarrow{x^{0}}}:=\left(\overrightarrow{z^{n}}\right)_{n \leq l+1}$ and $w_{\vec{y}, \overrightarrow{x^{0}}}:=\left(\overrightarrow{y^{n}}\right)_{n \leq l^{\prime}+1}$. Note that $\overrightarrow{z^{l}} \neq \overrightarrow{y^{l^{\prime}}}$ since $z_{j}^{l}=x_{j}^{0}$ and $y_{j}^{l^{\prime}} \neq x_{j}^{0}$, since otherwise $\overrightarrow{y^{l^{\prime}}}, \overrightarrow{x^{0}} \in \mathcal{T}, \overrightarrow{y^{l^{\prime}}} \neq \overrightarrow{x^{0}}$ and $y_{j}^{l^{\prime}}=x_{j}^{0}, y_{k}^{l^{\prime}}=x_{k}^{0}$, which contradicts the fact that $\mathcal{T}$ is one-sided.

We denote by $W:=\left(\overrightarrow{w^{h}}\right)_{n \leq L}$ the following $G^{\mathcal{T}}$-walk: $\overrightarrow{z^{l}}, \overrightarrow{z^{l-1}}, \ldots, \overrightarrow{z^{0}}, \overrightarrow{y^{0}}, \overrightarrow{y^{1}}, \ldots, \overrightarrow{y^{l^{\prime}}}$. If there are $k<n \leq L$ with $\overrightarrow{w^{k}}=\overrightarrow{w^{n}}$, then we put $W^{\prime}:=\overrightarrow{w^{b}}, \ldots, \overrightarrow{w^{k}}, \overrightarrow{w^{n+1}}, \ldots, \overrightarrow{w^{L}}$. If we iterate this construction, then we get a $G^{\mathcal{T}}$-walk without repetition $V:=\left(\overrightarrow{v^{n}}\right)_{n \leq L^{\prime}}$ from $\overrightarrow{w^{0}}$ to $\overrightarrow{w^{L}}$.

If there are $i \in d$ and $k+1<n \leq L^{\prime}$ with $v_{i}^{k}=v_{i}^{n}$, then we put $V^{\prime}:=\overrightarrow{v^{0}}, \ldots, \overrightarrow{v^{k}}, \overrightarrow{v^{n}}, \ldots, \overrightarrow{v^{L^{\prime}}}$. If we iterate this construction, then we get a $G^{\mathcal{T}}$-walk without repetition $U:=\left(\overrightarrow{u^{h}}\right)_{n \leq L^{\prime \prime}}$ from $\overrightarrow{w^{0}}$ to $\overrightarrow{w^{L}}$ for which it is not possible to find $i \in d$ and $k+1<n \leq L^{\prime \prime}$ with $u_{i}^{k}=u_{i}^{n}$.

Now $\overrightarrow{x^{0}}, \overrightarrow{u^{0}}, \ldots, \overrightarrow{u^{L^{\prime \prime}}}, \overrightarrow{x^{0}}$ is a $G^{\mathcal{T}}$-cycle contradicting the almost acyclicity of $\mathcal{T}$.
(2) If $\vec{x} \in N$, then $w_{\vec{x}, \overrightarrow{x^{0}}}$ does not exist. This implies that $x_{i} \neq x_{i}^{0}$ for each $i \in d$, since otherwise $\vec{x}$ and $\overrightarrow{x^{0}}$ would be $G^{\mathcal{T}}$-related, which contradicts the non-existence of $w_{\vec{x}, \overrightarrow{x^{0}}}$.

If $\vec{x} \in L_{j}$, then $i$ is the only coordinate for which $x_{i}=x_{i}^{0}$ since $\mathcal{T}$ is one-sided. Note that $w_{\vec{x}, \overrightarrow{x^{0}}}=\left(\vec{x}, \overrightarrow{x^{0}}\right)$. As $\vec{x} \in L_{j}$, we get $\left(w_{\vec{x}, \vec{x}^{0}}\left(\left|w_{\vec{x}, \overrightarrow{x^{0}}}\right|-2\right)\right)_{j}=x_{j}^{0}$. But $w_{\vec{x}, \overrightarrow{x^{0}}}\left(\left|w_{\vec{x}, x^{0}}\right|-2\right)=\vec{x}$. Thus $x_{j}=x_{j}^{0}$ and $i=j$.
(b) $\Rightarrow$ (a) Let $\overrightarrow{x^{0}} \neq \vec{x} \in \mathcal{T}, i, j \in d$ such that $x_{i}^{0}=x_{i}$ and $x_{j}^{0}=x_{j}$, and $k \in \mathcal{L}$ such that $\vec{x} \in M_{k}$. By (2) we get $i=k=j$ and $\mathcal{T}$ is one-sided. Now consider a $G^{\mathcal{T}}$-cycle $\left(\overrightarrow{x^{n}}\right)_{n \leq L}$. By (1) there is $j \in \mathcal{L}$ such that $\overrightarrow{x^{n}} \in M_{j}$ for each $0<n<L$. Then by (2) we get $x_{j}^{0}=x_{j}^{1}=x_{j}^{L-1}$ and $\mathcal{T}$ is almost acyclic.

Definition 4.1.2 and Lemma 4.1.3 below are essentially due to G. Debs (see Subsection 2.1 in [L7]):

Definition 4.1.2 (Debs) Let $\Theta: \mathcal{X}^{d} \rightarrow 2^{\left(\omega^{\omega}\right)^{d}}, \mathcal{T} \subseteq \mathcal{X}^{d}$. We say that the map $\theta=\Pi_{i \in d} \theta_{i} \in\left(\left(\omega^{\omega}\right)^{\mathcal{X}}\right)^{d}$ is a $\pi$-selector on $\mathcal{T}$ for $\Theta$ if
(a) $\theta(\vec{x})=\left(\theta_{i}\left(x_{i}\right)\right)_{i \in d}$ for each $\vec{x} \in \mathcal{X}^{d}$.
(b) $\theta(\vec{x}) \in \Theta(\vec{x})$ for each $\vec{x} \in \mathcal{T}$.

Lemma 4.1.3 (Debs) Let $l$ be an integer, $\mathcal{X}:=d^{l+1}, \mathcal{T} \subseteq \mathcal{X}^{d}$ be $\Delta_{1}^{1}$, finite, one-sided, and almost acyclic, $\Theta: \mathcal{X}^{d} \rightarrow \Sigma_{1}^{1}\left(\left(\omega^{\omega}\right)^{d}\right)$, and $\bar{\Theta}: \mathcal{X}^{d} \rightarrow \Sigma_{1}^{1}\left(\left(\omega^{\omega}\right)^{d}\right)$ defined by $\bar{\Theta}(\vec{x}):=\overline{\Theta(\vec{x})^{r_{1}}}$. Then $\Theta$ admits a $\pi$-selector on $\mathcal{T}$ if $\bar{\Theta}$ does.

Proof. (a) Let $\overrightarrow{x^{b}} \in \mathcal{T}$, and $\Psi: \mathcal{X}^{d} \rightarrow \Sigma_{1}^{1}\left(\left(\omega^{\omega}\right)^{d}\right)$. We assume that $\Psi(\vec{x})=\Theta(\vec{x})$ if $\vec{x} \neq \overrightarrow{x^{0}}$, and that $\Psi\left(\overrightarrow{x^{0}}\right) \subseteq{\overline{\Theta\left(\overrightarrow{x^{0}}\right)}}^{\tau_{1}}$. We first prove that $\Theta$ admits a $\pi$-selector on $\mathcal{T}$ if $\Psi$ does.

- Lemma 4.1.1 gives a finite partition $\left(M_{j}\right)_{j \in \mathcal{L}}$ of $\mathcal{T} \backslash\left\{\overrightarrow{x^{0}}\right\}$. Fix a $\pi$-selector $\tilde{\psi}$ on $\mathcal{T}$ for $\Psi$, and let $M:=\max (d \cap \mathcal{L})$. We define $\Sigma_{1}^{1}$ sets $U_{i}$, for $i \leq M$, by

$$
U_{i}:=\left\{\alpha \in \omega^{\omega} \mid \exists \psi \in\left(\left(\omega^{\omega}\right)^{\mathcal{X}}\right)^{d} \alpha=\psi_{i}\left(x_{i}^{0}\right) \wedge \forall \vec{x} \in \mathcal{T} \quad \psi(\vec{x}) \in \Psi(\vec{x})\right\} .
$$

As $\tilde{\psi}\left(\overrightarrow{x^{\delta}}\right)=\left(\tilde{\psi}_{i}\left(x_{i}^{0}\right)\right)_{i \in d} \in \Psi\left(\overrightarrow{x^{0}}\right) \cap\left(\left(\Pi_{i \leq M} U_{i}\right) \times\left(\omega^{\omega}\right)^{d-M-1}\right)$ we get

$$
\emptyset \neq \Psi\left(\overrightarrow{x^{6}}\right) \cap\left(\left(\Pi_{i \leq M} U_{i}\right) \times\left(\omega^{\omega}\right)^{d-M-1}\right) \subseteq{\overline{\Theta\left(\overrightarrow{x^{6}}\right)}}^{\tau_{1}} \cap\left(\left(\Pi_{i \leq M} U_{i}\right) \times\left(\omega^{\omega}\right)^{d-M-1}\right) .
$$

By the separation theorem this implies that $\Theta\left(\overrightarrow{x^{\delta}}\right) \cap\left(\left(\Pi_{i \leq M} U_{i}\right) \times\left(\omega^{\omega}\right)^{d-M-1}\right)$ is not empty and contains some point $\vec{\alpha}$. Fix $i \leq M$. As $\alpha_{i} \in U_{i}$ there is $\psi^{i} \in\left(\left(\omega^{\omega}\right)^{\mathcal{X}}\right)^{d}$ such that $\alpha_{i}=\psi_{i}^{i}\left(x_{i}^{0}\right)$ and $\psi^{i}(\vec{x}) \in \Psi(\vec{x})$ if $\vec{x} \in \mathcal{T}$.

- Now we can define $\theta_{i}: \mathcal{X} \rightarrow \omega^{\omega}$, for each $i \in d$. We put

$$
\theta_{i}\left(x_{i}\right):=\left\{\begin{array}{l}
\alpha_{i} \text { if } x_{i}=x_{i}^{0}, \\
\psi_{i}^{j}\left(x_{i}\right) \text { if } x_{i} \in \Pi_{i}\left[M_{j}\right] \backslash\left\{x_{i}^{0}\right\} \wedge j \leq M, \\
\psi_{i}^{0}\left(x_{i}\right) \text { otherwise. }
\end{array}\right.
$$

Then we set $\theta(\vec{x})(i):=\theta_{i}\left(x_{i}\right)$ if $i \in d$.

- It remains to see that $\theta(\vec{x}) \in \Theta(\vec{x})$ for each $\vec{x} \in \mathcal{T}$.

Note that $\theta\left(\overrightarrow{x^{0}}\right)=\vec{\alpha} \in \Theta\left(\overrightarrow{x^{b}}\right)$. So we may assume that $\vec{x} \neq \overrightarrow{x^{b}}$. So let $j \in \mathcal{L}$ with $\vec{x} \in M_{j}$.

- If $x_{i} \neq x_{i}^{0}$ for each $i \in d$ and $j \leq M$, then $\theta(\vec{x})=\left(\theta_{i}\left(x_{i}\right)\right)_{i \in d}=\psi^{j}(\vec{x}) \in \Psi(\vec{x})=\Theta(\vec{x})$.
- Similarly, if $x_{i} \neq x_{i}^{0}$ for each $i \in d$ and $j>M$, then $\theta(\vec{x})=\left(\theta_{i}\left(x_{i}\right)\right)_{i \in d}=\psi^{0}(\vec{x}) \in \Psi(\vec{x})=\Theta(\vec{x})$.
- If $x_{i}=x_{i}^{0}$ for some $i \in d$, then $i=j \leq M$. This implies that $\theta_{j}\left(x_{j}\right)=\alpha_{j}=\psi_{j}^{j}\left(x_{j}^{0}\right)=\psi_{j}^{j}\left(x_{j}\right)$ and

$$
\theta(\vec{x})=\left(\theta_{i}\left(x_{i}\right)\right)_{i \in d}=\psi^{j}(\vec{x}) \in \Psi(\vec{x})=\Theta(\vec{x}) .
$$

(b) Write $\mathcal{T}:=\left\{\overrightarrow{x^{1}}, \ldots, \overrightarrow{x^{n}}\right\}$, and set $\Psi_{0}:=\bar{\Theta}$. We define $\Psi_{j+1}: \mathcal{X}^{d} \rightarrow \Sigma_{1}^{1}\left(\left(\omega^{\omega}\right)^{d}\right)$ as follows. We put $\Psi_{j+1}(\vec{x}):=\Psi_{j}(\vec{x})$ if $\vec{x} \neq \overrightarrow{x^{j+1}}$, and $\Psi_{j+1}\left(\overrightarrow{x^{j+1}}\right):=\Theta\left(\overrightarrow{x^{j+1}}\right)$, for $j<n$. The result now follows from an iterative application of (a).

### 4.2 The topologies

In this subsection we prove two other results that will be used to show Theorem 4.1. We use tools of effective descriptive set theory (the reader should see [M] for the basic notions). We first recall a classical result in the spirit of Theorem 3.3.1 in [H-K-Lo].

Notation. Let $X$ be a recursively presented Polish space. Using the bijection between $\omega$ and $\omega^{2}$ defined before Definition 2.1, we can build a bijection $\left(x_{n}\right) \mapsto<x_{n}>$ between $\left(X^{\omega}\right)^{\omega}$ and $X^{\omega}$ by the formula $\left.<x_{n}\right\rangle(l):=x_{(l)_{0}}\left((l)_{1}\right)$. The inverse map $x \mapsto\left((x)_{n}\right)$ is given by $(x)_{n}(p):=x(<n, p>)$. These bijections are recursive.

Lemma 4.2.1 Let $X$ be a recursively presented Polish space. Then there are $\Pi_{1}^{1}$ sets $W^{X} \subseteq \omega^{\omega}$, $C^{X} \subseteq \omega^{\omega} \times X$ with $\left\{(\alpha, x) \in \omega^{\omega} \times X \mid \alpha \in W^{X}\right.$ and $\left.x \notin C_{\alpha}^{X}\right\} \in \Pi_{1}^{1}, \Delta_{1}^{1}(X)=\left\{C_{\alpha}^{X} \mid \alpha \in \Delta_{1}^{1} \cap W^{X}\right\}$, and $\Delta_{1}^{1}(X)=\left\{C_{\alpha}^{X} \mid \alpha \in W^{X}\right\}$.

Proof. By 3E.2, 3F. 6 and 3H. 1 in $[\mathrm{M}]$, there is $\mathcal{U}^{X} \in \Pi_{1}^{1}\left(\omega^{\omega} \times X\right)$ which is universal for $\Pi_{1}^{1}(X)$ and satisfies the two following properties:

- A subset $P$ of $X$ is $\Pi_{1}^{1}$ if and only if there is $\alpha \in \omega^{\omega}$ recursive with $P=\mathcal{U}_{\alpha}^{X}$.
- There is $S^{X}: \omega^{\omega} \times \omega^{\omega} \rightarrow \omega^{\omega}$ recursive such that $(\alpha, \beta, x) \in \mathcal{U}^{\omega^{\omega} \times X} \Leftrightarrow\left(S^{X}(\alpha, \beta), x\right) \in \mathcal{U}^{X}$.

We set, for $\varepsilon \in 2, U_{\varepsilon}:=\left\{(\alpha, x) \in \omega^{\omega} \times X \mid\left((\alpha)_{\varepsilon}, x\right) \in \mathcal{U}^{X}\right\}$. Then $U_{\varepsilon} \in \Pi_{1}^{1}$. By 4B. 10 in [M], $\Pi_{1}^{1}$ has the reduction property, which gives $U_{0}^{\prime}, U_{1}^{\prime} \in \Pi_{1}^{1}$ disjoint with $U_{\varepsilon}^{\prime} \subseteq U_{\varepsilon}$ and $U_{0}^{\prime} \cup U_{1}^{\prime}=U_{0} \cup U_{1}$. We set $W^{X}:=\left\{\alpha \in \omega^{\omega} \mid\left(U_{0}^{\prime}\right)_{\alpha} \cup\left(U_{1}^{\prime}\right)_{\alpha}=X\right\}$ and $C^{X}:=U_{0}^{\prime}$, which defines $\Pi_{1}^{1}$ sets. Moreover,

$$
\alpha \in W^{X} \wedge x \notin C_{\alpha}^{X} \Leftrightarrow \alpha \in W^{X} \wedge(\alpha, x) \in U_{1}^{\prime}
$$

is $\Pi_{1}^{1}$ in $(\alpha, x)$. Assume that $A \in \Delta_{1}^{1}(X)$, which gives $\alpha_{0}, \alpha_{1} \in \omega^{\omega}$ recursive with $A=\mathcal{U}_{\alpha_{0}}^{X}$ (resp., $\left.\neg A=\mathcal{U}_{\alpha_{1}}^{X}\right)$. We define $\alpha \in \omega^{\omega}$ by $(\alpha)_{\varepsilon}:=\alpha_{\varepsilon}$, so that $\alpha$ is recursive. We get

$$
\begin{aligned}
& x \in A \Leftrightarrow\left(\alpha_{0}, x\right) \in \mathcal{U}^{X} \Leftrightarrow(\alpha, x) \in U_{0} \Leftrightarrow(\alpha, x) \in U_{0} \backslash U_{1} \Leftrightarrow(\alpha, x) \in U_{0}^{\prime}, \\
& x \notin A \Leftrightarrow\left(\alpha_{1}, x\right) \in \mathcal{U}^{X} \Leftrightarrow(\alpha, x) \in U_{1} \Leftrightarrow(\alpha, x) \in U_{1} \backslash U_{0} \Leftrightarrow(\alpha, x) \in U_{1}^{\prime},
\end{aligned}
$$

so that $\alpha \in W^{X}$ and $C_{\alpha}^{X}=A$. This also proves that $\Delta_{1}^{1}(X) \subseteq\left\{C_{\alpha}^{X} \mid \alpha \in W^{X}\right\}$.
Conversely, let $\alpha \in \Delta_{1}^{1} \cap W^{X}$. Then $C_{\alpha}^{X} \in \Pi_{1}^{1}$, and $x \notin C_{\alpha}^{X} \Leftrightarrow \alpha \in W^{X}$ and $x \notin C_{\alpha}^{X}$, so that $\neg C_{\alpha}^{X} \in \Pi_{1}^{1}$ and $C_{\alpha}^{X} \in \Delta_{1}^{1}$. Note that this also proves that $\Delta_{1}^{1}(X) \supseteq\left\{C_{\alpha}^{X} \mid \alpha \in W^{X}\right\}$.

We now give some notation to state an effective version of Theorem 4.1.
Notation. Let $X$ be a recursively presented Polish space.

- We will use the Gandy-Harrington topology $\Sigma_{X}$ on $X$ generated by $\Sigma_{1}^{1}(X)$. Recall that the set $\Omega_{X}:=\left\{x \in X \mid \omega_{1}^{x}=\omega_{1}^{\mathrm{CK}}\right\}$ is Borel and $\Sigma_{1}^{1}$, that $\left(\Omega_{X}, \Sigma_{X}\right)$ is a 0 -dimensional Polish space (the intersection of $\Omega_{X}$ with any nonempty $\Sigma_{1}^{1}$ set is a nonempty clopen subset of $\left(\Omega_{X}, \Sigma_{X}\right)$ ) (see [L8]).
- Recall the topology $\tau_{1}$ defined before Theorem 1.9. We will also consider some topologies between $\tau_{1}$ and $\Sigma_{\left(\omega^{\omega}\right) d}$. Let $2 \leq \xi<\omega_{1}^{\mathrm{CK}}$. The topology $\tau_{\xi}$ is generated by $\Sigma_{1}^{1}\left(\left(\omega^{\omega}\right)^{d}\right) \cap \boldsymbol{\Pi}_{<\xi}^{0}\left(\tau_{1}\right)$. We have $\boldsymbol{\Sigma}_{1}^{0}\left(\tau_{\xi}\right) \subseteq \boldsymbol{\Sigma}_{\xi}^{0}\left(\tau_{1}\right)$, so that $\boldsymbol{\Pi}_{1}^{0}\left(\tau_{\xi}\right) \subseteq \boldsymbol{\Pi}_{\xi}^{0}\left(\tau_{1}\right)$. These topologies are similar to the ones considered in [Lo2] (see Definition 1.5).
- We set $\operatorname{pot}\left(\boldsymbol{\Pi}_{0}^{0}\right):=\left\{\Pi_{i \in d} A_{i} \mid A_{i} \in \boldsymbol{\Delta}_{1}^{1}\left(\omega^{\omega}\right)\right.$, and $A_{i}=\omega^{\omega}$ for almost every $\left.i \in d\right\}$. We also set $W:=W^{\left(\omega^{\omega}\right)^{d}}$ and $C:=C^{\left(\omega^{\omega}\right)^{d}}$ (see Lemma 4.2.1). We will define specifically, for $\xi<\omega_{1}$,

$$
\left\{(\beta, \gamma) \in \omega^{\omega} \times W \mid \beta \operatorname{codes} \text { a } \operatorname{pot}\left(\Pi_{\xi}^{0}\right) \text { set and } C_{\gamma} \text { is the set coded by } \beta\right\} .
$$

The way we will do it is not the simplest possible (we can in fact forget $\beta$, and work with $\gamma$ integer instead of real, see [L7]). We do it this way to start to give the flavor of what is going on with the Wadge classes.

- To do this, we set

$$
\begin{aligned}
& V_{0}:=\left\{(\beta, \gamma) \in \omega^{\omega} \times W \mid \forall i<\beta(0)\left(\beta^{*}\right)_{i} \in W^{\omega^{\omega}} \wedge \gamma \in \Delta_{1}^{1}(\beta) \wedge\right. \\
& {\left[\begin{array}{c}
\beta(0)=d \wedge C_{\gamma}=\Pi_{i<\beta(0)} C_{\left(\beta^{*}\right)_{i}}^{\omega^{\omega}} \text { if } d<\omega \\
C_{\gamma}=\left(\Pi_{i<\beta(0)} C_{\left(\beta^{*}\right)_{i}}^{\omega^{\omega}}\right) \times\left(\omega^{\omega}\right)^{\omega} \text { if } d=\omega
\end{array}\right\} }
\end{aligned}
$$

We define an inductive operator $\Phi$ over $\omega^{\omega} \times \omega^{\omega}$ (see [C]) as follows:

$$
\begin{aligned}
& \Phi(A):=A \cup V_{0} \cup\left\{(\beta, \gamma) \in \omega^{\omega} \times W \mid \gamma \in \Delta_{1}^{1}(\beta) \wedge\right. \\
& \left.\exists \gamma^{\prime} \in \Delta_{1}^{1}(\beta) \forall n \in \omega \quad\left((\beta)_{n},\left(\gamma^{\prime}\right)_{n}\right) \in A \wedge \neg C_{\gamma}=\bigcup_{n \in \omega} C_{\left(\gamma^{\prime}\right)_{n}}\right\} .
\end{aligned}
$$

Then $\Phi$ is clearly a $\Pi_{1}^{1}$ monotone inductive operator. We set, for any ordinal $\xi, V_{\xi}:=\Phi^{\xi}$ (which is coherent with the definition of $V_{0}$ ). We also set $V_{<\xi}:=\bigcup_{\eta<\xi} V_{\eta}$. The effective version of Theorem 4.1, which is the specific version of Theorem 1.9 for the Borel classes, is as follows:

Theorem 4.2.2 Let $T_{d}$ be a tree with $\Delta_{1}^{1}$ suitable levels, $1 \leq \xi<\omega_{1}^{C K}$, and $A_{0}, A_{1}$ disjoint $\Sigma_{1}^{1}$ subsets of $\left(\omega^{\omega}\right)^{d}$.
(1) Assume that $S \in \boldsymbol{\Sigma}_{\xi}^{0}\left(\left\lceil T_{d}\right\rceil\right)$ is not separable from $\left\lceil T_{d}\right\rceil \backslash S$ by a pot $\left(\boldsymbol{\Pi}_{\xi}^{0}\right)$ set. Then the following are equivalent:
(a) The set $A_{0}$ is not separable from $A_{1}$ by a pot $\left(\boldsymbol{\Pi}_{\xi}^{0}\right)$ set.
(b) The set $A_{0}$ is not separable from $A_{1}$ by a $\Delta_{1}^{1} \cap \operatorname{pot}\left(\boldsymbol{\Pi}_{\xi}^{0}\right)$ set.
(c) $\neg\left(\exists(\beta, \gamma) \in\left(\Delta_{1}^{1} \times \Delta_{1}^{1}\right) \cap V_{\xi} \quad A_{0} \subseteq C_{\gamma} \subseteq \neg A_{1}\right)$.
(d) The set $A_{0}$ is not separable from $A_{1}$ by a $\Pi_{\xi}^{0}\left(\tau_{1}\right)$ set.
(e) ${\overline{A_{0}}}^{\tau \xi} \cap A_{1} \neq \emptyset$.
(f) The inequality $\left(\left(d^{\omega}\right)_{i \in d}, S,\left\lceil T_{d}\right\rceil \backslash S\right) \leq\left(\left(\omega^{\omega}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds.
(2) The sets $V_{\xi}$ and $V_{<\xi}$ are $\Pi_{1}^{1}$.
(3) Assume that $S^{0}, S^{1} \in \boldsymbol{\Sigma}_{\xi}^{0}\left(\left\lceil T_{d}\right\rceil\right)$ are disjoint and not separable by a $\operatorname{pot}\left(\boldsymbol{\Delta}_{\xi}^{0}\right)$ set. Then the following are equivalent:
(a) The set $A_{0}$ is not separable from $A_{1}$ by a $\operatorname{pot}\left(\boldsymbol{\Delta}_{\xi}^{0}\right)$ set.
(b) The set $A_{0}$ is not separable from $A_{1}$ by a $\Delta_{1}^{1} \cap \operatorname{pot}\left(\Delta_{\xi}^{0}\right)$ set.
(c) $\neg\left(\exists(\beta, \gamma),\left(\beta^{\prime}, \gamma^{\prime}\right) \in\left(\Delta_{1}^{1} \times \Delta_{1}^{1}\right) \cap V_{\xi} C_{\gamma^{\prime}}=\neg C_{\gamma}\right.$ and $\left.A_{0} \subseteq C_{\gamma} \subseteq \neg A_{1}\right)$.
(d) The set $A_{0}$ is not separable from $A_{1}$ by a $\Delta_{\xi}^{0}\left(\tau_{1}\right)$ set.
(e) ${\overline{A_{0}}}^{\tau_{\xi}} \cap{\overline{A_{1}}}^{\tau_{\xi}} \neq \emptyset$.
(f) The inequality $\left(\left(d^{\omega}\right)_{i \in d}, S^{0}, S^{1}\right) \leq\left(\left(\omega^{\omega}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds.

The proofs of Theorems 4.1 and 4.2 .2 will be by induction on $\xi$. This appears in the statement of the following lemma.

Lemma 4.2.3 (1) The set $V_{0}$ is $\Pi_{1}^{1}$.
(2) Let $1 \leq \xi<\omega_{1}^{C K}$. We assume that Theorem 4.2 .2 is proved for $\eta<\xi$.
(a) The set $V_{<\xi}$ is $\Pi_{1}^{1}$.
(b) Fix $A \in \Sigma_{1}^{1}\left(\left(\omega^{\omega}\right)^{d}\right)$. Then $\bar{A}^{\tau_{\xi}} \in \Sigma_{1}^{1}\left(\left(\omega^{\omega}\right)^{d}\right)$.
(c) Let $n \geq 1,1 \leq \xi_{1}<\xi_{2}<\ldots<\xi_{n} \leq \xi$, and $S_{1}, \ldots, S_{n}$ be $\Sigma_{1}^{1}$ sets. Assume that $S_{i} \subseteq{\overline{S_{i+1}}}^{\tau} \xi_{\xi_{i}+1}$ for $1 \leq i<n$. Then $S_{n} \cap \bigcap_{1 \leq i<n}{\overline{S_{i}}}^{{ }^{\xi_{i}}}$ is $\tau_{1}$-dense in ${\overline{S_{1}}}^{{ }_{1}}$.

Proof. (1) The set $V_{0}$ is clearly $\Pi_{1}^{1}$.
(2).(a) The proof is contained in the proof of Theorem 4.1 in [L7]. It is a consequence of Lemma 4.8 in [C].
(b) The proof is essentially the proof of Lemma 2.2.2.(a) in [L7].
(c) The proof is essentially the proof of Lemma 2.2.2.(b) in [L7].

Lemma 4.2.4 Let $S, T \in \Sigma_{1}^{1}\left(\left(\omega^{\omega}\right)^{d}\right)$ such that $S$ is $\tau_{1}$-dense in $T,\left(X_{i}\right)_{i \in d}$ a sequence of $\Sigma_{1}^{1}$ subsets of $\omega^{\omega}$ such that $X_{i}=\omega^{\omega}$ if $i \geq i_{0}$. Then $S \cap\left(\Pi_{i \in d} X_{i}\right)$ is $\tau_{1}$-dense in $T \cap\left(\Pi_{i \in d} X_{i}\right)$.

Proof. Let $\left(\Delta_{i}\right)_{i \in d}$ be a sequence of $\Delta_{1}^{1}$ subsets of $\omega^{\omega}$ such that $\Delta_{i}=\omega^{\omega}$ if $i \geq j_{0} \geq i_{0}$, and also $T \cap\left(\Pi_{i \in d} I_{i}\right) \neq \emptyset$, where $I_{i}:=X_{i} \cap \Delta_{i}$. We have to see that $S \cap\left(\Pi_{i \in d} I_{i}\right) \neq \emptyset$. We argue by contradiction. This gives a sequence $\left(D_{i}\right)_{i \in d}$ of $\Delta_{1}^{1}$ subsets of $\omega^{\omega}$ such that $I_{i} \subseteq D_{i}$ if $i \in d$, and $S \cap\left(\Pi_{i \in d} D_{i}\right)=\emptyset$, by $j_{0}$ applications of the separation theorem. But $T \cap\left(\Pi_{i \in d} D_{i}\right) \neq \emptyset$, and $D_{i}=\omega^{\omega}$ if $i \geq j_{0}$. So $S \cap\left(\Pi_{i \in d} D_{i}\right) \neq \emptyset$, by $\tau_{1}$-density of $S$ in $T$, which is absurd.

### 4.3 Representation of Borel sets

Now we come to the representation theorem of Borel sets by G. Debs and J. Saint Raymond (see [D-SR]). It specifies the classical result of Lusin asserting that any Borel set in a Polish space is the bijective continuous image of a closed subset of the Baire space. The material in this Subsection can be found in Subsection 2.3 of [L7], but we recall most of it since it will be used iteratively in the case of Wadge classes. The following definition can be found in [D-SR].

Definition 4.3.1 (Debs-Saint Raymond) Let c be a countable set. A partial order relation $R$ on $c^{<\omega}$ is a tree relation if, for $t \in c^{<\omega}$,
(a) $\emptyset R t$.
(b) The set $P_{R}(t):=\left\{s \in c^{<\omega} \mid s R t\right\}$ is finite and linearly ordered by $R$.

For instance, the non strict extension relation $\subseteq$ is a tree relation.

- Let $R$ be a tree relation. An $R$-branch is an $\subseteq$-maximal subset of $c^{<\omega}$ linearly ordered by $R$. We denote by $[R]$ the set of all infinite $R$-branches.

We equip $\left(c^{<\omega}\right)^{\omega}$ with the product of the discrete topology on $c^{<\omega}$. If $R$ is a tree relation, then the space $[R] \subseteq\left(c^{<\omega}\right)^{\omega}$ is equipped with the topology induced by that of $\left(c^{<\omega}\right)^{\omega}$. The map $h: c^{\omega} \rightarrow[\subseteq]$ defined by $h(\gamma):=(\gamma \mid j)_{j \in \omega}$ is an homeomorphism.

- Let $R, S$ be tree relations with $R \subseteq S$. The canonical map $\Pi:[R] \rightarrow[S]$ is defined by

$$
\Pi(\mathcal{B}):=\text { the unique } S \text {-branch containing } \mathcal{B} \text {. }
$$

- Let $S$ be a tree relation. We say that $R \subseteq S$ is distinguished in $S$ if

$$
\left.\forall s, t, u \in c^{<\omega} \quad \begin{array}{c}
s S t S u \\
s R u
\end{array}\right\} \Rightarrow s R t
$$

For example, let $C$ be a closed subset of $c^{\omega}$, and define

$$
s R t \Leftrightarrow s \subseteq t \wedge N_{s} \cap C \neq \emptyset
$$

Then $R$ is distinguished in $\subseteq$.

- Let $\eta<\omega_{1}$. A family $\left(R^{(\rho)}\right)_{\rho \leq \eta}$ of tree relations is a resolution family if
(a) $R^{(\rho+1)}$ is a distinguished subtree of $R^{(\rho)}$, for all $\rho<\eta$.
(b) $R^{(\lambda)}=\bigcap_{\rho<\lambda} R^{(\rho)}$, for all limit $\lambda \leq \eta$.

We will use the following extension of the property of distinction:
Lemma 4.3.2 Let $\eta<\omega_{1},\left(R^{(\rho)}\right)_{\rho \leq \eta}$ a resolution family, and $\rho<\eta$. Assume that $s R^{(0)} s^{\prime} R^{(\rho)} s^{\prime \prime}$ and $s R^{(\rho+1)} s^{\prime \prime}$. Then $s R^{(\rho+1)} s^{\prime}$.

Notation. Let $\eta<\omega_{1},\left(R^{(\rho)}\right)_{\rho \leq \eta}$ a resolution family such that $R^{(0)}$ is a subrelation of $\subseteq, \rho \leq \eta$ and $t \in c^{<\omega} \backslash\{\emptyset\}$. We set

$$
t^{\rho}:=t \mid \max \left\{r<|t||t| r R^{(\rho)} t\right\}
$$

We enumerate $\left\{t^{\rho} \mid \rho \leq \eta\right\}$ by $\left\{t^{\xi_{i}} \mid 1 \leq i \leq n\right\}$, where $1 \leq n \in \omega$ and $\xi_{1}<\ldots<\xi_{n}=\eta$. We can write $t^{\xi_{n}} \subset_{\neq} t^{\xi_{n-1}} \subset_{\neq \cdots} \ldots \subset_{\neq} t^{\xi_{2}} \subset_{\neq} t^{\xi_{1}} \subset_{\neq} t$. By Lemma 4.3.2 we have $t^{\xi_{i+1}} R^{\left(\xi_{i}+1\right)} t^{\xi_{i}}$ for each $1 \leq i<n$.

Lemma 4.3.3 Let $\eta<\omega_{1},\left(R^{(\rho)}\right)_{\rho \leq \eta}$ a resolution family such that $R^{(0)}$ is a subrelation of $\subseteq$, $t$ in $c^{<\omega} \backslash\{\emptyset\}$ and $1 \leq i<n$.
(a) Set $\eta_{i}:=\left\{\rho \leq \eta \mid t^{\xi_{i}} \subseteq t^{\rho}\right\}$. Then $\eta_{i}$ is a successor ordinal.
(b) We may assume that $t^{\xi_{i}+1} \subset_{\neq} t^{\xi_{i}}$.

The following is part of Theorem I-6.6 in [D-SR].
Theorem 4.3.4 (Debs-Saint Raymond) Let $\eta<\omega_{1}, R$ a tree relation, $\left(I_{n}\right)_{n \in \omega}$ a sequence of $\boldsymbol{\Pi}_{\eta+1}^{0}$ subsets of $[R]$. Then there is a resolution family $\left(R^{(\rho)}\right)_{\rho \leq \eta}$ with
(a) $R^{(0)}=R$.
(b) The canonical map $\Pi:\left[R^{(\eta)}\right] \rightarrow[R]$ is a continuous bijection.
(c) The set $\Pi^{-1}\left(I_{n}\right)$ is a closed subset of $\left[R^{(\eta)}\right]$ for each integer $n$.

Now we come to the actual proof of Theorem 4.1.

### 4.4 Proof of Theorem 4.1

The next result is essentially Theorem 2.4.1 in [L7]. But we give its proof since it is the basis for further generalizations.

Theorem 4.4.1 $\mathrm{Let} T_{d}$ be a tree with $\Delta_{1}^{1}$ suitable levels, $\xi<\omega_{1}^{C K}$ a successor ordinal, $S \in \boldsymbol{\Sigma}_{\xi}^{0}\left(\left\lceil T_{d}\right\rceil\right)$, and $A_{0}, A_{1}$ disjoint $\Sigma_{1}^{1}$ subsets of $\left(\omega^{\omega}\right)^{d}$. We assume that Theorem 4.2.2 is proved for $\eta<\xi$. Then one of the following holds:
(a) ${\overline{A_{0}}}^{{ }^{\tau}} \cap A_{1}=\emptyset$.
(b) The inequality $\left(\left(\Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil\right)_{i \in d}, S,\left\lceil T_{d}\right\rceil \backslash S\right) \leq\left(\left(\omega^{\omega}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds.

Proof. Fix $\eta<\omega_{1}^{\mathrm{CK}}$ with $\xi=\eta+1$.

- Recall the finite sets $c_{l}$ defined at the end of the proof of Proposition 2.2 (we only used the fact that $T_{d}$ has finite levels to see that they are finite). With the notation of Definition 4.3.1, we put $c:=\bigcup_{l \in \omega} c_{l}$, so that $c$ is countable. The set $I:=h\left[\left[T_{d}\right\rceil \backslash S\right]$ is a $\Pi_{\eta+1}^{0}$ subset of $[\subseteq]$. Theorem 4.3.4 provides a resolution family. We put

$$
D:=\left\{\vec{s} \in T_{d} \mid \vec{s}=\vec{\emptyset} \vee \exists \mathcal{B} \in \Pi^{-1}(I) \vec{s} \in \mathcal{B}\right\}
$$

- Assume that ${\overline{A_{0}}}^{{ }^{\tau}} \cap A_{1}$ is not empty. Recall that $\left(\Omega_{X}, \Sigma_{X}\right)$ is a Polish space (see the notation at the beginning of Section 4.2). We fix a complete metric $d_{X}$ on $\left(\Omega_{X}, \Sigma_{X}\right)$.
- We construct
- $\left(\alpha_{s}^{i}\right)_{i \in d, s \in \Pi_{i}^{\prime \prime} T_{d}} \subseteq \omega^{\omega}$,
- $\left(O_{s}^{i}\right)_{i \leq|s|, i \in d, s \in \Pi_{i}^{\prime \prime} T_{d} \subseteq \Sigma_{1}^{1}\left(\omega^{\omega}\right), ~}^{\text {, }}$
$-\left(U_{\vec{s}}\right)_{\vec{s} \in T_{d}} \subseteq \Sigma_{1}^{1}\left(\left(\omega^{\omega}\right)^{d}\right)$.
We want these objects to satisfy the following conditions.
(1) $\alpha_{s}^{i} \in O_{s}^{i} \subseteq \Omega_{\omega^{\omega}} \wedge\left(\alpha_{s_{i}}^{i}\right)_{i \in d} \in U_{\vec{s}} \subseteq \Omega_{\left(\omega^{\omega}\right)}$,
(2) $O_{s q}^{i} \subseteq O_{s}^{i}$,
(3) $\operatorname{diam}_{d_{\omega} \omega}\left(O_{s}^{i}\right) \leq 2^{-|s|} \wedge \operatorname{diam}_{d_{\left(\omega^{\omega}\right) d} d}\left(U_{\vec{s}}\right) \leq 2^{-|\vec{s}|}$,
(4) $U_{\vec{s}} \subseteq{\overline{A_{0}}}^{{ }^{\tau} \xi} \cap A_{1}$ if $\vec{s} \in D$,
(5) $U_{\vec{s}} \subseteq A_{0}$ if $\vec{s} \notin D$,
(6) $\left(1 \leq \rho \leq \eta \wedge \vec{s} R^{(\rho)} \vec{t}\right) \Rightarrow U_{\vec{t}} \subseteq{\overline{U_{\vec{s}}}}^{\tau_{\rho}}$,
(7) $\left((\vec{s}, \vec{t} \in D \vee \vec{s}, \vec{t} \notin D) \wedge \vec{s} R^{(\eta)} \vec{t}\right) \Rightarrow U_{\vec{t}} \subseteq U_{\vec{s}}$.
- Let us prove that this construction is sufficient to get the theorem.
- Fix $\vec{\beta} \in\left\lceil T_{d}\right\rceil$. Then we can define $\left(j_{k}\right)_{k \in \omega}:=\left(j_{k}^{\vec{\beta}}\right)_{k \in \omega}$ by $\Pi^{-1}\left((\vec{\beta} \mid j)_{j \in \omega}\right)=\left(\vec{\beta} \mid j_{k}\right)_{k \in \omega}$, with the inequalities $j_{k}<j_{k+1}$. In particular, $\vec{\beta}\left|j_{k} R^{(\eta)} \vec{\beta}\right| j_{k+1}$. We have

$$
\vec{\beta} \notin S \Leftrightarrow h(\vec{\beta})=(\vec{\beta} \mid j)_{j \in \omega} \in I \Leftrightarrow\left(\vec{\beta} \mid j_{k}\right)_{k \in \omega} \in \Pi^{-1}(I) \Leftrightarrow \forall k \geq k_{0}:=0 \quad \vec{\beta} \mid j_{k} \in D
$$

since $\Pi^{-1}(I)$ is a closed subset of $\left[R^{(\eta)}\right]$. Similarly, $\vec{\beta} \in S$ is equivalent to the existence of $k_{0} \in \omega$ such that $\vec{\beta} \mid j_{k} \notin D$ for each $k \geq k_{0}$.

This implies that $\left(U_{\vec{\beta} \mid j_{k}}\right)_{k \geq k_{0}}$ is a non-increasing sequence of nonempty clopen subsets of the space $\left(\Omega_{\left(\omega^{\omega}\right)^{d}}, \Sigma_{\left.\left(\omega^{\omega}\right)^{d}\right)}\right.$ whose $d_{\left(\omega^{\omega}\right)^{d}}$-diameters tend to zero, and we can define

$$
\{\mathcal{F}(\vec{\beta})\}:=\bigcap_{k \geq k_{0}} U_{\vec{\beta} \mid j_{k}} \subseteq \Omega_{\left(\omega^{\omega}\right) d} .
$$

Note that $\mathcal{F}(\vec{\beta})$ is the limit of $\left(\left(\alpha_{\beta_{i} \mid j_{k}}^{i}\right)_{i \in d}\right)_{k \in \omega}$.

- Now let $\gamma \in \Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil$, and $\vec{\beta} \in\left\lceil T_{d}\right\rceil$ such that $\beta_{i}=\gamma$. We set $f_{i}(\gamma):=\mathcal{F}_{i}(\vec{\beta})$. This defines $f_{i}: \Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil \rightarrow \omega^{\omega}$.

Note that $f_{i}(\gamma)$ is the limit of $\left(\alpha_{\gamma \mid j}^{i}\right)_{j \in \omega}$. Indeed, $f_{i}(\gamma)$ is the limit of $\left(\alpha_{\gamma \mid j_{k}}^{i}\right)_{k \in \omega}$. If $j \geq i$, then $\alpha_{\gamma \mid j}^{i} \in O_{\gamma \mid j}^{i}$, and the sequence $\left(O_{\gamma \mid j}^{i}\right)_{j \geq i}$ is decreasing. Fix $\varepsilon>0, k \geq i$ such that $2^{-k}<\varepsilon$. Then we get, if $j \geq k, d_{\omega^{\omega}}\left(f_{i}(\gamma), \alpha_{\gamma \mid j}^{i}\right) \leq \operatorname{diam}_{d_{\omega} \omega}\left(O_{\gamma \mid j}^{i}\right) \leq 2^{-j} \leq 2^{-k}<\varepsilon$. In particular, $f_{i}(\gamma)$ does not depend on the choice of $\vec{\beta}$. This also proves that $f_{i}$ is continuous on $\Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil$.

- Note that $\mathcal{F}_{i}(\vec{\beta})$ is the limit of some subsequence of $\left(\alpha_{\beta_{i} \mid j}^{i}\right)_{j \in \omega}$, by continuity of the projections. Thus $\mathcal{F}_{i}(\vec{\beta})=f_{i}\left(\beta_{i}\right)$, and $\mathcal{F}(\vec{\beta})=\left(\prod_{i \in d} f_{i}\right)(\vec{\beta})$. This implies that the inclusions $S \subseteq\left(\Pi_{i \in d} f_{i}\right)^{-1}\left(A_{0}\right)$ and $\left\lceil T_{d}\right\rceil \backslash S \subseteq\left(\Pi_{i \in d} f_{i}\right)^{-1}\left(A_{1}\right)$ hold.
- So let us prove that the construction is possible.
- Let $\left(\alpha_{\emptyset}^{i}\right)_{i \in d} \in{\overline{A_{0}}}^{\tau_{\xi}} \cap A_{1} \cap \Omega_{\left(\omega^{\omega}\right) d}$, which is nonempty since ${\overline{A_{0}}}^{{ }^{\tau} \xi} \cap A_{1} \neq \emptyset$ is $\Sigma_{1}^{1}$, by Lemma 4.2.3.(2).(b). Then we choose a $\Sigma_{1}^{1}$ subset $U_{\vec{\emptyset}}$ of $\left(\omega^{\omega}\right)^{d}$, with $d_{\left(\omega^{\omega}\right)^{d}}$-diameter at most 1 , such that

$$
\left(\alpha_{\emptyset}^{i}\right)_{i \in d} \in U_{\vec{\emptyset}} \subseteq{\overline{A_{0}}{ }^{\tau_{\xi}} \cap A_{1} \cap \Omega_{\left(\omega^{\omega}\right)^{d}} .}
$$

We choose a $\Sigma_{1}^{1}$ subset $O_{\emptyset}^{0}$ of $\omega^{\omega}$, with $d_{\omega^{\omega}}$-diameter at most 1 , with $\alpha_{\emptyset}^{0} \in O_{\emptyset}^{0} \subseteq \Omega_{\omega^{\omega}}$, which is possible since $\Omega_{\left(\omega^{\omega}\right) d} \subseteq \Omega_{\omega^{\omega}}^{d}$. Assume that $\left(\alpha_{s}^{i}\right)_{|s| \leq l},\left(O_{s}^{i}\right)_{|s| \leq l}$ and $\left(U_{\vec{s}}\right)_{|\vec{s}| \leq l}$ satisfying conditions (1)-(7) have been constructed, which is the case for $l=0$.

- Let $\overrightarrow{t m} \in T_{d} \cap\left(d^{l+1}\right)^{d}$. Note that $\overrightarrow{t m}^{\eta} \in D$ if $\overrightarrow{t m}{ }^{\eta} \in D$ is not equivalent to $\overrightarrow{t m} \in D$ (see the notation before Lemma 4.3.3).
- The conclusions in the assertions (a), (b) and (c) of the following claim do not really depend on their respective assumptions, but we will use these assertions later in this form. We define $X_{i}:=O_{t_{i}}^{i}$ if $i \leq l$, and $\omega^{\omega}$ if $i>l$.

Claim. Assume that $\eta>0$.
(a) The set $A_{0} \cap \bigcap_{1 \leq \rho \leq \eta}{\overline{U_{\overrightarrow{t m}^{\rho}}}}^{\tau} \cap\left(\Pi_{i \in d} X_{i}\right)$ is $\tau_{1}$-dense in ${\overline{U_{\overrightarrow{t m}^{1}}}}^{\tau_{1}} \cap\left(\Pi_{i \in d} X_{i}\right)$ if $\overrightarrow{t m} \eta=D$ and $\overrightarrow{t m} \notin D$.
(b) The set $U_{\overrightarrow{t m}^{\eta}} \cap \bigcap_{1 \leq \rho<\eta}{\overrightarrow{U_{\overrightarrow{t m}}}}^{\tau_{\rho}} \cap\left(\Pi_{i \in d} X_{i}\right)$ is $\tau_{1}$-dense in ${\overrightarrow{U_{\overrightarrow{t m}^{1}}}}^{\tau_{1}} \cap\left(\Pi_{i \in d} X_{i}\right)$ if $\overrightarrow{t m} \eta, \overrightarrow{t m} \in D$ or $\overrightarrow{t m} \eta, \overrightarrow{t m} \notin D$.

Indeed, let us forget $\Pi_{i \in d} X_{i}$ for the moment. We may assume that $\overrightarrow{t m} \xi_{i}+1 \subset_{\neq t m} \overrightarrow{t m}_{i}$ if $1 \leq i<n$, by Lemma 4.3.3. We set $S_{i}:=U_{\overrightarrow{t m} \xi_{i}}$, for $1 \leq \xi_{i} \leq \eta$. As $\overrightarrow{t m}^{\xi_{i+1}} R^{\left(\xi_{i}+1\right)} \overrightarrow{t m} \xi_{i}$, we can write $S_{i} \subseteq \bar{S}_{i+1} \tau_{\xi_{i}+1}$, for $1 \leq \xi_{i}<\eta$, by induction assumption. If $\overrightarrow{t m} \eta \in D$ and $\overrightarrow{t m} \notin D$, then $S_{n} \subseteq{\overline{A_{0}}}^{\tau_{\eta+1}}$. Thus $A_{0} \cap \bigcap_{1 \leq \xi_{i} \leq \eta}{\overline{U_{\overrightarrow{t m}} \xi_{i}}}^{\tau} \xi_{i}$ and $U_{\overrightarrow{t m}}{ }^{\eta} \cap \bigcap_{1 \leq \xi_{i}<\eta}{\overline{U_{\overrightarrow{t m}} \xi_{i}}}^{\tau} \xi_{i}$ are $\tau_{1}$-dense in ${\overline{U_{\overrightarrow{t m}}}}^{\tau}$, by Lemma 4.2.3.(2).(c).

But if $1 \leq \rho \leq \eta$, then there is $1 \leq i \leq n$ with $\overrightarrow{t m}{ }^{\rho}=\overrightarrow{t m} \xi_{i}$. And $\rho \leq \xi_{i}$ since we have $\overrightarrow{t m} \xi_{i}+1 \subset_{\neq t m} \overrightarrow{t m}_{i}$ if $1 \leq i<n$. We are done since $\bigcap_{1 \leq \rho \leq \eta}{\overline{U_{\overrightarrow{t m}}}}^{\tau}=\bigcap_{1 \leq \xi_{i} \leq \eta}{\overline{U \overrightarrow{t m}} \xi_{i}}_{\tau_{\xi}}$ and

$$
U_{\overrightarrow{t m} \eta} \cap \bigcap_{1 \leq \rho<\eta}{\overline{U_{\overrightarrow{t m}}}}^{\tau_{\rho}}=U_{\overrightarrow{t m}} \overrightarrow{t r}^{\eta} \cap \bigcap_{1 \leq \xi_{i}<\eta}{\overline{U_{\overrightarrow{t m}} \xi_{i}}}^{\tau} \xi_{i}
$$

The claim now comes from Lemma 4.2.4.

- Let $\mathcal{X}:=d^{l+1}$. The map $\Theta: \mathcal{X}^{d} \rightarrow \Sigma_{1}^{1}\left(\left(\omega^{\omega}\right)^{d}\right)$ is defined on $\mathcal{T}^{l+1}$ by

$$
\Theta(\overrightarrow{t m}):=\left\{\begin{array}{l}
A_{0} \cap \bigcap_{1 \leq \rho \leq \eta}{\overrightarrow{U_{\overrightarrow{t m}^{\rho}}} \tau_{\rho} \cap\left(\Pi_{i \in d} X_{i}\right) \cap \Omega_{\left(\omega^{\omega}\right)^{d}} \text { if } \overrightarrow{t m}}^{\eta} \in D \wedge \overrightarrow{t m} \notin D, \\
U_{\overrightarrow{t m} \eta} \cap \bigcap_{1 \leq \rho<\eta}{\overline{U_{\overrightarrow{t m}^{\rho}}}}^{\tau_{\rho}} \cap\left(\Pi_{i \in d} X_{i}\right) \text { if } \overrightarrow{t m} \\
\eta \\
, \overrightarrow{t m} \in D \vee \overrightarrow{t m} \\
\eta
\end{array} \overrightarrow{t m} \notin D .\right.
$$

By the claim, $\Theta(\overrightarrow{t m})$ is $\tau_{1}$-dense in ${\overrightarrow{U_{\overrightarrow{t m}^{1}}}}^{\tau_{1}} \cap\left(\Pi_{i \in d} X_{i}\right)$ if $\eta>0$. As $\overrightarrow{t m}^{1} \subseteq \vec{t} \subseteq \overrightarrow{t m}$ and $R^{(1)}$ is distinguished in $\subseteq$ we get $\overrightarrow{t m}^{1} R^{(1)} \vec{t}$ and $U_{\vec{t}} \subseteq{\overline{U_{\overrightarrow{t m}^{1}}}}^{\tau_{1}}$, by induction assumption. Therefore
 $\eta=0$ ). Therefore $\bar{\Theta}$ admits a $\pi$-selector on $\mathcal{T}^{l+1}$. Indeed, we define, for each $i \in d, \bar{\theta}_{i}: \mathcal{X} \rightarrow \omega^{\omega}$ by $\bar{\theta}_{i}\left(t_{i} m_{i}\right):=\alpha_{t_{i}}^{i}$ if $t_{i} \in \Pi_{i}^{\prime \prime} T_{d}, 0^{\infty}$ otherwise.

- As $T_{d}$ is a tree with $\Delta_{1}^{1}$ suitable levels, we can apply Lemma 4.1.3. Thus $\Theta$ admits a $\pi$-selector $\theta$ on $\mathcal{T}^{l+1}$. We set, for $s \in \Pi_{i}\left[\mathcal{T}^{l+1}\right], \alpha_{s}^{i}:=\theta_{i}(s)$.
- We choose $\Sigma_{1}^{1}$ sets $U_{\overrightarrow{t m}}$ with $d_{\left(\omega^{\omega}\right)^{d} \text {-diameter at most } 2^{-l-1} \text { such that } \theta(\overrightarrow{t m}) \in U_{\overrightarrow{t m}} \subseteq \Theta(\overrightarrow{t m}) \text { if }}$ $\overrightarrow{t m} \in \mathcal{T}^{l+1}$.
- Finally, we choose the $O_{s q}^{i}$ 's. We first prove that $\alpha_{s q}^{i} \in O_{s}^{i}$ if $s q \in \Pi_{i}\left[\mathcal{T}^{l+1}\right], i \in d$ and $i \leq l$.

Let $\overrightarrow{t m} \in \mathcal{T}^{l+1}$ such that $s q=t_{i} m_{i}$. Then $\alpha_{s q}^{i}=\theta_{i}(s q)=\theta_{i}\left(t_{i} m_{i}\right)$. As $\theta(\overrightarrow{t m}) \in \Theta(\overrightarrow{t m})$ and $i \leq l$, we get $\alpha_{s q}^{i} \in O_{t_{i}}^{i}=O_{s}^{i}$.

Now we can define the $O_{s q}^{i}$ 's. If $s q \in \Pi_{i}\left[\mathcal{T}^{l+1}\right]$, then we choose a $\Sigma_{1}^{1}$ set $O_{s q}^{i}$, with $d_{\omega^{\omega}}$-diameter at most $2^{-l-1}$, such that

$$
\alpha_{s q}^{i} \in O_{s q}^{i} \subseteq\left\{\begin{array}{l}
O_{s}^{i} \text { if } i \leq l, \\
\Omega_{\omega^{\omega}} \text { otherwise } .
\end{array}\right.
$$

- This finishes the proof since $\vec{u} R^{(\rho)} \overrightarrow{t m}$ and $\vec{u} \neq \overrightarrow{t m} \Rightarrow \vec{u} R^{(\rho)} \overrightarrow{t m^{\rho}} R^{(\rho)} \overrightarrow{t m}$, by Lemma 4.3.2.

Now we come to the ambiguous classes.
Theorem 4.4.2 Let $T_{d}$ be a tree with $\Delta_{1}^{1}$ suitable levels, $\xi<\omega_{1}^{C K}$ a successor ordinal, $S^{0}, S^{1}$ in $\boldsymbol{\Sigma}_{\xi}^{0}\left(\left\lceil T_{d}\right\rceil\right)$ disjoint, and $A_{0}, A_{1}$ disjoint $\Sigma_{1}^{1}$ subsets of $\left(\omega^{\omega}\right)^{d}$. We assume that Theorem 4.2.2 is proved for $\eta<\xi$. Then one of the following holds:
(a) ${\overline{A_{0}}}^{{ }^{\tau}} \cap{\overline{A_{1}}}^{\tau_{\xi}}=\emptyset$.
(b) The inequality $\left(\left(\Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil\right)_{i \in d}, S^{0}, S^{1}\right) \leq\left(\left(\omega^{\omega}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds.

Proof. Let us indicate the differences with the proof of Theorem 4.4.1. Assume that ${\overline{A_{0}}}^{{ }^{\tau} \xi} \cap{\overline{A_{1}}}^{{ }^{\tau} \xi} \neq \emptyset$. We set $I^{\varepsilon}:=h\left[\left\lceil T_{d}\right\rceil \backslash S^{\varepsilon}\right]$, so that $I^{\varepsilon}$ is a $\Pi_{\xi}^{0}$ subset of $[\subseteq]$. We also set, for $\varepsilon \in 2$,

$$
D_{1}^{\varepsilon}:=\left\{\vec{s} \in T_{d} \mid \vec{s}=\vec{\emptyset} \vee \exists \mathcal{B} \in \Pi^{-1}\left(I^{\varepsilon}\right) \vec{s} \in \mathcal{B}\right\},
$$

and $D_{0}^{\varepsilon}:=T_{d} \backslash D_{1}^{\varepsilon}$. We set, for $\theta_{0}, \theta_{1} \in 2, D_{\theta_{0}, \theta_{1}}:=D_{\theta_{0}}^{0} \cap D_{\theta_{1}}^{1}$. For example, $\vec{\emptyset} \in D_{1,1}$.

- Conditions (4), (5), and (7) become the following:
(4) $U_{\vec{s}} \subseteq{\overline{A_{0}}}^{\tau_{\xi}} \cap{\overline{A_{1}}}^{\tau_{\xi}}$ if $\vec{s} \in D_{1,1}$,
(5) $U_{\vec{s}} \subseteq A_{\varepsilon}$ if $\vec{s} \in D_{\varepsilon, 1-\varepsilon}$,
(7) $\left(\vec{s}, \vec{t} \in D_{\varepsilon, 1-\varepsilon} \wedge \vec{s} R^{(\eta)} \vec{t}\right) \Rightarrow U_{\vec{t}} \subseteq U_{\vec{s}}$.
- Fix $\vec{\alpha} \in\left\lceil T_{d}\right\rceil$. There are $\left(\theta_{0}, \theta_{1}\right) \in 2^{2}$ and $k_{0} \in \omega$ such that, for $k \geq k_{0}, \vec{\alpha} \mid j_{k} \in D_{\theta_{0}, \theta_{1}}$. Thus $S^{\varepsilon} \subseteq\left(\Pi_{i \in d} f_{i}\right)^{-1}\left(A_{\varepsilon}\right)$.
- Let $\left(\alpha_{\emptyset}^{i}\right)_{i \in d} \in{\overline{A_{0}}}^{{ }^{\tau}}{ }^{\xi} \cap{\overline{A_{1}}}^{\tau_{\xi}} \cap \Omega_{\left(\omega^{\omega}\right) d}$, which is nonempty since ${\overline{A_{0}}}^{\tau_{\xi}} \cap{\overline{A_{1}}}^{\tau_{\xi}} \neq \emptyset$ is $\Sigma_{1}^{1}$. We choose

- The statement of the claim is now as follows:

Claim. Assume that $\eta>0$.
(a) $A_{\varepsilon} \cap \bigcap_{1 \leq \rho \leq \eta}{\overline{U_{\overrightarrow{t m}^{\rho}}}}^{\tau \rho} \cap\left(\Pi_{i \in d} X_{i}\right)$ is $\tau_{1}$-dense in ${\overline{U_{\overrightarrow{t m}^{1}}}}^{\tau_{1}} \cap\left(\Pi_{i \in d} X_{i}\right)$ if $\overrightarrow{t m}^{\eta} \notin D_{\varepsilon, 1-\varepsilon}$ and $\overrightarrow{t m} \in D_{\varepsilon, 1-\varepsilon}$.
(b) $U_{\overrightarrow{t m} \eta} \cap \bigcap_{1 \leq \rho<\eta}{\overline{U_{\overrightarrow{t m}^{\rho}}}}^{\tau} \cap\left(\Pi_{i \in d} X_{i}\right)$ is $\tau_{1}$-dense in ${\overline{U_{\overrightarrow{t m}^{1}}}}^{\tau_{1}} \cap\left(\Pi_{i \in d} X_{i}\right)$ otherwise. The point is that $\overrightarrow{t m}^{\eta} \in D_{1,1}$ if $\overrightarrow{t m}^{\eta} \notin D_{\varepsilon, 1-\varepsilon}$ since $\overrightarrow{t m}^{\eta} \in D_{\theta_{0}, \theta_{1}}$ with $\varepsilon \leq \theta_{0}$ and $1-\varepsilon \leq \theta_{1}$.

- In the same fashion, $\Theta(\overrightarrow{t m})$ is now defined as follows:

We conclude as in the proof of Theorem 4.4.1.
Now we come to the limit case. We need some more definitions that can be found in [D-SR].
Definition 4.4.3 (Debs-Saint Raymond) Let $R$ be a tree relation on $c^{<\omega}$. If $t \in c^{<\omega}$, then $h_{R}(t)$ is the number of strict $R$-predecessors of $t$. So we have $h_{R}(t)=\operatorname{Card}\left(P_{R}(t)\right)-1$.

Let $\xi<\omega_{1}$ be an infinite limit ordinal. We say that a resolution family $\left(R^{(\rho)}\right)_{\rho \leq \xi}$ is uniform if

$$
\forall k \in \omega \exists \eta_{k}<\xi \forall s, t \in c^{<\omega}\left(\min \left(h_{R^{(\xi)}}(s), h_{R^{(\xi)}}(t)\right) \leq k \wedge s R^{\left(\eta_{k}\right)} t\right) \Rightarrow s R^{(\xi)} t
$$

We may (and will) assume that $\eta_{k} \geq 2$.
The following is part of Theorem I-6.6 in [D-SR].
Theorem 4.4.4 (Debs-Saint Raymond) Let $\xi<\omega_{1}$ be an infinite limit ordinal, $R$ a tree relation, $\left(I_{n}\right)_{n \in \omega}$ a sequence of $\Pi_{\xi}^{0}$ subsets of $[R]$. Then there is a uniform resolution family $\left(R^{(\rho)}\right)_{\rho \leq \xi}$ with
(a) $R^{(0)}=R$.
(b) The canonical map $\Pi:\left[R^{(\xi)}\right] \rightarrow[R]$ is a continuous bijection.
(c) The set $\Pi^{-1}\left(I_{n}\right)$ is a closed subset of $\left[R^{(\xi)}\right]$ for each integer $n$.

Here again, the next result is essentially in [L7] (see Theorem 2.4.4).
Theorem 4.4.5 Let $T_{d}$ be a tree with $\Delta_{1}^{1}$ suitable levels, $\xi<\omega_{1}^{C K}$ an infinite limit ordinal, $S$ in $\boldsymbol{\Sigma}_{\xi}^{0}\left(\left\lceil T_{d}\right\rceil\right)$, and $A_{0}, A_{1}$ disjoint $\Sigma_{1}^{1}$ subsets of $\left(\omega^{\omega}\right)^{d}$. We assume that Theorem 4.2.2 is proved for $\eta<\xi$. Then one of the following holds:
(a) ${\overline{A_{0}}}^{\tau \xi} \cap A_{1}=\emptyset$.
(b) The inequality $\left(\left(\Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil\right)_{i \in d}, S,\left\lceil T_{d}\right\rceil \backslash S\right) \leq\left(\left(\omega^{\omega}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds.

Proof. Let us indicate the differences with the proof of Theorem 4.4.1.

- The set $I:=h\left[\left\lceil T_{d}\right\rceil \backslash S\right]$ is $\Pi_{\xi}^{0}([\subseteq])$. Theorem 4.4.4 provides a uniform resolution family.
- If $\vec{t} \in c^{<\omega}$ then we set $\eta(\vec{t}):=\max \left\{\eta_{h_{R^{(\xi)}}(\vec{s})+1} \mid \vec{s} \subseteq \vec{t}\right\}$. Note that $\eta(\vec{s}) \leq \eta(\vec{t})$ if $\vec{s} \subseteq \vec{t}$.
- Conditions (6) and (7) become
(6) $\left(1 \leq \rho \leq \eta(\vec{s}) \wedge \vec{s} R^{(\rho)} \vec{t}\right) \Rightarrow U_{\vec{t}} \subseteq{\overline{U_{\vec{s}}}}^{\tau_{\rho}}$,
(7) $\left((\vec{s}, \vec{t} \in D \vee \vec{s}, \vec{t} \notin D) \wedge \vec{s} R^{(\xi)} \vec{t}\right) \Rightarrow U_{\vec{t}} \subseteq U_{\vec{s}}$.

Claim 1. Assume that $\overrightarrow{t m}^{\rho} \neq \overrightarrow{t m}^{\xi}$. Then $\rho+1 \leq \eta\left(\overrightarrow{t m}^{\rho+1}\right)$.
We argue by contradiction. We get $\rho+1>\rho \geq \eta\left(\overrightarrow{t m^{\rho+1}}\right) \geq \eta_{h_{R^{(\xi)}}(\overrightarrow{t m} \xi)+1}=\eta_{h_{R}(\xi)}(\overrightarrow{t m})$. As $\overrightarrow{t m^{\rho}} R^{(\rho)} \overrightarrow{t m}$ we get $\overrightarrow{t m^{\rho}} R^{(\xi)} \overrightarrow{t m}$, and also $\overrightarrow{t m}{ }^{\rho}=\overrightarrow{t m} \xi$, which is absurd.

Claim 2. (a) The set $A_{0} \cap \bigcap_{1 \leq \rho \leq \eta(\overrightarrow{t m})}{\overline{U_{\overrightarrow{t m}}}}^{{ }^{\rho} \rho} \cap\left(\Pi_{i \in d} X_{i}\right)$ is $\tau_{1}$-dense in ${\overrightarrow{U_{\overrightarrow{t m}}}}^{\tau_{1}} \cap\left(\Pi_{i \in d} X_{i}\right)$ if $\overrightarrow{t m}{ }^{\eta} \in D$ and $\overrightarrow{t m} \notin D$.
(b) The set $U_{\overrightarrow{m m} \xi} \cap \bigcap_{1 \leq \rho<\eta(\overrightarrow{t m})}{\overline{U_{\overrightarrow{t m} \rho}}}^{\tau_{\rho}} \cap\left(\Pi_{i \in d} X_{i}\right)$ is $\tau_{1}$-dense in ${\overline{U_{\overrightarrow{t_{m}}}}}^{\tau_{1}} \cap\left(\Pi_{i \in d} X_{i}\right)$ if $\overrightarrow{t m} \xi, \overrightarrow{t m} \in D$ or $\overrightarrow{t m} \xi, \overrightarrow{t m} \notin D$.

Indeed, we set $S_{i}:=U_{\overrightarrow{t m} \xi_{i}}$, for $1 \leq \xi_{i} \leq \xi$. By Claim 1 we can apply Lemma 4.2.3.(2).(c) and we are done.

- The map $\Theta: \mathcal{X}^{d} \rightarrow \Sigma_{1}^{1}\left(\left(\omega^{\omega}\right)^{d}\right)$ is defined on $\mathcal{T}^{l+1}$ by

$$
\Theta(\overrightarrow{t m}):=\left\{\begin{array}{l}
A_{0} \cap \bigcap_{1 \leq \rho \leq \eta(\overrightarrow{t m})}{\overline{U_{\overrightarrow{t m}^{\rho}}}}^{\tau_{\rho}} \cap\left(\Pi_{i \in d} X_{i}\right) \cap \Omega_{\left(\omega^{\omega}\right)^{d}} \text { if } \overrightarrow{t m^{\eta}} \in D \wedge \overrightarrow{t m} \notin D, \\
U_{\overrightarrow{t m} \xi} \cap \bigcap_{1 \leq \rho<\eta(\overrightarrow{t m})}{\overline{U_{\overrightarrow{t m^{\prime}}}}}^{\tau_{\rho}} \cap\left(\Pi_{i \in d} X_{i}\right) \text { if } \overrightarrow{t m^{\xi}}, \overrightarrow{t m} \in D \vee \overrightarrow{t m^{\xi}}, \overrightarrow{t m} \notin D .
\end{array}\right.
$$

We conclude as in the proof of Theorem 4.4.1, using the facts that $\eta_{k} \geq 1$ and $\eta($.$) is increasing.$
Now we come to the ambiguous classes.
Theorem 4.4.6 Let $T$ be a tree with $\Delta_{1}^{1}$ suitable levels, $\xi<\omega_{1}^{C K}$ an infinite limit ordinal, $S^{0}, S^{1}$ in $\boldsymbol{\Sigma}_{\xi}^{0}\left(\left\lceil T_{d}\right\rceil\right)$ disjoint, and $A_{0}, A_{1}$ disjoint $\Sigma_{1}^{1}$ subsets of $\left(\omega^{\omega}\right)^{d}$. We assume that Theorem 4.2.2 is proved for $\eta<\xi$. Then one of the following holds:
(a) ${\overline{A_{0}}}^{{ }^{\xi}} \cap{\overline{A_{1}}}^{{ }^{\tau}}=\emptyset$.
(b) The inequality $\left(\left(\Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil\right)_{i \in d}, S^{0}, S^{1}\right) \leq\left(\left(\omega^{\omega}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds.

Proof. Let us indicate the differences with the proofs of Theorems 4.4.1, 4.4.2 and 4.4.5.

- The set $I^{\varepsilon}:=h\left[\left\lceil T_{d}\right\rceil \backslash S^{\varepsilon}\right]$ is $\Pi_{\xi}^{0}([\subseteq])$.
- The statement of Claim 2 is now as follows.

Claim 2. (a) $A_{\varepsilon} \cap \bigcap_{1 \leq \rho \leq \eta(\overrightarrow{t m})}{\overline{U_{\overrightarrow{t m}^{\rho}}}}^{\tau_{\rho}} \cap\left(\Pi_{i \in d} X_{i}\right)$ is $\tau_{1}$-dense in ${\overline{U_{\overrightarrow{t m}^{1}}}}^{\tau_{1}} \cap\left(\Pi_{i \in d} X_{i}\right)$ if $\overrightarrow{t m}^{\xi} \notin D_{\varepsilon, 1-\varepsilon}$ and $\overrightarrow{t m} \in D_{\varepsilon, 1-\varepsilon}$.
(b) $U_{\overrightarrow{t m} \xi} \cap \bigcap_{1 \leq \rho<\eta(\overrightarrow{t m})}{\overline{U_{\overrightarrow{t m} \rho}}}^{\tau_{\rho}} \cap\left(\Pi_{i \in d} X_{i}\right)$ is $\tau_{1}$-dense in ${\overline{U_{\overrightarrow{t m}}}}^{\tau_{1}} \cap\left(\Pi_{i \in d} X_{i}\right)$ otherwise.

- In the same fashion, $\Theta(\overrightarrow{\mathrm{tm}})$ is now defined as follows:

$$
\Theta(\overrightarrow{t m}):=\left\{\begin{array}{l}
A_{\varepsilon} \cap \bigcap_{1 \leq \rho \leq \eta(\overrightarrow{t m})}{\overline{U_{\overrightarrow{t m} \rho}}}^{\tau_{\rho}} \cap\left(\Pi_{i \in d} X_{i}\right) \cap \Omega_{\left(\omega^{\omega}\right)^{d}} \text { if } \overrightarrow{t m} \xi \notin D_{\varepsilon, 1-\varepsilon} \wedge \overrightarrow{t m} \in D_{\varepsilon, 1-\varepsilon}, \\
U_{\overrightarrow{t m} \xi} \cap \bigcap_{1 \leq \rho<\eta(\overrightarrow{t m})} \overline{\bar{U}_{\overrightarrow{t m} \rho}} \tau_{\rho} \cap\left(\Pi_{i \in d} X_{i}\right) \text { otherwise. }
\end{array}\right.
$$

We conclude as in the proof of Theorem 4.4.5.
Lemma 4.4.7 Let $\boldsymbol{\Gamma}$ be a Wadge class of Borel sets. Then the class of pot $(\boldsymbol{\Gamma})$ sets is closed under pre-images by products of continuous maps.

Proof. Assume that $A \in \operatorname{pot}(\boldsymbol{\Gamma}), A \subseteq \Pi_{i \in d} Y_{i}$, and $f_{i}: X_{i} \rightarrow Y_{i}$ is continuous. Let $\tau_{i}$ be a finer 0 -dimensional Polish topology on $Y_{i}$ such that $A \in \boldsymbol{\Gamma}\left(\Pi_{i \in d}\left(Y_{i}, \tau_{i}\right)\right)$. As $f_{i}: X_{i} \rightarrow\left(Y_{i}, \tau_{i}\right)$ is Borel, there is a finer 0-dimensional Polish topology $\sigma_{i}$ on $X_{i}$ such that $f_{i}:\left(X_{i}, \sigma_{i}\right) \rightarrow\left(Y_{i}, \tau_{i}\right)$ is continuous. Thus $\left(\Pi_{i \in d} f_{i}\right)^{-1}(A) \in \boldsymbol{\Gamma}\left(\Pi_{i \in d}\left(X_{i}, \sigma_{i}\right)\right)$ and $\left(\Pi_{i \in d} f_{i}\right)^{-1}(A) \in \operatorname{pot}(\boldsymbol{\Gamma})$.

## Proof of Theorem 4.1 for $\xi$, assuming that Theorem 4.2.2 is proved for $\eta<\xi$.

(1) We assume that (a) does not hold. This implies that the $X_{i}$ 's are not empty.

- We first prove that we may assume that $X_{i}=\omega^{\omega}$ for each $i \in d$.

By 13.5 in [K], there is a finer zero-dimensional Polish topology $\tau_{i}$ on $X_{i}$, and, by 7.8 in [K], $\left(X_{i}, \tau_{i}\right)$ is homeomorphic to a closed subset $F_{i}$ of $\omega^{\omega}$, via a map $\varphi_{i}$. By 2.8 in [K], there is a continuous retraction $r_{i}: \omega^{\omega} \rightarrow F_{i}$. Let $A_{\varepsilon}^{\prime}$ be the intersection of $\Pi_{i \in d} F_{i}$ with the pre-image of $A_{\varepsilon}$ by $\Pi_{i \in d}\left(\varphi_{i}^{-1} \circ r_{i}\right)$. Then $A_{0}^{\prime}$ and $A_{1}^{\prime}$ are disjoint analytic subsets of $\left(\omega^{\omega}\right)^{d}$. Moreover, $A_{0}^{\prime}$ is not separable from $A_{1}^{\prime}$ by a $\operatorname{pot}\left(\boldsymbol{\Pi}_{\xi}^{0}\right)$ set, since otherwise (a) would hold.

This gives $g_{i}: d^{\omega} \rightarrow \omega^{\omega}$ continuous with $S \subseteq\left(\Pi_{i \in d} g_{i}\right)^{-1}\left(A_{0}^{\prime}\right)$ and $\left\lceil T_{d}\right\rceil \backslash S \subseteq\left(\Pi_{i \in d} g_{i}\right)^{-1}\left(A_{1}^{\prime}\right)$. It remains to set $f_{i}(\alpha):=\left(\varphi_{i}^{-1} \circ r_{i} \circ g_{i}\right)(\alpha)$ if $\alpha \in d^{\omega}$.

- To simplify the notation, we may assume that $T_{d}$ has $\Delta_{1}^{1}$ levels, $\xi<\omega_{1}^{\mathrm{CK}}$ and $A_{0}, A_{1}$ are $\Sigma_{1}^{1}\left(\left(\omega^{\omega}\right)^{d}\right)$. Notice that $\overline{A_{0}{ }^{\tau_{\xi}}} \cap A_{1}$ is not empty, since otherwise $A_{0}$ would be separable from $A_{1}$ by a set in $\boldsymbol{\Pi}_{1}^{0}\left(\tau_{\xi}\right) \subseteq \boldsymbol{\Pi}_{\xi}^{0}\left(\tau_{1}\right) \subseteq \operatorname{pot}\left(\boldsymbol{\Pi}_{\xi}^{0}\right)$ set, which is absurd. So (b) holds, by Theorems 4.4.1 and 4.4.5 (as $\Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil$ is compact, we just have to compose with continuous retractions to get functions defined on $d^{\omega}$ ). So (a) or (b) holds.
- If $P \in \operatorname{pot}\left(\Pi_{\xi}^{0}\right)$ separates $A_{0}$ from $A_{1}$ and (b) holds, then $S \subseteq\left(\Pi_{i \in d} f_{i}\right)^{-1}(P) \subseteq \neg\left(\left\lceil T_{d}\right\rceil \backslash S\right)$. This implies that $S$ is separable from $\left\lceil T_{d}\right\rceil \backslash S$ by a $\operatorname{pot}\left(\Pi_{\xi}^{0}\right)$ set, by Lemma 4.4.7.
(2) We argue as in the proof of (1). Here we consider ${\overline{A_{0}}}^{\tau_{\xi}} \cap{\overline{A_{1}}}^{{ }^{\xi} \xi}$, and we apply Theorems 4.4.2 and 4.4.6. This finishes the proof.

Proof of Theorem 4.2.2. We assume that Theorem 4.1 is proved for $\xi$, and that Theorem 4.2 .2 is proved for $\eta<\xi$.
(1) By Lemma 4.2.3, $V_{0}$ and $V_{<\xi}$ are $\Pi_{1}^{1}$.
(a) $\Rightarrow$ (b) and (a) $\Rightarrow$ (d) are clear since $\Delta_{\omega^{\omega}}$ is Polish.
(b) $\Rightarrow$ (c) We argue by contradiction. As $\gamma \in \Delta_{1}^{1}$ we get $C_{\gamma} \in \Delta_{1}^{1}$. If $(\beta, \gamma) \in V_{<\xi}$, then $C_{\gamma} \in \operatorname{pot}\left(\boldsymbol{\Pi}_{<\xi}^{0}\right)$, which is absurd. If $(\beta, \gamma) \in V_{0}$, then $C_{\gamma} \in \operatorname{pot}\left(\boldsymbol{\Pi}_{0}^{0}\right) \subseteq \operatorname{pot}\left(\boldsymbol{\Pi}_{\xi}^{0}\right)$, which is absurd. If $(\beta, \gamma) \notin V_{<\xi} \cup V_{0}$, then we get $\gamma^{\prime} \in \Delta_{1}^{1}$ (see the definition of $\Phi$ before Theorem 4.2.2). As $\left((\beta)_{n},\left(\gamma^{\prime}\right)_{n}\right) \in V_{<\xi}$, we get $C_{\left(\gamma^{\prime}\right)_{n}} \in \operatorname{pot}\left(\boldsymbol{\Pi}_{<\xi}^{0}\right)$. Now the equality $\neg C_{\gamma}=\bigcup_{n \in \omega} C_{\left(\gamma^{\prime}\right)_{n}}$ implies that $C_{\gamma} \in \operatorname{pot}\left(\boldsymbol{\Pi}_{\xi}^{0}\right)$, which is absurd.
$(\mathrm{d}) \Rightarrow$ (e) This comes from the proof of Theorem 4.1.(1).
(e) $\Rightarrow$ (f) This comes from Theorems 4.4.1 and 4.4.5.
$(f) \Rightarrow$ (a) This comes from Theorem 4.1.(1).
(c) $\Rightarrow$ (e) We argue by contradiction, so that ${\overline{A_{0}}}^{{ }^{\xi} \xi}$ separates $A_{0}$ from $A_{1}$.

If $\xi=1$, then for each $\vec{\delta} \in A_{1}$ there is $(\tilde{\beta}, \tilde{\gamma}) \in\left(\Delta_{1}^{1} \times \Delta_{1}^{1}\right) \cap V_{0}$ such that $\vec{\delta} \in C_{\tilde{\gamma}} \subseteq \neg A_{0}$. The first reflection theorem gives $\beta, \gamma^{\prime} \in \Delta_{1}^{1}$ such that $\left((\beta)_{n},\left(\gamma^{\prime}\right)_{n}\right) \in V_{0}$ for each integer $n$ and $A_{1} \subseteq U:=\bigcup_{n \in \omega} C_{\left(\gamma^{\prime}\right)_{n}} \subseteq \neg A_{0}$. We choose $\gamma \in \Delta_{1}^{1} \cap W$ with $\neg C_{\gamma}=U$, and ( $\beta, \gamma$ ) contradicts (c).

If $\xi \geq 2$, then by induction assumption and the first reflection theorem there are $\beta, \gamma^{\prime} \in \Delta_{1}^{1}$ with $\left((\beta)_{n},\left(\gamma^{\prime}\right)_{n}\right) \in V_{<\xi}$ and $C_{\left(\gamma^{\prime}\right)_{n}} \subseteq \neg A_{0}$, for each integer $n$, and $A_{1} \subseteq U:=\bigcup_{n} C_{\left(\gamma^{\prime}\right)_{n}}$. But $U$ is $\Delta_{1}^{1} \cap \operatorname{pot}\left(\boldsymbol{\Sigma}_{\xi}^{0}\right)$ and separates $A_{1}$ from $A_{0}$. So let $\gamma \in \Delta_{1}^{1} \cap W$ with $\neg C_{\gamma}=U$. We have $(\beta, \gamma) \in V_{\xi}$ and $C_{\gamma}$ separates $A_{0}$ from $A_{1}$, which is absurd.
(2) It is clear that $V_{\xi}$ is $\Pi_{1}^{1}$.
(3) We argue as in the proof of (1), except for the implication (c) $\Rightarrow$ (e) (for the implication (e) $\Rightarrow$ (f) we use Theorems 4.4.2 and 4.4.6).
(c) $\Rightarrow$ (e) We argue by contradiction. By 4D. 2 in $[\mathrm{M}]$, there are $W \in \Pi_{1}^{1}(\omega)$ and a partial function $\mathbf{d}: \omega \rightarrow \omega^{\omega}, \Pi_{1}^{1}$-recursive on $W$, such that $\mathbf{d}^{\prime \prime} W$ is the set of $\Delta_{1}^{1}$ points of $\omega^{\omega}$. We define

$$
\Pi_{A_{\varepsilon}}:=\left\{n \in \omega \mid(n)_{0},(n)_{1} \in W \wedge\left(\mathbf{d}\left((n)_{0}\right), \mathbf{d}\left((n)_{1}\right)\right) \in V_{<\xi} \wedge C_{\mathbf{d}\left((n)_{1}\right)} \cap A_{\varepsilon}=\emptyset\right\}
$$

Then $\Pi_{A_{\varepsilon}} \in \Pi_{1}^{1}$ and $\forall \vec{\beta} \in\left(\omega^{\omega}\right)^{d} \quad \exists n \in \Pi_{A_{0}} \cup \Pi_{A_{1}} \vec{\beta} \in C_{\mathbf{d}\left((n)_{1}\right)}$ since ${\overline{A_{0}}}^{\tau_{\xi}} \cap{\overline{A_{1}}}^{\tau_{\xi}}=\emptyset$ (we use the induction assumption). By the first reflection theorem there is $D \in \Delta_{1}^{1}(\omega)$ such that $D \subseteq \Pi_{A_{0}} \cup \Pi_{A_{1}}$ and $\forall \vec{\beta} \in\left(\omega^{\omega}\right)^{d} \quad \exists n \in D \quad \vec{\beta} \in C_{\mathbf{d}\left((n)_{1}\right)}$.

As $\Pi_{1}^{1}$ has the reduction property, we can find $\Pi_{A_{\varepsilon}}^{\prime} \in \Pi_{1}^{1}$ disjoint such that $\Pi_{A_{\varepsilon}}^{\prime} \subseteq \Pi_{A_{\varepsilon}}$ and $\Pi_{A_{0}}^{\prime} \cup \Pi_{A_{1}}^{\prime}=\Pi_{A_{0}} \cup \Pi_{A_{1}}$. We set $\Delta:=\bigcup_{n \in D \cap \Pi_{A_{1}}^{\prime}} C_{\mathbf{d}\left((n)_{1}\right)} \backslash\left(\bigcup_{q<n} C_{\mathbf{d}\left((q)_{1}\right)}\right)$. Then

$$
\neg \Delta=\bigcup_{n \in D \cap \Pi_{A_{0}}^{\prime}} C_{\mathbf{d}\left((n)_{1}\right)}^{\left(\omega^{\omega}\right)^{d}} \backslash\left(\bigcup_{q<n} C_{\mathbf{d}\left((q)_{1}\right)}^{\left(\omega^{\omega}\right)^{d}}\right),
$$

which proves that $\Delta \in \Delta_{1}^{1} \cap \operatorname{pot}\left(\boldsymbol{\Delta}_{\xi}^{0}\right)$, and separates $A_{0}$ from $A_{1}$. Let $(\beta, \gamma),\left(\beta^{\prime}, \gamma^{\prime}\right) \in\left(\Delta_{1}^{1} \times \Delta_{1}^{1}\right) \cap V_{\xi}$ with $\Delta=C_{\gamma}$ and $\neg \Delta=C_{\gamma^{\prime}}$. Then we get a contradiction with (c).

Remarks. The assertions 4.2.3.(2).(a) and 4.2.3.(2).(b) admit uniform versions in the following sense. By 3E.2, 3F. 6 and 3 H .1 in [M], there is $S: \omega^{\omega} \times \omega^{\omega} \rightarrow \omega^{\omega}$ recursive such that for each recursively presented Polish space $X$ there is a universal set $\mathcal{U}^{X} \in \Pi_{1}^{1}\left(\left(\omega^{\omega}\right)^{d}\right)$ satisfying the following properties:

- $\Pi_{1}^{1}(X)=\left\{\mathcal{U}_{\alpha}^{X} \mid \alpha \in \omega^{\omega}\right\}$,
- $\Pi_{1}^{1}(X)=\left\{\mathcal{U}_{\alpha}^{X} \mid \alpha \in \omega^{\omega}\right.$ recursive $\}$,
$-(\alpha, \beta, x) \in \mathcal{U}^{\omega^{\omega} \times X} \Leftrightarrow(S(\alpha, \beta), x) \in \mathcal{U}^{X}$.
We set $\mathcal{U}:=\mathcal{U}^{\left(\omega^{\omega}\right)^{d}}$. The following relations are $\Pi_{1}^{1}$ :

$$
\begin{aligned}
& Q(\alpha, \beta, \gamma) \Leftrightarrow \alpha \in \mathrm{WO} \wedge(\beta, \gamma) \in V_{|\alpha|}, \\
& R(\alpha, \beta, \vec{\delta}) \Leftrightarrow \alpha \in \Delta_{1}^{1} \cap \mathrm{WO} \wedge|\alpha| \geq 1 \wedge \vec{\delta} \not \overline{\mathcal{U}}_{\beta}^{\tau_{|\alpha|}} .
\end{aligned}
$$

Indeed, this comes from the proof of Lemma 4.2.3.

- One can give simpler examples $\mathbb{S}^{0}, \mathbb{S}^{1}$ for which Corollary 4.2 is fullfilled when $\boldsymbol{\Gamma}=\boldsymbol{\Pi}_{1}^{0}$. Indeed, recall the map $b_{\omega}$ defined before Lemma 2.3. As $\left|b_{\omega}(n)\right| \leq n$ for each integer $n$, we can define the sequence $s_{n}^{\omega}:=b_{\omega}(n) 0^{n-\left|b_{\omega}(n)\right|}$. We set $\mathbb{S}^{1}:=\overline{\mathbb{S}^{0}} \backslash \mathbb{S}^{0}$, where

$$
\mathbb{S}^{0}:=\left\{\left(0 s_{n}^{\omega} 0 \gamma, \ldots, 0 s_{n}^{\omega} n \gamma,(n+1) s_{n}^{\omega}(n+1) \gamma,(n+1) s_{n}^{\omega}(n+2) \gamma, \ldots\right) \mid(n, \gamma) \in \omega \times \omega^{\omega}\right\}
$$

(we do not really need $T_{\omega}$ when $\boldsymbol{\Gamma}=\boldsymbol{\Pi}_{1}^{0}$ ). We have $\mathbb{S}^{0}=\left(\Pi_{i \in d} f_{i}\right)^{-1}\left(A_{0}\right) \cap \overline{\mathbb{S}^{0}}$ if (b) holds. Let us denote this by $\mathbb{S}^{0} \leq A_{0}$ (we have a quasi-order, by continuity of the $f_{i}$ 's).

- The fact that $T_{d}$ has finite levels was used to give a proof of Corollary 4.2 as simple as possible. The tree $T_{d}$ has finite levels when $d<\omega$, and not always when $d=\omega$. This is one of the main new points in the case of the infinite dimension. Let us specify this.
(a) We saw in the proof of Proposition 2.2 that the tree $\tilde{T}_{d}$ generated by an effective frame is a tree with one-sided almost acyclic levels. As before Lemma 2.6 , we can define

$$
\tilde{S}_{C_{1}}^{\omega}:=\left\{\vec{\alpha} \in\left\lceil\tilde{T}_{d}\right\rceil \mid \mathcal{S}\left(\alpha_{0} \Delta \alpha_{1}\right) \in C_{1}\right\},
$$

which is not separable from $\left\lceil\tilde{T}_{d}\right\rceil \backslash \tilde{S}_{C_{1}}^{\omega}$ by a potentially closed set, since otherwise $S_{C_{1}}^{\omega}$ would be separable from $\left\lceil T_{d}\right\rceil \backslash S_{C_{1}}^{\omega}$ by a potentially closed set, which would contradict Lemmas 2.6 and 3.4.

But $\mathbb{A}_{0}:=\left\{0^{1+n}(1+n)^{\infty} \mid n \in \omega\right\} \subseteq \omega^{\omega}$ is not potentially closed since $0^{\infty} \in \overline{\mathbb{A}_{0}} \backslash \mathbb{A}_{0}$ and the topology on $\omega$ is discrete. And one can prove, in a straightforward way, that $\tilde{S}_{C_{1}}^{\omega} \not \leq \mathbb{A}_{0}$ and $\mathbb{A}_{0} \not \leq \tilde{S}_{C_{1}}^{\omega}$. This proves that the finiteness of the levels of $T_{d}$ is useful. But we will see that it is not necessary.
(b) We define $o:\left\{s \in 2^{<\omega} \mid 0 \nsubseteq s\right\} \rightarrow \omega^{<\omega}$ such that $|o(s)|=|s|$ by

$$
o\left(10^{n_{0}} 10^{n_{1}} \ldots 10^{n_{l}}\right):=0^{1+n_{0}}\left(1+n_{0}\right)^{1+n_{1}} \ldots\left(\left(1+n_{0}\right)+\ldots+\left(1+n_{l-1}\right)\right)^{1+n_{l}}
$$

In other words, we have $o(s)(i)=i$ if $s(i)=1, o(s)(i)=o(s)(i-1)$ if $s(i)=0$. Note that $o$ is an injective homomorphism, in the sense that $o(s) \subseteq o(t)$ if $s \subseteq t$. This implies that we can extend $o$ to a continuous map from the basic clopen set $N_{1}$ into $\omega^{\omega}$ by the formula $o(\alpha):=\sup _{m \in \omega} o(\alpha \mid m)$.

We set $F_{\omega}:=\left\{\left(m_{i} \alpha_{i}\right)_{i \in \omega} \in\left(\omega^{\omega}\right)^{\omega} \mid \vec{\alpha} \in\left\lceil\tilde{T}_{\omega}\right\rceil\right.$ and $\left.\forall i \in \omega m_{i}=o\left(\alpha_{0} \Delta \alpha_{1}\right)(i)\right\}$, and we put $\underline{S}_{C_{\xi}}^{\omega}:=\left\{\left(m_{i} \alpha_{i}\right)_{i \in \omega} \in F_{\omega} \mid \mathcal{S}\left(\alpha_{0} \Delta \alpha_{1}\right) \in C_{\xi}\right\}$. One can take $\mathbb{S}_{\xi}^{\omega}=\underline{S}_{C_{\xi}}^{\omega}$, and the proof is much more complicated than the one we gave. But the tree associated with $\overline{S_{C_{\xi}}^{\omega}}=F_{\omega}$ is

$$
\{\vec{\emptyset}\} \cup\left\{\left(m_{i} s_{i}\right)_{i \in \omega} \in\left(\omega^{\omega}\right)^{<\omega} \mid\left(m_{i}\right)_{i \in \omega} \in o^{\prime \prime}\left[N_{1}\right] \text { and } \vec{s} \in \tilde{T}_{\omega} \text { and } \forall i<|\vec{s}| m_{i}=o\left(s_{0} \Delta s_{1}\right)(i)\right\}
$$

and has infinite levels. This proves that the finiteness of the levels of the tree associated with $\overline{\mathbb{S}_{\xi} \omega}$ is not necessary.
(c) In [L8], an extension to any dimension of the Kechris-Solecki-Todorčević dichotomy about analytic graphs is proved. In [L5], it is proved that Corollary 4.2 is a consequence of the Kechris-SoleckiTodorčević dichotomy when $\boldsymbol{\Gamma}=\boldsymbol{\Pi}_{1}^{0}$. This works as well when $d<\omega$, but not when $d=\omega$. More specifically, let $\mathbb{G}:=\left\{\alpha \in \omega^{\omega} \mid \forall m \in \omega \exists n \geq m s_{n}^{\omega} 0 \subseteq \alpha\right\}$ and

$$
\mathbb{A}_{\omega}:=\left\{\left(s_{n}^{\omega} i \gamma\right)_{i \in \omega} \mid n \in \omega \wedge \gamma \in \omega^{\omega}\right\}
$$

Then the extension to the case where $d=\omega$ of the Kechris-Solecki-Todorčević dichotomy works with $\mathbb{G}^{\omega} \cap \mathbb{A}_{\omega}$ (see [L8]). But one can prove the following result:

Theorem 4.4.8 Let $X$ be a recursively presented Polish space, $\sigma_{X}$ the topology on $X^{\omega}$ generated by $\left\{\Pi_{i \in \omega} C_{i} \mid C \in \Delta_{1}^{1}(\omega \times X)\right\}$, and $A$ a $\Delta_{1}^{1}$ subset of $X^{\omega}$. Then exactly one of the following holds:
(a) $\bar{A}^{\sigma_{X}} \backslash A=\emptyset$.
(b) $\mathbb{G}^{\omega} \cap \mathbb{A}_{\omega} \leq A$.

In particular, $\mathbb{G}^{\omega} \cap \mathbb{A}_{\omega} \not \leq \mathbb{A}_{0}$ and we cannot take $\mathbb{S}_{1}^{\omega}=\mathbb{G}^{\omega} \cap \mathbb{A}_{\omega}$.

## 5 The proof of Theorem 1.7

### 5.1 Some material in dimension one

The material in this subsection is due to A. Louveau and J. Saint Raymond, and can be found in [Lo-SR1] or [Lo-SR2]. However, some changes are needed for our purposes, and moreover some proofs are left to the reader in these papers. So we will sometimes give some proofs. The following definition can be found in [Lo-SR2] (see Definition 1.5).

Definition 5.1.1 Let $1 \leq \xi<\omega_{1}, \boldsymbol{\Gamma}$ and $\boldsymbol{\Gamma}^{\prime}$ two classes. Then

$$
A \in S_{\xi}\left(\boldsymbol{\Gamma}, \boldsymbol{\Gamma}^{\prime}\right) \Leftrightarrow A=\bigcup_{p \geq 1}\left(A_{p} \cap C_{p}\right) \cup\left(B \backslash \bigcup_{p \geq 1} C_{p}\right)
$$

for some sequence of sets $A_{p}$ in $\boldsymbol{\Gamma}, B \in \boldsymbol{\Gamma}^{\prime}$, and a sequence $\left(C_{p}\right)_{p \geq 1}$ of pairwise disjoint $\boldsymbol{\Sigma}_{\xi}^{0}$ sets.
Now we come to the definition of second type descriptions of non self-dual Wadge classes of Borel sets, which are elements of $\omega_{1}^{\omega}$, sometimes identified with $\left(\omega_{1}^{\omega}\right)^{\omega}$. This definition can also be found in [Lo-SR2] (see Definition 1.6).

Definition 5.1.2 The relations " $u$ is a second type description" and " $u$ describes $\boldsymbol{\Gamma}$ " (written $u \in \mathcal{D}$ and $\boldsymbol{\Gamma}_{u}=\boldsymbol{\Gamma}$ - ambiguously) are the least relations satisfying
(a) If $u=0^{\infty}$, then $u \in \mathcal{D}$ and $\boldsymbol{\Gamma}_{u}=\{\emptyset\}$.
(b) If $u=\xi \frown 1 \frown u^{*}$, with $u^{*} \in \mathcal{D}$ and $u^{*}(0)=\xi$, then $u \in \mathcal{D}$ and $\boldsymbol{\Gamma}_{u}=\check{\Gamma}_{u^{*}}$.
(c) If $u=\xi \frown 2 \frown<u_{p}>$ satisfies $\xi \geq 1, u_{p} \in \mathcal{D}$, and $u_{p}(0) \geq \xi$ or $u_{p}(0)=0$, then $u \in \mathcal{D}$ and $\boldsymbol{\Gamma}_{u}=S_{\xi}\left(\bigcup_{p \geq 1} \boldsymbol{\Gamma}_{u_{p}}, \boldsymbol{\Gamma}_{u_{0}}\right)$.

Remark. If $A \in S_{\xi}\left(\bigcup_{p \geq 1} \boldsymbol{\Gamma}_{u_{p}}, \boldsymbol{\Gamma}_{u_{0}}\right)$, then $A$ has a decomposition as in Definition 5.1.1, and $A_{p}$ is in $\bigcup_{p \geq 1} \boldsymbol{\Gamma}_{u_{p}}$. But we may assume that $A_{p} \in \boldsymbol{\Gamma}_{u_{(p)}{ }_{0}+1}$, using the fact that $C_{p}$ may be empty if necessary. This remark will be useful in the sequel, since it specifies the class of $A_{p}$.

The following result can be found in [Lo-SR2] (see Section 3).
Theorem 5.1.3 Let $\boldsymbol{\Gamma}$ be a non self-dual Wadge class of Borel sets. Then there is $u \in \mathcal{D}$ such that $\boldsymbol{\Gamma}\left(\omega^{\omega}\right)=\boldsymbol{\Gamma}_{u}\left(\omega^{\omega}\right)$. Conversely,
$\boldsymbol{\Gamma}_{u}:=\left\{f^{-1}(A) \mid f: X \rightarrow \omega^{\omega}\right.$ continuous $\wedge X$ 0-dimensional Polish space $\left.\wedge A \in \boldsymbol{\Gamma}_{u}\left(\omega^{\omega}\right)\right\}$ is a non self-dual Wadge class of Borel sets if $u \in \mathcal{D}$.

If $\eta \leq \xi<\omega_{1}$, then $\xi-\eta$ is the unique ordinal $\theta$ with $\eta+\theta=\xi$. The following definition can be found in [Lo-SR2] (see Definition 1.9).

Definition 5.1.4 Let $\eta<\omega_{1}$ and $u \in \mathcal{D}$. We define $u^{\eta} \in \mathcal{D}$ as follows:
(a) If $u(0)=0$, then $u^{\eta}:=u$.
(b) If $u=\xi 1 u^{*}$, with $\xi \geq 1$, then $u^{\eta}:=(1+\eta+(\xi-1)) 1\left(u^{*}\right)^{\eta}$.
(c) If $u=\xi 2<u_{p}>$, with $\xi \geq 1$, then $u^{\eta}:=(1+\eta+(\xi-1)) 2<\left(u_{p}\right)^{\eta}>$.

The following result can be found in [Lo-SR2] (see Proposition 1.10).
Proposition 5.1.5 (a) If $f: \omega^{\omega} \rightarrow \omega^{\omega}$ is $\boldsymbol{\Sigma}_{1+\eta}^{0}$-measurable, and $A \in \boldsymbol{\Gamma}_{u}\left(\omega^{\omega}\right)$ for some $u \in \mathcal{D}$, then $f^{-1}(A) \in \boldsymbol{\Gamma}_{u^{\eta}}$.
(b) The set $\mathcal{D}$ is the least subset $D \subseteq \mathcal{D}$ such that $0^{\infty} \in D, u(0) 1 u \in D$ if $u \in D, 12<u_{p}>\in D$ if $u_{p} \in D$ for each $p \in \omega$, and $u^{\eta} \in D$ if $u \in D$, for each $\eta<\omega_{1}$.

Recall the definition of an independent $\eta$-function (see Definition 3.3).

Example. Let $\tau: \omega \rightarrow \omega$ be one-to-one (in [Lo-SR2] just before Lemma 2.5, increasing maps are considered, but here we relax this condition). We define $\tilde{\tau}: 2^{\omega} \rightarrow 2^{\omega}$ by $\tilde{\tau}(\alpha):=\alpha \circ \tau$. Clearly $\tilde{\tau}$ is an independent 0 -function, with $\pi(k)=\tau^{-1}(k)$ if $k$ is in the range of $\tau, 0$ otherwise. We now describe an important instance of this situation.

Example. Let $n$ be an integer, and $\mathcal{S}$ the shift map (see the notation before Definition 2.5). Then $\mathcal{S}^{n}$ is an independent 0 -function. Indeed, if we set $\tau^{n}(m):=m+n$, then $\mathcal{S}^{n}=\tilde{\tau^{n}}$, by induction on $n$. In particular, $\mathrm{Id}_{2} \omega=\mathcal{S}^{0}$ is an independent 0 -function.

The next result is essentially Lemma 2.5 in [Lo-SR2], which is given without proof, so we give the details here.

Lemma 5.1.6 Let $\tau: \omega \rightarrow \omega$ be one-to-one, $\rho$ an independent $\eta$-function. Then $\tilde{\tau} \circ \rho$ is an independent $\eta$-function.
Proof. Let $\pi$ associated with $\rho$. We define $\pi^{\prime}: \omega \rightarrow \omega$ by $\pi^{\prime}(k):=\tau^{-1}(\pi(k))$ if $\pi(k)$ is in the range of $\tau, 0$ otherwise, so that $\pi^{\prime}(k)=m$ if $\pi(k)=\tau(m)$. If $m$ is an integer, then $(\tilde{\tau} \circ \rho)(\alpha)(m)=\rho(\alpha)(\tau(m))$ depends only of the values of $\alpha$ on $\pi^{-1}(\{\tau(m)\}) \subseteq\left(\pi^{\prime}\right)^{-1}(\{m\})$.

If $\xi=0$ (resp., $\xi=\theta+1, \xi=\sup _{m \in \omega} \theta_{m}$ ), then $\mathcal{C}_{m}=\left\{\alpha \in 2^{\omega} \mid \rho(\alpha)(\tau(m))=1\right\}$ is $\boldsymbol{\Delta}_{1}^{0}$ complete (resp., $\Pi_{1+\theta^{-}}^{0}$-strategically complete, $\Pi_{1+\theta_{\tau(m)}}^{0}$-strategically complete). We are done since $\xi=\sup _{p \geq 1} \theta_{\tau\left(m_{p}\right)}$ if $\xi$ is a limit ordinal ( $\tau$ is one-to-one).

After Definition 3.3, we saw that $\rho_{0}^{\eta}$ is an independent $\eta$-function. We will actually prove more, actually a result which is essentially Theorem 2.4.(b) in [Lo-SR2].
Theorem 5.1.7 Let $\eta, \xi<\omega_{1}, \rho$ an independent $\xi$-function. Then $\rho_{0}^{\eta} \circ \rho$ is an independent $(\xi+\eta)$ function.
Proof. Note first that if $\varepsilon \in 2, \rho^{\varepsilon}: 2^{\omega} \rightarrow 2^{\omega}$ is equipped with $\pi^{\varepsilon}$ such that $\rho^{\varepsilon}(\alpha)(m)$ depends only on the values of $\alpha$ on $\left(\pi^{\varepsilon}\right)^{-1}(\{m\})$, then $\left(\rho^{0} \circ \rho^{1}\right)(\alpha)(m)$ depends only on the values of $\rho^{1}(\alpha)$ on $\left(\pi^{0}\right)^{-1}(\{m\})$, so it depends only on the values of $\alpha$ on $\left(\pi^{1}\right)^{-1}\left(\left(\pi^{0}\right)^{-1}(\{m\})\right)$, so that if we set $\pi:=\pi^{0} \circ \pi^{1}$, then $\left(\rho^{0} \circ \rho^{1}\right)(\alpha)(m)$ depends only on the values of $\alpha$ on $\pi^{-1}(\{m\})$.

- We argue by induction on $\eta$. The result is clear for $\eta=0$. So assume that $\eta=\theta+1$, so that $\rho_{0}^{\eta} \circ \rho=\rho_{0} \circ \rho_{0}^{\theta} \circ \rho$. The induction assumption implies that $\rho^{\theta} \circ \rho$ is an independent $(\xi+\theta)$-function. The fact that $\rho_{0}$ is an independent 1 -function and the previous point prove the existence of $\pi_{\eta}$ such that $\left(\rho_{0}^{\eta} \circ \rho\right)(\alpha)(m)$ depends only on the values of $\alpha$ on $\pi_{\eta}^{-1}(\{m\})$.

We set $A_{n}:=\left\{\alpha \in 2^{\omega} \mid\left(\rho_{0}^{\theta} \circ \rho\right)(\alpha)(<m, n>)=1\right\}$. Let us prove that $\bigcap_{n \in \omega} \neg A_{n}$ is $\Pi_{1+\xi+\theta^{-}}^{0}$ strategically complete.

Assume first that $\xi+\theta \neq 0$. As $\rho^{\theta} \circ \rho$ is an independent $(\xi+\theta)$-function, $A_{n}$ is $\Pi_{1+\theta_{n}}^{0}$-strategically complete, for some $\theta_{n}<\xi+\theta$ satisfying $\theta_{n}+1=\xi+\theta$ if $\xi+\theta$ is a successor ordinal, $\sup _{n \in \omega} \theta_{n}=\xi+\theta$ if $\xi+\theta$ is a limit ordinal. Note that $\xi+\theta=\sup _{n \in \omega}\left(\theta_{n}+1\right)$. As $\rho^{\theta} \circ \rho$ is an independent $(\xi+\theta)$ function, there is $\pi_{\theta}$ such that $\left(\rho_{0}^{\theta} \circ \rho\right)(\alpha)(q)$ depends only on the values of $\alpha$ on $\pi_{\theta}^{-1}(\{q\})$. We set $\pi(\alpha)(k):=\left(\pi_{\theta}(\alpha)\right)_{1}$, so that the fact that $\alpha \in A_{n}$ depends only on the values of $\alpha$ on $\pi^{-1}(\{n\})$. By Lemma 3.7 in [Lo-SR1], $\bigcap_{n \in \omega} \neg A_{n}$ is $\Pi_{1+\xi+\theta}^{0}$-strategically complete.

Assume now that $\xi+\theta=0$. Then $A_{n}:=\left\{\alpha \in 2^{\omega} \mid \rho(\alpha)(<m, n>)=1\right\}$ is $\boldsymbol{\Delta}_{1}^{0}$-complete since $\rho$ is an independent 0 -function. Let $B$ be a closed subset of $\omega^{\omega},\left(B_{n}\right)_{n \in \omega}$ a sequence of clopen subsets with $B=\bigcap_{n \in \omega} B_{n}$, and $g_{n}: \omega^{\omega} \rightarrow 2^{\omega}$ continuous with $B_{n}=g_{n}^{-1}\left(\neg A_{n}\right)$. As $\rho$ is an independent 0 -function, there is $\pi_{\rho}$ such that $\rho(\alpha)(q)$ depends only on the values of $\alpha$ on $\pi_{\rho}^{-1}(\{q\})$. We set $\pi(\alpha)(k):=\left(\pi_{\rho}(\alpha)\right)_{1}$, so that the fact that $\alpha \in A_{n}$ depends only on the values of $\alpha$ on $\pi^{-1}(\{n\})$. We define $g: \omega^{\omega} \rightarrow 2^{\omega}$ by $g(\beta)(k):=g_{\pi(k)}(\beta)(k)$, so that $g$ is continuous. Moreover, $\beta \in B_{n} \Leftrightarrow g_{n}(\beta) \notin A_{n} \Leftrightarrow g(\beta) \notin A_{n}$ since the fact that $\alpha \in A_{n}$ depends only on the values of $\alpha$ on $\pi^{-1}(\{n\})$. Thus $B=g^{-1}\left(\bigcap_{n \in \omega} \neg A_{n}\right)$ and $\bigcap_{n \in \omega} \neg A_{n}$ is $\Pi_{1}^{0}$-complete. Therefore $\bigcap_{n \in \omega} \neg A_{n}$ is $\boldsymbol{\Pi}_{1+\xi+\theta^{-}}^{0}$-strategically complete.

Now note that

$$
\begin{aligned}
\bigcap_{n \in \omega} \neg A_{n} & =\left\{\alpha \in 2^{\omega} \mid \forall n \in \omega\left(\rho_{0}^{\theta} \circ \rho\right)(\alpha)(<m, n>)=0\right\} \\
& =\left\{\alpha \in 2^{\omega} \mid\left(\rho_{0} \circ \rho_{0}^{\theta} \circ \rho\right)(\alpha)(m)=1\right\}=\left\{\alpha \in 2^{\omega} \mid\left(\rho_{0}^{\eta} \circ \rho\right)(\alpha)(m)=1\right\} .
\end{aligned}
$$

Thus $\left\{\alpha \in 2^{\omega} \mid\left(\rho_{0}^{\eta} \circ \rho\right)(\alpha)(m)=1\right\}$ is $\boldsymbol{\Pi}_{1+\xi+\theta^{0}}^{0}$-strategically complete for each $m$, and $\xi+\eta=\xi+\theta+1$, so that $\rho_{0}^{\eta} \circ \rho$ is an independent $(\xi+\eta)$-function.

- Assume now that $\eta$ is a limit ordinal. In the definition of $\rho_{0}^{\eta}$ we fixed a sequence $\left(\theta_{m}^{\eta}\right)_{m \in \omega} \subseteq \eta$ of successor ordinals with $\Sigma_{m \in \omega} \theta_{m}^{\eta}=\eta$. As $\rho_{0}^{\theta_{m}^{\eta}}$ is an independent $\theta_{m}^{\eta}$-function, we get $\pi_{m}^{\eta}: \omega \rightarrow \omega$. We define $\pi_{m, m+1}: \omega \rightarrow \omega$ by $\pi_{m, m+1}(k):=k$ if $k<m, \pi_{m}^{\eta}(k-m)+m$ if $k \geq m$. Let us check that $\rho_{0}^{(m, m+1)}(\alpha)(i)$ depends only on the values of $\alpha$ on $\pi_{m, m+1}^{-1}(\{i\})$. It is clearly the case if $i<m$. So assume that $i \geq m$. Note that $\pi_{m, m+1}(k)=i$ if $k \in\left(\pi_{m}^{\eta}\right)^{-1}(\{i-m\})+m$, and we are done. Now the first point of this proof gives $\pi_{0, m+1}: \omega \rightarrow \omega$ such that $\rho_{0}^{(0, m+1)}(\alpha)(i)$ depends only on the values of $\alpha$ on $\pi_{0, m+1}^{-1}(\{i\})$. We will check that $\rho_{0}^{\eta}(\alpha)(m):=\rho_{0}^{(0, m+1)}(\alpha)(m)$ depends only on the values of $\alpha$ on $E_{m}:=\pi_{0, m+1}^{-1}(\{m\}) \cap \bigcap_{l<m} \pi_{0, l+1}^{-1}(\neg(l+1))$. We actually prove something stronger: for each integer $k, \rho_{0}^{(0, m+1)}(\alpha)(k+m)$ depends only on the values of $\alpha$ on

$$
\pi_{0, m+1}^{-1}(\{k+m\}) \cap \bigcap_{l<m} \pi_{0, l+1}^{-1}(\neg(l+1)) .
$$

We argue by induction on $m$. For $m=0$, the result is clear. Assume that the result is true for $m$. Note that $\rho_{0}^{(0, m+2)}(\alpha)(k+m+1)$ depends only on the values of $\alpha$ on $\pi_{0, m+2}^{-1}(\{k+m+1\})$. But

$$
\rho_{0}^{(0, m+2)}(\alpha)(k+m+1)=\rho_{0}^{(m+1, m+2)}\left(\rho_{0}^{(0, m+1)}(\alpha)\right)(k+m+1)=\rho_{0}^{\theta_{m+1}^{\eta}}\left(\mathcal{S}^{m+1}\left(\rho_{0}^{(0, m+1)}(\alpha)\right)\right)(k)
$$

and we are done since $\rho_{0}^{(0, m+2)}(\alpha)(\alpha)(k+m+1)$ depends only on the values of $\mathcal{S}^{m+1}\left(\rho_{0}^{(0, m+1)}(\alpha)\right)$, which depends only on the values of $\alpha$ on $\pi_{0, m+1}^{-1}(\neg(m+1)) \cap \bigcap_{l<m} \pi_{0, l+1}^{-1}(\neg(l+1))$.

As the $E_{m}$ 's are pairwise disjoint, we can define a map $\pi^{\eta}: \omega \rightarrow \omega$ by $\pi^{\eta}(k):=m$ if $k \in E_{m}$, and 0 if $k \notin \bigcup_{m \in \omega} E_{m}$. Now it is clear that $\rho_{0}^{\eta}(\alpha)(m)$ depends only on the values of $\alpha$ on $\left(\pi^{\eta}\right)^{-1}(\{m\})$. The first point of this proof gives $\pi_{\eta}: \omega \rightarrow \omega$ such that $\left(\rho_{0}^{\eta} \circ \rho\right)(\alpha)(m)$ depends only on the values of $\alpha$ on $\pi_{\eta}^{-1}(\{m\})$.

Let $\zeta_{m}^{\eta}$ such that $\theta_{m}^{\eta}:=\zeta_{m}^{\eta}+1$, and $\theta_{m}:=\xi+\Sigma_{l<m} \theta_{l}^{\eta}+\zeta_{m}^{\eta}$, so that $\theta_{m}<\xi+\eta$ and $\sup _{p \geq 1} \theta_{m_{p}}=\xi+\eta$ for each one-to-one sequence $\left(m_{p}\right)_{p \geq 1}$ of integers. It remains to see that

$$
\mathcal{C}_{m}:=\left\{\alpha \in 2^{\omega} \mid\left(\rho_{0}^{\eta} \circ \rho\right)(\alpha)(m)=1\right\}
$$

is $\Pi_{1+\theta_{m}}^{0}$-strategically complete for each integer $m$.
Let us check that $\mathcal{S}^{m} \circ \rho_{0}^{(0, m+1)}=\rho_{0}^{\theta_{m}^{\eta}} \circ \circ_{l<m}\left(\mathcal{S} \circ \rho_{0}^{\theta_{m-l-1}^{\eta}}\right)$ for each integer $m$. We argue by induction on $m$. For $m=0$ the property is clear since $\rho_{0}^{(0,1)}=\rho_{0}^{\theta_{0}^{\eta}}$. Assume that the property is true for $m$. Then

$$
\begin{aligned}
\mathcal{S}^{m+1} \circ \rho_{0}^{(0, m+2)} & =\rho_{0}^{\theta_{m+1}^{\eta}} \circ \mathcal{S}^{m+1} \circ \rho_{0}^{(0, m+1)}=\rho_{0}^{\theta_{m+1}^{\eta}} \circ \mathcal{S} \circ \mathcal{S}^{m} \circ \rho_{0}^{(0, m+1)} \\
& =\rho_{0}^{\theta_{m+1}^{\eta}} \circ \mathcal{S} \circ \rho_{0}^{\theta_{m}^{\eta}} \circ \circ_{l<m}\left(\mathcal{S} \circ \rho_{0}^{\theta_{m-l-1}^{\eta}}\right)=\rho_{0}^{\theta_{m+1}^{\eta}} \circ \circ{ }_{l \leq m}\left(\mathcal{S} \circ \rho_{0}^{\theta_{m-l}^{\eta}}\right)
\end{aligned}
$$

since in the last induction we proved that $\mathcal{S}^{m+1} \circ \rho_{0}^{(0, m+2)}=\rho_{0}^{\theta_{m+1}^{\eta}} \circ \mathcal{S}^{m+1} \circ \rho_{0}^{(0, m+1)}$. Thus

$$
\begin{aligned}
\mathcal{C}_{m} & =\left\{\alpha \in 2^{\omega} \mid \rho_{0}^{(0, m+1)}(\rho(\alpha))(m)=1\right\}=\left\{\alpha \in 2^{\omega} \mid\left(\mathcal{S}^{m} \circ \rho_{0}^{(0, m+1)} \circ \rho\right)(\alpha)(0)=1\right\} \\
& =\left\{\alpha \in 2^{\omega} \mid\left(\rho_{0}^{\theta_{m}^{\eta}} \circ \circ_{l<m}\left(\mathcal{S} \circ \rho_{0}^{\theta_{m-l-1}^{\eta}}\right) \circ \rho\right)(\alpha)(0)=1\right\}
\end{aligned}
$$

So it is enough to see that $\rho^{m}:=\rho_{0}^{\theta_{m}^{\eta}} \circ \circ \circ_{l<m}\left(\mathcal{S} \circ \rho_{0}^{\theta_{m-l-1}^{\eta}}\right) \circ \rho$ is an independent $\left(\theta_{m}+1\right)$-function.
We argue by induction on $m$. For $m=0$, we are done since $\rho_{0}^{\theta_{0}^{\eta}} \circ \rho$ is by induction assumption an independent $\left(\xi+\theta_{0}^{\eta}\right)$-function, and $\xi+\theta_{0}^{\eta}=\xi+\zeta_{0}^{\eta}+1=\theta_{0}+1$. Assume that the property is true for $m$. Then $\rho^{m+1}=\rho_{0}^{\theta_{m+1}^{\eta}} \circ \mathcal{S} \circ \rho^{m}$. By induction assumption, $\rho^{m}$ is an independent $\left(\theta_{m}+1\right)$-function. By Lemma 5.1.6 and the example just before it, $\mathcal{S} \circ \rho^{m}$ is also an independent $\left(\theta_{m}+1\right)$-function. By induction assumption, $\rho^{m+1}$ is an independent $\left(\theta_{m}+1+\theta_{m+1}^{\eta}\right)$-function, and

$$
\theta_{m}+1+\theta_{m+1}^{\eta}=\xi+\Sigma_{l<m} \theta_{l}^{\eta}+\zeta_{m}^{\eta}+1+\theta_{m+1}^{\eta}=\xi+\Sigma_{l \leq m} \theta_{l}^{\eta}+\zeta_{m+1}^{\eta}+1=\theta_{m+1}+1
$$

This finishes the proof.

### 5.2 Some complicated sets

Now we come to the existence of complicated sets, as in the statement of Theorem 1.7. Their construction is based on Theorem 2.7 in [Lo-SR2] that we now change. The main problem is that we want to ensure the ccs conditions of Lemma 2.6. To do this, we modify the definition of the maps $\tau_{i}$ of Lemma 2.11 in [Lo-SR2].

Notation. Let $i$ be an integer. We define $\tau_{i}: \omega \rightarrow \omega$ by

$$
\tau_{i}(k):=\left\{\begin{array}{l}
<0, k>\text { if } i=0 \\
\ll i,(k)_{0}>,(k)_{1}>\text { if } i \geq 1
\end{array}\right.
$$

so that $\tau_{i}$ is one-to-one. This allows us to define, for each $\alpha \in 2^{\omega}, \alpha_{i}:=\tilde{\tau}_{i}(\alpha)$. If $s \in(\omega \backslash\{0\})^{<\omega}$, then we set $\tilde{\tau}_{s}:=\tilde{\tau}_{s(0)} \circ \ldots \circ \tilde{\tau}_{s(|s|-1)}$.

Lemma 5.2.1 Let $\boldsymbol{\Gamma}$ be a non self-dual Wadge class of Borel sets, and H a $\boldsymbol{\Gamma}$-strategically complete set. Then
(a) The set $\tilde{\tau}_{i}^{-1}(H)$ is $\boldsymbol{\Gamma}$-strategically complete for each integer $i$.
(b) Assume that $\tau: \omega \rightarrow \omega$ is one-to-one such that the fact that $\alpha \in H$ depends only on $\alpha \circ \tau$. Then $L:=\{\alpha \circ \tau \mid \alpha \in H\}$ is $\boldsymbol{\Gamma}$-strategically complete.

Proof. (a) As $\tilde{\tau}_{i}$ is continuous, $\tilde{\tau}_{i}^{-1}(H) \in \boldsymbol{\Gamma}\left(2^{\omega}\right)$. We define a continuous map $f_{\tau_{i}}: 2^{\omega} \rightarrow 2^{\omega}$ by $f_{\tau_{i}}(\alpha)(m):=\alpha\left(\tau_{i}^{-1}(m)\right)$ if $m$ is in the range of $\tau_{i}, 0$ otherwise. Note that $\tilde{\tau}_{i}\left(f_{\tau_{i}}(\alpha)\right)=\alpha$, so that $H=f_{\tau_{i}}^{-1}\left(\tilde{\tau}_{i}^{-1}(H)\right)$. This implies that $\tilde{\tau}_{i}^{-1}(H)$ is $\boldsymbol{\Gamma}$-strategically complete.
(b) As in (a), we consider the continuous map $f_{\tau}$, so that $\tilde{\tau}\left(f_{\tau}(\beta)\right)=\beta$ for each $\beta \in 2^{\omega}$. Here again we get that $f_{\tau}^{-1}(H) \in \boldsymbol{\Gamma}\left(2^{\omega}\right)$. Let $\beta \in L$, which gives $\alpha \in H$ with $\beta=\alpha \circ \tau$. As $f_{\tau}(\beta) \circ \tau=\tilde{\tau}\left(f_{\tau}(\beta)\right)=\beta$, we get $f_{\tau}(\beta) \circ \tau=\alpha \circ \tau$ and $f_{\tau}(\beta) \in H$ by the assumption on $H$. Conversely, if $f_{\tau}(\beta) \in H$, then $\beta=\tilde{\tau}\left(f_{\tau}(\beta)\right)=f_{\tau}(\beta) \circ \tau \in L$. Thus $f_{\tau}^{-1}(H)=L$, and $L \in \boldsymbol{\Gamma}\left(2^{\omega}\right)$.

If $\alpha \in H$, then $\tilde{\tau}(\alpha)=\alpha \circ \tau \in L$. Conversely, assume that $\tilde{\tau}(\alpha) \in L$. Then there is $\beta \in H$ with $\beta \circ \tau=\alpha \circ \tau$. The assumption on $H$ implies that $\alpha \in H$. Thus $H=\tilde{\tau}^{-1}(L)$ and $L$ is $\boldsymbol{\Gamma}$-strategically complete.

Lemma 5.2.2 Let $\boldsymbol{\Gamma}$ be a Wadge class of Borel sets, and $A \subseteq 2^{\omega}$. Then $A \in \boldsymbol{\Gamma}\left(2^{\omega}\right)$ if and only if there is $B \in \boldsymbol{\Gamma}\left(\omega^{\omega}\right)$ with $A=B \cap 2^{\omega}$.

Proof. $\Rightarrow$ Let $r: \omega^{\omega} \rightarrow 2^{\omega}$ be a continuous retraction. We just have to set $B:=r^{-1}(A)$.
$\Leftarrow$ Let $i: 2^{\omega} \rightarrow \omega^{\omega}$ be the canonical injection. Then $A=i^{-1}(B) \in \boldsymbol{\Gamma}\left(2^{\omega}\right)$.
This lemma shows that the notation $\boldsymbol{\Gamma}_{u}$ in Theorem 5.1.3 will not create any trouble, since it is equivalent to the one in Definition 5.1.2.

Notation. The following notation can essentially be found in [Lo-SR2] (after Lemma 2.5). Let $\mathcal{R}$ be the least set of functions from $2^{\omega}$ into itself which contains the functions $\rho_{0}^{\eta}$, the functions $\tilde{\tau}_{i}$ for $i \geq 1$, and is closed under composition. By Lemma 5.1.6 and Theorem 5.1.7, each $\rho \in \mathcal{R}$ is an independent $\eta$-function for some $\eta$ called the $\operatorname{order} o(\rho)$ of $\rho$.
Definition 5.2.3 Let $u \in \mathcal{D}$. A set $H \subseteq 2^{\omega}$ is strongly u-strategically complete iffor each $\rho \in \mathcal{R}$ of order $\eta, \rho^{-1}(H)$ is $\boldsymbol{\Gamma}_{u^{\eta} \text {-strategically complete and ccs. }}$

Theorem 5.2.4 Let $u \in \mathcal{D}$. Then there exists a strongly $u$-strategically complete set $H_{u} \subseteq 2^{\omega}$. In particular, $H_{u}$ is $\boldsymbol{\Gamma}_{u}$-complete and ccs.

Proof. We will check that the sets $H_{u}$ given by Theorem 2.7 in [Lo-SR2] essentially work, even if we change them.

The construction is by induction on $u \in \mathcal{D}$. Let us say that $u$ is nice if it satisfies the conclusion of the theorem. By Proposition 5.1.5, it is enough to prove that $0^{\infty}$ is nice, that $u(0) 1 u$ is nice if $u$ is nice, that $u^{\eta}$ is nice if $u$ is nice and $\eta<\omega_{1}$, and that $12<u_{p}>$ is nice if the $u_{p}$ 's are nice.

- We set $H_{0 \infty}:=\emptyset$, which is clearly strongly $0^{\infty}$-strategically complete.
- Assume that $u$ is nice. We set $H_{u(0) 1 u}:=\neg H_{u}$, which is strongly $u(0) 1 u$-strategically complete. Indeed, if $u(0)=0$, then $\boldsymbol{\Gamma}_{(u(0) 1 u)^{\eta}}=\boldsymbol{\Gamma}_{u(0) 1 u}=\check{\boldsymbol{\Gamma}}_{u}=\check{\boldsymbol{\Gamma}}_{u^{\eta}}$. If $u(0) \geq 1$, then

$$
\boldsymbol{\Gamma}_{(u(0) 1 u)^{\eta}}=\boldsymbol{\Gamma}_{(1+\eta+(u(0)-1)) 1 u^{\eta}}=\check{\boldsymbol{\Gamma}}_{u^{\eta}}
$$

since $u^{\eta}(0)=1+\eta+(u(0)-1)$.

- Assume that $u$ is nice, and let $\eta<\omega_{1}$. We set $H_{u^{\eta}}:=\left(\rho_{0}^{\eta}\right)^{-1}\left(H_{u}\right)$, which is strongly $u^{\eta}$-strategically complete. Indeed, let $\rho \in \mathcal{R}$ of order $\xi$. Then $\rho^{-1}\left(H_{u^{\eta}}\right)=\left(\rho_{0}^{\eta} \circ \rho\right)^{-1}\left(H_{u}\right)$ is $\boldsymbol{\Gamma}_{u}{ }^{\xi+\eta}$-strategically complete and compatible with comeager sets since $u$ is nice and $\rho_{0}^{\eta} \circ \rho$ is in $\mathcal{R}$ of order $\xi+\eta$. It remains to notice that $\left(u^{\eta}\right)^{\xi}=u^{\xi+\eta}$, which is clear by induction on $u$ and by definition of the ordinal subtraction.
- Assume that the $u_{p}$ 's are nice. We set

$$
\alpha \in H_{12<u_{p}>} \Leftrightarrow\left\{\begin{array}{l}
\alpha_{0}=0^{\infty} \wedge \alpha_{1} \in H_{u_{0}} \\
\text { or } \\
\exists m \in \omega \alpha_{0}(m)=1 \wedge \forall l<m \quad \alpha_{0}(l)=0 \wedge \alpha_{(m)_{0}+2} \in H_{u_{\left((m)_{0}+2\right)_{0}+1}} .
\end{array}\right.
$$

- Recall that $\boldsymbol{\Gamma}_{12<u_{p}>}=S_{1}\left(\bigcup_{p \geq 1} \boldsymbol{\Gamma}_{u_{p}}, \boldsymbol{\Gamma}_{u_{0}}\right)$. We set $H_{0}^{\prime}:=\left\{\alpha \in 2^{\omega} \mid \alpha_{1} \in H_{u_{0}}\right\}={\tilde{\tau_{1}}}^{-1}\left(H_{u_{0}}\right)$, and for $n \geq 2$,

$$
\begin{aligned}
& H_{n}^{\prime}:=\left\{\alpha \in 2^{\omega} \mid \alpha_{n} \in H_{u_{(n)_{0}+1}}\right\}={\tilde{\tau_{n}}}^{-1}\left(H_{u_{(n)_{0}+1}}\right), \\
& C_{n}:=\left\{\alpha \in 2^{\omega} \mid \exists m \in \omega \alpha_{0}(m)=1 \text { and } \forall l<m \quad \alpha_{0}(l)=0 \text { and }(m)_{0}+2=n\right\} .
\end{aligned}
$$

Note that $\left(C_{n}\right)_{n \geq 2}$ is a sequence of pairwise disjoint open sets, and $H_{0}^{\prime} \in \boldsymbol{\Gamma}_{u_{0}}, H_{n}^{\prime} \in \boldsymbol{\Gamma}_{u_{(n)_{0}+1}}$ if $n \geq 2$ by Lemma 5.2.1.(a). Moreover, $H_{12<u_{p}>}=\bigcup_{n>2}\left(H_{n}^{\prime} \cap C_{n}\right) \cup\left(H_{0}^{\prime} \backslash \bigcup_{n>2} C_{n}\right) \in \boldsymbol{\Gamma}_{12<u_{p}>}\left(2^{\omega}\right)$, by Lemma 5.2.2 and the reduction property for the class of open sets (see 22.16 in [K]).

- Let $\rho \in \mathcal{R}$ of order $\eta$. Then $\rho^{-1}\left(H_{12<u_{p}>}\right) \in \boldsymbol{\Gamma}_{\left(12<u_{p}>\right)^{\eta}}\left(2^{\omega}\right)$, by Proposition 5.1.5.(a) and a retraction argument in the style of the proof of Lemma 5.2.2. Let $\pi$ be associated with $\rho, \theta_{0}: \omega \rightarrow \omega$ be a one-to-one enumeration of $\pi^{-1}\left(\operatorname{Ran}\left(\tau_{1}\right)\right)$, and, for $n \geq 2, \theta_{n}: \omega \rightarrow \omega$ be a one-to-one enumeration of $\pi^{-1}\left(\operatorname{Ran}\left(\tau_{n}\right)\right)$ and $\theta_{0}^{n}: \omega \rightarrow \omega$ be a one-to-one enumeration of

$$
\pi^{-1}\left(\left\{j \in \operatorname{Ran}\left(\tau_{0}\right) \mid\left(\tau_{0}^{-1}(j)\right)_{0}+2=n\right\}\right)
$$

As $\tau_{i}$ is one-to-one, $\operatorname{Ran}\left(\tau_{i}\right)$ is infinite, and $\pi^{-1}\left(\operatorname{Ran}\left(\tau_{i}\right)\right)$ is also infinite since $\pi$ is onto. This proves the existence of the $\theta_{n}$ 's and of the $\theta_{0}^{n}$ 's. Note that the $\operatorname{Ran}\left(\tau_{i}\right)$ 's are pairwise disjoint since $0=<0,0>$. This implies that the elements of $\left\{\operatorname{Ran}\left(\theta_{n}\right) \mid n \neq 1\right\} \cup\left\{\operatorname{Ran}\left(\theta_{0}^{n}\right) \mid n \geq 2\right\}$ are pairwise disjoint.

- Note that the fact that $\alpha \in H_{n}^{\eta}:=\rho^{-1}\left(H_{n}^{\prime}\right)$ depends only on $\alpha \circ \theta_{n}$ if $n \neq 1$. We set, for $n \neq 1$,

$$
L_{n}^{\eta}:=\left\{\alpha \circ \theta_{n} \mid \alpha \in H_{n}^{\eta}\right\} .
$$

Note that $\rho^{-1}\left(H_{0}^{\prime}\right)=\rho^{-1}\left(\tilde{\tau}_{1}^{-1}\left(H_{u_{0}}\right)\right)=\left(\tilde{\tau_{1}} \circ \rho\right)^{-1}\left(H_{u_{0}}\right)$ is $\boldsymbol{\Gamma}_{u_{0}^{\eta} \text {-strategically complete since } u_{0}}$ is nice and $\tilde{\tau_{1}} \circ \rho$ is in $\mathcal{R}$ of order $\eta$. Similarly, $\rho^{-1}\left(H_{n}^{\prime}\right)$ is $\boldsymbol{\Gamma}_{u_{(n)_{0}+1}^{\eta}}$-strategically complete if $n \geq 2$.
 complete if $n \geq 2$.

- We set, for $n \geq 2, C_{n}^{\eta}:=\left\{\alpha \circ \theta_{0}^{n} \mid \exists m \in \omega \rho(\alpha)_{0}(m)=1\right.$ and $\left.(m)_{0}+2=n\right\}$. Let us prove that $C_{n}^{\eta}$ is $\Sigma_{1+\eta}^{0}$-strategically complete.

Note first that $\left\{\alpha \in 2^{\omega} \mid f(\alpha) \neq 0^{\infty}\right\}$ is $\boldsymbol{\Sigma}_{1+\eta}^{0}$-strategically complete if $f$ is an independent $\eta$-function. Indeed, with the notation of Definition 3.3, we can write

$$
\left\{\alpha \in 2^{\omega} \mid f(\alpha)=0^{\infty}\right\}=\bigcap_{m \in \omega} \neg \mathcal{C}_{m}
$$

Moreover, the fact that $\alpha \in \mathcal{C}_{m}$ depends only of the values of $\alpha$ on $\pi_{f}^{-1}(\{m\})$.
Assume first that $\eta \geq 1$. As $f$ is an independent $\eta$-function, $\mathcal{C}_{m}$ is $\boldsymbol{\Pi}_{1+\theta_{m}}^{0}$-strategically complete, for some $\theta_{m}<\eta$ satisfying $\theta_{m}+1=\eta$ if $\eta$ is a successor ordinal, $\sup _{m \in \omega} \theta_{m}=\eta$ if $\eta$ is a limit ordinal. Note that $\eta=\sup _{m \in \omega}\left(\theta_{m}+1\right)$. By Lemma 3.7 in [Lo-SR1], $\left\{\alpha \in 2^{\omega} \mid f(\alpha)=0^{\infty}\right\}$ is $\boldsymbol{\Pi}_{1+\eta}^{0}$-strategically complete.

Assume now that $\eta=0$. As in the proof of Theorem 5.1 .7 we see that $\left\{\alpha \in 2^{\omega} \mid f(\alpha)=0^{\infty}\right\}$ is $\Pi_{1+\eta}^{0}$-strategically complete.

Now we come back to the $C_{n}^{\eta}$, s. We define $\tau: \omega \rightarrow \omega$ by $\tau(k):=<n-2, k>$, so that $\tau$ is one-to-one and $\operatorname{Ran}(\tau)=\left\{m \in \omega \mid(m)_{0}=n-2\right\}$. As $\rho$ is an independent $\eta$-function, $\tilde{\tau_{0}} \circ \rho$ and $\tilde{\tau} \circ \tilde{\tau_{0}} \circ \rho$ are also independent $\eta$-functions by Lemma 5.1.6. The previous point shows that

$$
L_{n}:=\left\{\alpha \in 2^{\omega} \mid\left(\tilde{\tau} \circ \tilde{\tau_{0}} \circ \rho\right)(\alpha) \neq 0^{\infty}\right\}
$$

is $\Sigma_{1+\eta}^{0}$-strategically complete. But

$$
\begin{aligned}
L_{n} & =\left\{\alpha \in 2^{\omega} \mid \exists k \in \omega \tilde{\tau}\left(\left(\tilde{\tau_{0}} \circ \rho\right)(\alpha)\right)(k)=1\right\}=\left\{\alpha \in 2^{\omega} \mid \exists k \in \omega\left(\tilde{\tau_{0}} \circ \rho\right)(\alpha)(\tau(k))=1\right\} \\
& =\left\{\alpha \in 2^{\omega} \mid \exists m \in \omega\left(\tilde{\tau_{0}} \circ \rho\right)(\alpha)(m)=1 \text { and }(m)_{0}+2=n\right\}
\end{aligned}
$$

and the fact that $\alpha \in L_{n}$ depends only on $\alpha \circ \theta_{0}^{n}$. By Lemma 5.2.1.(b), we get that $C_{n}^{\xi}$ is $\boldsymbol{\Sigma}_{1+\eta^{-}}^{0}$ strategically complete.

- Let $H^{*} \in \boldsymbol{\Gamma}_{\left(12<u_{p}>\right)^{\eta}}\left(\omega^{\omega}\right)$, say $H^{*}=\bigcup_{n \geq 2}\left(H_{n}^{*} \cap C_{n}^{*}\right) \cup\left(H_{0}^{*} \backslash \bigcup_{n \geq 2} C_{n}^{*}\right)$, with pairwise disjoint $C_{n}^{*} \in \boldsymbol{\Sigma}_{1+\eta}^{0}, H_{0}^{*} \in \boldsymbol{\Gamma}_{u_{0}^{\eta}}$, and without loss of generality $H_{n}^{*} \in \boldsymbol{\Gamma}_{u_{(n)_{0}+1}^{\eta}}$. Then Player 2 has for each $n \neq 1$ a winning strategy $\sigma_{n}$ in $G\left(H_{n}^{*}, L_{n}^{\eta}\right)$, and for each $n \geq 2$ a winning strategy $\sigma_{n}^{*}$ in $G\left(C_{n}^{*}, C_{n}^{\eta}\right)$. Let then Player 2 plays in $G\left(H^{*}, \rho^{-1}\left(H_{u_{12<u_{p}>}}\right)\right)$ against $\beta$ by playing his strategies $\sigma_{n}, \sigma_{n}^{*}$ at the right places (the ranges of $\theta_{n}$ and $\theta_{0}^{n}$ respectively) against this same $\beta$, independently, and by playing 0 out of these ranges. The result is some $\alpha$ such that $\alpha \circ \theta_{n}$ wins against $\beta$ in $G\left(H_{n}^{*}, L_{n}^{\eta}\right)$ and $\alpha \circ \theta_{0}^{n}$ wins against $\beta$ in $G\left(C_{n}^{*}, C_{n}^{\eta}\right)$. This wins, for $\alpha \in \rho^{-1}\left(H_{n}^{\prime}\right)$ just in case $\beta \in H_{n}^{*}$, and $\rho(\alpha)_{0}$ takes value 1 on some $m$ with $(m)_{0}+2=n$ just in case $\beta \in C_{n}^{*}$. But as the $C_{n}^{*}$ are pairwise disjoint, there is at most one $n$ in $\left\{(m)_{0}+2 \mid \rho(\alpha)_{0}(m)=1\right\}$, and $\alpha \in \rho^{-1}\left(C_{n}\right)$ just in case $\beta \in C_{n}^{*}$. Thus $\rho^{-1}\left(H_{\left.12<u_{p}\right\rangle}\right)$ is $\boldsymbol{\Gamma}_{\left(12<u_{p}>\right)^{\eta}}$-strategically complete.
- It remains to see that $\rho^{-1}\left(H_{12<u_{p}>}\right)$ is ccs. So let $\alpha_{0} \in d^{\omega}$ and $F: 2^{\omega} \rightarrow\left(d^{\omega}\right)^{d-1}$ satisfying the conclusion of Lemma 2.4.(b).
$\circ$ Let $N \geq 1$ and $M \in \omega$. Then $\rho(\alpha)_{N} \in H_{u_{M}} \Leftrightarrow\left(\tilde{\tau_{N}} \circ \rho\right)(\alpha) \in H_{u_{M}} \Leftrightarrow \alpha \in\left(\tilde{\tau_{N}} \circ \rho\right)^{-1}\left(H_{u_{M}}\right)$. As $N \geq 1, \tilde{\tau_{N}} \circ \rho$ is in $\mathcal{R}$, and $\left(\tilde{\tau_{N}} \circ \rho\right)^{-1}\left(H_{u_{M}}\right)$ is ccs since $u_{M}$ is nice. Thus $\rho(\alpha)_{N} \in H_{u_{M}}$ if and only if $\rho\left(\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\right)_{N} \in H_{u_{M}}$.
- Recall the notation before Lemma 2.4. We define $q: \omega^{<\omega} \backslash\{\emptyset\} \rightarrow \omega$ as follows:

$$
q(t):=\left\{\begin{array}{l}
t(0) \text { if }|t|=1 \\
<t(|t|-1), q\left(t^{-}\right)>\text {if }|t| \geq 2
\end{array}\right.
$$

- Let us prove that $\tilde{\tau}_{s}(\alpha)(n)=\alpha\left(<q\left((n)_{0} s\right),(n)_{1}>\right)$ for each $s \in(\omega \backslash\{0\})^{<\omega}$.

We argue by induction on $|s|$. So assume that the result is proved for $|s| \leq l$, which is the case for $l=0$. Assume that $|s|=l+1$. We get

$$
\begin{aligned}
\tilde{\tau}_{s}(\alpha)(n) & =\tilde{\tau}_{s \mid l}\left(\tau_{s(l)}^{\tilde{}}(\alpha)\right)(n)=\tilde{\tau_{s(l)}}(\alpha)\left(<q\left((n)_{0}(s \mid l)\right),(n)_{1}>\right)=\alpha\left(\tau_{s(l)}\left(<q\left((n)_{0}(s \mid l)\right),(n)_{1}>\right)\right) \\
& =\alpha\left(\left\langle<s(l), q\left((n)_{0}(s \mid l)\right)>,(n)_{1}\right\rangle\right)=\alpha\left(<q\left((n)_{0} s\right),(n)_{1}>\right)
\end{aligned}
$$

$\circ$ Let us prove that $\left(\rho_{0} \circ \tilde{\tau}_{s}\right)(\alpha)=\left(\rho_{0} \circ \tilde{\tau}_{s}\right)\left(\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\right)$ for each $s \in(\omega \backslash\{0\})^{<\omega}$ and each $\alpha \in 2^{\omega}$. This comes from the following equivalences:

$$
\begin{aligned}
\left(\rho_{0} \circ \tilde{\tau}_{s}\right)(\alpha)(n)=0 & \Leftrightarrow \exists m \in \omega \tilde{\tau}_{s}(\alpha)(<n, m>)=1 \Leftrightarrow \exists m \in \omega \alpha(<q(n s), m>)=1 \\
& \Leftrightarrow \exists m^{\prime} \in \omega \mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\left(<q(n s), m^{\prime}>\right)=1 \\
& \Leftrightarrow\left(\rho_{0} \circ \tilde{\tau}_{s}\right)\left(\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\right)(n)=0
\end{aligned}
$$

$\circ$ Let us prove that $\left(\rho_{0}^{\eta} \circ \tilde{\tau}_{s}\right)(\alpha)=\left(\rho_{0}^{\eta} \circ \tilde{\tau}_{s}\right)\left(\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\right)$ for each $1 \leq \eta<\omega_{1}$, each $s \in(\omega \backslash\{0\})^{<\omega}$ and each $\alpha \in 2^{\omega}$.

We argue by induction on $\eta$. For $\eta=1$, this comes from the previous point. If $\theta \geq 1$ and $\eta=\theta+1$, then this comes from the fact that $\rho_{0}^{\eta}=\rho_{0} \circ \rho_{0}^{\theta}$. If $\eta$ is a limit ordinal and $m$ is an integer, then

$$
\begin{aligned}
& \left(\rho_{0}^{\eta} \circ \tilde{\tau}_{s}\right)(\alpha)(m) \\
= & \rho_{0}^{\eta}\left(\tilde{\tau}_{s}(\alpha)\right)(m)=\rho_{0}^{(0, m+1)}\left(\tilde{\tau}_{s}(\alpha)\right)(m) \\
= & \left(\rho_{0}^{(m, m+1)} \circ \ldots \circ \rho_{0}^{(1,2)}\right)\left(\rho_{0}^{(0,1)}\left(\tilde{\tau}_{s}(\alpha)\right)\right)(m)=\left(\rho_{0}^{(m, m+1)} \circ \ldots \circ \rho_{0}^{(1,2)}\right)\left(\rho_{0}^{\theta_{0}^{\eta}}\left(\tilde{\tau}_{s}(\alpha)\right)\right)(m) \\
= & \left(\rho_{0}^{(m, m+1)} \circ \ldots \circ \rho_{0}^{(1,2)}\right)\left(\rho_{0}^{\theta_{0}^{\eta}}\left(\tilde{\tau}_{s}\left(\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\right)\right)\right)(m)=\left(\rho_{0}^{\eta} \circ \tilde{\tau}_{s}\right)\left(\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\right)(m) .
\end{aligned}
$$

○ Note that $\rho(\alpha)_{0}=0^{\infty} \Leftrightarrow \alpha \in\left(\tilde{\tau_{0}} \circ \rho\right)^{-1}\left(\left\{0^{\infty}\right\}\right)$. Let us prove that $\left(\tilde{\tau_{0}} \circ \rho\right)^{-1}\left(\left\{0^{\infty}\right\}\right)$ is ccs.
We can write $\rho=o_{j \leq l} \rho^{j}$, where $l$ is an integer and each $\rho^{j}$ is either of the form $\rho_{0}^{\eta}$, or one of the $\tilde{\tau}_{i}$ 's for $i \geq 1$. By the previous point, we may assume that that each $\rho^{j}$ is either $\rho_{0}^{0}=\operatorname{Id}_{2} \omega$, or one of the $\tilde{\tau}_{i}$ 's for $i \geq 1$. So there is $s \in(\omega \backslash\{0\})^{<\omega}$ such that $\rho=\tilde{\tau}_{s}$. We get

$$
\begin{aligned}
\alpha \notin\left(\tilde{\tau_{0}} \circ \rho\right)^{-1}\left(\left\{0^{\infty}\right\}\right) & \Leftrightarrow \exists m \in \omega\left(\tilde{\tau_{0}} \circ \rho\right)(\alpha)(m)=1 \Leftrightarrow \exists m \in \omega \rho(\alpha)\left(\tau_{0}(m)\right)=1 \\
& \Leftrightarrow \exists m \in \omega \tilde{\tau}_{s}(\alpha)(<0, m>)=1 \Leftrightarrow \exists m \in \omega \alpha(<q(0 s), m>)=1 \\
& \Leftrightarrow \exists m \in \omega \alpha(p(q(0 s), m))=1 \\
& \Leftrightarrow \exists m^{\prime} \in \omega \mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\left(p\left(q(0 s), m^{\prime}\right)\right)=1 \\
& \Leftrightarrow \mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right) \notin\left(\tilde{\tau_{0}} \circ \rho\right)^{-1}\left(\left\{0^{\infty}\right\}\right) .
\end{aligned}
$$

Thus $\rho(\alpha)_{0}=0^{\infty} \Leftrightarrow \rho\left(\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)\right)_{0}=0^{\infty}$.

- It remains to see that if $\rho(\alpha)_{0} \neq 0^{\infty}$ and $m_{\alpha}$ is minimal with $\rho(\alpha)_{0}\left(m_{\alpha}\right)=1$, then

$$
\left(m_{\alpha}\right)_{0}=\left(m_{\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)}\right)_{0}
$$

As in the previous point we may assume that there is $s \in(\omega \backslash\{0\})^{<\omega}$ such that $\rho=\tilde{\tau}_{s}$. The computations of the previous point show that $\rho(\alpha)_{0}(m)=\alpha(<q(0 s), m>)$ for each integer $m$. Note that

$$
n_{\alpha}:=<q(0 s), m_{\alpha}>=\min \left\{n \in \omega \mid \alpha(n)=1 \wedge(n)_{0}=q(0 s)\right\}
$$

since $<q(0 s), .>$ is increasing, and similarly

$$
<q(0 s), m_{\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)}>=\min \left\{m \in \omega \mid \mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)(m)=1 \wedge(m)_{0}=q(0 s)\right\}
$$

But

$$
B_{\alpha}\left[\left\{n \in \omega \mid \alpha(n)=1 \text { and }(n)_{0}=q(0 s)\right\}\right]=\left\{m \in \omega \mid \mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)(m)=1 \text { and }(m)_{0}=q(0 s)\right\}
$$

since $B_{\alpha}$ is a bijection satisfying $(n)_{0}=\left(B_{\alpha}(n)\right)_{0}$. As $B_{\alpha}$ is increasing we get

$$
B_{\alpha}\left(n_{\alpha}\right)=<q(0 s), m_{\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)}>
$$

Thus $\left(m_{\mathcal{S}\left(\alpha_{0} \Delta F_{0}(\alpha)\right)}\right)_{0}=\left(\left(B_{\alpha}\left(n_{\alpha}\right)\right)_{1}\right)_{0}=\left(\left(n_{\alpha}\right)_{1}\right)_{0}=\left(m_{\alpha}\right)_{0}$ and we are done.
Corollary 5.2.5 Let $\boldsymbol{\Gamma}$ be a non self-dual Wadge class of Borel sets. Then there is $C_{\boldsymbol{\Gamma}} \subseteq 2^{\omega}$ which is $\Gamma$-complete and ccs.

Proof. By Theorem 5.1.3 there is $u \in \mathcal{D}$ such that $\boldsymbol{\Gamma}\left(\omega^{\omega}\right)=\boldsymbol{\Gamma}_{u}\left(\omega^{\omega}\right)$. By Theorem 5.2.4 there is $H_{u} \subseteq 2^{\omega}$ which is strongly $\boldsymbol{\Gamma}_{u}$-strategically complete. It is clear that $C_{\boldsymbol{\Gamma}}:=H_{u}$ is suitable.

Now we can prove Theorem 1.7.(1). But we need some more material to prove Theorem 1.7.(2).

Definition 5.2.6 (a) A set $U \subseteq 2^{\omega}$ is strongly ccs if for each $s \in(\omega \backslash\{0\})^{<\omega}$ the set $\tilde{\tau}_{s}^{-1}(U)$ is ccs.
(b) Let $\boldsymbol{\Gamma}$ be a Wadge class of Borel sets, and $U_{0}, U_{1} \in \boldsymbol{\Gamma}\left(2^{\omega}\right)$ disjoint. We say that $\left(U_{0}, U_{1}\right)$ is complete for pairs of disjoint $\boldsymbol{\Gamma}$ sets if for any pair $\left(A_{0}, A_{1}\right)$ of disjoint $\boldsymbol{\Gamma}$ subsets of $\omega^{\omega}$ there is $f: \omega^{\omega} \rightarrow 2^{\omega}$ continuous such that $A_{\varepsilon}=f^{-1}\left(U_{\varepsilon}\right)$ for each $\varepsilon \in 2$. Similarly, we can define the notion of a sequence $\left(U_{p}\right)_{p \geq 1}$ complete for sequences of pairwise disjoint $\boldsymbol{\Gamma}$ sets.

Lemma 5.2.7 (a) There is $\left(U_{1}, U_{2}\right)$ complete for pairs of disjoint $\Sigma_{1}^{0}$ sets with $U_{\varepsilon}$ strongly ccs, and such that for each $s \in(\omega \backslash\{0\})^{<\omega}$ there is a pair $\left(O_{1}, O_{2}\right)$ of ccs $\boldsymbol{\Sigma}_{1}^{0}$ sets reducing the pair $\left(\tilde{\tau}_{1 s 1}^{-1}\left(U_{1} \cup U_{2}\right), \tilde{\tau}_{1 s 2}^{-1}\left(U_{1} \cup U_{2}\right)\right)$.
(b) There is $\left(U_{p}\right)_{p \geq 1}$ complete for sequences of pairwise disjoint $\Sigma_{1}^{0}$ sets with $U_{p}$ strongly ccs, and such that for each $s \in(\omega \backslash\{0\})^{<\omega}$ there is a sequence $\left(O_{p}^{\varepsilon}\right)_{\varepsilon \in\{1,2\}, p \geq 1}$ of ccs $\Sigma_{1}^{0}$ sets reducing $\left(\tilde{\tau}_{s \varepsilon}^{-1}\left(U_{p}\right)\right)_{\varepsilon \in\{1,2\}, p \geq 1}$.

Proof. (a) Recall the definition of $H_{1}$ after Definition 3.3: $H_{1}:=\left\{0^{\infty}\right\}$. We saw that $H_{1} \in \boldsymbol{\Pi}_{1}^{0}\left(2^{\omega}\right)$ and is $\Pi_{1}^{0}$-complete. We set $U:=\neg H_{1}$, so that $U$ is $\boldsymbol{\Sigma}_{1}^{0}$-complete. Let $\left(A_{1}, A_{2}\right)$ be a pair of disjoint $\Sigma_{1}^{0}$ subsets of $\omega^{\omega}$. As $U$ is complete there are $f_{1}, f_{2}: \omega^{\omega} \rightarrow 2^{\omega}$ continuous such that $A_{\varepsilon}=f_{\varepsilon}^{-1}(U)$ for each $\varepsilon \in\{1,2\}$. We define $f: \omega^{\omega} \rightarrow 2^{\omega}$ by

$$
f(\alpha)\left(\left\langle<\varepsilon,(k)_{0}>,(k)_{1}\right\rangle\right):=\left\{\begin{array}{l}
f_{\varepsilon}(\alpha)(k) \text { if } \varepsilon \in\{1,2\} \\
0 \text { otherwise }
\end{array}\right.
$$

so that $f$ is continuous and $f_{\varepsilon}=\tilde{\tau}_{\varepsilon} \circ f$. Now $A_{\varepsilon}=f^{-1}\left(\tilde{\tau}_{\varepsilon}^{-1}(U)\right)$ and $\left(\tilde{\tau}_{1}^{-1}(U), \tilde{\tau}_{2}^{-1}(U)\right)$ is complete for pairs of $\Sigma_{1}^{0}$ sets (not necessarily disjoint). Note that

$$
\begin{aligned}
\tilde{\tau}_{\varepsilon}^{-1}(U) & =\left\{\alpha \in 2^{\omega} \mid \exists k \in \omega \alpha\left(\left\langle<\varepsilon,(k)_{0}>,(k)_{1}\right\rangle\right)=1\right\} \\
& =\left\{\alpha \in 2^{\omega} \mid \exists N \in \omega \quad\left((N)_{0}\right)_{0}=\varepsilon \wedge \alpha(N)=1\right\}
\end{aligned}
$$

We set $V_{\varepsilon}:=\left\{\alpha \in 2^{\omega} \mid \exists N \in \omega \quad\left((N)_{0}\right)_{0}=\varepsilon \wedge \alpha(N)=1 \wedge \forall l<N \quad\left(\left((l)_{0}\right)_{0} \notin\{1,2\} \vee \alpha(l)=0\right)\right\}$. Note that $V_{i} \in \Sigma_{1}^{0}$ and $\left(V_{1}, V_{2}\right)$ reduces $\left(\tilde{\tau}_{1}^{-1}(U), \tilde{\tau}_{2}^{-1}(U)\right)$. Thus

$$
\alpha \in A_{\varepsilon} \Leftrightarrow f(\alpha) \in \tilde{\tau}_{\varepsilon}^{-1}(U) \Leftrightarrow f(\alpha) \in \tilde{\tau}_{\varepsilon}^{-1}(U) \backslash \tilde{\tau}_{3-\varepsilon}^{-1}(U) \Leftrightarrow f(\alpha) \in V_{\varepsilon}
$$

and $\left(V_{1}, V_{2}\right)$ is complete for pairs of disjoint $\boldsymbol{\Sigma}_{1}^{0}$ sets. Recall the definition of $\tau_{0}$ before Lemma 5.2.1. We set $U_{\varepsilon}:=\tilde{\tau}_{0}^{-1}\left(V_{\varepsilon}\right)$, which defines a pair of disjoint $\Sigma_{1}^{0}$ sets. Now $g(\alpha):=<\alpha, \alpha, \ldots>$ defines $g: 2^{\omega} \rightarrow 2^{\omega}$ continuous. Note that $\alpha \in A_{\varepsilon} \Leftrightarrow f(\alpha) \in V_{\varepsilon} \Leftrightarrow \tilde{\tau}_{0}(g(f(\alpha))) \in V_{\varepsilon} \Leftrightarrow g(f(\alpha)) \in U_{\varepsilon}$, which shows that $\left(U_{1}, U_{2}\right)$ is complete for pairs of disjoint $\Sigma_{1}^{0}$ sets.

Fix $s \in(\omega \backslash\{0\})^{<\omega}$. The proof of Theorem 5.2.4 shows that $\tilde{\tau}_{s}(\alpha)(n)=\alpha\left(<q\left((n)_{0} s\right),(n)_{1}>\right)$. We get

$$
\begin{aligned}
& \tilde{\tau}_{s}^{-1}\left(U_{\varepsilon}\right)=\left\{\alpha \in 2^{\omega} \mid \exists N \in \omega\left((N)_{0}\right)_{0}=\varepsilon \wedge \alpha(<q(0 s), N>)=1 \wedge\right. \\
& \left.\forall l<N\left(\left((l)_{0}\right)_{0} \notin\{1,2\} \vee \alpha(<q(0 s), l>)=0\right)\right\} .
\end{aligned}
$$

Thus

$$
\begin{aligned}
& \tilde{\tau}_{s}^{-1}\left(U_{\varepsilon}\right)=\left\{\alpha \in 2^{\omega} \mid \exists M \in \omega\left(\left((M)_{1}\right)_{0}\right)_{0}=\varepsilon \wedge(M)_{0}=q(0 s) \wedge \alpha(M)=1 \wedge\right. \\
& \left.\forall l<M\left(\left(\left((M)_{1}\right)_{0}\right)_{0} \notin\{1,2\} \vee(l)_{0} \neq q(0 s) \vee \alpha(l)=0\right)\right\}
\end{aligned}
$$

Recall the conclusion of Lemma 2.4.(b). The bijection $B_{\alpha}$ induces an increasing bijection between

$$
\begin{aligned}
& \left\{M \in \omega \mid\left(\left((M)_{1}\right)_{0}\right)_{0} \in\{1,2\} \wedge(M)_{0}=q(0 s) \wedge \alpha(M)=1\right\} \text { and } \\
& \\
& \quad\left\{M^{\prime} \in \omega \mid\left(\left(\left(M^{\prime}\right)_{1}\right)_{0}\right)_{0} \in\{1,2\} \wedge\left(M^{\prime}\right)_{0}=q(0 s) \wedge \mathcal{S}\left(\alpha_{0} \Delta F(\alpha)\right)\left(M^{\prime}\right)=1\right\}
\end{aligned}
$$

since $(M)_{0}=\left(B_{\alpha}(M)\right)_{0}$ and $\left((M)_{1}\right)_{0}=\left(\left(B_{\alpha}(M)\right)_{1}\right)_{0}$. A second application of this shows that $\tilde{\tau}_{s}^{-1}\left(U_{\varepsilon}\right)$ is ccs. Thus $U_{\varepsilon}$ strongly ccs. Note that

$$
\tilde{\tau}_{1 s \varepsilon}^{-1}\left(U_{1} \cup U_{2}\right)=\left\{\alpha \in 2^{\omega} \mid \exists M \in \omega\left(\left((M)_{1}\right)_{0}\right)_{0} \in\{1,2\} \wedge(M)_{0}=q(01 s \varepsilon) \wedge \alpha(M)=1\right\}
$$

We set

$$
\begin{aligned}
& O_{\varepsilon}:=\left\{\alpha \in 2^{\omega} \mid \exists M \in \omega\left(\left((M)_{1}\right)_{0}\right)_{0} \in\{1,2\} \wedge(M)_{0}=q(01 s \varepsilon) \wedge \alpha(M)=1 \wedge\right. \\
&\left.\forall l<M\left(\left(\left((l)_{1}\right)_{0}\right)_{0} \notin\{1,2\} \vee(l)_{0} \notin\{q(01 s 1), q(01 s 2)\} \vee \alpha(l)=0\right)\right\}
\end{aligned}
$$

This defines a pair of $\boldsymbol{\Sigma}_{1}^{0}$ sets reducing $\left(\tilde{\tau}_{1 s 1}^{-1}\left(U_{1} \cup U_{2}\right), \tilde{\tau}_{1 s 2}^{-1}\left(U_{1} \cup U_{2}\right)\right)$. We check that they are ccs as for $\tilde{\tau}_{s}^{-1}\left(U_{\varepsilon}\right)$.
(b) The proof is completely similar to that of (a).

The following result is a consequence of Theorem 1.9 and Lemmas 1.11, 1.23 in [Lol], and of Theorem 3 in [Lo-SR3]:

Theorem 5.2.8 Let $\boldsymbol{\Gamma}$ be a self-dual Wadge class of Borel sets. Then there is a non self-dual Wadge class of Borel sets $\boldsymbol{\Gamma}^{\prime}$ such that $\boldsymbol{\Gamma}\left(\omega^{\omega}\right)=\Delta\left(\boldsymbol{\Gamma}^{\prime}\right)\left(\omega^{\omega}\right), \boldsymbol{\Gamma}^{\prime}$ does not have the separation property, and one of the following holds:
(1) There is $\bar{u} \in \mathcal{D}$ such that

$$
\boldsymbol{\Gamma}^{\prime}\left(\omega^{\omega}\right)=\left\{\left(A_{0} \cap C_{0}\right) \cup\left(A_{1} \cap C_{1}\right) \mid A_{0}, \neg A_{1} \in \boldsymbol{\Gamma}_{\bar{u}}\left(\omega^{\omega}\right) \wedge C_{0}, C_{1} \in \boldsymbol{\Sigma}_{1}^{0}\left(\omega^{\omega}\right) \wedge C_{0} \cap C_{1}=\emptyset\right\} .
$$

(2) There is $\left(\left(u^{\prime}\right)_{p}\right)_{p \geq 1} \in \mathcal{D}^{\omega}$ such that $\left(\boldsymbol{\Gamma}_{\left(u^{\prime}\right)_{p}}\left(\omega^{\omega}\right)\right)_{p \geq 1}$ is strictly increasing and

$$
\boldsymbol{\Gamma}^{\prime}\left(\omega^{\omega}\right)=\left\{\bigcup_{p \geq 1}\left(A_{p} \cap C_{p}\right) \mid A_{p} \in \boldsymbol{\Gamma}_{\left(u^{\prime}\right)_{p}}\left(\omega^{\omega}\right) \wedge C_{p} \in \boldsymbol{\Sigma}_{1}^{0}\left(\omega^{\omega}\right) \wedge C_{p} \cap C_{q}=\emptyset \text { if } p \neq q\right\}
$$

Lemma 5.2.9 Let $\boldsymbol{\Gamma}^{\prime}$ be as in the statement of Theorem 5.2.8. Then there are $C^{0}, C^{1} \in \Gamma^{\prime}\left(2^{\omega}\right)$ disjoint, ccs, and not separable by a $\Delta\left(\boldsymbol{\Gamma}^{\prime}\right)$ set.

Proof. (1) Lemma 5.2.7.(a) gives $\left(U_{1}, U_{2}\right)$ complete for pairs of disjoint $\boldsymbol{\Sigma}_{1}^{0}$ sets with $U_{\varepsilon}$ strongly ccs, and such that for each $s \in(\omega \backslash\{0\})^{<\omega}$ there is a pair $\left(O_{1}, O_{2}\right)$ of ccs $\Sigma_{1}^{0}$ sets reducing the pair $\left(\tilde{\tau}_{1 s 1}^{-1}\left(U_{1} \cup U_{2}\right), \tilde{\tau}_{1 s 2}^{-1}\left(U_{1} \cup U_{2}\right)\right)$. Theorem 5.2.4 gives $H_{\bar{u}} \subseteq 2^{\omega}$ which is $\boldsymbol{\Gamma}_{\bar{u}}$-complete and strongly ccs. We set $H:=\left(\tilde{\tau}_{2}^{-1}\left(H_{\bar{u}}\right) \cap \tilde{\tau}_{1}^{-1}\left(U_{1}\right)\right) \cup\left(\tilde{\tau}_{3}^{-1}\left(\neg H_{\bar{u}}\right) \backslash \tilde{\tau}_{1}^{-1}\left(U_{2}\right)\right)$ and, for $\varepsilon \in\{1,2\}, E_{\varepsilon}:=\tilde{\tau}_{\varepsilon}^{-1}(H)$. Finally, we set $C^{\varepsilon}:=\left(O_{\varepsilon} \cap E_{\varepsilon}\right) \cup\left(O_{3-\varepsilon} \backslash E_{3-\varepsilon}\right)$.

- We set, for $\varepsilon, j \in\{1,2\}, A_{1}^{\varepsilon}:=\tilde{\tau}_{2 \varepsilon}^{-1}\left(H_{\bar{u}}\right), A_{2}^{\varepsilon}:=\tilde{\tau}_{3 \varepsilon}^{-1}\left(\neg H_{\bar{u}}\right), F_{j}^{\varepsilon}:=\tilde{\tau}_{1 \varepsilon}^{-1}\left(U_{j}\right)$, so that

$$
E_{\varepsilon}=\left(A_{1}^{\varepsilon} \cap F_{1}^{\varepsilon}\right) \cup\left(A_{2}^{\varepsilon} \cap F_{2}^{\varepsilon}\right)
$$

Note that

$$
\begin{aligned}
C^{\varepsilon}= & \left(A_{1}^{\varepsilon} \cap F_{1}^{\varepsilon} \cap O_{\varepsilon}\right) \cup\left(A_{2}^{\varepsilon} \cap F_{2}^{\varepsilon} \cap O_{\varepsilon}\right) \cup\left(\neg A_{1}^{3-\varepsilon} \cap F_{1}^{3-\varepsilon} \cap O_{3-\varepsilon}\right) \cup\left(\neg A_{2}^{3-\varepsilon} \cap F_{2}^{3-\varepsilon} \cap O_{3-\varepsilon}\right) \\
= & \left(\left(\left(A_{1}^{\varepsilon} \cap F_{1}^{\varepsilon} \cap O_{\varepsilon}\right) \cup\left(\neg A_{2}^{3-\varepsilon} \cap F_{2}^{3-\varepsilon} \cap O_{3-\varepsilon}\right)\right) \cap\left(\left(F_{1}^{\varepsilon} \cap O_{\varepsilon}\right) \cup\left(F_{2}^{3-\varepsilon} \cap O_{3-\varepsilon}\right)\right)\right) \cup \\
& \left(\left(\left(A_{2}^{\varepsilon} \cap F_{2}^{\varepsilon} \cap O_{\varepsilon}\right) \cup\left(\neg A_{1}^{3-\varepsilon} \cap F_{1}^{3-\varepsilon} \cap O_{3-\varepsilon}\right)\right) \cap\left(\left(F_{2}^{\varepsilon} \cap O_{\varepsilon}\right) \cup\left(F_{1}^{3-\varepsilon} \cap O_{3-\varepsilon}\right)\right)\right),
\end{aligned}
$$

and that $F_{1}^{\varepsilon} \cap O_{\varepsilon}, F_{2}^{3-\varepsilon} \cap O_{3-\varepsilon}, F_{2}^{\varepsilon} \cap O_{\varepsilon}, F_{1}^{3-\varepsilon} \cap O_{3-\varepsilon}$ are pairwise disjoint open subsets of $2^{\omega}$. By Lemma 5.2.2 and the reduction property for $\Sigma_{1}^{0}$ we can write $C^{\varepsilon}$ as the intersection of $2^{\omega}$ with
$\left(\left(\left(\mathcal{A}_{1}^{\varepsilon} \cap \mathcal{O}_{1}^{\varepsilon}\right) \cup\left(\neg \mathcal{A}_{2}^{3-\varepsilon} \cap \mathcal{O}_{2}^{3-\varepsilon}\right)\right) \cap\left(\mathcal{O}_{1}^{\varepsilon} \cup \mathcal{O}_{2}^{3-\varepsilon}\right)\right) \cup\left(\left(\left(\mathcal{A}_{2}^{\varepsilon} \cap \mathcal{O}_{2}^{\varepsilon}\right) \cup\left(\neg \mathcal{A}_{1}^{3-\varepsilon} \cap \mathcal{O}_{1}^{3-\varepsilon}\right)\right) \cap\left(\mathcal{O}_{2}^{\varepsilon} \cup \mathcal{O}_{1}^{3-\varepsilon}\right)\right)$,
where $\mathcal{A}_{1}^{\varepsilon}, \neg \mathcal{A}_{2}^{\varepsilon} \in \boldsymbol{\Gamma}_{\bar{u}}\left(\omega^{\omega}\right)$ and $\mathcal{O}_{j}^{\varepsilon}$ are four pairwise disjoint open subsets of $\omega^{\omega}$. By Lemma 1.4.(b) in [Lo1], $\left(\mathcal{A}_{1}^{\varepsilon} \cap \mathcal{O}_{1}^{\varepsilon}\right) \cup\left(\neg \mathcal{A}_{2}^{3-\varepsilon} \cap \mathcal{O}_{2}^{3-\varepsilon}\right), \neg\left(\left(\mathcal{A}_{2}^{\varepsilon} \cap \mathcal{O}_{2}^{\varepsilon}\right) \cup\left(\neg \mathcal{A}_{1}^{3-\varepsilon} \cap \mathcal{O}_{1}^{3-\varepsilon}\right)\right) \in \boldsymbol{\Gamma}_{\bar{u}}\left(\omega^{\omega}\right)$, so that $C^{\varepsilon} \in \boldsymbol{\Gamma}^{\prime}\left(2^{\omega}\right)$, by Lemma 5.2.2 again.

- It is clear that $C^{1}$ and $C^{2}$ are disjoint and ccs.
- Assume, towards a contradiction, that $D \in \Delta\left(\boldsymbol{\Gamma}^{\prime}\right)$ separates $C^{1}$ from $C^{2}$. Let $D_{1}, D_{2} \in \boldsymbol{\Gamma}^{\prime}\left(\omega^{\omega}\right)$ disjoint. As $H$ is complete we get $f_{\varepsilon}: \omega^{\omega} \rightarrow 2^{\omega}$ continuous such that $D_{\varepsilon}=f_{\varepsilon}^{-1}(H)$. We define $f: \omega^{\omega} \rightarrow 2^{\omega}$ by

$$
f(\alpha)\left(\left\langle<\varepsilon,(k)_{0}>,(k)_{1}\right\rangle\right):=\left\{\begin{array}{l}
f_{\varepsilon}(\alpha)(k) \text { if } \varepsilon \in\{1,2\} \\
0 \text { otherwise }
\end{array}\right.
$$

so that $(f(\alpha))_{\varepsilon}=f_{\varepsilon}(\alpha)$. Then $f$ is continuous and $D_{\varepsilon}=f^{-1}\left(E_{\varepsilon}\right)$. Note that $E_{\varepsilon} \backslash E_{3-\varepsilon} \subseteq C^{\varepsilon}$. This implies that $\alpha \in D_{1} \Leftrightarrow f(\alpha) \in E_{1} \Leftrightarrow f(\alpha) \in E_{1} \backslash E_{2} \Rightarrow f(\alpha) \in C_{1} \subseteq D$. Similarly, $D_{2} \subseteq f^{-1}(\neg D)$, and $f^{-1}(D) \in \Delta\left(\Gamma^{\prime}\right)\left(\omega^{\omega}\right)$ separates $D_{1}$ from $D_{2}$. Thus $\Gamma^{\prime}$ has the separation property, which is absurd.
(2) Lemma 5.2.7.(b) gives $\left(U_{p}\right)_{p \geq 1}$ complete for sequences of pairwise disjoint $\boldsymbol{\Sigma}_{1}^{0}$ sets with $U_{p}$ strongly ccs, and such that for each $s \in(\omega \backslash\{0\})^{<\omega}$ there is a sequence $\left(O_{p}^{\varepsilon}\right)_{\varepsilon \in\{1,2\}, p \geq 1}$ of ccs $\boldsymbol{\Sigma}_{1}^{0}$ sets reducing $\left(\tilde{\tau}_{s \varepsilon}^{-1}\left(U_{p}\right)\right)_{\varepsilon \in\{1,2\}, p \geq 1}$. Theorem 5.2.4 gives $H_{\left(u^{\prime}\right)_{p}} \subseteq 2^{\omega}$ which is $\boldsymbol{\Gamma}_{\left(u^{\prime}\right)_{p}}$ - complete and strongly ccs. We set $H:=\bigcup_{p \geq 1}\left(\tilde{\tau}_{2 p}^{-1}\left(H_{\left(u^{\prime}\right)_{p}}\right) \cap \tilde{\tau}_{1}^{-1}\left(U_{p}\right)\right)$ and, for $\varepsilon \in\{1,2\}, E_{\varepsilon}:=\tilde{\tau}_{\varepsilon}^{-1}(H)$.

We also set $A_{p}^{\varepsilon}:=\tilde{\tau}_{(2 p) \varepsilon}^{-1}\left(H_{\left(u^{\prime}\right)_{p}}\right), F_{p}^{\varepsilon}:=\tilde{\tau}_{1 \varepsilon}^{-1}\left(U_{p}\right)$, so that $E_{\varepsilon}=\bigcup_{p \geq 1}\left(A_{p}^{\varepsilon} \cap F_{p}^{\varepsilon}\right)$. Finally, we set $C^{\varepsilon}:=\left(A_{1}^{\varepsilon} \cap O_{1}^{\varepsilon}\right) \cup \bigcup_{p \geq 1}\left(\left(O_{p}^{3-\varepsilon} \backslash A_{p}^{3-\varepsilon}\right) \cup\left(A_{p+1}^{\varepsilon} \cap O_{p+1}^{\varepsilon}\right)\right)$.

Note that $C^{\varepsilon} \in \boldsymbol{\Gamma}^{\prime}\left(2^{\omega}\right)$ since $\left(\boldsymbol{\Gamma}_{\left(u^{\prime}\right)_{p}}\left(\omega^{\omega}\right)\right)_{p \geq 1}$ is strictly increasing, using again Lemma 5.2.2, the generalized reduction property for $\boldsymbol{\Sigma}_{1}^{0}$ (see 22.16 in [K]), and Lemma 1.4.(b) in [Lo1]. Here again, $E_{\varepsilon} \backslash E_{3-\varepsilon} \subseteq C^{\varepsilon}$ and we conclude as in (1).

Proof of Theorem 1.7. It is clear that Proposition 2.2, Lemmas 2.3, 2.6, Corollary 5.2.5, Lemma 5.2.9 and Theorem 3.1 imply Theorem 1.7, if we set $\mathbb{S}_{\Gamma}^{d}:=S_{C_{\Gamma}}^{d}$ and $\mathbb{S}_{\Gamma}^{\varepsilon}:=S_{C^{\varepsilon}}^{d}$.

## 6 The proof of Theorem 1.8

We first introduce an operator in the spirit of $\Phi$ defined before Theorem 4.2.2, but in dimension one. Another important difference to notice is the following. In Theorem 4.2.2, (f) for example, $S$ is in a boldface class, while $A_{0}$ and $A_{1}$ are in a lightface class. The same phenomenon will hold in the case of Wadge classes, and in the new operator we introduce we have boldface conditions (for example, we do not ask $\gamma^{\prime}$ to be $\Delta_{1}^{1}(\beta)$ ). We code the Borel classes, and define an operator $\Phi_{1}$ on $\omega^{\omega} \times \omega^{\omega}$ to do it. Recall the definition of Seq before Lemma 2.3. We set
$W_{0}:=\left\{(\beta, \gamma) \in \omega^{\omega} \times W^{\omega^{\omega}} \mid\left(\beta(0) \in \operatorname{Seq} \wedge C_{\gamma}^{\omega^{\omega}}=\left\{\delta \in \omega^{\omega} \mid \mathcal{I}^{-1}(\beta(0)) \subseteq \delta\right\}\right) \vee\right.$

$$
\left.\left(\beta(0) \notin \operatorname{Seq} \wedge C_{\gamma}^{\omega^{\omega}}=\emptyset\right)\right\},
$$

$\Phi_{1}(A):=A \cup W_{0} \cup\left\{(\beta, \gamma) \in \omega^{\omega} \times W^{\omega} \mid \exists \gamma^{\prime} \in \omega^{\omega} \forall n \in \omega\left((\beta)_{n},\left(\gamma^{\prime}\right)_{n}\right) \in A\right.$ and

$$
\left.\neg C_{\gamma}^{\omega^{\omega}}=\bigcup_{n \in \omega} C_{\left(\gamma^{\prime}\right)_{n}}^{\omega^{\omega}}\right\} .
$$

In the sequel, we will denote $\Phi_{1}^{<\xi}:=\bigcup_{\eta<\xi} \Phi_{1}^{\eta}$.
Lemma 6.1 Let $1 \leq \xi<\omega_{1}$ and $B \subseteq \omega^{\omega}$. Then $B \in \Pi_{\xi}^{0}$ if and only if there is $(\beta, \gamma) \in \Phi_{1}^{\xi}$ such that $C_{\gamma}^{\omega^{\omega}}=B$.

Proof. Note first that $B=N_{s}:=\left\{\delta \in \omega^{\omega} \mid s \subseteq \delta\right\}$ for some $s \in \omega^{<\omega}$ or $B=\emptyset$ if and only if there is $(\beta, \gamma) \in W_{0}=\Phi_{1}^{0}$ with $C_{\gamma}^{\omega^{\omega}}=B$. Then

$$
\begin{aligned}
B \in \Pi_{1}^{0} & \Leftrightarrow \exists\left(s_{n}\right)_{n \in \omega} \in\left(\omega^{<\omega}\right)^{\omega} \neg B=\bigcup_{n \in \omega} N_{s_{n}} \vee \neg B=\emptyset \\
& \Leftrightarrow \exists \beta, \gamma^{\prime} \in \omega^{\omega} \forall n \in \omega\left((\beta)_{n},\left(\gamma^{\prime}\right)_{n}\right) \in \Phi_{1}^{0} \wedge \neg B=\bigcup_{n \in \omega} C_{\left(\gamma^{\prime}\right)_{n}}^{\omega^{\omega}} \\
& \Leftrightarrow \exists(\beta, \gamma) \in \Phi_{1}^{1} C_{\gamma}^{\omega \omega}=B .
\end{aligned}
$$

Assume now that the result is proved for $1 \leq \eta<\xi \geq 2$. We get

$$
\begin{aligned}
B \in \boldsymbol{\Pi}_{\xi}^{0} & \Leftrightarrow \exists\left(B_{n}\right)_{n \in \omega} \in\left(\boldsymbol{\Pi}_{<\xi}^{0}\right)^{\omega} \neg B=\bigcup_{n \in \omega} B_{n} \\
& \Leftrightarrow \exists \beta, \gamma^{\prime} \in \omega^{\omega} \forall n \in \omega \quad\left((\beta)_{n},\left(\gamma^{\prime}\right)_{n}\right) \in \Phi_{1}^{<\xi} \wedge \neg B=\bigcup_{n \in \omega} C_{\left(\gamma^{\prime}\right)_{n}}^{\omega^{\omega}} \\
& \Leftrightarrow \exists(\beta, \gamma) \in \Phi_{1}^{\xi} C_{\gamma}^{\omega^{\omega}}=B .
\end{aligned}
$$

This finishes the proof.

We now define a $\Pi_{1}^{1}$ coding of $\mathcal{D}$ (recall Definition 5.1.2).
Notation. We define an inductive operator $\Lambda$ over $\omega^{\omega}$ as follows:

$$
\begin{aligned}
& \Lambda(D):=D \cup\left\{\alpha \in \omega^{\omega}\left|\forall n \in \omega(\alpha)_{n} \in \mathrm{WO} \wedge\right|(\alpha)_{n} \mid=0\right\} \cup \\
& \left\{\alpha \in \omega^{\omega}\left|\forall n \in \omega(\alpha)_{n} \in \mathrm{WO} \wedge(\alpha)_{0}=(\alpha)_{2} \wedge\right|(\alpha)_{1} \mid=1 \wedge<(\alpha)_{2+j}>\in D\right\} \cup \\
& \left\{\alpha \in \omega^{\omega}\left|\forall n \in \omega(\alpha)_{n} \in \mathrm{WO} \wedge\right|(\alpha)_{0}|\geq 1 \wedge|(\alpha)_{1} \mid=2 \wedge\right. \\
& \left.\forall p \in \omega<(\alpha)_{2+<p, q>}>\in D \wedge\left(\left|(\alpha)_{2+<p, 0>}\right| \geq\left|(\alpha)_{0}\right| \vee\left|(\alpha)_{2+<p, 0>}\right|=0\right)\right\}
\end{aligned}
$$

Then $\Lambda$ is a $\Pi_{1}^{1}$ monotone inductive operator, by 4A. 2 in [M].
By 7C. 1 in [M] we get $\Lambda^{\infty}:=\bigcup_{\xi} \Lambda^{\xi}=\Lambda\left(\Lambda^{\infty}\right)=\bigcap\left\{D \subseteq \omega^{\omega} \mid \Lambda(D) \subseteq D\right\}$. An easy induction on $\xi$ shows that $\Lambda^{\infty} \subseteq\left\{\alpha \in \omega^{\omega} \mid \forall n \in \omega(\alpha)_{n} \in \mathrm{WO}\right\}$, so that the coding function $c$, partially defined by $c(\alpha):=\left(\left|(\alpha)_{n}\right|\right)_{n \in \omega}$, is defined on $\Lambda^{\infty}$.
Lemma 6.2 The set $\Lambda^{\infty}$ is a $\Pi_{1}^{1}$ coding of $\mathcal{D}$, which means that $\Lambda^{\infty} \in \Pi_{1}^{1}\left(\omega^{\omega}\right)$ and $c\left[\Lambda^{\infty}\right]=\mathcal{D}$.
Proof. We first prove that $\Lambda^{\infty} \in \Pi_{1}^{1}\left(\omega^{\omega}\right)$ (see 7C in [M] for that). We define a set relation $\varphi(\alpha, D)$ on $\omega^{\omega}$ by $\varphi(\alpha, D) \Leftrightarrow \alpha \in \Lambda(D)$. As $\Lambda$ is monotone, $\varphi$ is operative. If $Q \in \Pi_{1}^{1}\left(Z \times \omega^{\omega}\right)$, then the relation $\varphi\left(\alpha,\left\{\beta \in \omega^{\omega} \mid(z, \beta) \in Q\right\}\right)$ is in $\Pi_{1}^{1}$. Thus $\varphi$ is $\Pi_{1}^{1}$ on $\Pi_{1}^{1}$. By 7 C .8 in $[\mathrm{M}], \varphi^{\infty}(\alpha)$ is in $\Pi_{1}^{1}$ and $\Lambda^{\infty} \in \Pi_{1}^{1}\left(\omega^{\omega}\right)$.

Let $\beta_{\varepsilon} \in$ WO such that $\left|\beta_{\varepsilon}\right|=\varepsilon$, for $\varepsilon \in 3$. Then $<\beta_{0} \mid n \in \omega>\in \Lambda^{0} \subseteq \Lambda^{\infty}$, so that $0^{\infty} \in c\left[\Lambda^{\infty}\right]$. Let $u^{*} \in c\left[\Lambda^{\infty}\right], \alpha^{*} \in \Lambda^{\infty}$ with $u^{*}=c\left(\alpha^{*}\right)$. Then $<\left(\alpha^{*}\right)_{0}, \beta_{1},\left(\alpha^{*}\right)_{0},\left(\alpha^{*}\right)_{1}, \ldots>\in \Lambda\left(\Lambda^{\infty}\right)=\Lambda^{\infty}$, so that $u^{*}(0) 1 u^{*}=c\left(<\left(\alpha^{*}\right)_{0}, \beta_{1},\left(\alpha^{*}\right)_{0},\left(\alpha^{*}\right)_{1}, \ldots>\right) \in c\left[\Lambda^{\infty}\right]$.

Now let $\xi \geq 1, u_{p} \in c\left[\Lambda^{\infty}\right]$ such that $u_{p}(0) \geq \xi$ or $u_{p}(0)=0$, for each $p \in \omega$. Choose $\alpha \in \mathrm{WO}$ with $|\alpha|=\xi$, and $\alpha^{p} \in \Lambda^{\infty}$ with $u_{p}=c\left(\alpha^{p}\right)$. Then $<\alpha, \beta_{2},\left(\alpha^{(0)_{0}}\right)_{(0)_{1}},\left(\alpha^{(1)_{0}}\right)_{(1)_{1}}, \ldots>\in \Lambda\left(\Lambda^{\infty}\right)=\Lambda^{\infty}$, so that $\xi 2<u_{p}>=c\left(<\alpha, \beta_{2},\left(\alpha^{(0)_{0}}\right)_{(0)_{1}},\left(\alpha^{(1)_{0}}\right)_{(1)_{1}}, \ldots>\right) \in c\left[\Lambda^{\infty}\right]$. Thus $\mathcal{D} \subseteq c\left[\Lambda^{\infty}\right]$.

Assume now that $\tilde{\mathcal{D}} \subseteq \omega_{1}^{\omega}$ satisfies the following properties:
(a) $0^{\infty} \in \tilde{\mathcal{D}}$.
(b) $u^{*} \in \tilde{\mathcal{D}} \Rightarrow u^{*}(0) 1 u^{*} \in \tilde{\mathcal{D}}$.
(c) $\left(\xi \geq 1 \wedge \forall p \in \omega\left(u_{p} \in \tilde{\mathcal{D}} \wedge\left(u_{p}(0) \geq \xi \vee u_{p}(0)=0\right)\right)\right) \Rightarrow \xi 2<u_{p}>\in \tilde{\mathcal{D}}$.

We set $D:=\left\{\alpha \in \omega^{\omega} \mid \forall n \in \omega \quad(\alpha)_{n} \in \mathrm{WO} \wedge c(\alpha) \in \tilde{\mathcal{D}}\right\}$. It remains to see that $\Lambda(D) \subseteq D$. Indeed, this will imply that $\Lambda^{\infty} \subseteq D, c\left[\Lambda^{\infty}\right] \subseteq c[D] \subseteq \tilde{\mathcal{D}}$ and $c\left[\Lambda^{\infty}\right] \subseteq \mathcal{D}$.

As $0^{\infty} \in \tilde{\mathcal{D}}$ we get $\left\{\alpha \in \omega^{\omega}\left|\forall n \in \omega \quad(\alpha)_{n} \in \mathrm{WO} \wedge\right|(\alpha)_{n} \mid=0\right\} \subseteq D$. Assume that $(\alpha)_{n} \in$ WO for each $n \in \omega$, that $(\alpha)_{0}=(\alpha)_{2},\left|(\alpha)_{1}\right|=1$ and $<(\alpha)_{2+j}>\in D$. Then $u^{*}:=\left(\left|(\alpha)_{2+j}\right|\right) \in \tilde{\mathcal{D}}$, and $\left|(\alpha)_{2}\right| 1 u^{*} \in \tilde{\mathcal{D}}$. Thus $c(\alpha) \in \tilde{\mathcal{D}}$ and $\alpha \in D$.

Assume now that $(\alpha)_{n} \in$ WO for each $n \in \omega,\left|(\alpha)_{0}\right| \geq 1,\left|(\alpha)_{1}\right|=2,<(\alpha)_{2+<p, q>}>\in D$, and $\left|(\alpha)_{2+<p, 0>}\right| \geq\left|(\alpha)_{0}\right|$ or $\left|(\alpha)_{2+<p, 0>}\right|=0$ for each $p \underset{\tilde{D}}{ } \omega$. We set $\xi:=\left|(\alpha)_{0}\right|$. Then we have $u_{p}:=\left(\left|(\alpha)_{2+<p, q>}\right|\right) \in \tilde{\mathcal{D}}$, and $\xi 2<u_{p}>\in \tilde{\mathcal{D}}$. Thus $c(\alpha) \in \tilde{\mathcal{D}}$ and $\alpha \in D$.

Note that just like Definition 5.1.2, the definition of $\Lambda$ is cut into three cases, that we will meet again later on: $\left|(\alpha)_{1}\right|=0$ (or, equivalently, $\left|(\alpha)_{n}\right|=0$ for each integer $n$ ), $\left|(\alpha)_{1}\right|=1$ or $\left|(\alpha)_{1}\right|=2$.

Even if " $u \in \mathcal{D}$ " is the least relation satisfying some conditions, some simplifications are possible. For example, $\boldsymbol{\Gamma}_{01010^{\infty}}=\boldsymbol{\Gamma}_{0^{\infty}}$. Some other simplifications are possible, and some of them will simplify the notation later on. This will lead to the notion of a normalized code of a description. To define it, we need to associate a tree to a code of a description. The idea is to describe the construction of a set in $\boldsymbol{\Gamma}_{u}$ using simpler and simpler sets, until we get the simplest set, namely the empty set. More specifically, we define $\mathfrak{T}: \Lambda^{\infty} \rightarrow\left\{\right.$ trees on $\left.\omega \times \Lambda^{\infty}\right\}$ as follows. Let $\alpha \in \Lambda^{\xi} \backslash \Lambda^{<\xi}$. We set

$$
\mathfrak{T}(\alpha):=\left\{\begin{array}{l}
\{\emptyset\} \cup\{<(0, \alpha)>\} \text { if }\left|(\alpha)_{1}\right|=0 \\
\{\emptyset\} \cup\left\{(0, \alpha)^{\frown} s \mid s \in \mathfrak{T}\left(<(\alpha)_{2+j}>\right)\right\} \text { if }\left|(\alpha)_{1}\right|=1 \\
\{\emptyset\} \cup\left\{(0, \alpha)^{\left.\frown s \mid s \in \mathfrak{T}\left(<(\alpha)_{2+<0, q \gg}>\right)\right\} \cup}\right. \\
\quad \bigcup_{p \geq 1}\left\{(p, \alpha)^{-} s \mid s \in \mathfrak{T}\left(<(\alpha)_{2+<(p)_{0}+1, q>}>\right)\right\} \text { if }\left|(\alpha)_{1}\right|=2
\end{array}\right.
$$

An easy induction on $\eta$ shows that $\mathfrak{T}(\alpha)$ is always a countable well-founded tree (the first coordinate of ( $p, \alpha$ ) ensures the well-foundedness). A sequence $s \in \mathfrak{T}(\alpha)$ is said to be maximal if $s \subseteq t \in \mathfrak{T}(\alpha)$ implies that $s=t$. Note that $\left|\left(s_{1}(|s|-1)\right)_{1}\right|=0$ if $s$ is maximal. We denote by $\mathcal{M}_{\alpha}$ the set of maximal sequences in $\mathfrak{T}(\alpha)$.

Definition 6.3 We say that $\alpha \in \Lambda^{\infty}$ is normalized if the following holds:

$$
\left(s \in \mathcal{M}_{\alpha} \wedge i<|s| \wedge\left|\left(s_{1}(i)\right)_{1}\right|=1\right) \Rightarrow i=|s|-2
$$

This means that in a maximal sequence $s$ of $\mathfrak{T}(\alpha),\left|\left(s_{1}(i)\right)_{1}\right|$ is 2 , then possibly 1 once, and finally 0 once. The next lemma says that we can always assume that $\alpha$ is normalized. It is based on the fact that $\check{S}_{\xi}\left(\boldsymbol{\Gamma}, \boldsymbol{\Gamma}^{\prime}\right)=S_{\xi}\left(\check{\boldsymbol{\Gamma}}^{\prime}, \check{\boldsymbol{\Gamma}}^{\prime}\right)$.

Lemma 6.4 Let $\alpha \in \Lambda^{\infty}$. Then there is $\alpha^{\prime} \in \Lambda^{\infty}$ normalized with $\left(\alpha^{\prime}\right)_{0}=(\alpha)_{0}$ and $\boldsymbol{\Gamma}_{c\left(\alpha^{\prime}\right)}=\boldsymbol{\Gamma}_{c(\alpha)}$.
Proof. Assume that $\alpha \in \Lambda^{\xi} \backslash \Lambda^{<\xi}$. We argue by induction on $\xi$.
Case 1. $\left|(\alpha)_{1}\right|=0$.
We just set $\alpha^{\prime}:=\alpha$ since $\left|\left(s_{1}(i)\right)_{1}\right|=0$.
Case 2. $\left|(\alpha)_{1}\right|=1$.

- We first define $N: \Lambda^{\infty} \rightarrow \Lambda^{\infty}$ as follows. We ensure that $(N(\beta))_{0}=(\beta)_{0}$ and $\boldsymbol{\Gamma}_{c(N(\beta))}=\check{\boldsymbol{\Gamma}}_{c(\beta)}$. Let $\beta_{1} \in$ WO with $\left|\beta_{1}\right|=1$. We set

$$
N(\beta):=\left\{\begin{array}{l}
<(\beta)_{0}, \beta_{1},(\beta)_{0},(\beta)_{1},(\beta)_{2}, \ldots>\text { if }\left|(\beta)_{1}\right|=0 \\
<(\beta)_{2+j}>\text { if }\left|(\beta)_{1}\right|=1 \\
<(\beta)_{0},(\beta)_{1},\left(\left(N\left(<(\beta)_{2+<(i-2)_{0}, q>}>\right)\right)_{(i-2)_{1}}\right)_{i \geq 2}>\text { if }\left|(\beta)_{1}\right|=2
\end{array}\right.
$$

and one easily checks that $N$ is defined and suitable.

- As $<(\alpha)_{2+j}>\in \Lambda^{<\xi}$, the induction assumption gives $\alpha^{\prime \prime} \in \Lambda^{\infty}$ normalized satisfying the equalities $\left(\alpha^{\prime \prime}\right)_{0}=(\alpha)_{2}=(\alpha)_{0}$ and $\boldsymbol{\Gamma}_{c\left(\alpha^{\prime \prime}\right)}=\boldsymbol{\Gamma}_{c\left(\left\langle(\alpha)_{2+j}>\right)\right.}$. In particular,

$$
\boldsymbol{\Gamma}_{c(\alpha)}=\check{\boldsymbol{\Gamma}}_{c\left(<(\alpha)_{2+j}>\right)}=\check{\boldsymbol{\Gamma}}_{c\left(\alpha^{\prime \prime}\right)}=\boldsymbol{\Gamma}_{c\left(N\left(\alpha^{\prime \prime}\right)\right)}
$$

So we have to find $\alpha^{\prime} \in \Lambda^{\infty}$ normalized with $\left(\alpha^{\prime}\right)_{0}=\left(\alpha^{\prime \prime}\right)_{0}$ and $\boldsymbol{\Gamma}_{c\left(\alpha^{\prime}\right)}=\boldsymbol{\Gamma}_{c\left(N\left(\alpha^{\prime \prime}\right)\right)}$. Assume that $\alpha^{\prime \prime} \in \Lambda^{\eta} \backslash \Lambda^{<\eta}$. We argue by induction on $\eta$.
Subcase 1. $\left|\left(\alpha^{\prime \prime}\right)_{1}\right| \leq 1$.
We just set $\alpha^{\prime}:=N\left(\alpha^{\prime \prime}\right)$.
Subcase 2. $\left|\left(\alpha^{\prime \prime}\right)_{1}\right|=2$.
Note that $<\left(\alpha^{\prime \prime}\right)_{2+<p, q>}>$ is normalized since $\left(0, \alpha^{\prime \prime}\right) \frown s \in \mathcal{M}_{\alpha^{\prime \prime}}\left(\right.$ resp., $\left.\left(p, \alpha^{\prime \prime}\right) \frown s \in \mathcal{M}_{\alpha^{\prime \prime}}\right)$ if $s \in \mathcal{M}_{\left(\alpha^{\prime \prime}\right)_{2+<0, q>}}$ (resp., $s \in \mathcal{M}_{\left(\alpha^{\prime \prime}\right)_{2+<(p)_{0}+1, q>}}$ and $p \geq 1$ ). The induction assumption gives $<\left(\alpha^{\prime}\right)_{2+<p, q>}>\in \Lambda^{\infty}$ normalized with $\left(\alpha^{\prime}\right)_{2+<p, 0>}=\left(\alpha^{\prime \prime}\right)_{2+<p, 0>}$ and

$$
\boldsymbol{\Gamma}_{c\left(<\left(\alpha^{\prime}\right)_{2+<p, q \gg)}\right.}=\boldsymbol{\Gamma}_{c\left(N\left(<\left(\alpha^{\prime \prime}\right)_{2+<p, q \gg)}\right)\right.}
$$

We set $\left(\alpha^{\prime}\right)_{i}:=\left(\alpha^{\prime \prime}\right)_{i}$ if $i \in 2$ and we are done.
Case 3. $\left|(\alpha)_{1}\right|=2$.
The induction assumption gives $<\left(\alpha^{\prime}\right)_{2+<p, q>}>\in \Lambda^{\infty}$ normalized satisfying the equalities $\left(\alpha^{\prime}\right)_{2+<p, 0>}=(\alpha)_{2+<p, 0>}$ and $\boldsymbol{\Gamma}_{c\left(<\left(\alpha^{\prime}\right)_{2+<p, q \gg)}\right.}=\boldsymbol{\Gamma}_{c\left(<(\alpha)_{2+<p, q \gg)} \text {. We set }\left(\alpha^{\prime}\right)_{i}:=(\alpha)_{i} \text { if } i \in 2 \text { and }, ~\right.}$ we are done.

Using $\Phi_{1}$, we will now code the non self-dual Wadge classes of Borel sets, and define an operator $\Upsilon_{1}$ on $\left(\omega^{\omega}\right)^{3}$ to do it. We set

$$
\begin{array}{r}
\Upsilon_{1}(A):=A \cup\left\{(\alpha, \beta, \gamma) \in\left(\omega^{\omega}\right)^{2} \times W^{\omega^{\omega}} \mid \forall n \in \omega(\alpha)_{n} \in \mathrm{WO} \wedge\right. \\
\left(\forall n \in \omega\left|(\alpha)_{n}\right|=0 \wedge \beta(0)=0 \wedge C_{\gamma}^{\omega^{\omega}}=\emptyset\right) \vee \\
\left(\left|(\alpha)_{1}\right|=1 \wedge(\alpha)_{0}=(\alpha)_{2} \wedge \beta(0)=1 \wedge\right. \\
\left.\exists \gamma^{\prime} \in \omega^{\omega} \quad\left(<(\alpha)_{2+j}>, \beta^{*}, \gamma^{\prime}\right) \in A \wedge C_{\gamma}^{\omega^{\omega}}=\neg C_{\gamma^{\prime}}^{\omega^{\omega}}\right) \vee \\
\left(\left|(\alpha)_{1}\right|=2 \wedge\left|(\alpha)_{0}\right| \geq 1 \wedge \forall p \in \omega\left(\left|(\alpha)_{2+<p, 0>}\right| \geq\left|(\alpha)_{0}\right| \vee\left|(\alpha)_{2+<p, 0>}\right|=0\right) \wedge\right. \\
\beta(0)=2 \wedge \exists \gamma^{\prime} \in \omega^{\omega}\left(<(\alpha)_{2+<0, q>}>,\left(\beta^{*}\right)_{0},\left(\gamma^{\prime}\right)_{0}\right) \in A \wedge \\
\forall p \geq 1\left(<(\alpha)_{2+<(p)_{0}+1, q \gg}>,\left(\left(\beta^{*}\right)_{p}\right)_{0},\left(\left(\gamma^{\prime}\right)_{p}\right)_{0}\right) \in A \wedge\left(\left(\left(\beta^{*}\right)_{p}\right)_{1},\left(\left(\gamma^{\prime}\right)_{p}\right)_{1}\right) \in \Phi_{1}^{\left|(\alpha)_{0}\right|} \wedge \\
\forall p \neq q \geq 1 C_{\left(\left(\gamma^{\prime}\right)_{p}\right)_{1}}^{\omega_{1}} \cup C_{\left(\left(\gamma^{\prime}\right)_{q}\right)_{1}}^{\omega_{1}^{\omega}}=\omega^{\omega} \wedge \\
\left.C_{\gamma}^{\omega^{\omega}}=\bigcup_{p \geq 1}\left(C_{\left.\left(\gamma^{\prime}\right)_{p}\right)_{0}}^{\omega^{\omega}} \backslash C_{\left(\left(\gamma^{\prime}\right)_{p}\right)_{1}}^{\omega^{\omega}}\right) \cup\left(C_{\left(\gamma^{\prime}\right)_{0}}^{\omega^{\omega}} \cap \bigcap_{p \geq 1} C_{\left.\left(\left(\gamma^{\prime}\right)_{p}\right)_{1}\right)}^{\omega^{\omega}}\right)\right\}
\end{array}
$$

Lemma 6.5 Let $\xi$ be an ordinal.
(a) Assume that $(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\xi}$. Then $\alpha \in \Lambda^{\xi}$.
(b) Let $\alpha \in \Lambda^{\xi}$ and $B \subseteq \omega^{\omega}$. Then $B \in \boldsymbol{\Gamma}_{c(\alpha)}$ if and only if there are $\beta, \gamma \in \omega^{\omega}$ such that $(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\xi}$ and $C_{\gamma}^{\omega^{\omega}}=B$.

Proof. (a) We argue by induction on $\xi$. So let $\alpha \in \Upsilon_{1}^{\xi} \backslash \Upsilon_{1}^{<\xi}$. We may assume that $\left|(\alpha)_{1}\right| \geq 1$. If $\left|(\alpha)_{1}\right|=1$, then $\left(<(\alpha)_{2+j}>, \beta^{*}, \gamma^{\prime}\right) \in \Upsilon_{1}^{<\xi}$ for some $\gamma^{\prime}$ and $<(\alpha)_{2+j}>\in \Lambda^{<\xi}$ by induction assumption, so we are done. If $\left|(\alpha)_{1}\right|=2$, then

$$
\left(<(\alpha)_{2+<0, q>}>,\left(\beta^{*}\right)_{0},\left(\gamma^{\prime}\right)_{0}\right),\left(<(\alpha)_{2+<(p)_{0}+1, q>}>,\left(\left(\beta^{*}\right)_{p}\right)_{0},\left(\left(\gamma^{\prime}\right)_{p}\right)_{0}\right) \in \Upsilon_{1}^{<\xi}
$$

for some $\gamma^{\prime}$ and $<(\alpha)_{2+<p, q>}>\in \Lambda^{<\xi}$ by induction assumption for each integer $p$.
(b) $\Rightarrow$ We argue by induction on $\xi$, and we may assume that $\alpha \notin \Lambda^{<\xi}$.

Case 1. $\left|(\alpha)_{1}\right|=0$.
Note that $c(\alpha)=0^{\infty}$ and $B=\emptyset$. We set $\beta:=0^{\infty}$, and we choose $\gamma \in W^{\omega}$ with $C_{\gamma}=\emptyset$. Then $(\alpha, \beta, \gamma) \in \Upsilon_{1}^{0} \subseteq \Upsilon_{1}^{\xi}$.

Case 2. $\left|(\alpha)_{1}\right|=1$.
Note that $<(\alpha)_{2+j}>\in \Lambda^{<\xi}$, and $\neg B \in \boldsymbol{\Gamma}_{c\left(<(\alpha)_{2+j}>\right)}$. By induction assumption we get $\beta^{\prime}, \gamma^{\prime} \in \omega^{\omega}$ such that $\left(<(\alpha)_{2+j}>, \beta^{\prime}, \gamma^{\prime}\right) \in \Upsilon_{1}^{<\xi}$ and $C_{\gamma^{\prime}}^{\omega^{\omega}}=\neg B$. We set $\beta:=1 \beta^{\prime}$ and we choose $\gamma \in W^{\omega^{\omega}}$ with $C_{\gamma}^{\omega^{\omega}}=\neg C_{\gamma^{\prime}}^{\omega^{\omega}}$.

Case 3. $\left|(\alpha)_{1}\right|=2$.
Note that $<(\alpha)_{2+<p, q>}>\in \Lambda^{<\xi}$ for each integer $p$. We can write

$$
B=\bigcup_{p \geq 1}\left(A_{p} \cap C_{p}\right) \cup\left(B^{\prime} \backslash \bigcup_{p \geq 1} C_{p}\right)
$$

where $\left(C_{p}\right)_{p \geq 1}$ is a sequence of pairwise disjoint $\boldsymbol{\Sigma}_{\left|(\alpha)_{0}\right|}^{0}$ sets, $B^{\prime} \in \boldsymbol{\Gamma}_{c\left(<(\alpha)_{2+<0, q \gg}\right)}$ and

$$
A_{p} \in \boldsymbol{\Gamma}_{c\left(<(\alpha)_{2+<(p)_{0}+1, q>}>\right)}
$$

Lemma 6.1 gives $\left(\left(\left(\beta^{*}\right)_{p}\right)_{1},\left(\left(\gamma^{\prime}\right)_{p}\right)_{1}\right) \in \Phi_{1}^{\left|(\alpha)_{0}\right|}$ such that $C_{\left(\left(\gamma^{\prime}\right)_{p}\right)_{1}}^{\omega^{\omega}}=\neg C_{p}$. The induction assumption gives $\left(\beta^{*}\right)_{0},\left(\gamma^{\prime}\right)_{0} \in \omega^{\omega}$ such that $\left(<(\alpha)_{2+<0, q>}>,\left(\beta^{*}\right)_{0},\left(\gamma^{\prime}\right)_{0}\right) \in \Upsilon_{1}^{<\xi}$ and $C_{\left(\gamma^{\prime}\right)_{0}}^{\omega}=B^{\prime}$, and $\left(\left(\beta^{*}\right)_{p}\right)_{0},\left(\left(\gamma^{\prime}\right)_{p}\right)_{0} \in \omega^{\omega}$ such that $\left(<(\alpha)_{2+<(p)_{0+1, q>}>,}\left(\left(\beta^{*}\right)_{p}\right)_{0},\left(\left(\gamma^{\prime}\right)_{p}\right)_{0}\right) \in \Upsilon_{1}^{<\xi}$ and $C_{\left(\left(\gamma^{\prime}\right)_{p}\right)_{0}}^{\omega^{\omega}}=A_{p}$. We set $\beta(0):=2$ and we choose $\gamma \in W^{\omega^{\omega}}$ with

$$
C_{\gamma}^{\omega^{\omega}}=\bigcup_{p \geq 1}\left(C_{\left(\left(\gamma^{\prime}\right)_{p}\right)_{0}}^{\omega^{\omega}} \backslash C_{\left(\left(\gamma^{\prime}\right)_{p}\right)_{1}}^{\omega^{\omega}}\right) \cup\left(C_{\left(\gamma^{\prime}\right)_{0}}^{\omega^{\omega}} \cap \bigcap_{p \geq 1} C_{\left(\left(\gamma^{\prime}\right)_{p}\right)_{1}}^{\omega^{\omega}}\right)
$$

$\Leftarrow$ We argue by induction on $\xi$, and we may assume that $(\alpha, \beta, \gamma) \notin \Upsilon_{1}^{<\xi}$.
Case 1. $\left|(\alpha)_{1}\right|=0$.
Note that $B=C_{\gamma}^{\omega^{\omega}}=\emptyset \in \boldsymbol{\Gamma}_{0^{\infty}}=\boldsymbol{\Gamma}_{c(\alpha)}$.
Case 2. $\left|(\alpha)_{1}\right|=1$.
Note that there is $\gamma^{\prime}$ such that $\left(<(\alpha)_{2+j}>, \beta^{*}, \gamma^{\prime}\right) \in \Upsilon_{1}^{<\xi}$ and $C_{\gamma}^{\omega^{\omega}}=\neg C_{\gamma^{\prime}}^{\omega^{\omega}}$, which implies that $B \in \check{\boldsymbol{\Gamma}}_{c\left(<(\alpha)_{2+j}>\right)}=\boldsymbol{\Gamma}_{c(\alpha)}$.

Case 3. $\left|(\alpha)_{1}\right|=2$.
We get $\gamma^{\prime}$ since $(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\xi}$. As

$$
\left(<(\alpha)_{2+<0, q>}>,\left(\beta^{*}\right)_{0},\left(\gamma^{\prime}\right)_{0}\right),\left(<(\alpha)_{2+<(p)_{0}+1, q>}>,\left(\left(\beta^{*}\right)_{p}\right)_{0},\left(\left(\gamma^{\prime}\right)_{p}\right)_{0}\right) \in \Upsilon_{1}^{<\xi}
$$

we get $C_{\left(\gamma^{\prime}\right)_{0}}^{\omega} \in \boldsymbol{\Gamma}_{c\left(<(\alpha)_{2+<0, q \gg)}\right)}$ and $C_{\left(\left(\gamma^{\prime}\right)_{p}\right)_{0}}^{\omega} \in \boldsymbol{\Gamma}_{c\left(<(\alpha)_{\left.2+<(p)_{0}+1, q \gg\right)}\right.}$, by induction assumption. As $\left(\left(\left(\beta^{*}\right)_{p}\right)_{1},\left(\left(\gamma^{\prime}\right)_{p}\right)_{1}\right) \in \Phi_{1}^{\left|(\alpha)_{0}\right|}$, we get $C_{\left(\left(\gamma^{\prime}\right)_{p}\right)_{1}}^{\omega \omega} \in \boldsymbol{\Pi}_{\left|(\alpha)_{0}\right|}^{0}$ by Lemma 6.1. This implies that

$$
B \in S_{\left|(\alpha)_{0}\right|}\left(\bigcup_{p \geq 1} \boldsymbol{\Gamma}_{c\left(<(\alpha)_{2+<p, q \gg)}\right)}, \boldsymbol{\Gamma}_{c\left(<(\alpha)_{2+<0, q>}>\right)}\right)=\boldsymbol{\Gamma}_{c(\alpha)} .
$$

This finishes the proof.
Remark. We will also consider the operator $\Upsilon$ defined just like $\Upsilon_{1}$, except that

- We replace $\left(W^{\omega^{\omega}}, C^{\omega^{\omega}}\right.$ ) with $(W, C)$ (we work in $\left(\omega^{\omega}\right)^{d}$ instead of $\omega^{\omega}$ ).
- We replace the condition of the form $(\tilde{\beta}, \tilde{\gamma}) \in \Phi_{1}^{\left|(\alpha)_{0}\right|}$ with $\left((\alpha)_{0}, \tilde{\beta}, \tilde{\gamma}\right) \in Q$ (see the remark at the end of Section 4 for the definition of $Q$ ).
- We ask $\beta, \gamma, \gamma^{\prime}$ to be $\Delta_{1}^{1}(\alpha)$, so that $\Upsilon$ is a $\Pi_{1}^{1}$ monotone inductive operator.

To prove Theorem 1.8, we will consider some tuples $\vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right)$, where $\alpha \in \Lambda^{\infty}$. We will inductively define them through an inductive operator over $\left(\omega^{\omega}\right)^{6}$ called $\Theta$. The definition of $\Theta$ is in the spirit of that of $\Upsilon_{1}$, and is cut into three cases, depending on the value of $\left|(\alpha)_{1}\right|$. As the definition of $\Theta$ is long and technical, we give first some more informal explanations about its meaning. We will have $\vec{v} \in \Theta^{\infty}$. So there is an ordinal $\xi$ such that $\vec{v} \in \Theta^{\xi}$.

- $\alpha \in \Lambda^{\xi}$ is a (normalized in practice) code for a description $u=c(\alpha)$.
- $a_{0}, a_{1} \in \Delta_{1}^{1}(\alpha)$ are codes for a pair of disjoint analytic subsets of $\left(\omega^{\omega}\right)^{d}$. Using the good universal set $\mathcal{U}$ for $\Pi_{1}^{1}$ defined after the proof of Theorem 4.2.2, at the end of Section 4, we will actually code the complement of these analytic sets, so that we will set $A_{i}:=\neg \mathcal{U}_{a_{i}}$ for $i \in 2$.
- Similarly, $\underline{a}_{0}, \underline{a}_{1} \in \Delta_{1}^{1}(\alpha)$ are codes for a pair of disjoint analytic subsets of $\left(\omega^{\omega}\right)^{d}$. In fact, we will have $\underline{A}_{i}:=\neg \mathcal{U}_{\underline{a}_{i}} \subseteq A_{i}$. These codes will be used to build $r$, and $\underline{a}_{0}, \underline{a}_{1}, r$ will be completely determined by $\left(\alpha, a_{0}, a_{1}\right)$. So one should think that $\underline{a}_{i}=\underline{a}_{i}\left(\alpha, a_{0}, a_{1}\right) \simeq \underline{a}_{i}\left(u, a_{0}, a_{1}\right)$, $r=r\left(\alpha, a_{0}, a_{1}\right) \simeq r\left(u, a_{0}, a_{1}\right)$. We need the following lemma to specify their meaning.

Lemma 6.6 There is a recursive map $f_{a}:\left(\omega^{\omega}\right)^{2} \rightarrow \omega^{\omega}$ such that $\mathcal{U}_{f_{a}(\alpha, r)}=\mathcal{U}_{(r)_{0}} \cup \bigcup_{p \geq 1}{\neg \overline{\mathcal{U}}_{(r)_{p}}}^{\tau_{|\alpha|}}$ if $\alpha \in \Delta_{1}^{1} \cap W O$ and $|\alpha| \geq 1$.

Proof. Note first that $P:=\left\{(\beta, \vec{\delta}) \in \omega^{\omega} \times\left(\omega^{\omega}\right)^{d}\left|(\beta)_{0} \in \Delta_{1}^{1} \cap \mathrm{WO} \wedge\right|(\beta)_{0} \mid \geq 1 \wedge\right.$
is a $\Pi_{1}^{1}$ set, by the remark at the end of Section 4 defining $R$. This gives $\gamma \in \omega^{\omega}$ recursive with $P=\mathcal{U}_{\gamma}^{\omega^{\omega} \times\left(\omega^{\omega}\right)^{d}}$. Let $\alpha \in \Delta_{1}^{1} \cap$ WO with $|\alpha| \geq 1$, and $r \in \omega^{\omega}$. We have

$$
\begin{aligned}
\vec{\delta} \in \mathcal{U}_{(r)_{0}} \cup \bigcup_{p \geq 1} \neg{\overline{\neg \mathcal{U}_{(r)_{p}}}}^{\tau|\alpha|} & \Leftrightarrow(<\alpha, r, r, \ldots>, \vec{\delta}) \in P \\
& \Leftrightarrow(\gamma,<\alpha, r, r, \ldots>, \vec{\delta}) \in \mathcal{U}^{\omega} \times\left(\omega^{\omega}\right)^{d} \\
& \Leftrightarrow(S(\gamma,<\alpha, r, r, \ldots>), \vec{\delta}) \in \mathcal{U}
\end{aligned}
$$

We just have to set $f_{a}(\alpha, r):=S(\gamma,<\alpha, r, r, \ldots>)$.
The following will hold:

- If $u=0^{\infty}$ or $u=\xi 1 u^{*}$, then $\underline{a}_{i}=\underline{a}_{i}\left(\alpha, a_{0}, a_{1}\right)=\underline{a}_{i}\left(u, a_{0}, a_{1}\right)=a_{i}$.
- If $u=\xi 2<u_{p}>$, then there will be $a_{0}^{\prime}, a_{1}^{\prime}, r^{\prime} \in \Delta_{1}^{1}(\alpha)$ such that, for each $p \geq 1$,

$$
\left(<(\alpha)_{2+<(p)_{0}+1, q>}>, a_{0}, a_{1},\left(a_{0}^{\prime}\right)_{p},\left(a_{1}^{\prime}\right)_{p},\left(r^{\prime}\right)_{p}\right) \in \Theta^{<\xi}
$$

We will have $\underline{a}_{i}=\underline{a}_{i}\left(u, a_{0}, a_{1}\right)=f_{a}\left((\alpha)_{0},<a_{i},\left(r^{\prime}\right)_{1},\left(r^{\prime}\right)_{2}, \ldots>\right)$, and $\left(r^{\prime}\right)_{p}=r\left(u_{(p)_{0}+1}, a_{0}, a_{1}\right)$ if

- $r \in \Delta_{1}^{1}(\alpha)$ is a code for an analytic subset of $\left(\omega^{\omega}\right)^{d}$ playing the role that ${\overline{A_{0}}}^{{ }^{\xi} \xi} \cap A_{1}$ played in Theorem 4.2.2. In other words, the emptyness of this analytic set is equivalent to the possibility of separating $A_{0}$ from $A_{1}$ by a pot $\left(\boldsymbol{\Gamma}_{u}\right)$ set. Here again, using $\mathcal{U}$, we will actually code the complement of this analytic set: $\neg \mathcal{U}_{r}$ is an analytic subset of $\left(\omega^{\omega}\right)^{d}$. In particular,
- If $u=0^{\infty}$, then $r=r\left(\alpha, a_{0}, a_{1}\right)=r\left(u, a_{0}, a_{1}\right)=a_{1}$.
- If $u=\xi 1 u^{*}$, then $r=r\left(\alpha, a_{0}, a_{1}\right)=r\left(u, a_{0}, a_{1}\right)=a_{0}$.
- If $u=\xi 2<u_{p}>$, then we there will be $a_{0}^{\prime \prime}, a_{1}^{\prime \prime} \in \Delta_{1}^{1}(\alpha)$ such that

$$
\left(<(\alpha)_{2+<0, q>}>, \underline{a}_{0}, \underline{a}_{1}, a_{0}^{\prime \prime}, a_{1}^{\prime \prime}, r\right) \in \Theta^{<\xi} .
$$

In particular, $r\left(u, a_{0}, a_{1}\right)=r\left(u_{0}, \underline{a}_{0}, \underline{a}_{1}\right)=r\left(u_{0}, \underline{a}_{0}\left(u, a_{0}, a_{1}\right), \underline{a}_{1}\left(u, a_{0}, a_{1}\right)\right)$. We are now ready to define $\Theta$ (recall the remark at the end of Section 4 defining $Q$ ).

The operator $\Theta$ is defined as follows (recall the definition of $\Lambda$ ):

$$
\begin{array}{r}
\Theta(A):=A \cup\left\{\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in\left(\omega^{\omega} \cap \Delta_{1}^{1}(\alpha)\right)^{6} \mid \forall n \in \omega(\alpha)_{n} \in \mathrm{WO} \wedge\right. \\
\left(\forall n \in \omega\left|(\alpha)_{n}\right|=0 \wedge \mathcal{U}_{a_{0}} \cup \mathcal{U}_{a_{1}}=\left(\omega^{\omega}\right)^{d} \wedge\left(\underline{a}_{0}, \underline{a}_{1}\right)=\left(a_{0}, a_{1}\right) \wedge r=a_{1}\right) \vee \\
\left(\left|(\alpha)_{1}\right|=1 \wedge(\alpha)_{0}=(\alpha)_{2} \wedge\left(<(\alpha)_{2+j}>, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, a_{1}\right) \in A \wedge r=a_{0}\right) \vee \\
\left(\left|(\alpha)_{1}\right|=2 \wedge\left|(\alpha)_{0}\right| \geq 1 \wedge \forall p \in \omega\left(\left|(\alpha)_{2+<p, 0>}\right| \geq\left|(\alpha)_{0}\right| \vee\left|(\alpha)_{2+<p, 0>}\right|=0\right) \wedge\right. \\
\exists a_{0}^{\prime}, a_{1}^{\prime}, r^{\prime} \in \Delta_{1}^{1}(\alpha)\left(<(\alpha)_{2+<0, q>}>, a_{0}, a_{1},\left(a_{0}^{\prime}\right)_{0},\left(a_{1}^{\prime}\right)_{0},\left(r^{\prime}\right)_{0}\right) \in A \wedge \\
\forall p \geq 1\left(<(\alpha)_{\left.2+<(p)_{0}+1, q \gg, a_{0}, a_{1},\left(a_{0}^{\prime}\right)_{p},\left(a_{1}^{\prime}\right)_{p},\left(r^{\prime}\right)_{p}\right) \in A \wedge}^{\forall i \in 2 \underline{a}_{i}=f_{a}\left((\alpha)_{0},<a_{i},\left(r^{\prime}\right)_{1},\left(r^{\prime}\right)_{2}, \ldots>\right) \wedge}\right. \\
\left.\left.\exists a_{0}^{\prime \prime}, a_{1}^{\prime \prime} \in \Delta_{1}^{1}(\alpha)\left(<(\alpha)_{2+<0, q>}>, \underline{a}_{0}, \underline{a}_{1}, a_{0}^{\prime \prime}, a_{1}^{\prime \prime}, r\right) \in A\right)\right\}
\end{array}
$$

Then $\Theta$ is a $\Pi_{1}^{1}$ monotone inductive operator.
Remark. Let $\xi$ be an ordinal, and $\vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\xi}$. Then an induction on $\xi$ shows the following properties:
$-\neg \mathcal{U}_{a_{0}} \cap \neg \mathcal{U}_{a_{1}}=\emptyset$.
$-\neg \mathcal{U}_{\underline{a}_{i}} \subseteq \neg \mathcal{U}_{a_{i}}$ for each $i \in 2$. In particular, $\neg \mathcal{U}_{\underline{a}_{0}} \cap \neg \mathcal{U}_{\underline{a}_{1}}=\emptyset$.

- $\underline{a}_{0}, \underline{a}_{1}, r$ are completely determined by $\left(\alpha, a_{0}, a_{1}\right)$.
- If $\neg \mathcal{U}_{a_{i}} \subseteq \neg \mathcal{U}_{b_{i}}$ for each $i \in 2$, then $\neg \mathcal{U}_{\underline{a}_{i}} \subseteq \neg \mathcal{U}_{\underline{b}_{i}}$ for each $i \in 2$ and $\neg \mathcal{U}_{r\left(\alpha, a_{0}, a_{1}\right)} \subseteq \neg \mathcal{U}_{r\left(\alpha, b_{0}, b_{1}\right)}$.
- There is $i \in 2$ such that $\neg \mathcal{U}_{r} \subseteq \neg \mathcal{U}_{a_{i}}$.

Lemma 6.7 (a) Let $\xi$ be an ordinal, $\alpha \in \Delta_{1}^{1}$, and $(\alpha, \beta, \gamma) \in \Upsilon^{\xi}$. Then $\alpha \in \Lambda^{\xi}$ and the set $C_{\gamma}$ is in $\Delta_{1}^{1} \cap \boldsymbol{\Gamma}_{c(\alpha)}\left(\tau_{1}\right)$.
(b) Let $\alpha \in \Delta_{1}^{1} \cap \Lambda^{\infty}$ normalized, $a_{0}, a_{1} \in \Delta_{1}^{1}$ with $A_{0} \cap A_{1}=\emptyset$. Then there are $\underline{a}_{0}, \underline{a}_{1}, r \in \omega^{\omega}$ such that $\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$.

Proof. (a) We argue as in the proof of Lemmas 6.5.(a) and 6.5.(b) $\Leftarrow$. The only thing to notice is that in the case $\left|(\alpha)_{1}\right|=2,\left((\alpha)_{0},\left(\left(\beta^{*}\right)_{p}\right)_{1},\left(\left(\gamma^{\prime}\right)_{p}\right)_{1}\right) \in Q$. Proposition 2.2, Lemma 2.3 and Theorem 3.1 give a tree $T_{d}$ with $\Delta_{1}^{1}$ suitable levels and $S \in \Sigma_{\left|(\alpha)_{0}\right|}^{0}\left(\left\lceil T_{d}\right\rceil\right)$ not separable from $\left\lceil T_{d}\right\rceil \backslash S$ by a $\operatorname{pot}\left(\boldsymbol{\Pi}_{\left|(\alpha)_{0}\right|}^{0}\right)$ set. As $\alpha \in \Delta_{1}^{1},\left|(\alpha)_{0}\right|<\omega_{1}^{\mathrm{CK}}$ and Theorem 4.2.2 implies that $C_{\left(\left(\gamma^{\prime}\right)_{p}\right)_{1}}$ is in $\boldsymbol{\Pi}_{\left|(\alpha)_{0}\right|}^{0}\left(\tau_{1}\right)$. Thus $C_{\gamma} \in \boldsymbol{\Gamma}_{c(\alpha)}\left(\tau_{1}\right)$.
(b) Let $\xi$ be an ordinal with $\alpha \in \Lambda^{\xi}$. Here again we argue by induction on $\xi$. So assume that $\alpha \notin \Lambda^{<\xi}$.

Case 1. $\left|(\alpha)_{1}\right|=0$.
Let $\underline{a}_{i}:=a_{i}$ and $r:=a_{1}$. Then $\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{0} \subseteq \Theta^{\infty}$.

Case 2. $\left|(\alpha)_{1}\right|=1$.
As $<(\alpha)_{2+j}>\in \Lambda^{<\xi}$ we get, by induction assumption, $\left(\underline{a}_{0}, \underline{a}_{1}, r^{\prime}\right)$ with

$$
\left(<(\alpha)_{2+j}>, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r^{\prime}\right) \in \Theta^{\infty}
$$

As $\alpha$ is normalized we get $\left|(\alpha)_{2+j}\right|=0$ for each $j$, and $r^{\prime}=a_{1}$. We set $r:=a_{0}$. Then

$$
\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta\left(\Theta^{\infty}\right)=\Theta^{\infty} .
$$

Case 3. $\left|(\alpha)_{1}\right|=2$.
As $<(\alpha)_{2+<p, q>}>\in \Lambda^{<\xi}$ we get, by induction assumption, $\left(a_{0}^{p}, a_{1}^{p}, r_{p}^{\prime}\right)$ with

$$
\left(<(\alpha)_{2+<0, q>}>, a_{0}, a_{1}, a_{0}^{0}, a_{1}^{0}, r_{0}^{\prime}\right) \in \Theta^{\infty}
$$

and $\left(<(\alpha)_{2+<(p)_{0+1, q>}>}>, a_{0}, a_{1}, a_{0}^{p}, a_{1}^{p}, r_{p}^{\prime}\right) \in \Theta^{\infty}$, for each $p \geq 1$. As in the proof of Lemma 6.2 we see that $\Theta^{\infty} \in \Pi_{1}^{1}$. By $\Delta_{1}^{1}$-selection, we may assume that the sequences $\left(a_{0}^{p}\right),\left(a_{1}^{p}\right)$ and $\left(r_{p}^{\prime}\right)$ are $\Delta_{1}^{1}$. In particular, there is $a_{i}^{\prime} \in \Delta_{1}^{1}$ with $\left(a_{i}^{\prime}\right)_{p}=a_{i}^{p}$. We set $\left(r^{\prime}\right)_{p}:=r_{p}^{\prime}$, and

$$
\underline{a}_{i}:=f_{a}\left((\alpha)_{0},<a_{i},\left(r^{\prime}\right)_{1},\left(r^{\prime}\right)_{2}, \ldots>\right)
$$

The induction assumption gives $a_{0}^{\prime \prime}, a_{1}^{\prime \prime}, r$ such that $\left(<(\alpha)_{2+<0, q>}>, \underline{a}_{0}, \underline{a}_{1}, a_{0}^{\prime \prime}, a_{1}^{\prime \prime}, r\right) \in \Theta^{\infty}$. We are done since $\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$.

The next lemma is the crucial separation lemma announced in the presentation of $r$.
Lemma 6.8 Let $\vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $a_{0}, a_{1} \in \Delta_{1}^{1}$, $\Sigma$ in $\Sigma_{1}^{1}\left(\left(\omega^{\omega}\right)^{d}\right)$ with $\left(\neg \mathcal{U}_{r}\right) \cap \Sigma=\emptyset$. Then there are $\beta^{\prime}, \gamma^{\prime} \in \omega^{\omega}$ such that $\left(\alpha, \beta^{\prime}, \gamma^{\prime}\right) \in \Upsilon^{\infty}$ and $C_{\gamma^{\prime}}$ separates $A_{1} \cap \Sigma$ from $A_{0} \cap \Sigma$. In particular, $A_{1} \cap \Sigma$ is separable from $A_{0} \cap \Sigma$ by a $\Delta_{1}^{1} \cap \boldsymbol{\Gamma}_{c(\alpha)}\left(\tau_{1}\right)$ set.

Proof. The last assertion comes from Lemma 6.7.(a). Let $\eta$ be an ordinal with $\vec{v} \in \Theta^{\eta}$. We argue by induction on $\eta$. So assume that $\vec{v} \in \Theta^{\eta} \backslash \Theta^{<\eta}$.

Case 1. $\left|(\alpha)_{1}\right|=0$.
We set $\beta^{\prime}:=0^{\infty}$, and choose $\gamma^{\prime} \in \Delta_{1}^{1} \cap W$ with $C_{\gamma^{\prime}}=\emptyset$. We are done since $\emptyset=A_{1} \cap \Sigma$.
Case 2. $\left|(\alpha)_{1}\right|=1$.
As $\alpha$ is normalized, we get $\left|(\alpha)_{2+j}\right|=0$ for each $j$. We set $\beta^{\prime}:=10^{\infty}$, and choose $\gamma^{\prime} \in \Delta_{1}^{1} \cap W$ with $C_{\gamma^{\prime}}=\left(\omega^{\omega}\right)^{d}$. Then $\gamma^{\prime \prime} \in \Delta_{1}^{1} \cap W$ with $C_{\gamma^{\prime \prime}}=\emptyset$ is a witness for the fact that $\left(\alpha, \beta^{\prime}, \gamma^{\prime}\right) \in \Upsilon^{\infty}$. We are done since $r=a_{0}$.

Case 3. $\left|(\alpha)_{1}\right|=2$.
 $p \geq 1$, and, for each $i \in 2, \underline{a}_{i}=f_{a}\left((\alpha)_{0},<a_{i},\left(r^{\prime}\right)_{1},\left(r^{\prime}\right)_{2}, \ldots>\right)$. Moreover, there are $a_{0}^{\prime \prime}, a_{1}^{\prime \prime} \in \Delta_{1}^{1}$ with $\left(<(\alpha)_{2+<0, q>}>, \underline{a}_{0}, \underline{a}_{1}, a_{0}^{\prime \prime}, a_{1}^{\prime \prime}, r\right) \in \Theta^{<\eta}$.

By Lemma 6.7.(a), one of the goals is to build $C_{\gamma^{\prime}} \in \boldsymbol{\Gamma}_{c(\alpha)}\left(\tau_{1}\right)$. The proof of Lemma 6.7.(a) shows that $\boldsymbol{\Gamma}_{c(\alpha)}=S_{\left|(\alpha)_{0}\right|}\left(\bigcup_{p \geq 1} \boldsymbol{\Gamma}_{c\left(<(\alpha)_{2+<p, q \gg)}\right.}, \boldsymbol{\Gamma}_{c\left(<(\alpha)_{2+<0, q \gg)}\right)}\right)$. This means that we want to find sequences $\left(C_{p}\right)_{p \geq 1},\left(S_{p}\right)_{p \geq 1}$ and $B$ such that $C_{\gamma^{\prime}}=\bigcup_{p \geq 1}\left(S_{p} \cap C_{p}\right) \cup\left(B \backslash \bigcup_{p \geq 1} C_{p}\right)$.

## - Let us construct $B$.

The induction assumption gives $\beta^{\prime \prime \prime}, \gamma^{\prime \prime \prime} \in \omega^{\omega}$ such that $\left(<(\alpha)_{2+<0, q>}>, \beta^{\prime \prime \prime}, \gamma^{\prime \prime \prime}\right) \in \Upsilon^{\infty}$ and $C_{\gamma^{\prime \prime \prime}}$ separates $\underline{A}_{1} \cap \Sigma$ from $\underline{A}_{0} \cap \Sigma$. We set $B:=C_{\gamma^{\prime \prime \prime}}$.

- Let us construct the $C_{p}$ 's.

We set $\xi:=\left|(\alpha)_{0}\right|$. Note that $\underline{A}_{i}=A_{i} \cap \bigcap_{p \geq 1} \overline{\mathcal{U}}_{\left(r^{\prime}\right)_{p}}{ }^{{ }^{\xi}}$. This implies that

$$
U:=\left(C_{\gamma^{\prime \prime \prime}} \cap A_{0} \cap \Sigma\right) \cup\left(\neg C_{\gamma^{\prime \prime \prime}} \cap A_{1} \cap \Sigma\right) \subseteq \bigcup_{p \geq 1} \neg{\overline{\mathcal{U}}\left(r^{\prime}\right)_{p}}^{\tau_{\xi}} .
$$

As in the proof of Lemma 6.6 we see that the relation " $\vec{\delta} \notin \overline{\mathcal{U}}_{\left(r^{\prime}\right)_{p}}{ }^{T_{(\alpha)}}{ }^{\prime} \mid$ " is $\Pi_{1}^{1}$ in $\left(p, \alpha, r^{\prime}, \vec{\delta}\right)$. By $\Delta_{1}^{1}$-selection there is a $\Delta_{1}^{1}$-recursive map $f:\left(\omega^{\omega}\right)^{d} \rightarrow \omega$ such that $f(\vec{\delta}) \geq 1$ for each $\vec{\delta} \in\left(\omega^{\omega}\right)^{d}$ and $\vec{\delta} \notin \mathcal{U}_{\left(r^{\prime}\right)_{f(\tilde{\delta})}}{ }^{\tau_{\xi}}$ for each $\vec{\delta} \in U$.

In particular, for each $\vec{\delta} \in U$ there is $P \in \Sigma_{1}^{1} \cap \Pi_{<\xi}^{0}\left(\tau_{1}\right)$ such that $\vec{\delta} \in P \subseteq \mathcal{U}_{\left(r^{\prime}\right)_{f(\vec{\delta})}}$. Now $P$ and $\neg \mathcal{U}_{\left(r^{\prime}\right)_{f(\bar{\delta})}}$ are disjoint $\Sigma_{1}^{1}$ sets, and separable by a $\Pi_{<\xi}^{0}\left(\tau_{1}\right)$ set. As $\alpha \in \Delta_{1}^{1}$ we get $1 \leq\left|(\alpha)_{0}\right|<\omega_{1}^{C K}$. As in the proof of Lemma 6.7.(a) we get $T_{d}$ and $S$. By Theorem 4.2.2 we get $(\beta, \gamma) \in\left(\Delta_{1}^{1} \times \Delta_{1}^{1}\right) \cap V_{<\xi}$ with $P \subseteq C_{\gamma} \subseteq \mathcal{U}_{\left(r^{\prime}\right)_{f(\bar{\delta})}}$.

By Lemma 4.2.3.(2).(a) the relation " $(\beta, \gamma)$ is in $\left(\Delta_{1}^{1} \times \Delta_{1}^{1}\right) \cap V_{<\xi}$ " is $\Pi_{1}^{1}$, so there is a $\Delta_{1}^{1}$-recursive map $g:\left(\omega^{\omega}\right)^{d} \rightarrow \omega \times\left(\omega^{\omega} \times \omega^{\omega}\right)$ such that

$$
\forall \vec{\delta} \in U \quad g_{0}(\vec{\delta})=f(\vec{\delta}) \text { and } g_{1}(\vec{\delta}) \in\left(\Delta_{1}^{1} \times \Delta_{1}^{1}\right) \cap V_{<\xi} \text { and } \vec{\delta} \in C_{\left(g_{1}(\vec{\delta})\right)_{1}} \subseteq \mathcal{U}_{\left(r^{\prime}\right)_{f(\vec{\delta})}}
$$

by $\Delta_{1}^{1}$-selection. In particular, the $\Sigma_{1}^{1}$ set $g[U]$ is a subset of

$$
\left\{(p,(\beta, \gamma)) \in \omega \times\left(\left(\Delta_{1}^{1} \times \Delta_{1}^{1}\right) \cap V_{<\xi}\right) \mid C_{\gamma} \subseteq \mathcal{U}_{\left(r^{\prime}\right)_{p}}\right\}
$$

which is $\Pi_{1}^{1}$ and countable. The separation theorem gives $D \in \Delta_{1}^{1}$ between these two sets. As $D$ is countable, there are $N, \tilde{\beta}, \tilde{\gamma} \in \Delta_{1}^{1}$ with $D=\left\{\left(N(q),\left((\tilde{\beta})_{q},(\tilde{\gamma})_{q}\right)\right) \mid q \in \omega\right\}$. Now we can define $C_{p}:=\bigcup_{q \in \omega, N(q)=p} C_{(\tilde{\gamma})_{q}} \backslash\left(\bigcup_{q^{\prime}<q} C_{\left(\tilde{\gamma} q_{q^{\prime}}\right.}\right)$.

- We now study the properties of the $C_{p}$ 's. We can say that
- The relation " $\vec{\delta} \in C_{p}$ " is $\Delta_{1}^{1}$ in $(p, \vec{\delta})$.
$\circ$ The $C_{p}$ 's are pairwise disjoint.
- $C_{p} \in \boldsymbol{\Sigma}_{\xi}^{0}\left(\tau_{1}\right)$ since $C_{(\tilde{\gamma})_{q}} \in \boldsymbol{\Pi}_{<\xi}^{0}\left(\tau_{1}\right) \subseteq \boldsymbol{\Delta}_{\xi}^{0}\left(\tau_{1}\right)$, by Theorem 4.2.2.
$\circ$ We set $\tilde{C}:=\left\{(p, \vec{\delta}) \in \omega \times\left(\omega^{\omega}\right)^{d} \mid \exists q \in \omega \quad N(q)=p\right.$ and $\left.\vec{\delta} \in C_{(\tilde{\gamma})_{q}}\right\}$, so that $\tilde{C} \in \Delta_{1}^{1}$ and $\tilde{C}_{p} \in \boldsymbol{\Sigma}_{1}^{0}\left(\tau_{\xi}\right)$ for each $p \geq 1$. We have $C_{p} \subseteq \tilde{C}_{p}$.
- $\bigcup_{p \geq 1} C_{p}=\bigcup_{p \geq 1} \tilde{C}_{p}$.
- $\tilde{C}_{p}$ separates $U \cap f^{-1}(\{p\})$ from $\neg \mathcal{U}_{\left(r^{\prime}\right)_{p}}$. In particular, $U$ is a subset of the $\Delta_{1}^{1}$ set $\bigcup_{p \geq 1} C_{p}$. Moreover, $\bigcap_{p \geq 1} \overline{\mathcal{U}}_{\left(r^{\prime}\right)_{p}}{ }^{\tau} \subseteq \neg\left(\bigcup_{p \geq 1} \tilde{C}_{p}\right)$.
- The induction assumption gives, for each $p \geq 1, \beta^{p}, \gamma^{p}$ with $\left(<(\alpha)_{2+<(p)_{0}+1, q>}>, \beta^{p}, \gamma^{p}\right) \in \Upsilon^{\infty}$ and $C_{\gamma^{p}}$ separates $A_{1} \cap \tilde{C}_{p}$ from $A_{0} \cap \tilde{C}_{p}$. As in the proof of Lemma 6.7.(b) we may assume that the sequences $\left(\beta^{p}\right)$ and $\left(\gamma^{p}\right)$ are $\Delta_{1}^{1}$. By $\Delta_{1}^{1}$-selection again there is a $\Delta_{1}^{1}$-recursive map $h: \omega \rightarrow \omega^{\omega} \times \omega^{\omega}$ such that $h(p) \in\left(\Delta_{1}^{1} \times \Delta_{1}^{1}\right) \cap V_{\xi}$ and $C_{h_{1}(p)}=\neg C_{p}$ for each $p \geq 1$. We set $\left(\left(\beta^{*}\right)_{p}\right)_{1}:=h_{0}(p)$ and $\left((\bar{\gamma})_{p}\right)_{1}:=h_{1}(p)$, so that $\left((\alpha)_{0},\left(\left(\beta^{\prime *}\right)_{p}\right)_{1},\left((\bar{\gamma})_{p}\right)_{1}\right) \in Q$ for each $p \geq 1$.

We set $\beta^{\prime}(0):=2,\left(\beta^{\prime *}\right)_{0}:=\beta^{\prime \prime \prime}$, and $\left(\left(\beta^{\prime *}\right)_{p}\right)_{0}:=\beta^{p}$ if $p \geq 1$, so that $\beta^{\prime}$ is completely defined. Similarly, we set $(\bar{\gamma})_{0}:=\gamma^{\prime \prime \prime}$, and $\left((\bar{\gamma})_{p}\right)_{0}:=\gamma^{p}$ if $p \geq 1$. Finally, we choose $\gamma^{\prime} \in \Delta_{1}^{1} \cap W$ with $C_{\gamma^{\prime}}=\bigcup_{p \geq 1}\left(C_{\gamma^{p}} \backslash C_{h_{1}(p)}\right) \cup\left(C_{(\bar{\gamma})_{0}} \cap \bigcap_{p \geq 1} C_{h_{1}(p)}\right)$, so that $\left(\alpha, \beta^{\prime}, \gamma^{\prime}\right) \in \Upsilon^{\infty}$ and $C_{\gamma^{\prime}}$ separates $A_{1} \cap \Sigma$ from $A_{0} \cap \Sigma$.

The next result is the actual (effective) content of Theorem 1.8.(1). It is also the version of Theorem 4.4.1 for the non self-dual Wadge classes of Borel sets. Let $j_{d}:\left(d^{\omega}\right)^{d} \rightarrow \omega^{\omega}$ be a continuous embedding (for example we can embed $\left(d^{\omega}\right)^{d}$ into $\left(\omega^{\omega}\right)^{d}$ in the obvious way, and then use a bijection between $\left(\omega^{\omega}\right)^{d}$ and $\left.\omega^{\omega}\right)$.

Theorem 6.9 Let $T_{d}$ be a tree with $\Delta_{1}^{1}$ suitable levels, $\alpha$ in $\Delta_{1}^{1}$ normalized, $\beta$, $\gamma$ in $\omega^{\omega}$ such that $(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}, S:=j_{d}^{-1}\left(C_{\gamma}^{\omega^{\omega}}\right) \cap\left\lceil T_{d}\right\rceil$, and $a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r \in \omega^{\omega}$ with $\vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$. Then one of the following holds:
(a) $\neg \mathcal{U}_{r}=\emptyset$.
(b) The inequality $\left(\left(\Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil\right)_{i \in d}, S,\left\lceil T_{d}\right\rceil \backslash S\right) \leq\left(\left(\omega^{\omega}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds.

Now we can state the version of Theorem 4.2.2 for the non self-dual Wadge classes of Borel sets.
Theorem 6.10 Let $T_{d}$ be a tree with $\Delta_{1}^{1}$ suitable levels, $\alpha$ in $\Delta_{1}^{1}$ normalized, $\beta$, $\gamma$ in $\omega^{\omega}$ such that $(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}, S:=j_{d}^{-1}\left(C_{\gamma}^{\omega^{\omega}}\right) \cap\left\lceil T_{d}\right\rceil$, and $a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r \in \omega^{\omega}$ with $\vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$. We assume that $S$ is not separable from $\left\lceil T_{d}\right\rceil \backslash S$ by a pot $\left(\check{\Gamma}_{c(\alpha)}\right)$ set. Then the following are equivalent:
(a) The set $A_{0}$ is not separable from $A_{1}$ by a $\operatorname{pot}\left(\check{\boldsymbol{\Gamma}}_{c(\alpha)}\right)$ set.
(b) The set $A_{0}$ is not separable from $A_{1}$ by a $\Delta_{1}^{1} \cap \operatorname{pot}\left(\check{\boldsymbol{\Gamma}}_{c(\alpha)}\right)$ set.
(c) $\neg\left(\exists \beta^{\prime}, \gamma^{\prime} \in \omega^{\omega}\right.$ such that $\left(\alpha, \beta^{\prime}, \gamma^{\prime}\right) \in \Upsilon^{\infty}$ and $\left.A_{1} \subseteq C_{\gamma^{\prime}} \subseteq \neg A_{0}\right)$.
(d) The set $A_{0}$ is not separable from $A_{1}$ by a $\check{\Gamma}_{c(\alpha)}\left(\tau_{1}\right)$ set.
(e) $\neg \mathcal{U}_{r} \neq \emptyset$.
(f) The inequality $\left(\left(d^{\omega}\right)_{i \in d}, S,\left\lceil T_{d}\right\rceil \backslash S\right) \leq\left(\left(\omega^{\omega}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds.

Proof. (a) $\Rightarrow$ (b) and (a) $\Rightarrow$ (d) are clear since $\Delta_{\omega^{\omega}}$ is Polish.
(b) $\Rightarrow$ (c) This comes from Lemma 6.7.(a).
$(\mathrm{b}) \Rightarrow(\mathrm{e}),(\mathrm{c}) \Rightarrow(\mathrm{e})$ and $(\mathrm{d}) \Rightarrow(\mathrm{e})$ This comes from Lemma 6.8.
(e) $\Rightarrow$ (f) This comes from Theorem 6.9 (as $\Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil$ is compact, we just have to compose with continuous retractions to get functions defined on $d^{\omega}$ ).
(f) $\Rightarrow$ (a) If $P \in \operatorname{pot}\left(\check{\boldsymbol{\Gamma}}_{c(\alpha)}\right)$ separates $A_{0}$ from $A_{1}$ and (f) holds, then $S \subseteq\left(\Pi_{i \in d} f_{i}\right)^{-1}(P) \subseteq \neg\left(\left\lceil T_{d}\right\rceil \backslash S\right)$. This implies that $S$ is separable from $\left\lceil T_{d}\right\rceil \backslash S$ by a $\operatorname{pot}\left(\check{\Gamma}_{c(\alpha)}\right)$ set, by Lemma 4.4.7. But this contradicts the assumption on $S$.

Proof of Theorem 1.8.(1). Note first that (a) and (b) cannot hold simultaneously, as in the proof of Theorem 6.10.

We assume that (a) does not hold. This implies that the $X_{i}$ 's are not empty, since otherwise $A_{0}=A_{1}=\emptyset$, and $\emptyset \in \check{\boldsymbol{\Gamma}}$ unless $\boldsymbol{\Gamma}=\{\emptyset\}$. As in the proof of Theorem 4.1, we may assume that $X_{i}=\omega^{\omega}$ for each $i \in d$, by Lemma 4.4.7. By Theorem 5.1.3 there is $u \in \mathcal{D}$ with $\boldsymbol{\Gamma}\left(\omega^{\omega}\right)=\boldsymbol{\Gamma}_{u}\left(\omega^{\omega}\right)$. If $E$ is a 0 -dimensional Polish space, then we also have $\boldsymbol{\Gamma}(E)=\boldsymbol{\Gamma}_{u}(E)$, by Theorem 4.1.3 in [Lo-SR2]. It follows that $\operatorname{pot}(\boldsymbol{\Gamma})=\operatorname{pot}\left(\boldsymbol{\Gamma}_{u}\right)$. By Lemmas 6.2 and 6.4 we may assume that there is $\alpha \in \Lambda^{\infty}$ normalized with $c(\alpha)=u$.

By Theorem 4.1.3 in [Lo-SR2] there is $B \in \boldsymbol{\Gamma}\left(\omega^{\omega}\right)$ with $S=j_{d}^{-1}(B) \cap\left\lceil T_{d}\right\rceil$. To simplify the notation, we may assume that $T_{d}$ has $\Delta_{1}^{1}$ levels, $\alpha \in \Delta_{1}^{1}$, and $A_{0}, A_{1} \in \Sigma_{1}^{1}\left(\left(\omega^{\omega}\right)^{d}\right)$. By Lemma 6.5 there are $\beta, \gamma \in \omega^{\omega}$ such that $(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}$ and $C_{\gamma}^{\omega^{\omega}}=B$. Lemma 6.7.(b) gives $\underline{a}_{0}, \underline{a}_{1}, r$ with $\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$. Lemma 6.8 implies that $\neg \mathcal{U}_{r} \neq \emptyset$. So (b) holds, by Theorem 6.10.

The sequel is devoted to the proof of Theorem 6.9. We have to introduce a lot of objects before we can do it. We will create some paragraphs to describe these objects. We start with a general notion. The idea is that, given a set $S$ in $\boldsymbol{\Gamma}_{c(\alpha)}\left(\left\lceil T_{d}\right\rceil\right)$, and with the help of the tree $\mathfrak{T}(\alpha)$, we will keep in mind all the $\boldsymbol{\Sigma}_{\xi}^{0}$ (or equivalently $\boldsymbol{\Pi}_{\xi}^{0}$, passing to complements) used to build $S$. We will represent these $\Pi_{\xi}^{0}$ sets, on most sequences $s$ of $\mathfrak{T}(\alpha)$, by induction on $|s|$, applying the Debs-Saint Raymond theorem. At each induction step, we make closed some $\Pi_{\xi}^{0}$ sets of this level, but we also partially simplify the $\Pi_{\xi}^{0}$ sets to come. This is why the ordinal substraction is involved (recall the definition of ordinal substraction after Theorem 5.1.3).

Definition 6.11 Let $X$ be a set, $A \subseteq X, \mathcal{B}$ a countable family of subsets of $X$, and $\boldsymbol{\Gamma}$ a Borel class. We say that $A \in \boldsymbol{\Gamma}(\mathcal{B})$ if $A \in \boldsymbol{\Gamma}(X, \tau)$ for any topology $\tau$ on $X$ containing $\mathcal{B}$.

Proposition 6.12 Let $X$ be a topological space.
(a) Let $A \subseteq X, \mathcal{B}$ a countable family of open subsets of $X$, and $\boldsymbol{\Gamma}$ a Borel class. Then $A \in \boldsymbol{\Gamma}(X)$ if $A \in \boldsymbol{\Gamma}(\mathcal{B})$.
(b) Let $Y$ be a set, $B \subseteq Y, f: X \rightarrow Y$ a bijection, $\mathcal{B}$ a countable family of subsets of $Y$, and $\boldsymbol{\Gamma}$ a Borel class. Then $f^{-1}(B) \in \boldsymbol{\Gamma}\left(\left\{f^{-1}(D) \mid D \in \mathcal{B}\right\}\right)$ if $B \in \boldsymbol{\Gamma}(\mathcal{B})$.
(c) Let $1 \leq \eta \leq \xi$ and $A \in \boldsymbol{\Pi}_{\xi}^{0}(X)$. We assume that $X$ is metrizable. Then there is $\mathcal{B} \subseteq \boldsymbol{\Pi}_{\eta}^{0}(X)$ countable such that $A \in \Pi_{1+(\xi-\eta)}^{0}(\check{\mathcal{B}})$, where $\check{\mathcal{B}}:=\{\neg B \mid B \in \mathcal{B}\}$.

In practice, $X$ will be the metrizable space $[R]$ for some tree relation $R$, and $f$ will be the canonical map given by the Debs-Saint Raymond theorem.

Proof. (a) The topology $\tau$ is simply the topology of $X$.
(b) Let $\tau$ be a topology on $X$ containing $\left\{f^{-1}(D) \mid D \in \mathcal{B}\right\}$. Then $\sigma:=\{f[A] \mid A \in \tau\}$ is a topology on $Y$ containing $\mathcal{B}$. Thus $B \in \boldsymbol{\Gamma}(Y, \sigma)$ since $B \in \boldsymbol{\Gamma}(\mathcal{B})$. Therefore $f^{-1}(B) \in \boldsymbol{\Gamma}(X, \tau)$ since $f:(X, \tau) \rightarrow(Y, \sigma)$ is continuous.
(c) We argue by induction on $\xi-\eta$. The result is clear if $\xi-\eta=0$. So assume that $\xi-\eta \geq 1$. Write $A=\bigcap_{n \in \omega} \neg A_{n}$, where $\eta_{n}<\xi$ and $A_{n} \in \Pi_{\eta_{n}}^{0}(X)$. As $X$ is metrizable, we may assume that $\eta \leq \eta_{n}$. The induction assumption gives $\mathcal{B}_{n} \subseteq \boldsymbol{\Pi}_{\eta}^{0}(X)$ countable such that $A_{n} \in \boldsymbol{\Pi}_{1+\left(\eta_{n}-\eta\right)}^{0}\left(\check{\mathcal{B}}_{n}\right)$. It remains to set $\mathcal{B}:=\bigcup_{n \in \omega} \mathcal{B}_{n}$.

## (A) The witnesses

Notation. We first define a map producing witnesses for the fact that $\vec{v} \in \Theta^{\infty}$. More specifically, we define a map $\mathfrak{W J}: \Theta^{\infty} \rightarrow \Theta^{\infty} \cup\left(\Theta^{\infty}\right)^{\omega}$. Let $\vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\xi} \backslash \Theta^{<\xi}$. If $\left|(\alpha)_{1}\right|=0$, then we set $\mathfrak{W}(\vec{v}):=\vec{v}$. If $\left|(\alpha)_{1}\right|=1$, then using the definition of $\Theta$ we set

$$
\mathfrak{W}(\vec{v}):=\left(<(\alpha)_{2+j}>, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, a_{1}\right)
$$

Note that $\mathfrak{W J}(\vec{v}) \in \Theta^{<\xi}$. If $\left|(\alpha)_{1}\right|=2$, then we set

$$
\mathfrak{W}(\vec{v})(p):=\left\{\begin{array}{l}
\left(<(\alpha)_{2+<0, q>}>, a_{0}, a_{1},\left(a_{0}^{\prime}\right)_{0},\left(a_{1}^{\prime}\right)_{0},\left(r^{\prime}\right)_{0}\right) \text { if } p=0 \\
\left(<(\alpha)_{2+<(p)_{0}+1, q>}>, a_{0}, a_{1},\left(a_{0}^{\prime}\right)_{p},\left(a_{1}^{\prime}\right)_{p},\left(r^{\prime}\right)_{p}\right) \text { if } p \geq 1
\end{array}\right.
$$

Here again, $\mathfrak{W}(\vec{v})(p) \in \Theta^{<\xi}$.

- Similarly, we define a map $\mathfrak{W}^{1}$ witnessing that $\vec{w} \in \Upsilon_{1}^{\infty}$. Moreover, we keep in mind $\gamma^{\prime}$. More specifically, we define a map $\mathfrak{W}^{1}: \Upsilon_{1}^{\infty} \rightarrow \Upsilon_{1}^{\infty} \cup\left(\omega^{\omega} \times \Upsilon_{1}^{\infty}\right) \cup\left(\omega^{\omega} \times\left(\Upsilon_{1}^{\infty}\right)^{\omega}\right)$. Let $\vec{w}:=(\alpha, \beta, \gamma)$ in $\Upsilon_{1}^{\xi} \backslash \Upsilon_{1}^{<\xi}$. If $\left|(\alpha)_{1}\right|=0$, then we set $\mathfrak{W}^{1}(\vec{w}):=\vec{w}$. If $\left|(\alpha)_{1}\right|=1$, then using the definition of $\Upsilon_{1}$ and some choice for $\gamma^{\prime}$, we set $\mathfrak{W}^{1}(\vec{w}):=\left(\gamma^{\prime},\left(\left\langle(\alpha)_{2+j}>, \beta^{*}, \gamma^{\prime}\right)\right)\right.$. If $\left|(\alpha)_{1}\right|=2$, then we set $\mathfrak{W}^{1}(\vec{w}):=\left(\gamma^{\prime}, \mathfrak{W}_{1}^{1}(\vec{w})\right)$, where

$$
\mathfrak{W}_{1}^{1}(\vec{w})(p):=\left\{\begin{array}{l}
\left(<(\alpha)_{2+<0, q>}>,\left(\beta^{*}\right)_{0},\left(\gamma^{\prime}\right)_{0}\right) \text { if } p=0 \\
\left(<(\alpha)_{2+<(p)_{0}+1, q>}>,\left(\left(\beta^{*}\right)_{p}\right)_{0},\left(\left(\gamma^{\prime}\right)_{p}\right)_{0}\right) \text { if } p \geq 1
\end{array}\right.
$$

## (B) The trees associated with the codes for the non self-dual Wadge classes of Borel sets

- Recall the definition of $\mathfrak{T}(\alpha)$ after Lemma 6.2. Similarly, we define $\mathfrak{T}: \Upsilon_{1}^{\infty} \rightarrow\left\{\right.$ trees on $\left.\omega \times \Upsilon_{1}^{\infty}\right\}$ as follows. Let $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\xi} \backslash \Upsilon_{1}^{<\xi}$. We set

$$
\mathfrak{T}(\vec{w}):=\left\{\begin{array}{l}
\{\emptyset\} \cup\{<(0, \vec{w})>\} \text { if }\left|(\alpha)_{1}\right|=0, \\
\{\emptyset\} \cup\left\{(0, \vec{w}) \frown s \mid s \in \mathfrak{T}\left(\mathfrak{W}_{1}^{1}(\vec{w})\right)\right\} \text { if }\left|(\alpha)_{1}\right|=1, \\
\{\emptyset\} \cup \bigcup_{p \in \omega}\left\{(p, \vec{w}) \frown s \mid s \in \mathfrak{T}\left(\mathfrak{W}_{1}^{1}(\vec{w})(p)\right)\right\} \text { if }\left|(\alpha)_{1}\right|=2 .
\end{array}\right.
$$

Here again $\mathfrak{T}(\vec{w})$ is always a countable well founded tree containing the sequence $<(0, \vec{w})>$. The set of maximal sequences in $\mathfrak{T}(\vec{w})$ is $\mathcal{M}_{\vec{w}}:=\{s \in \mathfrak{T}(\vec{w}) \mid \forall t \in \mathfrak{T}(\vec{w}) s \subseteq t \Rightarrow s=t\}$.

- Fix $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized. In the sequel, it will be convenient to set, for $s \in \mathfrak{T}(\vec{w}) \backslash \mathcal{M}_{\vec{w}}$,

$$
s_{1}(|s|):=\left\{\begin{array}{l}
\vec{w} \text { if } s=\emptyset \\
\mathfrak{W}_{1}^{1}\left(s_{1}(|s|-1)\right) \text { if } s \neq \emptyset \wedge\left|\left(s_{1}(|s|-1)(0)\right)_{1}\right|=1 \\
\mathfrak{W}_{1}^{1}\left(s_{1}(|s|-1)\right)\left(s_{0}(|s|-1)\right) \text { if } s \neq \emptyset \wedge\left|\left(s_{1}(|s|-1)(0)\right)_{1}\right|=2
\end{array}\right.
$$

- Let $s \in \mathfrak{T}(\vec{w})$. We set $B_{s}:=\left\{i<|s|| |\left(s_{1}(i)(0)\right)_{1} \mid=2\right\}$. As $\alpha$ is normalized, $B_{s}$ is an integer. We always have $B_{s} \leq|s|$. If moreover $s \in \mathfrak{T}(\vec{w}) \backslash \mathcal{M}_{\vec{w}}$, then we set $B_{s}^{\prime}:=\left\{i \leq|s|| |\left(s_{1}(i)(0)\right)_{1} \mid=2\right\}$.
- The ordinals $\left|(\alpha)_{0}\right|$, for $\alpha \in \Delta_{1}^{1} \cap \Lambda^{\infty}$, will be of particular importance in the sequel. We define a function $\mathcal{Z}: \mathfrak{T}(\vec{w}) \backslash \mathcal{M}_{\vec{w}} \rightarrow\left(\omega_{1}^{\mathrm{CK}}\right)^{<\omega}$ satisfying $|\mathcal{Z}(s)|=|s|+1$. The sequence $\mathcal{Z}(s)$ gives the ordinals $\xi$ of the $\Pi_{\xi}^{0}$ sets coded by $s$. We set $\mathcal{Z}(s)(i):=\left|\left(s_{1}(i)(0)\right)_{0}\right|$ if $i \leq|s|$. Note the following properties of $\mathcal{Z}(s)$, easy to check:
- $\mathcal{Z}(s)(i)$ depends only on $s \mid i$.
- $\mathcal{Z}(s) \subseteq \mathcal{Z}(t)$ if $s \subseteq t$.
- $\mathcal{Z}(s)(i+1) \geq \mathcal{Z}(s)(i)$ or $\mathcal{Z}(s)(i+1)=0$ if $i<|s|$.
$-\mathcal{Z}(s)(i+1)=0$ if $\mathcal{Z}(s)(i)=0$ and $i<|s|$.
- $(\mathcal{Z}(s)(i))_{i \in B_{s}^{\prime}}$ is a non-decreasing sequence of non zero recursive ordinals.

## (C) The resolution families

- Fix $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized, and $p \geq 1$. We set

$$
\tilde{P}_{p}^{\vec{w}}:=\left\{\begin{array}{l}
\omega^{\omega} \text { if }\left|(\alpha)_{1}\right| \leq 1, \\
C_{\left(\left(\mathfrak{W}_{0}^{1}(\vec{w})\right)_{p}\right)_{1}}^{\omega^{\omega}} \text { if }\left|(\alpha)_{1}\right|=2
\end{array}\right.
$$

Note that $\tilde{P}_{p}^{\vec{w}} \in \boldsymbol{\Pi}_{\left|(\alpha)_{0}\right|}^{0}\left(\omega^{\omega}\right)$ if $\left|(\alpha)_{1}\right|=2$, by Lemma 6.1.

- Recall the finite sets $c_{l} \subseteq d^{d}$ defined at the end of the proof of Proposition 2.2 (we only used the fact that $T_{d}$ has finite levels to see that they are finite). We put $c:=\bigcup_{l \in \omega} c_{l}$, so that $c$ is countable. This will be the countable set $c$ of Definition 4.3.1.
- Recall the embedding $j_{d}$ defined before Theorem 6.9. We set $\mathcal{P}_{p}^{\vec{w}}:=h\left[j_{d}^{-1}\left(\tilde{P}_{p}^{\vec{w}}\right) \cap c^{\omega}\right]$, so that the union $\mathcal{P}_{p}^{\vec{w}} \cup \mathcal{P}_{q}^{\vec{w}}=[\subseteq]$ if $p \neq q \geq 1$. Moreover, $\mathcal{P}_{p}^{s_{1}(i)} \in \boldsymbol{\Pi}_{\mathcal{Z}(s)(i)}^{0}([\subseteq])$ if $s \in \mathfrak{T}(\vec{w}) \backslash \mathcal{M}_{\vec{w}}$ and $i \in B_{s}^{\prime}$.
- If $T$ is a tree and $s \in T$, then $T_{s}:=\{t \in T \mid s \subseteq t\}$.
- Fix $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2$. We say that $s \in \mathfrak{T}(\vec{w})$ is extensible if there is $t \in \mathfrak{T}(\vec{w})_{s}$ such that $|s|<B_{t}$ (which implies that $s \notin \mathcal{M}_{\vec{w}}$ ). We will construct, for each $s$ extensible, a resolution family $\left(R_{s}^{(\rho)}\right)_{\rho \leq \eta_{s}}$. Simultaneously, we construct some ordinals $\xi_{s}$ and $\theta_{s}$. If $\theta$ is an ordinal, then we set

$$
\theta^{*}:=\left\{\begin{array}{l}
\eta \text { if } \theta=\eta+1, \\
\theta \text { otherwise }
\end{array}\right.
$$

(this is what appears in the Debs-Saint Raymond theorem). We will have $\eta_{s}=\theta_{s}^{*}, \xi_{s}=\mathcal{Z}(s)(|s|)$ and

$$
\theta_{s}:=\left\{\begin{array}{l}
\xi_{s}=\mathcal{Z}(s)(0)=\left|(\alpha)_{0}\right| \text { if } s=\emptyset \\
1+\left(\xi_{s}-\xi_{s^{-}}\right) \text {if } s \neq \emptyset
\end{array}\right.
$$

We want the resolution family to satisfy the following conditions:

- The family $\left(R_{s}^{(\rho)}\right)_{\rho \leq \eta_{s}}$ is uniform if $\theta_{s}$ is a limit ordinal.
- $R_{\emptyset}^{(0)}=\subseteq$, and $R_{s^{-}}^{\left(\eta_{s^{-}}\right)}=R_{s}^{(0)}$ if $s \neq \emptyset$.
- $\Pi_{s}:\left[R_{s}^{\left(\eta_{s}\right)}\right] \rightarrow\left[R_{s}^{(0)}\right]$ is a continuous bijection.
$-\left(\Pi_{s \mid 0} \circ \Pi_{s \mid 1} \circ \ldots \circ \Pi_{s}\right)^{-1}\left(\mathcal{P}_{p}^{s_{1}(|s|)}\right) \in \Pi_{1}^{0}\left(\left[R_{s}^{\left(\eta_{s}\right)}\right]\right)$ if $p \geq 1$.
$-\left(\Pi_{s \mid 0} \circ \Pi_{s \mid 1} \circ \ldots \circ \Pi_{s}\right)^{-1}\left(\mathcal{P}_{p}^{t_{1}(j+1)}\right) \in \Pi_{1+\left(\mathcal{Z}(t)(j+1)-\xi_{s}\right)}^{0}\left(\left[R_{s}^{\left(\eta_{s}\right)}\right]\right)$ if $p \geq 1, t \in \mathfrak{T}(\vec{w})_{s} \backslash \mathcal{M}_{\vec{w}}$ and $|s|<j+1 \in B_{t}^{\prime}$.
- The construction is by induction on $|s|$. Assume that $s=\emptyset, p \geq 1, t \in \mathfrak{T}(\vec{w}) \backslash \mathcal{M}_{\vec{w}}$ and $j+1 \in B_{t}^{\prime}$. Proposition 6.12.(c) gives $\mathcal{B}_{p}^{t, j} \subseteq \boldsymbol{\Pi}_{\theta_{\emptyset}}^{0}([\subseteq])$ countable such that $\mathcal{P}_{p}^{t_{1}(j+1)} \in \boldsymbol{\Pi}_{1+\left(\mathcal{Z}(t)(j+1)-\theta_{\emptyset}\right)}^{0}\left(\check{\mathcal{B}}_{p}^{t, j}\right)$. This implies that $u_{\emptyset}:=\left\{\mathcal{P}_{p}^{\vec{w}} \mid p \geq 1\right\} \cup \bigcup_{p \geq 1, t \in \mathfrak{T}(\vec{w}) \backslash \mathcal{M}_{\vec{w}}, j+1 \in B_{t}^{\prime}} \mathcal{B}_{p}^{t, j}$ is countable and made of $\Pi_{\theta_{\emptyset}}^{0}([\subseteq])$ sets. Theorems 4.3.4 and 4.4.4 give a family $\left(R_{\emptyset}^{(\rho)}\right)_{\rho \leq \eta_{\emptyset}}$, uniform if $\theta_{\emptyset}$ is a limit ordinal, such that
$-R_{\emptyset}^{(0)}=\subseteq$.
$-\Pi_{\emptyset}:\left[R_{\emptyset}^{\left(\eta_{\emptyset}\right)}\right] \rightarrow\left[R_{\emptyset}^{(0)}\right]$ is a continuous bijection.
- $\Pi_{\emptyset}^{-1}(Q) \in \Pi_{1}^{0}\left(\left[R_{\emptyset}^{\left(\eta_{\emptyset}\right)}\right]\right)$ for each $Q \in u_{\emptyset}$.

This family is suitable, by Proposition 6.12.

- Assume now that $s \neq \emptyset$ is extensible, and the construction is done for the strict predecessors of $s$. Note that $\left(\Pi_{s \mid 0} \circ \Pi_{s \mid 1} \circ \ldots \circ \Pi_{s^{-}}\right)^{-1}\left(\mathcal{P}_{p}^{s_{1}(|s|)}\right) \in \Pi_{\theta_{s}}^{0}\left(\left[R_{s^{-}}^{\left(\eta_{s^{-}}\right)}\right]\right)$. Assume that $p \geq 1, t \in \mathfrak{T}(\vec{w})_{s} \backslash \mathcal{M}_{\vec{w}}$ and $|s|<j+1 \in B_{t}^{\prime}$. Then Proposition 6.12.(c) gives a countable family $\mathcal{C}_{p}^{t, j} \subseteq \Pi_{\theta_{s}}^{0}\left(\left[R_{s^{-}}^{\eta_{s^{-}}}\right]\right)$such that $\left(\Pi_{s \mid 0} \circ \Pi_{s \mid 1} \circ \ldots \circ \Pi_{s^{-}}\right)^{-1}\left(\mathcal{P}_{p}^{t_{1}(j+1)}\right) \in \Pi_{1+\left(\mathcal{Z}(t)(j+1)-\xi_{s}\right)}^{0}\left(\check{\mathcal{C}}_{p}^{t, j}\right)$. This implies that

$$
u_{s}:=\left\{\left(\Pi_{s \mid 0} \circ \Pi_{s \mid 1} \circ \ldots \circ \Pi_{s^{-}}\right)^{-1}\left(\mathcal{P}_{p}^{s_{1}(|s|)}\right) \mid p \geq 1\right\} \cup \bigcup_{p \geq 1, t \in \mathfrak{T}(\vec{w})_{s} \backslash \mathcal{M}_{\vec{w}},|s|<j+1 \in B_{t}^{\prime}} \mathcal{C}_{p}^{t, j}
$$

is countable and made of $\boldsymbol{\Pi}_{\theta_{s}}^{0}\left(\left[R_{s^{-}}^{\left(\eta_{s^{-}}\right)}\right]\right)$sets. Theorems 4.3.4 and 4.4.4 give a resolution family $\left(R_{s}^{(\rho)}\right)_{\rho \leq \eta_{s}}$, uniform if $\theta_{s}$ is a limit ordinal, such that
$-R_{s}^{(0)}=R_{s^{-}}^{\left(\eta_{s^{-}}\right)}$.
$-\Pi_{s}:\left[R_{s}^{\left(\eta_{s}\right)}\right] \rightarrow\left[R_{s}^{(0)}\right]$ is a continuous bijection.

- $\Pi_{s}^{-1}(Q) \in \boldsymbol{\Pi}_{1}^{0}\left(\left[R_{s}^{\left(\eta_{s}\right)}\right]\right)$ for each $Q \in u_{s}$.

This family is suitable, by Proposition 6.12. This completes the construction of the families.

## (D) The subsets of $T_{d}$

We now build some subsets of $T_{d}$ that will play the role that $D$ and $T_{d} \backslash D$ played in the proof of Theorem 4.4.1. Fix $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2$. We will define a family of subsets of $T_{d}$ as follows. Assume that $s \in \mathfrak{T}(\vec{w})$ is extensible. We set, for $q \geq 1$,

$$
\begin{aligned}
P_{0}(s):=\left\{\begin{array}{rl}
\vec{s} \in T_{d} \mid & \left.\vec{s}=\vec{\emptyset} \vee \forall p \geq 1 \quad \exists \mathcal{B}_{p} \in\left(\Pi_{s \mid 0} \circ \Pi_{s \mid 1} \circ \ldots \circ \Pi_{s}\right)^{-1}\left(\mathcal{P}_{p}^{s_{1}(|s|)}\right) \vec{s} \in \mathcal{B}_{p}\right\} \\
P_{q}(s):=\left\{\vec{s} \in T_{d} \mid\right. & \vec{s} \neq \vec{\emptyset} \wedge \forall \mathcal{B}_{q} \in\left(\Pi_{s \mid 0} \circ \Pi_{s \mid 1} \circ \ldots \circ \Pi_{s}\right)^{-1}\left(\mathcal{P}_{q}^{s_{1}(|s|)}\right) \vec{s} \notin \mathcal{B}_{q} \wedge \\
& \left.\forall p \in \omega \backslash\{0, q\} \exists \mathcal{B}_{p} \in\left(\Pi_{s \mid 0} \circ \Pi_{s \mid 1} \circ \ldots \circ \Pi_{s}\right)^{-1}\left(\mathcal{P}_{p}^{s_{1}(|s|)}\right) \vec{s} \in \mathcal{B}_{p}\right\}
\end{array} .\right.
\end{aligned}
$$

Note that the $P_{q}(s)$ 's are pairwise disjoint. The next lemma associates to each $\vec{t} \in T_{d}$ a sequence $s(\vec{t})$ in $\mathfrak{T}(\vec{w})$ saying in which $P_{q}(s)$ 's the sequence $\vec{t}$ is.

Proposition 6.13 Let $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2$, and $\vec{t} \in T_{d}$. Then there are $l \in \omega$ and $s(\vec{t}) \in \mathfrak{T}(\vec{w})$ of length $l$ such that
(a) $\vec{t} \in \bigcap_{i<l} P_{s(\vec{t})(i)(0)}(s(\vec{t}) \mid i)$.
(b) If $s(\vec{t})$ is extensible by $t$, then $\vec{t} \notin P_{t(l)(0)}(t \mid l)$.

Proof. We actually construct, for $j \in \omega$, a sequence $s_{j} \in \mathfrak{T}(\vec{w})$. We will have $s_{j} \subseteq s_{j+1},\left|s_{j}\right|=j$ if $j \leq l, s_{j}=s_{l}$ if $j>l$, and $\vec{t} \in \bigcap_{i<\left|s_{j}\right|} P_{s_{j}(i)(0)}\left(s_{j} \mid i\right)$. At the end, $s(\vec{t})$ will be $s_{l}$. The definition of $s_{j}$ is by induction on $j$. Assume that $\left(s_{k}\right)_{k \leq j}$ are constructed satisfying these properties, which is the case for $j=0$. We may assume that $\left|s_{j}\right|=j$.

If $s_{j}$ is not extensible or $\vec{t} \notin \mathcal{B}$ for each $\mathcal{B} \in\left[R_{s_{j}}^{\left(\eta_{s_{j}}\right)}\right]$, then we set $s_{j+1}:=s_{j}$. If $\vec{t} \in \mathcal{B}$ for some $\mathcal{B} \in\left[R_{s_{j}}^{\left(\eta_{s_{j}}\right)}\right]$, then there is a unique integer $q$ such that $\vec{t} \in P_{q}\left(s_{j}\right)$ since

$$
\left(\Pi_{s_{j} \mid 0} \circ \Pi_{s_{j} \mid 1} \circ \ldots \circ \Pi_{s_{j}}\right)^{-1}\left(\mathcal{P}_{p}^{\left(s_{j}\right)_{1}(j)}\right) \cup\left(\Pi_{s_{j} \mid 0} \circ \Pi_{s_{j} \mid 1} \circ \ldots \circ \Pi_{s_{j}}\right)^{-1}\left(\mathcal{P}_{q}^{\left(s_{j}\right)_{1}(j)}\right)=\left[R_{s_{j}}^{\left(\eta_{s_{j}}\right)}\right]
$$

if $p \neq q \geq 1$. We will have $\left|s_{j+1}\right|=j+1$, and $s_{j+1}(j)(0):=q$. Moreover,

$$
s_{j+1}(j)(1):=\left\{\begin{array}{l}
\vec{w} \text { if } j=0, \\
\mathfrak{W}_{1}^{1}\left(s_{j}(j-1)(1)\right)\left(s_{j}(j-1)(0)\right) \text { if } j \geq 1 .
\end{array}\right.
$$

This completes the construction of the $s_{j}$ 's, and they are in $\mathfrak{T}(\vec{w})$. The well-foundedness of $\mathfrak{T}(\vec{w})$ proves the existence of $l$, and $s(\vec{t})$ is suitable.

Notation. Proposition 6.13 associates $s(\vec{t}) \in \mathfrak{T}(\vec{w})$ to $\vec{t} \in T_{d}$. Under the same conditions, we can associate $S(\vec{t}) \in \mathcal{M}_{\vec{w}}$ to $\vec{t}$. To do this, we need the following lemma:

Lemma 6.14 Let $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2$, and $s \in \mathfrak{T}(\vec{w})$. Then there is $S \in \mathcal{M}_{\vec{w}}$ extending $s$ such that $S_{0}(i)=0$ for $|s| \leq i<|S|$.

Proof. If $s=\emptyset$, then we set $S(0):=(0, \vec{w})$ and, if $\mathfrak{W}^{1}\left(S_{1}(i)\right) \neq S_{1}(i)$, then we set

$$
S(i+1):=\left\{\begin{array}{l}
\left(0, \mathfrak{W}_{1}^{1}(S(i))\right) \text { if } \mathfrak{W}_{1}^{1}(S(i)) \in \Upsilon_{1}^{\infty}, \\
\left(0, \mathfrak{W}_{1}^{1}(S(i))(0)\right) \text { if } \mathfrak{W}_{1}^{1}(S(i)) \in\left(\Upsilon_{1}^{\infty}\right)^{\omega} .
\end{array}\right.
$$

By induction, we see that $S \mid(i+1) \in \mathfrak{T}(\vec{w})$ for each $i<|S|$, which proves that the length of $S$ is finite since $\mathfrak{T}(\vec{w})$ is well-founded. Thus $S \in \mathcal{M}_{\vec{w}}$.

If $s \neq \emptyset$, then $S(|s|-1)$ is defined. We argue similarly. The only thing to change is that

$$
S(|s|):=\left(0, \mathfrak{W}_{1}^{1}(s(|s|-1))\left(s_{0}(|s|-1)\right)\right)
$$

if $\mathfrak{W}^{1}\left(s_{1}(|s|-1)\right) \neq s_{1}(|s|-1)$ and $\mathfrak{W}_{1}^{1}(s(|s|-1)) \in\left(\Upsilon_{1}^{\infty}\right)^{\omega}$.
We now associate a maximal extension $S(\vec{t})$ of $s(\vec{t})$ to any $\vec{t}$ in $T_{d}$.
Remark. In particular, there is $S(\vec{\emptyset}) \in \mathcal{M}_{\vec{w}}$ with $(S(\vec{\emptyset}))_{0}(i)=0$ for $i<|S(\vec{\emptyset})|$. Note that $s(\vec{\emptyset}) \subseteq S(\vec{\emptyset})$. If $\vec{\emptyset} \neq \vec{t} \in T_{d}$, then we define $S(\vec{t})$ by induction on $|\vec{t}|$ :

- If $s(\vec{t})=\emptyset$, then $\vec{t} \neq \emptyset$ since $\vec{\emptyset} \in P_{0}(\emptyset)$, and $S(\vec{t}):=S\left(\vec{t}_{\emptyset}^{\eta_{\emptyset}}\right)$.
- If $s(\vec{t}) \neq \emptyset$ and $\vec{t}_{s(\vec{t})^{-}}^{\left.\eta_{s(\vec{t}}\right)^{-}} \in \bigcap_{i<|s(\vec{t})|} P_{s(\vec{t})(i)(0)}(s(\vec{t}) \mid i)$, then $S(\vec{t}):=S\left(\vec{t}_{s(\vec{t})^{-}} \eta^{-}\right)$.
- If $s(\vec{t}) \neq \emptyset$ and $\vec{t}_{s(\vec{t})^{-}}^{\eta_{s(\overrightarrow{)}}} \notin \bigcap_{i<|s(\vec{t})|} P_{s(\vec{t})(i)(0)}(s(\vec{t}) \mid i)$, then $S(\vec{t})$ is the extension of $s(\vec{t})$ given by Lemma 6.14 applied to $s:=s(\vec{t})$.

Note that $S(\vec{t}) \in \mathcal{M}_{\vec{w}}$ and is always an extension of $s(\vec{t})$, by induction on $|\vec{t}|$. This comes from the fact that $s(\vec{t}) \subseteq s\left(\vec{t}_{s(\vec{t})^{-}} \eta_{s,}\right)$ in the second case.

## (E) The tuples

We now keep in mind the tuples $\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right)$ along any sequence of $\mathfrak{T}(\vec{w})$, using the witness map $\mathfrak{W}$. Fix $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}, \vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2$. We will define a map $V: \mathfrak{T}(\vec{w}) \rightarrow\left(\Theta^{\infty}\right)^{<\omega}$ such that $|V(s)|=|s|, V(s)(i)$ depends only on $s \mid i$ as follows. We set, for $i<|s|$,

$$
V(s)(i):=\left\{\begin{array}{l}
\vec{v} \text { if } i=0, \\
\mathfrak{W}(V(s)(i-1)) \text { if } i \geq 1 \wedge\left|(V(s)(i-1)(0))_{1}\right| \leq 1, \\
\mathfrak{W}(V(s)(i-1))\left(s_{0}(i-1)\right) \text { if } i \geq 1 \wedge\left|(V(s)(i-1)(0))_{1}\right|=2 .
\end{array}\right.
$$

Lemma 6.15 Let $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}, \vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2, s \in \mathfrak{T}(\vec{w})$, and $i<|s|$. Then $V(s)(i)(0)=s_{1}(i)(0)$. In particular, $s \notin \mathcal{M}_{\vec{w}}$ and $i \leq|s|$ imply that $\mathcal{Z}(s)(i)=\left|(V(s)(i)(0))_{0}\right|$.

Proof. The last assertion clearly comes from the first one. The proof is by induction on $i$. The assertion is clear for $i=0$ since $V(s)(0)(0)=s_{1}(0)(0)=\alpha$. Assume that it holds for $i<|s|-1$.

- If $i \notin B_{s}$, then $\left|(V(s)(i)(0))_{1}\right|=\left|\left(s_{1}(i)(0)\right)_{1}\right|=1$. Thus

$$
V(s)(i+1)(0)=\mathfrak{W}(V(s)(i))(0)=<(V(s)(i)(0))_{2+j}>=<\left(s_{1}(i)(0)\right)_{2+j}>=s_{1}(i+1)(0) .
$$

- If $i \in B_{s}$, then $\left|(V(s)(i)(0))_{1}\right|=\left|\left(s_{1}(i)(0)\right)_{1}\right|=2$. If moreover $s_{0}(i)=0$, then

$$
V(s)(i+1)(0)=<(V(s)(i)(0))_{2+<0, q>}>=<\left(s_{1}(i)(0)\right)_{2+<0, q>}>=s_{1}(i+1)(0)
$$

The argument is similar if $s_{0}(i) \geq 1$.
The next lemma is a preparation for Lemma 6.21, which is the crucial step to prove a version of the claim in the proof of Theorem 4.4.1 for the non self-dual Wadge classes of Borel sets.

Lemma 6.16 Let $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}, \vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2, s \in \mathfrak{T}(\vec{w})$, and $i \in B_{s}$.
(a) If $s_{0}(i)=0$, then $\neg \mathcal{U}_{V(s)(i)(5)} \subseteq \neg \mathcal{U}_{V(s)(i+1)(5)}$.
(b) We have $\neg \mathcal{U}_{V(s)(i)(5)} \subseteq \overline{\mathcal{U}}_{V(s)(i+1)(5)} \tau_{\xi_{s \mid i}}$.

Proof. (a) We have $V(s)(i+1)=\mathfrak{W}(V(s)(i))(0)$, by Lemma 6.15. Thus

$$
V(s)(i+1)(5)=\mathfrak{W}(V(s)(i))(0)(5)=\left(r^{\prime}\right)_{0}
$$

for some $r^{\prime}$ for which $\neg \mathcal{U}_{V(s)(i)(5)} \subseteq \neg \mathcal{U}_{\left(r^{\prime}\right)_{0}}$, by the 2 nd and the 4th remarks after the definition of $\Theta$.
(b) We may assume that $s_{0}(i) \geq 1$, so that $V(s)(i+1)(5)=\left(r^{\prime}\right)_{s_{0}(i)}$, and

$$
\neg \mathcal{U}_{V(s)(i)(5)} \subseteq{\overline{\neg \mathcal{U}_{V(s)(i+1)(5)}}}^{\tau_{\left|(V(s)(i)(0))_{0}\right|}}
$$

by the 5th remark after the definition of $\Theta$ and the definition of $f_{a}$. We are done by Lemma 6.15.

## $(F)$ The sequences of integers

We have to keep in mind the integers $s_{0}(i)$ for $s \in \mathfrak{T}(\vec{w})$. We will consider an ordering of these finite sequences of integers that will help us to prove the claim just mentioned.

Notation. Fix $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}, \vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2$, and $s, s^{\prime} \in \mathfrak{T}(\vec{w})$.

- If $s$ and $s^{\prime}$ are not compatible, then we denote $s \wedge s^{\prime}:=s\left|i=s^{\prime}\right| i$, where $i$ is minimal with $s(i) \neq s^{\prime}(i)$. Note that $\left|s \wedge s^{\prime}\right| \in B_{s}$.
- We define $O(s) \in \omega^{|s|}$ : we set $O(s)(i):=s_{0}(i)$.
- We also define a partial order on $\omega^{<\omega}$ as follows:

$$
O \sqsubseteq O^{\prime} \Leftrightarrow O=O^{\prime} \vee \exists i<\min \left(|O|,\left|O^{\prime}\right|\right) \quad\left(O\left|i=O^{\prime}\right| i \wedge O(i)=0<O^{\prime}(i)\right) .
$$

Lemma 6.17 Let $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}, \vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2$, and $s, s^{\prime} \in \mathfrak{T}(\vec{w})$ uncompatible. Assume that $\vec{s} \in \bigcap_{i \leq\left|s \wedge s^{\prime}\right|} P_{s_{0}(i)}(s \mid i), \vec{t}$ is in $\bigcap_{i \leq\left|s \wedge s^{\prime}\right|} P_{s_{0}^{\prime}(i)}\left(s^{\prime} \mid i\right)$ and $\vec{s} R_{s| |\left|\wedge \Lambda s^{\prime}\right|}^{\left(\eta_{s\left|s \wedge s^{\prime}\right|}\right)} \vec{t}$. Then $O(s) \sqsubseteq O\left(s^{\prime}\right)$.

Proof. As $s\left(\left|s \wedge s^{\prime}\right|\right) \neq s^{\prime}\left(\left|s \wedge s^{\prime}\right|\right)$ and $s_{1}\left(\left|s \wedge s^{\prime}\right|\right)=s_{1}^{\prime}\left(\left|s \wedge s^{\prime}\right|\right)$, we get $s_{0}\left(\left|s \wedge s^{\prime}\right|\right) \neq s_{0}^{\prime}\left(\left|s \wedge s^{\prime}\right|\right)$. Recall the definition of the $P_{q}(s)$ 's. Note the following facts. Assume that $i \in B_{s}$ and $\vec{s} R_{s \mid i}^{\left(\eta_{s \mid i}\right)} \vec{t}$.

- If $s_{0}(i)=0$ and $\vec{t} \in P_{0}(s \mid i)$, then $\vec{s} \in P_{0}(s \mid i)$ too.
- If $s_{0}(i) \geq 1$ and $\vec{t} \in P_{s_{0}(i)}(s \mid i)$, then $\vec{s} \in P_{0}(s \mid i) \cup P_{s_{0}(i)}(s \mid i)$.

These facts imply that $s_{0}\left(\left|s \wedge s^{\prime}\right|\right)=0<s_{0}^{\prime}\left(\left|s \wedge s^{\prime}\right|\right)$. Therefore $O(s) \sqsubseteq O\left(s^{\prime}\right)$.

## (G) The ranges

The goal of this paragraph is to defiine the analytic sets $r(S(\vec{t}))$ that will contain $U_{\vec{t}}$ in the inductive construction of the proof of Theorem 6.9. They will play the role that ${\overline{A_{0}}}^{{ }^{\xi} \xi} \cap A_{1}$ and $A_{0}$ played in the proof of Theorem 4.4.1, Conditions (4)-(5).

Notation. Fix $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}, \vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2$, and $s \in \mathfrak{T}(\vec{w}) \backslash\{\emptyset\}$. We set

$$
\begin{aligned}
& i^{s}:=\left\{\begin{array}{l}
|s|-1 \text { if } \forall j<|s| s_{0}(j) \geq 1, \\
\min \left\{i<|s| \mid s_{0}(i)=0\right\} \text { otherwise, },
\end{array}\right. \\
& I^{s}:=\left\{\begin{array}{l}
|s|-1 \text { if } s_{0}(|s|-1) \geq 1, \\
\min \left\{i<|s| \mid \forall j \geq i \quad s_{0}(j)=0\right\} \text { otherwise. }
\end{array}\right.
\end{aligned}
$$

Note that $i^{s} \leq I^{s} \leq B_{s}$. We associate, with each $i^{s} \leq i<|s|, \underline{a}_{0}^{s, i}, \underline{a}_{1}^{s, i}, r^{s, i} \in \omega^{\omega}$. The definition is by induction on $i$. We set $\underline{\underline{e}}_{\varepsilon}^{s, i^{s}}:=\underline{a}_{\varepsilon}\left(V(s)\left(i^{s}\right)(0), a_{0}, a_{1}\right), r^{s, i^{s}}:=r\left(V(s)\left(i^{s}\right)(0), a_{0}, a_{1}\right)=V(s)\left(i^{s}\right)(5)$. Then

$$
\begin{aligned}
& \underline{a}_{\varepsilon}^{s, i+1}:=\left\{\begin{array}{l}
\underline{a}_{\varepsilon}^{s, i} \text { if } s_{0}(i+1) \geq 1, \\
\underline{a}_{\varepsilon}\left(V(s)(i+1)(0), \underline{a}_{0}^{s, i}, \underline{a}_{1}^{s, i}\right) \text { if } s_{0}(i+1)=0,
\end{array}\right. \\
& r^{s, i+1}:=\left\{\begin{array}{l}
r^{s, i} \text { if } s_{0}(i+1) \geq 1, \\
r\left(V(s)(i+1)(0), \underline{a}_{0}^{s, i}, \underline{a}_{1}^{s, i}\right) \text { if } s_{0}(i+1)=0 .
\end{array}\right.
\end{aligned}
$$

The range of $s$ is $r(s):=\neg \mathcal{U}_{r^{s}, I^{s}}$.
Lemma 6.18 Let $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}, \vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2, s \in \mathfrak{T}(\vec{w}) \backslash\{\emptyset\}$, and $i^{s} \leq i<B_{s}-1$ with $s_{0}(i)=0$. Then $r^{s, i}=r^{s, i+1}$.

Proof. We may assume that $s_{0}(i+1)=0$. Assume first that $i=i^{s}$. Then

$$
\begin{aligned}
r^{s, i^{s}} & =r\left(V(s)\left(i^{s}\right)(0), a_{0}, a_{1}\right) \\
& =r\left(\mathfrak{W}\left(V(s)\left(i^{s}\right)\right)(0)(0), \underline{a}_{0}\left(V(s)\left(i^{s}\right)(0), a_{0}, a_{1}\right), \underline{a}_{1}\left(V(s)\left(i^{s}\right)(0), a_{0}, a_{1}\right)\right) \\
& =r\left(\mathfrak{W}\left(V(s)\left(i^{s}\right)\right)\left(s_{0}\left(i^{s}\right)\right)(0), \underline{a}_{0}\left(V(s)\left(i^{s}\right)(0), a_{0}, a_{1}\right), \underline{a}_{1}\left(V(s)\left(i^{s}\right)(0), a_{0}, a_{1}\right)\right) \\
& =r\left(V(s)\left(i^{s}+1\right)(0), \underline{a}_{0}\left(V(s)\left(i^{s}\right)(0), a_{0}, a_{1}\right), \underline{a}_{1}\left(V(s)\left(i^{s}\right)(0), a_{0}, a_{1}\right)\right) \\
& =r\left(V(s)\left(i^{s}+1\right)(0), \underline{a}_{0}^{s, i^{s}}, \underline{a}_{1}^{s, i^{s}}\right) \\
& =r^{s, i^{s}+1} .
\end{aligned}
$$

The argument is similar if $i>i^{s}$.
Lemma 6.19 Let $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}, \vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2$. Then there is $S(\vec{\emptyset}) \in \mathcal{M}_{\vec{w}}$ with $\vec{\emptyset} \in \bigcap_{i<B_{S(\vec{\emptyset})}} P_{\left(S(\vec{\emptyset})_{0}(i)\right.}(S(\vec{\emptyset}) \mid i)$ and $\neg \mathcal{U}_{r} \subseteq r(S(\vec{\emptyset}))$.

Proof. We set $s:=S(\vec{\emptyset})$ for short. We already saw that $s \in \mathcal{M}_{\vec{w}}, \vec{\emptyset} \in \bigcap_{i<B_{s}} P_{s_{0}(i)}(s \mid i)$, and $s_{0}(i)=0$ for each $i<|s|$ after Lemma 6.14. Note that $i^{s}=I^{s}=0$. We get

$$
\neg \mathcal{U}_{r}=\neg \mathcal{U}_{V(s)(0)(5)}=\neg \mathcal{U}_{V(s)\left(i^{s}\right)(5)}=\neg \mathcal{U}_{r^{s}, i^{s}}=\neg \mathcal{U}_{r^{s, I^{s}}}=r(s) .
$$

This finishes the proof.
The role of the next objects is to determine if we go to the $A_{0}$ side or the $A_{1}$ side in the inductive construction of the proof of Theorem 6.9.

Notation. Let $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2$, and $s \in \mathcal{M}_{\vec{w}}$. We set $\varepsilon_{s}:=0$ if $B_{s}<|s|-1, \varepsilon_{s}:=1$ otherwise, i.e., if $B_{s}=|s|-1$.

Lemma 6.20 Let $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}, \vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2$, and $s \in \mathcal{M}_{\vec{w}}$. Then $r(s) \subseteq \neg \mathcal{U}_{a_{\varepsilon_{s}}}$.

Proof. Note first that $\neg \mathcal{U}_{a_{\varepsilon}^{s, i}} \subseteq \neg \mathcal{U}_{a_{\varepsilon}}$, by induction on $i$ and the 2nd remark after the definition of $\Theta$. This implies that $\neg \mathcal{U}_{r^{s, 1 s}}{\underset{\varepsilon}{s}}_{\underline{a_{\varepsilon}^{s}}}^{\mathcal{\sim}} \mathcal{U}_{r\left(V(s)\left(I^{s}\right)(0), a_{0}, a_{1}\right)}=\neg \mathcal{U}_{V(s)\left(I^{s}\right)(5)}$, by the 4th remark after the definition of $\Theta$. Thus $r(s)=\neg \mathcal{U}_{r^{s}, I^{s}} \subseteq \neg \mathcal{U}_{V(s)\left(I^{s}\right)(5)}$. Lemma 6.16 implies that $\neg \mathcal{U}_{V(s)\left(I^{s}\right)(5)} \subseteq \neg \mathcal{U}_{V(s)\left(B_{s}\right)(5)}$. But $V(s)\left(B_{s}\right)(5)=a_{\varepsilon_{s}}$, by Lemma 6.15.

Now we come to the crucial lemma for the claim mentioned earlier.
Lemma 6.21 Let $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}, \vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2, s, s^{\prime} \in \mathfrak{T}(\vec{w})$ with $O(s) \neq O\left(s^{\prime}\right)$ and $O(s) \sqsubseteq O\left(s^{\prime}\right)$. Then $r(s) \subseteq{\overline{r\left(s^{\prime}\right)}}^{\tau_{\xi}} \Delta_{\| \wedge \wedge s^{\prime} \mid}$.

Proof. We can write $O(s):=0^{k_{0}} n_{0} \ldots 0^{k_{l-1}} n_{l-1} 0^{k_{l}}$, with $l, k_{i} \in \omega$, and $n_{i} \geq 1$. Similarly, we write $O\left(s^{\prime}\right):=0^{k_{0}^{\prime}} n_{0}^{\prime} \ldots 0^{k_{l^{\prime}-1}^{\prime}} n_{l^{\prime}-1}^{\prime} 0^{k_{l^{\prime}}^{\prime}}$. The assumption implies that $l^{\prime} \geq 1$, and the existence of $j<l^{\prime}$ with $\left(k_{i}, n_{i}\right)=\left(k_{i}^{\prime}, n_{i}^{\prime}\right)$ if $i<j$ and $k_{j}^{\prime}<k_{j}$. Lemma 6.14 shows the existence of $k_{j+1}^{\prime \prime} \geq 1$ and $s^{\prime \prime} \in \mathcal{M}_{\vec{w}}$ with $O\left(s^{\prime \prime}\right)=0^{k_{0}^{\prime}} n_{0}^{\prime} \ldots 0^{k_{j-1}^{\prime}} n_{j-1}^{\prime} 0^{k_{j}^{\prime}} n_{j}^{\prime} 0^{k_{j+1}^{\prime \prime}}$ if $j<l^{\prime}-1$. If $j=l^{\prime}-1$, then we set $s^{\prime \prime}:=s^{\prime}$.

Note that $O(s) \neq O\left(s^{\prime \prime}\right), O(s) \sqsubseteq O\left(s^{\prime \prime}\right)$, and $O\left(s^{\prime \prime}\right) \sqsubseteq O\left(s^{\prime}\right)$. Moreover, $O\left(s^{\prime \prime}\right) \neq O\left(s^{\prime}\right)$ and $\left|s \wedge s^{\prime}\right|=\left|s \wedge s^{\prime \prime}\right|<\left|s^{\prime} \wedge s^{\prime \prime}\right|$ if $j<l^{\prime}-1$. It is enough to prove that $r(s) \subseteq{\overline{r\left(s^{\prime \prime}\right)}}^{\tau_{\xi}} \xi_{s| | s \wedge s^{\prime \prime} \mid}$. This means that we may assume that $\left(k_{i}, n_{i}\right)=\left(k_{i}^{\prime}, n_{i}^{\prime}\right)$ if $i<l^{\prime}-1$ and $k_{l^{\prime}-1}^{\prime}<k_{l^{\prime}-1}$. This implies that $I^{s^{\prime}} \geq 1$, $\left|s \wedge s^{\prime}\right|=I^{s^{\prime}}-1, s\left|\left(I^{s^{\prime}}-1\right)=s^{\prime}\right|\left(I^{s^{\prime}}-1\right), s_{0}\left(I^{s^{\prime}}-1\right)=0<s_{0}^{\prime}\left(I^{s^{\prime}}-1\right)$ and $i^{s} \leq I^{s^{\prime}}-1$.

Case 1. $i^{s}=I^{s}$ and $i^{s^{\prime}}=I^{s^{\prime}}$.
Note that $r(s)=\neg \mathcal{U}_{r^{s, I^{s}}}=\neg \mathcal{U}_{r^{s,} i^{s}}=\neg \mathcal{U}_{V(s)\left(i^{s}\right)(5)}=\neg \mathcal{U}_{V\left(s^{\prime}\right)\left(I^{s}\right)(5)}$. Lemma 6.16 implies that

$$
r(s)=\neg \mathcal{U}_{V\left(s^{\prime}\right)\left(I^{s}\right)(5)} \subseteq \neg \mathcal{U}_{V\left(s^{\prime}\right)\left(I^{s^{\prime}}-1\right)(5)} \subseteq{\overline{\neg \mathcal{U}_{V\left(s^{\prime}\right)\left(I^{s^{\prime}}\right)(5)}}{ }^{\tau} \xi_{s^{\prime} \mid\left(I^{s^{\prime}}-1\right)}={\overline{r\left(s^{\prime}\right)}}^{\tau_{\xi_{s| | s \wedge s^{\prime} \mid}} .} . . . .}
$$

Case 2. $i^{s}=I^{s}$ and $i^{s^{\prime}}<I^{s^{\prime}}$.
Note that $i^{s}=i^{s^{\prime}}<I^{s^{\prime}}-1$. Lemma 6.18 implies that $r(s)=\neg \mathcal{U}_{r^{s, I^{s}}}=\neg \mathcal{U}_{r^{s, I^{s^{\prime}}-1}}$. Thus

$$
\begin{aligned}
& =\neg \mathcal{U}_{r\left(V\left(s^{\prime}\right)\left(I^{s^{\prime}}-1\right)(0),,_{0}^{\left.s^{\prime}, I^{s^{\prime}}-2, \underline{a}_{1}^{s^{\prime}, I s^{s^{\prime}}-2}\right)}\right.}
\end{aligned}
$$

$$
\begin{aligned}
& \left.=\frac{r\left(V\left(s^{\prime}\right)\left(I^{s^{\prime}}\right)\right.}{r\left(s^{\prime}\right)}{ }^{\tau}{ }_{s}| | s \wedge s^{\prime} \right\rvert\,,
\end{aligned}
$$

by Lemma 6.16.
Case 3. $i^{s}<I^{s}<I^{s^{\prime}}$.

We argue as in Case 2.
Case 4. $i^{s}<I^{s}$ and $I^{s^{\prime}} \leq I^{s}$, which implies that $I^{s^{\prime}}<I^{s}$.
The 5 th remark after the definition of $\Upsilon$ gives $\varepsilon \in 2$ with $r(s)=\neg \mathcal{U}_{r^{s, I^{s}}} \subseteq \neg \mathcal{U}_{\underline{a}_{\varepsilon}^{s, I^{s}-1}}$. Thus $r(s) \subseteq \neg \mathcal{U}_{\underline{a}_{\varepsilon}^{s, I^{s}-1}} \subseteq \ldots \subseteq \neg \mathcal{U}_{\underline{a}_{\varepsilon}^{s, I I^{s^{\prime}}-1}}$. If $I^{s^{\prime}} \geq 2$, then we get

Otherwise, we get $I^{s^{\prime}}=1, i^{s}=0, i^{s^{\prime}}=I^{s^{\prime}}$ and

This finishes the proof.

## (H) The maximal sequences

We now associate a maximal sequence to a couple $(\vec{\beta}, \vec{w})$ with $\vec{\beta} \in\left\lceil T_{d}\right\rceil$. It is build in a way similar to that of the $s(\vec{t})$ 's, but for infinite sequences instead of finite ones.

- Let $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2$, and $\vec{\beta} \in\left\lceil T_{d}\right\rceil$. We will define $s(\vec{\beta}, \vec{w}) \in \mathcal{M}_{\vec{w}}$. Recall the definition of $\tilde{\mathcal{P}} \vec{p}$. We set, for $s \in \mathcal{M}_{\vec{w}}$ and $i \in B_{s}$,

$$
E_{i}^{s}:=\left\{\begin{array}{l}
\bigcap_{p \geq 1} \tilde{\mathcal{P}}_{p}^{s(i)(1)} \text { if } s(i)(0)=0 \\
\neg \tilde{\mathcal{P}}_{s(i)(0)}^{s(i)(1)} \text { if } s(i)(0) \geq 1
\end{array}\right.
$$

We define $s(\vec{\beta}, \vec{w})$ in such a way that $j_{d}(\vec{\beta}) \in \bigcap_{i \in B_{s(\vec{\beta}, \vec{w})}} E_{i}^{s(\vec{\beta}, \vec{w})}$. Let $\xi$ be an ordinal such that $\vec{w} \in \Upsilon_{1}^{\xi} \backslash \Upsilon_{1}^{<\xi}$. The definition of $s(\vec{\beta}, \vec{w})$ is by induction on $\xi$.

Case 1. $\left|(\alpha)_{1}\right|=0$.
We set $s(\vec{\beta}, \vec{w}):=<(0, \vec{w})>$.
Case 2. $\left|(\alpha)_{1}\right|=1$.
We set $s(\vec{\beta}, \vec{w}):=(0, \vec{w}) \frown s\left(\vec{\beta}, \mathfrak{W}_{1}^{1}(\vec{w})\right)$.
Case 3. $\left|(\alpha)_{1}\right|=2$.
We set $s(\vec{\beta}, \vec{w}):=\left\{\begin{array}{l}\left(0, \vec{w} \frown^{\text {Co }} s\left(\vec{\beta}, \mathfrak{W}_{1}^{1}(\vec{w})(0)\right) \text { if } j_{d}(\vec{\beta}) \in \bigcap_{p \geq 1} \tilde{\mathcal{P}}_{p}^{\vec{w}},\right. \\ (p, \vec{w}) \frown s\left(\vec{\beta}, \mathfrak{W}_{1}^{1}(\vec{w})(p)\right) \text { if } j_{d}(\vec{\beta}) \notin \tilde{\mathcal{P}}_{p}^{\vec{w}} \wedge p \geq 1 .\end{array}\right.$

- We set $\left(\vec{\beta} \mid j_{k}\right)_{k \in \omega}:=\left(\Pi_{s(\vec{\beta}, \vec{w}) \mid 0} \circ \ldots \circ \Pi_{s(\vec{\beta}, \vec{w}) \mid\left(B_{s(\vec{\beta}, \vec{w})}-1\right)}\right)^{-1}(h(\vec{\beta}))$.

Recall the definition of $\varepsilon_{s}$ before Lemma 6.20.
Lemma 6.22 Let $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2$, and $\vec{\beta} \in\left\lceil T_{d}\right\rceil$.
(a) There is $k_{0} \in \omega$ such that $\vec{\beta} \mid j_{k} \in \bigcap_{i<B_{s(\vec{\beta}, \vec{w})}} P_{s(\vec{\beta}, \vec{w})(i)(0)}(s(\vec{\beta}, \vec{w}) \mid i)$ if $k \geq k_{0}$. In this case, the sequence $s\left(\vec{\beta} \mid j_{k}\right)$ given by Proposition 6.13 is $s(\vec{\beta}, \vec{w}) \mid B_{s(\vec{\beta}, \vec{w})}$, and is not extensible.
(b) We have $j_{d}(\vec{\beta}) \in C_{\gamma}^{\omega^{\omega}}$ if and only if $\varepsilon_{s(\vec{\beta}, \vec{w})}=0$.

Proof. We set $s:=s(\vec{\beta}, \vec{w})$ for simplicity.
(a) To define $k_{0}$, we will define, for $i<B_{s}, k_{0}^{i} \in \omega$ and we will set $k_{0}:=\max \left\{k_{0}^{i} \mid i<B_{s}\right\}$. To do this, we set $\left(\vec{\beta} \mid j_{k}^{i}\right)_{k \in \omega}:=\left(\Pi_{s \mid 0} \circ \ldots \circ \Pi_{s \mid i}\right)^{-1}(h(\vec{\beta}))$, so that $\left(\vec{\beta} \mid j_{k}^{i+1}\right)_{k \in \omega}$ is a subsequence of $\left(\vec{\beta} \mid j_{k}^{i}\right)_{k \in \omega}$ if $i<B_{s}-1$.

By the choice of the $E_{i}^{s}$ 's we get, for $i<B_{s}$,

$$
\begin{aligned}
& h(\vec{\beta}) \in\left\{\begin{array}{l}
\bigcap_{p \geq 1} \mathcal{P}_{p}^{s_{1}(i)} \text { if } s_{0}(i)=0, \\
\neg \mathcal{P}_{s_{0}(i)}^{s_{1}(i)} \text { if } s_{0}(i) \geq 1,
\end{array}\right. \\
&\left(\vec{\beta} \mid j_{k}^{i}\right)_{k \in \omega} \in\left\{\begin{array}{l}
\bigcap_{p \geq 1}\left(\Pi_{s \mid 0} \circ \ldots \circ \Pi_{s \mid i}\right)^{-1}\left(\mathcal{P}_{p}^{s_{1}(i)}\right) \text { if } s_{0}(i)=0, \\
\neg\left(\Pi_{s \mid 0} \circ \ldots \circ \Pi_{s \mid i}\right)^{-1}\left(\mathcal{P}_{s_{0}(i)}^{s_{1}(i)}\right) \text { if } s_{0}(i) \geq 1 .
\end{array}\right.
\end{aligned}
$$

Note the existence of $\mathcal{B}_{p}^{i}$ in $\left(\Pi_{s \mid 0} \circ \ldots \circ \Pi_{s \mid i}\right)^{-1}\left(\mathcal{P}_{p}^{s_{1}(i)}\right)$ such that $\vec{\beta} \mid j_{k}^{i} \in \mathcal{B}_{p}^{i}$ if $s_{0}(i)=0, k \in \omega$ and $p \geq 1$. If $s_{0}(i) \geq 1$ and $p \in \omega \backslash\left\{0, s_{0}(i)\right\}$, then $\left(\vec{\beta} \mid j_{k}^{i}\right)_{k \in \omega} \in\left(\Pi_{s \mid 0} \circ \ldots \circ \Pi_{s \mid i}\right)^{-1}\left(\mathcal{P}_{p}^{s_{1}(i)}\right)$ since $\mathcal{P}_{p}^{s_{1}(i)} \cup \mathcal{P}_{s_{0}(i)}^{s_{1}(i)}=[\subseteq]$. This implies the existence of $\mathcal{B}_{p}^{i} \in\left(\Pi_{s \mid 0} \circ \ldots \circ \Pi_{s \mid i}\right)^{-1}\left(\mathcal{P}_{p}^{s_{1}(i)}\right)$ such that $\vec{\beta} \mid j_{k}^{i} \in \mathcal{B}_{p}^{i}$ if $k \in \omega$. As $\left(\Pi_{s \mid 0} \circ \ldots \circ \Pi_{s \mid i}\right)^{-1}\left(\mathcal{P}_{s_{0}(i)}^{s_{1}(i)}\right) \in \Pi_{1}^{0}\left(\left[R_{s \mid i}^{\left(\eta_{s \mid i}\right)}\right]\right)$, there is $k_{0}^{i} \geq 1$ such that $\vec{\beta} \mid j_{k}^{i} \notin \mathcal{B}_{s_{0}(i)}^{i}$ if $s_{0}(i) \geq 1, \mathcal{B}_{s_{0}(i)}^{i} \in\left(\Pi_{s \mid 0} \circ \ldots \circ \Pi_{s \mid i}\right)^{-1}\left(\mathcal{P}_{s_{0}(i)}^{s_{1}(i)}\right)$ and $k \geq k_{0}^{i}$. This defines $k_{0}^{i}$ and $k_{0}$. It remains to check that $\vec{\beta} \mid j_{k} \in P_{s(i)(0)}(s \mid i)$ if $i<B_{s}$ and $k \geq k_{0}$. This comes from the fact that $j_{k}=j_{k}^{B_{s}-1}=j_{K(k)}^{i}$ for some $K(k) \geq k \geq k_{0} \geq k_{0}^{i}$. The last assertion comes from the construction of $s(\vec{t})$.
(b) We define, for $i<|s|, \varepsilon_{s}^{i} \in 2$. The definition is by induction on $i$. We first set $\varepsilon_{s}^{0}:=1$. Then $\varepsilon_{s}^{i+1}:=0$ if $|s|-i-2 \notin B_{s}, \varepsilon_{s}^{i+1}:=\varepsilon_{s}^{i}$ otherwise. Note that $\varepsilon_{s}=\varepsilon_{s}^{|s|-1}\left(\varepsilon_{s}\right.$ is defined before Lemma 6.20). We have to see that $j_{d}(\vec{\beta})$ is in $C_{s_{1}(0)(2)}^{\omega^{\omega}}$ is equivalent to $\varepsilon_{s}^{|s|-1}=0$. We prove the following stronger fact: $j_{d}(\vec{\beta}) \in C_{s_{1}(|s|-i-1)(2)}^{\omega^{\omega}}$ is equivalent to $\varepsilon_{s}^{i}=0$ if $i<|s|$. Here again we argue by induction on $i$. The result is clear for $i=0$ since $C_{s_{1}(|s|-1)(2)}^{\omega^{\omega}}=\emptyset$. So assume that the result is true for $i<|s|-1$.

If $|s|-i-2 \notin B_{s}$, then we are done since $\varepsilon_{s}^{i+1}=1-\varepsilon_{s}^{i}$ and $C_{s_{1}(|s|-i-2)(2)}^{\omega^{\omega}}=\neg C_{s_{1}(|s|-i-1)(2)}^{\omega^{\omega}}$. If $|s|-i-2 \in B_{s}$, then $\varepsilon_{s}^{i+1}=\varepsilon_{s}^{i}$ and

$$
\begin{aligned}
& C_{s_{1}(|s|-i-2)(2)}^{\omega^{\omega}}=\bigcup_{p \geq 1}\left(C_{\left(\left(\mathfrak{W}_{0}^{1}\left(s_{1}(|s|-i-2)\right)\right)_{p}\right)_{0}}^{\omega^{\omega}} \backslash C_{\left.\left(\left(\mathfrak{W}_{0}^{1}\left(s_{1}(|s|-i-2)\right)\right)_{p}\right)_{1}\right)}^{\omega^{\omega}}\right) \cup \\
& \left(C_{\left(\mathfrak{W}_{0}^{1}\left(s_{1}(|s|-i-2)\right)\right)_{0}}^{\omega^{\omega}} \cap \bigcap_{p \geq 1} C_{\left(\left(\mathfrak{W}_{0}^{1}\left(s_{1}(|s|-i-2)\right)\right)_{p}\right)_{1}}^{\omega_{1}^{\omega}}\right) .
\end{aligned}
$$

If $s_{0}(|s|-i-2)=0$, then $j_{d}(\vec{\beta}) \in \bigcap_{p \geq 1} \quad \tilde{\mathcal{P}}_{p}^{s_{1}(|s|-i-2)}=\bigcap_{p \geq 1} C_{\left(\left(\overrightarrow{W_{0}^{1}}{ }_{0}^{\omega}\left(s_{1}(|s|-i-2)\right)\right)_{p}\right)_{1}}$. We can say that $j_{d}(\vec{\beta}) \in C_{s_{1}(|s|-i-2)(2)}^{\omega^{\omega}}$ is equivalent to $j_{d}(\vec{\beta}) \in C_{\left(\mathfrak{W}_{0}^{1}\left(s_{1}(|s|-i-2)\right)\right)_{0}}^{\omega^{\omega}}=C_{s_{1}(|s|-i-1)(2)}^{\omega^{\omega}}$, and we are done by induction assumption. We argue similarly when $s_{0}(|s|-i-2) \geq 1$.

Remark. Recall the definition of an extensible sequence at the beginning of the construction of the resolution families. If $s$ is not extensible, then $s$ admits a unique extension $M(s)$ in $\mathcal{M}_{\vec{w}}$. In particular, in Lemma 6.22.(a), $M\left(s\left(\vec{\beta} \mid j_{k}\right)\right)=s(\vec{\beta}, \vec{w})=S\left(\vec{\beta} \mid j_{k}\right)$. In Lemma 6.19, $s(\vec{\emptyset})=s \mid B_{s}$ is not extensible and $M(s(\vec{\emptyset}))=S(\vec{\emptyset})$.

Notation. Recall the construction of the resolution families, and also the proof of Theorem 4.4.5, especially the definition of $\eta(\vec{t})$. If $\theta_{s}$ is a limit ordinal, then we consider some ordinals $\eta_{s}(\vec{t})$ 's, as in the proof of Theorem 4.4.5. We set $\rho(s, \vec{s}):=\left\{\begin{array}{l}\eta_{s} \text { if } \theta_{s} \text { is a successor ordinal, } \\ \eta_{s}(\vec{s}) \text { if } \theta_{s} \text { is a limit ordinal. }\end{array}\right.$

The next lemma is the final preparation for the claim mentioned earlier.
Lemma 6.23 Let $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\infty}$ with $\alpha \in \Delta_{1}^{1}$ normalized and $\left|(\alpha)_{1}\right|=2$, $s \in \mathfrak{T}(\vec{w})$, and $i<B_{s}$. Then $\left(\Sigma_{i^{\prime} \leq i} \rho\left(s \mid i^{\prime}, \overrightarrow{t m}\right)\right)+1 \leq \xi_{s \mid i}$.

Proof. We argue by induction on $i$. Note first that $\rho(s \mid 0, \overrightarrow{t m})+1 \leq \theta_{s \mid 0}=\xi_{s \mid 0}$. Then, inductively,

$$
\begin{aligned}
\left(\Sigma_{i^{\prime} \leq i+1} \rho\left(s \mid i^{\prime}, \overrightarrow{t m}\right)\right)+1 & \leq\left(\Sigma_{i^{\prime} \leq i} \rho\left(s \mid i^{\prime}, \overrightarrow{t m}\right)\right)+\theta_{s \mid(i+1)} \\
& \leq\left(\Sigma_{i^{\prime} \leq i} \rho\left(s \mid i^{\prime}, \overrightarrow{t m}\right)\right)+1+\left(\xi_{s \mid(i+1)}-\xi_{s \mid i}\right) \\
& \leq \xi_{s \mid i}+\left(\xi_{s \mid(i+1)}-\xi_{s \mid i}\right) \\
& \leq \xi_{s \mid(i+1)}
\end{aligned}
$$

This finishes the proof.
Proof of Theorem 6.9. Let $\xi$ be an ordinal with $\vec{w}:=(\alpha, \beta, \gamma) \in \Upsilon_{1}^{\xi}$. We argue by induction on $\xi$. So assume that $\vec{w} \in \Upsilon_{1}^{\xi} \backslash \Upsilon_{1}^{<\xi}$.

Case 1. $\left|(\alpha)_{1}\right|=0$.
Lemma 6.5 implies that $C_{\gamma}^{\omega^{\omega}} \in \boldsymbol{\Gamma}_{c(\alpha)}=\boldsymbol{\Gamma}_{0 \infty}=\{\emptyset\}$, so that $S=\emptyset$. We also have $r=a_{1}$. Assume that (a) does not hold. Then $A_{1} \neq \emptyset$, so it contains some $\vec{\alpha}$. We just have to set $f_{i}\left(\beta_{i}\right):=\alpha_{i}$.

Case 2. $\left|(\alpha)_{1}\right|=1$.
As $\vec{w} \in \Upsilon_{1}^{\xi}$ we get $\gamma^{\prime} \in \omega^{\omega}$ with $\left(<(\alpha)_{2+j}>, \beta^{*}, \gamma^{\prime}\right) \in \Upsilon_{1}^{<\xi}$ and $C_{\gamma}^{\omega^{\omega}}=\neg C_{\gamma^{\prime}}^{\omega^{\omega}}$ (see the definition of $\Upsilon_{1}$ ). As $\alpha$ is normalized, $C_{\gamma^{\prime}}^{\omega^{\omega}}=\emptyset$, so that $S=\left\lceil T_{d}\right\rceil$. We also have $r=a_{0}$. Assume that (a) does not hold. Then $A_{0} \neq \emptyset$, and we argue as in Case 1.

Case 3. $\left|(\alpha)_{1}\right|=2$.
Assume that (a) does not hold. As for Theorems 4.4.1 and 4.4.5 we construct $\left(\alpha_{s}^{i}\right)_{i \in d, s \in \Pi_{i}^{\prime \prime} T_{d}}$, $\left(O_{s}^{i}\right)_{i \leq|s|, i \in d, s \in \Pi_{i}^{\prime \prime} T_{d}},\left(U_{\vec{s}}\right)_{\vec{s} \in T_{d}}$. We want these objects to satisfy the following conditions.
(1) $\alpha_{s}^{i} \in O_{s}^{i} \subseteq \Omega_{\omega^{\omega}} \wedge\left(\alpha_{s_{i}}^{i}\right)_{i \in d} \in U_{\vec{s}} \subseteq \Omega_{\left(\omega^{\omega}\right)^{d}}$,
(2) $O_{s q}^{i} \subseteq O_{s}^{i}$,
(3) $\operatorname{diam}_{d_{\omega^{\omega}}}\left(O_{s}^{i}\right) \leq 2^{-|s|} \wedge \operatorname{diam}_{d_{\left(\omega^{\omega}\right)^{d}}}\left(U_{\vec{s}}\right) \leq 2^{-|\vec{s}|}$,
(4) $\vec{t} \in T_{d} \Rightarrow U_{\vec{t}} \subseteq r(S(\vec{t}))$,
(5) $\left(\begin{array}{c}\vec{s}, \vec{t} \in \bigcap_{i^{\prime}<i, \eta_{s \mid i^{\prime}} \geq 1} P_{s_{0}\left(i^{\prime}\right)}\left(s \mid i^{\prime}\right) \\ 1 \leq \rho \leq \rho(s \mid i, \vec{s}) \\ \vec{s} R_{s \mid i}^{(\rho)} \vec{t}\end{array}\right) \Rightarrow U_{\vec{t}} \subseteq{\overline{U_{\vec{s}}}}^{\tau_{\left(\Sigma_{i^{\prime}<i} \rho\left(s \mid i^{\prime}, \vec{s}\right)\right)+\rho}}$,
(6) $\left(\vec{s} \in \bigcap_{i<|s(\vec{t})|} P_{s(\vec{t})(i)(0)}(s(\vec{t}) \mid i) \wedge \vec{s} R_{s(\vec{t})^{-}}^{\left(\eta_{s(\vec{t})^{-}}\right)} \vec{t}\right) \Rightarrow U_{\vec{t}} \subseteq U_{\vec{s}}$.

- Let us prove that this construction is sufficient to get the theorem.
- Fix $\vec{\beta} \in\left\lceil T_{d}\right\rceil$. Lemma 6.22 gives $k_{0} \in \omega$ such that $\vec{\beta} \mid j_{k} \in \bigcap_{i<B_{s(\vec{\beta}, \vec{w})}} P_{s(\vec{\beta}, \vec{w})(i)(0)}(s(\vec{\beta}, \vec{w}) \mid i)$ for each $k \geq k_{0}$. Proposition 6.13 gives $l$ and $s\left(\vec{\beta} \mid j_{k}\right) \in \mathfrak{T}(\vec{w})$ with $\vec{\beta} \mid j_{k} \in \bigcap_{i<l} P_{s\left(\vec{\beta} \mid j_{k}\right)(i)(0)}\left(s\left(\vec{\beta} \mid j_{k}\right) \mid i\right)$, and Lemma 6.22.(a) implies that $s\left(\vec{\beta} \mid j_{k}\right)=s(\vec{\beta}, \vec{w}) \mid B_{s(\vec{\beta}, \vec{w})}$. This implies that $\left(U_{\vec{\beta} \mid j_{k}}\right)_{k \geq k_{0}}$ is nonincreasing since $\vec{\beta}\left|j_{k} R_{s(\beta, \vec{w}) \mid\left(B_{s(\beta, \vec{w})-1)}\right.}^{\left(\eta_{s(\beta, \vec{w})\left(B_{s(\beta)}-1\right)}\right)} \vec{\beta}\right| j_{k+1}$ for each integer $k$, by Condition (6). As in the proof of Theorem 4.4.1 we define $\mathcal{F}(\vec{\beta})$ and $f_{i}$ continuous with $\mathcal{F}(\vec{\beta})=\left(\Pi_{i \in d} f_{i}\right)(\vec{\beta})$. The inclusions

$$
S \subseteq\left(\Pi_{i \in d} f_{i}\right)^{-1}\left(A_{0}\right)
$$

and $\left\lceil T_{d}\right\rceil \backslash S \subseteq\left(\Pi_{i \in d} f_{i}\right)^{-1}\left(A_{1}\right)$ hold, by Lemmas 6.20 and 6.22 , since $r(s(\beta, \vec{w})) \subseteq A_{\varepsilon_{s(\beta, \vec{w})}}$.

- So let us prove that the construction is possible.
- As $\neg \mathcal{U}_{r}$ is nonempty and $\Sigma_{1}^{1}$, we can choose $\left(\alpha_{\emptyset}^{i}\right)_{i \in d} \in \neg \mathcal{U}_{r} \cap \Omega_{\left(\omega^{\omega}\right) d}$. Then we choose a $\Sigma_{1}^{1}$ subset $U_{\vec{\emptyset}}$ of $\left(\omega^{\omega}\right)^{d}$, with $d_{\left(\omega^{\omega}\right)^{d}}$-diameter at most 1 , such that $\left(\alpha_{\emptyset}^{i}\right)_{i \in d} \in U_{\vec{\emptyset}} \subseteq \neg \mathcal{U}_{r} \cap \Omega_{\left(\omega^{\omega}\right)^{d}}$. We choose a $\Sigma_{1}^{1}$ subset $O_{\emptyset}^{0}$ of $\Omega_{\omega^{\omega}}$, with $d_{\omega^{\omega}}$-diameter at most 1 , with $\alpha_{\emptyset}^{0} \in O_{\emptyset}^{0} \subseteq \Omega_{\omega^{\omega}}$, which is possible since $\Omega_{\left(\omega^{\omega}\right)^{d}} \subseteq \Omega_{\omega^{\omega}}^{d}$. Assume that $\left(\alpha_{s}^{i}\right)_{|s| \leq l},\left(O_{s}^{i}\right)_{|s| \leq l}$ and $\left(U_{\vec{s}}\right)_{\left|s_{0}\right| \leq l}$ satisfying conditions (1)-(6) have been constructed, which is the case for $l=0$ by Lemma 6.19.
- Let $\overrightarrow{t m} \in T_{d} \cap\left(d^{l+1}\right)^{d}$. We define $X_{i}:=O_{t_{i}}^{i}$ if $i \leq l$, and $\omega^{\omega}$ if $i>l$.

Claim. Assume that $s \in \mathfrak{T}(\vec{w}), i<B_{s}, \overrightarrow{t m}_{s \mid i}^{\eta_{s \mid i}}, \overrightarrow{\operatorname{tm}} \in \bigcap_{i^{\prime}<i} P_{s_{0}\left(i^{\prime}\right)}\left(s \mid i^{\prime}\right)$, and $i_{0} \leq i$ is minimal with $\eta_{s \mid i_{0}} \geq 1$.
(a) The set

$$
\begin{aligned}
& U_{\overrightarrow{t m}}^{s \mid i} \rho(s \mid i \overrightarrow{t m}), ~ \cap \bigcap_{1 \leq \rho<\rho(s \mid i, \overrightarrow{t m})}{\overline{U_{\overrightarrow{t m}}^{s \mid i}}}^{\tau}\left(\Sigma_{i^{\prime}<i} \rho\left(s \mid i^{\prime}, \overrightarrow{t m}\right)\right)+\rho \\
& \cap \bigcap_{i^{\prime}<i} \bigcap_{1 \leq \rho \leq \rho\left(s \mid i^{\prime}, \overrightarrow{t m}\right)}{\overline{\overline{t m}_{\overrightarrow{t \mid} \mid i^{\prime}}^{\rho}}}^{\tau}\left(\Sigma_{i^{\prime \prime}<i^{\prime}} \rho\left(s \mid i^{\prime \prime}, \overrightarrow{t m}\right)\right)+\rho \cap\left(\Pi_{i \in d} X_{i}\right)
\end{aligned}
$$

is $\tau_{1}$-dense in ${\overline{U_{\overrightarrow{t m}_{s \mid i_{0}}}^{1}}}^{\tau_{1}} \cap\left(\Pi_{i \in d} X_{i}\right)$.
(b) Assume moreover that $s^{\prime} \in \mathfrak{T}(\vec{w})$, $s$ and $s^{\prime}$ are uncompatible, $i:=\left|s \wedge s^{\prime}\right|, \overrightarrow{t m} \in P_{s_{0}^{\prime}(i)}\left(s^{\prime} \mid i\right)$, and $\overrightarrow{t m}_{s \mid i}^{\eta_{s \mid i}} \in P_{s_{0}(i)}(s \mid i)$. Then

$$
r(S(\overrightarrow{t m})) \cap \bigcap_{i^{\prime} \leq i} \bigcap_{1 \leq \rho \leq \rho\left(s \mid i^{\prime}, \overrightarrow{t m}\right)}{\overrightarrow{\overrightarrow{t m}_{s \mid i^{\prime}}^{\rho}}}^{\tau}\left(\Sigma_{i^{\prime \prime}<i^{\prime}} \rho\left(s \mid i^{\prime \prime}, \overrightarrow{t m}\right)\right)+\rho \cap\left(\Pi_{i \in d} X_{i}\right)
$$

is $\tau_{1}$-dense in ${\overline{U_{\overrightarrow{t m}_{s \mid i_{0}}}^{1}}}^{\tau_{1}} \cap\left(\Pi_{i \in d} X_{i}\right)$.
(a) Assume first that $i_{0}=0$. Note that $\overrightarrow{t m}{ }_{\emptyset}^{\rho+1} R_{\emptyset}^{(\rho+1)} \overrightarrow{t m}_{\emptyset}^{\rho} R_{\emptyset}^{(\rho)} \overrightarrow{t m}$ if $1 \leq \rho<\rho(\emptyset, \overrightarrow{t m})$, by Lemma 4.3.2. As in the proof of Claim 2 in Theorem 4.4.5, this implies that $U_{\overrightarrow{t m}}^{\emptyset} \subseteq{\overrightarrow{U_{\overrightarrow{t m}}^{\rho+1}}}^{\tau_{\rho+1}}$. By assumption, $\overrightarrow{t m}_{s \mid i}^{\eta_{s \mid i}}, \overrightarrow{t m} \in \bigcap_{i^{\prime}<i} P_{s_{0}\left(i^{\prime}\right)}\left(s \mid i^{\prime}\right)$.

Note that $\overrightarrow{t m}_{s \mid\left(i^{\prime}+1\right)}^{\rho} \in P_{s_{0}\left(i^{\prime \prime}\right)}\left(s \mid i^{\prime \prime}\right)$ if $i^{\prime \prime} \leq i^{\prime}<i$ and $\rho \leq \eta_{s \mid\left(i^{\prime}+1\right)}$. Indeed, this comes from the fact that $\overrightarrow{t m}_{s \mid i}^{\eta_{s \mid i}} R_{s \mid i^{\prime \prime}}^{\left(\eta_{s \mid \prime^{\prime \prime}}\right)} \overrightarrow{t m}_{s \mid\left(i^{\prime}+1\right)}^{\rho} R_{s \mid i^{\prime \prime}}^{\left(\eta_{s| |^{\prime \prime}}\right)} \overrightarrow{\mathrm{tm}}$. As in the proof of Claim 2 in Theorem 4.4.5 again, this implies that $U_{\overrightarrow{t m}_{s| |\left(i^{\prime}+1\right)}^{\rho}} \subseteq{\overline{U_{\overrightarrow{t m}_{s} \mid\left(i^{\prime}+1\right)}^{\rho+1}}}_{\left(\Sigma_{i^{\prime \prime}}<i^{\prime}+1\right.}^{\left.\rho\left(s \mid i^{\prime \prime}, \overrightarrow{m m}\right)\right)+\rho+1}$ if $\rho<\rho\left(s \mid\left(i^{\prime}+1\right), \overrightarrow{t m}\right)$. Note that $\overrightarrow{t m}_{s \mid\left(i^{\prime}+1\right)}^{0}=\overrightarrow{t m}_{s \mid i^{\prime}} \eta_{s \mid \prime^{\prime}}=\overrightarrow{t m}_{s \mid i^{\prime}}^{\rho\left(s \mid i^{\prime}, \overrightarrow{t m}\right)}$. This implies the result. We argue similarly if $i_{0}>0$.
(b) By (a) and Lemma 6.22, it is enough to see that $\left.U:=U_{\overrightarrow{t m_{s \mid i}}{ }_{s,(s i i, \overrightarrow{m m})} \subseteq} \overline{r(S(\overrightarrow{t m})}\right)^{\tau \tau_{s \mid i}}$. The induction assumption implies that $U \subseteq r\left(S\left(\overrightarrow{t m}_{s \mid i} \eta_{s \mid i}\right)\right.$. So let us prove that $r\left(S\left(\overrightarrow{t m}_{s \mid i} \eta_{s \mid i}\right) \subseteq \overrightarrow{r(S(\overrightarrow{t m})}\right)^{\tau \varepsilon_{s \mid i}}$. Note that $s \mid(i+1) \subseteq s\left(\overrightarrow{t m} \vec{m}_{s \mid i}\right) \subseteq S\left(\overrightarrow{t m_{s \mid i}} \vec{n}_{s \mid i}\right)$ and, similarly, $s^{\prime} \mid(i+1) \subseteq S(\overrightarrow{t m})$. Lemma 6.17 implies that $O\left(S\left(\overrightarrow{t m}_{s \mid i} \eta_{s i}\right) \sqsubseteq O(S(\overrightarrow{t m}))\right.$, and the beginning of its proof that $O\left(S\left(\overrightarrow{t m}_{s \mid i}^{\eta_{s \mid i}}\right)\right) \neq O(S(\overrightarrow{t m}))$. Now Lemma 6.21 implies the result.

- Let $\mathcal{X}:=d^{l+1}$. The map $\Psi: \mathcal{X}^{d} \rightarrow \Sigma_{1}^{1}\left(\left(\omega^{\omega}\right)^{d}\right)$ is defined on $\mathcal{T}^{l+1}$ by

$$
\begin{aligned}
& \cap \bigcap_{i^{\prime}<|s(\overrightarrow{t m})|-1} \bigcap_{1 \leq \rho \leq \rho\left(s i^{\prime}, \overrightarrow{t m}\right)}{\overline{\overline{t \vec{m}}_{s \mid i^{\prime}}^{\rho}}}^{\tau}\left(\Sigma_{i^{\prime \prime}<i^{\prime}} \rho\left(s \mid i^{\prime \prime}, \overrightarrow{t m}\right)\right)+\rho \cap\left(\Pi_{i \in d} X_{i}\right) \\
& \text { if } s(\overrightarrow{t m}) \neq \emptyset \wedge \overrightarrow{t m}_{s(\overrightarrow{t m})^{-}}^{n_{s(\overrightarrow{t m})}^{-}} \in \bigcap_{i^{\prime}<|s(\overrightarrow{t m})|} P_{s(\overrightarrow{t m})\left(i^{\prime}\right)(0)}\left(s(\overrightarrow{t m}) \mid i^{\prime}\right) \\
& \wedge \exists i_{0}<|s(\overrightarrow{t m})| \quad \eta_{s(\overrightarrow{t m}) \mid i_{0}} \geq 1, \\
& r(S(\overrightarrow{t m}))
\end{aligned}
$$

$$
\begin{aligned}
& U_{\vec{t}} \cap\left(\Pi_{i \in d} X_{i}\right) \text { if } s(\overrightarrow{t m}) \neq \emptyset \wedge \overrightarrow{t m}_{s(\overrightarrow{t m})^{-}} \eta_{s(\overrightarrow{t a}}^{-} \in \bigcap_{i^{\prime}<|s(\overrightarrow{t m})|} P_{s(\overrightarrow{t m})\left(i^{\prime}\right)(0)}\left(s(\overrightarrow{t m}) \mid i^{\prime}\right) \\
& \wedge \forall i_{0}<|s(\overrightarrow{t m})| \eta_{s(\overrightarrow{t m}) \mid i_{0}}=0, \\
& \begin{aligned}
r(S(\overrightarrow{t m})) \cap\left(\Pi_{i \in d} X_{i}\right) \cap \Omega_{\left(\omega^{\omega}\right)^{d}} & \text { if } \begin{aligned}
& s(\overrightarrow{t m}) \neq \emptyset \\
& \wedge \overrightarrow{t m} \eta_{s(t \overrightarrow{t m})-}
\end{aligned} \neq \bigcap_{i^{\prime}<|s(\overrightarrow{t m})|} P_{s(\overrightarrow{t m})\left(i^{\prime}\right)(0)}\left(s(\overrightarrow{t m}) \mid i^{\prime}\right)
\end{aligned} \\
& \wedge i<|s(\overrightarrow{t m})| \text { is maximal with } \overrightarrow{t m}_{s(\overrightarrow{t m}) \mid i} \eta_{s(\vec{m}) \mid i} \in \bigcap_{i^{\prime}<i} P_{s(\overrightarrow{t m})\left(i^{\prime}\right)(0)}\left(s(\overrightarrow{t m}) \mid i^{\prime}\right) \\
& \wedge \forall i_{0} \leq i \quad \eta_{s(\overrightarrow{t m}) \mid i_{0}}=0 .
\end{aligned}
$$

In these cases, as $\overrightarrow{t m}_{s(\overrightarrow{t m}) \mid i_{0}}^{1} \subseteq \vec{t} \subseteq \overrightarrow{t m}$ and $R_{s(\overrightarrow{t m}) \mid i_{0}}^{(1)}$ is distinguished in $R_{s(\overrightarrow{t m}) \mid i_{0}}^{(0)}=\subseteq$,

$$
\overrightarrow{t m}_{s(\overrightarrow{t m}) \mid i_{0}}^{1} R_{s(\overrightarrow{t m}) \mid i_{0}}^{(1)} \vec{t}
$$

and $U_{\vec{t}} \subseteq{\overrightarrow{U_{\overrightarrow{t m}}^{s(\vec{m}) \mid i_{0}}}}^{{ }^{1}}{ }^{1}$, by induction assumption. Therefore

$$
U_{\vec{t}} \cap\left(\Pi_{i \in d} X_{i}\right) \subseteq{\overline{U_{\overrightarrow{t m}}^{s(\overrightarrow{t m}) \mid i_{0}}}}^{\tau_{1}} \cap\left(\Pi_{i \in d} X_{i}\right) \subseteq \bar{\Psi}(\overrightarrow{t m})
$$

Using similar arguments, one can prove that this also holds in the last two cases.
Let us look at the first case. If $\eta_{\emptyset} \geq 1$, then using arguing as in the claim one can prove that
 $U_{\overrightarrow{t m}}^{\boldsymbol{\emptyset}}, \stackrel{(\emptyset, \overrightarrow{t m})}{ } \subseteq r\left(S\left(\overrightarrow{t m}_{\emptyset}^{\eta_{\emptyset}}\right)\right)=r(S(\overrightarrow{t m}))$ and we can repeat the previous argument since $i_{0}=0$. If $\eta_{\emptyset}=0$, then we get $\overrightarrow{t m}{ }_{\emptyset}^{\eta_{\emptyset}}=\vec{t}$, and $U_{\vec{t}} \cap\left(\Pi_{i \in d} X_{i}\right) \subseteq r(S(\vec{t})) \cap\left(\Pi_{i \in d} X_{i}\right)=r(S(\overrightarrow{t m})) \cap\left(\Pi_{i \in d} X_{i}\right)$ and we are done.

Now we can write $\left(\alpha_{t_{i}}^{i}\right)_{i \in d} \in U_{\vec{t}} \cap\left(\Pi_{i \in d} X_{i}\right) \subseteq \bar{\Psi}(\overrightarrow{t m})$, and we conclude as in the proof of Theorem 4.4.1.

The rest of this section is devoted to the proof of Theorem 1.8.(2) when $\Delta(\boldsymbol{\Gamma})$ is a Wadge class. Recall Theorem 5.2.8. We will say that $\alpha \in \Delta_{1}^{1} \cap \Lambda^{\infty}$ is suitable if $\Delta\left(\boldsymbol{\Gamma}_{c(\alpha)}\right)$ is a Wadge class and one of the following holds:
(1) There is $\bar{\alpha} \in \Delta_{1}^{1} \cap \Lambda^{\infty}$ normalized with

$$
\boldsymbol{\Gamma}_{c(\alpha)}=\left\{\left(A_{0} \cap C_{0}\right) \cup\left(A_{1} \cap C_{1}\right) \mid A_{0}, \neg A_{1} \in \boldsymbol{\Gamma}_{c(\bar{\alpha})} \wedge C_{0}, C_{1} \in \boldsymbol{\Sigma}_{1}^{0} \wedge C_{0} \cap C_{1}=\emptyset\right\}
$$

(2) There is $\alpha^{\prime} \in \Delta_{1}^{1}$ such that $\left(\alpha^{\prime}\right)_{p} \in \Lambda^{\infty}$ is normalized for each $p \geq 1,\left(\boldsymbol{\Gamma}_{c\left(\left(\alpha^{\prime}\right)_{p}\right)}\right)_{p \geq 1}$ is strictly increasing, and $\boldsymbol{\Gamma}_{c(\alpha)}=\left\{\bigcup_{p \geq 1}\left(A_{p} \cap C_{p}\right) \mid A_{p} \in \boldsymbol{\Gamma}_{c\left(\left(\alpha^{\prime}\right)_{p}\right)} \wedge C_{p} \in \boldsymbol{\Sigma}_{1}^{0} \wedge C_{p} \cap C_{q}=\emptyset\right.$ if $\left.p \neq q\right\}$.

Assume that $\alpha$ is suitable and $a_{0}, a_{1} \in \Delta_{1}^{1}$ satisfy $A_{0} \cap A_{1}=\emptyset$. Then Lemma 6.7.(b) gives $r\left(\bar{\alpha}, a_{0}, a_{1}\right)$ and $r\left(\bar{\alpha}, a_{1}, a_{0}\right)$, or $r\left(\left(\alpha^{\prime}\right)_{p}, a_{0}, a_{1}\right)$. We set $R\left(\bar{\alpha}, a_{0}, a_{1}\right):=\neg \mathcal{U}_{r\left(\bar{\alpha}, a_{0}, a_{1}\right)}$ in the same fashion as before, and

$$
R^{\prime}\left(\alpha, a_{0}, a_{1}\right):=\left\{\begin{array}{l}
{\overline{R\left(\bar{\alpha}, a_{0}, a_{1}\right)}}^{\tau_{1}} \cap{\overline{R\left(\bar{\alpha}, a_{1}, a_{0}\right)}}^{\tau_{1}} \text { if we are in Case (1), } \\
\bigcap_{p \geq 1}{\overline{R\left(\left(\alpha^{\prime}\right)_{p}, a_{0}, a_{1}\right)}}^{\tau_{1}} \text { if we are in Case (2). }
\end{array}\right.
$$

We now give the self-dual version of Lemma 6.8.
Lemma 6.24 Let $\alpha$ suitable, and $a_{0}, a_{1} \in \Delta_{1}^{1}$ such that $A_{0} \cap A_{1}=\emptyset$. We assume that $R^{\prime}\left(\alpha, a_{0}, a_{1}\right)=\emptyset$. Then $A_{0}$ is separable from $A_{1}$ by a $\Delta_{1}^{1} \cap \Delta\left(\boldsymbol{\Gamma}_{c(\alpha)}\right)\left(\tau_{1}\right)$ set.
 $R\left(\bar{\alpha}, a_{1}, a_{0}\right)$. As $R\left(\bar{\alpha}, a_{0}, a_{1}\right)$ and $R\left(\bar{\alpha}, a_{1}, a_{0}\right)$ are $\Sigma_{1}^{1}$, we may assume that $C \in \Delta_{1}^{1}$, by Theorem 4.2.2. A double application of Lemmas 6.7.(b) and 6.8 gives some sets $B_{0}, B_{1} \in \Delta_{1}^{1} \cap \boldsymbol{\Gamma}_{c(\bar{\alpha})}\left(\tau_{1}\right)$ such that $B_{0}$ (resp., $B_{1}$ ) separates $A_{0} \cap C$ (resp., $A_{1} \backslash C$ ) from $A_{1} \cap C$ (resp., $A_{0} \backslash C$ ). Now the set $\left(B_{0} \cap C\right) \cup\left(\neg B_{1} \cap \neg C\right)$ is suitable.
(2) The proof is similar, but we have to make some $\Delta_{1}^{1}$-selection. As $\Theta^{\infty}$ is $\Pi_{1}^{1}$ and $r\left(\left(\alpha^{\prime}\right)_{p}, a_{0}, a_{1}\right)$ is $\Delta_{1}^{1}$ and completely determined by $\left(\alpha^{\prime}\right)_{p}, a_{0}$ and $a_{1}$, the sequence $\left(r\left(\left(\alpha^{\prime}\right)_{p}, a_{0}, a_{1}\right)\right)_{p \geq 1}$ is $\Delta_{1}^{1}$. As $\bigcap_{p \geq 1}{\overline{R\left(\left(\alpha^{\prime}\right)_{p}, a_{0}, a_{1}\right)}}^{\tau_{1}}=\emptyset$, there is a $\Delta_{1}^{1}$-recursive map $f:\left(\omega^{\omega}\right)^{d} \rightarrow \omega$ such that $f(\vec{\alpha}) \geq 1$ and $\vec{\alpha} \notin \overline{R\left(\left(\alpha^{\prime}\right)_{f(\vec{\alpha})}, a_{0}, a_{1}\right)^{\tau_{1}}}$ for each $\vec{\alpha} \in\left(\omega^{\omega}\right)^{d}$.

We set $U_{p}:=f^{-1}(\{p\})$, so that $U_{p}$ and $R\left(\left(\alpha^{\prime}\right)_{p}, a_{0}, a_{1}\right)$ are disjoint $\Sigma_{1}^{1}$ sets and separable by a $\tau_{1}$-open set. By Theorem 4.2.2, there is $V_{p} \in \Delta_{1}^{1} \cap \Sigma_{1}^{0}\left(\tau_{1}\right)$ separating them. Moreover, we may assume that the sequence $\left(V_{p}\right)$ is $\Delta_{1}^{1}$. We reduce the sequence $\left(V_{p}\right)$ into a $\Delta_{1}^{1}$-sequence $\left(C_{p}\right)$ of $\Delta_{1}^{1} \cap \boldsymbol{\Sigma}_{1}^{0}\left(\tau_{1}\right)$ sets. Note that $\left(C_{p}\right)$ is a partition of $\left(\omega^{\omega}\right)^{d}$ into $\Delta_{1}^{0}\left(\tau_{1}\right)$ sets. As $R\left(\left(\alpha^{\prime}\right)_{p}, a_{0}, a_{1}\right) \cap C_{p}=\emptyset$, Lemma 6.8 gives $\beta^{\prime}, \gamma^{\prime} \in \omega^{\omega}$ such that $\left(\left(\alpha^{\prime}\right)_{p},\left(\beta^{\prime}\right)_{p},\left(\gamma^{\prime}\right)_{p}\right) \in \Upsilon^{\infty}$ and $C_{\left(\gamma^{\prime}\right)_{p}}$ separates $A_{1} \cap C_{p}$ from $A_{0} \cap C_{p}$ for each $p \geq 1$. Moreover, we may assume that $\beta^{\prime}, \gamma^{\prime} \in \Delta_{1}^{1}$. Now the set $\bigcup_{p \geq 1}\left(\neg C_{\left(\gamma^{\prime}\right)_{p}} \cap C_{p}\right)$ is suitable.

We now give the self-dual version of Theorem 6.9.
Theorem 6.25 Let $T_{d}$ be a tree with $\Delta_{1}^{1}$ suitable levels, $\alpha$ suitable, $\beta^{\varepsilon}, \gamma^{\varepsilon} \in \omega^{\omega}$ with $\left(\alpha, \beta^{\varepsilon}, \gamma^{\varepsilon}\right) \in \Upsilon_{1}^{\infty}$, $S^{\varepsilon}:=j_{d}^{-1}\left(C_{\gamma^{\varepsilon}}^{\omega^{\omega}}\right) \cap\left\lceil T_{d}\right\rceil$, and $a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r \in \omega^{\omega}$ such that $\vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$. We assume that $S^{0}$ and $S^{1}$ are disjoint. Then one of the following holds:
(a) $R^{\prime}\left(\alpha, a_{0}, a_{1}\right)=\emptyset$.
(b) The inequality $\left(\left(\Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil\right)_{i \in d}, S^{0}, S^{1}\right) \leq\left(\left(\omega^{\omega}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds.

Now we can state the version of Theorem 4.2.2 for the self-dual Wadge classes of Borel sets.
Theorem 6.26 Let $T_{d}$ be a tree with $\Delta_{1}^{1}$ suitable levels, $\alpha$ suitable, $\beta^{\varepsilon}, \gamma^{\varepsilon} \in \omega^{\omega}$ with $\left(\alpha, \beta^{\varepsilon}, \gamma^{\varepsilon}\right) \in \Upsilon_{1}^{\infty}$, $S^{\varepsilon}:=j_{d}^{-1}\left(C_{\gamma^{\varepsilon}}^{\omega^{\omega}}\right) \cap\left\lceil T_{d}\right\rceil$, and $a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r \in \omega^{\omega}$ such that $\vec{v}:=\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$. We assume that $S^{0}, S^{1}$ are disjoint and not separable by a pot $\left(\Delta\left(\boldsymbol{\Gamma}_{c(\alpha)}\right)\right)$ set. Then the following are equivalent:
(a) The set $A_{0}$ is not separable from $A_{1}$ by a pot $\left(\Delta\left(\boldsymbol{\Gamma}_{c(\alpha)}\right)\right)$ set.
(b) The set $A_{0}$ is not separable from $A_{1}$ by a $\Delta_{1}^{1} \cap \operatorname{pot}\left(\Delta\left(\boldsymbol{\Gamma}_{c(\alpha)}\right)\right)$ set.
(c) The set $A_{0}$ is not separable from $A_{1}$ by a $\Delta\left(\boldsymbol{\Gamma}_{c(\alpha)}\right)\left(\tau_{1}\right)$ set.
(d) $R^{\prime}\left(\alpha, a_{0}, a_{1}\right) \neq \emptyset$.
(e) The inequality $\left(\left(d^{\omega}\right)_{i \in d}, S^{0}, S^{1}\right) \leq\left(\left(\omega^{\omega}\right)_{i \in d}, A_{0}, A_{1}\right)$ holds.

Proof. We argue as in the proof of Theorem 6.10, using Lemma 6.24 (resp., Theorem 6.25) instead of Lemma 6.8 (resp., Theorem 6.9).

Proof of Theorem 1.8.(2). We argue as in the proof of Theorem 1.8.(1). Theorem 5.2 .8 gives $\bar{u}$ or $\left(\left(u^{\prime}\right)_{p}\right)_{p \geq 1}$. The equalities in Theorem 5.2.8 hold in $\omega^{\omega}$, but also in any 0-dimensional Polish space (we argue like in Lemma 5.2.2 to see it). Using Definition 5.1.2, we can build $u \in \mathcal{D}$ with $\boldsymbol{\Gamma}=\boldsymbol{\Gamma}_{u}$.

Using Lemmas 6.2 and 6.4, we get $\alpha \in \Lambda^{\infty}$ normalized with $\boldsymbol{\Gamma}_{c(\alpha)}=\boldsymbol{\Gamma}_{u}$, and $\bar{\alpha} \in \Lambda^{\infty}$ (or $\alpha^{\prime} \in \Lambda^{\infty}$ such that $\left(\alpha^{\prime}\right)_{p}$ is) normalized with $\boldsymbol{\Gamma}_{\bar{u}}=\boldsymbol{\Gamma}_{c(\bar{\alpha})}\left(\right.$ or $\left.\boldsymbol{\Gamma}_{\left(u^{\prime}\right)_{p}}=\boldsymbol{\Gamma}_{c\left(\left(\alpha^{\prime}\right)_{p}\right)}\right)$.

By Theorem 4.1.3 in [Lo-SR2] there is $B^{\varepsilon} \in \boldsymbol{\Gamma}\left(\omega^{\omega}\right)$ with $S^{\varepsilon}=j_{d}^{-1}\left(B^{\varepsilon}\right) \cap\left\lceil T_{d}\right\rceil$. To simplify the notation, we may assume that $T_{d}$ has $\Delta_{1}^{1}$ levels, $\alpha$, as well as $\bar{\alpha}$ (or $\alpha^{\prime}$ ), are $\Delta_{1}^{1}$, and $A_{0}, A_{1}$ are $\Sigma_{1}^{1}$. By Lemma 6.5 there are $\beta^{\varepsilon}, \gamma^{\varepsilon} \in \omega^{\omega}$ such that $\left(\alpha, \beta^{\varepsilon}, \gamma^{\varepsilon}\right) \in \Upsilon_{1}^{\infty}$ and $C_{\gamma^{\varepsilon}}^{\omega^{\omega}}=B^{\varepsilon}$. Lemma 6.7.(b) gives $\underline{a}_{0}, \underline{a}_{1}, r$ with $\left(\alpha, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \in \Theta^{\infty}$. Lemma 6.24 implies that $R^{\prime}\left(\alpha, a_{0}, a_{1}\right) \neq \emptyset$. So (b) holds, by Theorem 6.26.

Proof of Theorem 6.25. (1) Let $C_{\varepsilon^{\prime}}^{\varepsilon} \in \boldsymbol{\Sigma}_{1}^{0}\left(\left\lceil T_{d}\right\rceil\right), A_{0}^{\varepsilon} \in \boldsymbol{\Gamma}_{c(\bar{\alpha})}\left(\left\lceil T_{d}\right\rceil\right), A_{1}^{\varepsilon} \in \check{\boldsymbol{\Gamma}}_{c(\bar{\alpha})}\left(\left\lceil T_{d}\right\rceil\right)$ such that $S^{\varepsilon}=\left(A_{0}^{\varepsilon} \cap C_{0}^{\varepsilon}\right) \cup\left(A_{1}^{\varepsilon} \cap C_{1}^{\varepsilon}\right)$. We reduce the family $\left(C_{0}^{0}, C_{1}^{0}, C_{0}^{1}, C_{1}^{1}\right)$ into a family $\left(O_{0}^{0}, O_{1}^{0}, O_{0}^{1}, O_{1}^{1}\right)$ of open subsets of $\left\lceil T_{d}\right\rceil$. Note that $S^{\varepsilon} \subseteq T^{\varepsilon}:=\left(A_{0}^{\varepsilon} \cap O_{0}^{\varepsilon}\right) \cup\left(A_{1}^{\varepsilon} \cap O_{1}^{\varepsilon}\right) \cup\left(\neg A_{0}^{1-\varepsilon} \cap O_{0}^{1-\varepsilon}\right) \cup\left(\neg A_{1}^{1-\varepsilon} \cap O_{1}^{1-\varepsilon}\right)$. We will in fact ensure that $\left(\left(\Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil\right)_{i \in d}, T^{0}, T^{1}\right) \leq\left(\left(\omega^{\omega}\right)_{i \in d}, A_{0}, A_{1}\right)$ if (a) does not hold, which will be enough.

Subcase 1. $\left|(\alpha)_{0}\right|=0$.
We set $o_{\varepsilon^{\prime}}^{\varepsilon}:=h\left[\left\lceil T_{d}\right\rceil \backslash O_{\varepsilon^{e}}^{\varepsilon}\right]$, so that $o_{\varepsilon^{\prime}}^{\varepsilon} \in \Pi_{1}^{0}([\subseteq])$. We also set

$$
\begin{gathered}
D:=\left\{\vec{s} \in T_{d} \mid \vec{s}=\vec{\emptyset} \vee \forall\left(\varepsilon, \varepsilon^{\prime}\right) \in 2^{2} \exists \mathcal{B} \in o_{\varepsilon^{\prime}}^{\varepsilon} \vec{s} \in \mathcal{B}\right\}, \\
D_{\varepsilon^{\prime}}^{\varepsilon}:=\left\{\vec{s} \in T_{d} \mid \vec{s} \neq \vec{\emptyset} \wedge \forall \mathcal{B} \in o_{\varepsilon^{\prime}}^{\varepsilon} \vec{s} \notin \mathcal{B} \wedge \forall\left(\varepsilon^{\prime \prime}, \varepsilon^{\prime \prime \prime}\right) \in 2^{2} \backslash\left\{\left(\varepsilon, \varepsilon^{\prime}\right)\right\} \quad \exists \mathcal{B} \in o_{\varepsilon^{\prime \prime \prime}}^{\varepsilon^{\prime \prime}} \vec{s} \in \mathcal{B}\right\},
\end{gathered}
$$

so that $\left(D, D_{0}^{0}, D_{1}^{0}, D_{0}^{1}, D_{1}^{1}\right)$ is a partition of $T_{d}$. The proof is very similar to the proof of Theorem 4.4.2 when $\xi=1$. The changes to make in the conditions (1)-(7) are as follows:
(4) $U_{\vec{s}} \subseteq R^{\prime}\left(\alpha, a_{0}, a_{1}\right)={\overline{A_{0}}}^{\tau_{1}} \cap{\overline{A_{1}}}^{\tau_{1}}$ if $\vec{s} \in D$,
(5) $U_{\vec{s}} \subseteq A_{0}$ if $\vec{s} \in D_{1}^{0} \cup D_{0}^{1}$,
(6) $U_{\vec{s}} \subseteq A_{1}$ if $\vec{s} \in D_{0}^{0} \cup D_{1}^{1}$,
(7) $\left(\vec{s}, \vec{t} \in D \vee \vec{s}, \vec{t} \in D_{\varepsilon^{\prime}}^{\varepsilon}\right) \Rightarrow U_{\vec{t}} \subseteq U_{\vec{s}}$.

We conclude as in the proof of Theorem 4.4.2.
Subcase 2. $\left|(\alpha)_{0}\right| \geq 1$.
We will have the same scheme of construction as in the proof of Theorem 6.9. As long as $\vec{t} \in D$, we will have $U_{\vec{t}} \subseteq R^{\prime}\left(\alpha, a_{0}, a_{1}\right)$. If $\vec{t} \in D_{\varepsilon^{\prime}}^{\varepsilon}$, then all the extensions of $\vec{t}$ will stay in $D_{\varepsilon^{\prime}}^{\varepsilon}$, and we will copy the construction of the proof of Theorem 6.9 , since inside the clopen set defined by $\vec{t}$ we want to reduce a pair $\left(\tilde{S}^{0}, \tilde{S}^{1}\right)$ to $\left(A_{0}, A_{1}\right)$.

As $A_{0}^{\varepsilon} \in \boldsymbol{\Gamma}_{c(\bar{\alpha})}\left(\left\lceil T_{d}\right\rceil\right)$, there is $B_{0}^{\varepsilon} \in \boldsymbol{\Gamma}_{c(\bar{\alpha})}\left(\omega^{\omega}\right)$ with $A_{0}^{\varepsilon}=j_{d}^{-1}\left(B_{0}^{\varepsilon}\right) \cap\left\lceil T_{d}\right\rceil$. As $\bar{\alpha} \in \Delta_{1}^{1} \cap \Lambda^{\infty}$, Lemma 6.5.(b) gives $\beta_{0}^{\varepsilon}, \gamma_{0}^{\varepsilon} \in \omega^{\omega}$ such that $\left(\bar{\alpha}, \beta_{0}^{\varepsilon}, \gamma_{0}^{\varepsilon}\right) \in \Upsilon_{1}^{\infty}$ and $C_{\gamma_{0}^{\omega}}^{\omega^{\omega}}=B_{0}^{\varepsilon}$. Similarly, there are $\beta_{1}^{\varepsilon}, \gamma_{1}^{\varepsilon} \in \omega^{\omega}$ such that $\left(\bar{\alpha}, \beta_{1}^{\varepsilon}, \gamma_{1}^{\varepsilon}\right) \in \Upsilon_{1}^{\infty}$ and $A_{1}^{\varepsilon}=j_{d}^{-1}\left(\neg C_{\gamma_{1}^{\omega}}^{\omega^{\omega}}\right) \cap\left\lceil T_{d}\right\rceil$.

We can associate with any $\left(\varepsilon, \varepsilon^{\prime}\right) \in 2^{2}$ the objects met before, among which the function $\mathcal{Z}^{\varepsilon, \varepsilon^{\prime}}$, the ordinals $\eta_{s}^{\varepsilon, \varepsilon^{\prime}}$, the resolution families $\left(R_{\varepsilon, \varepsilon^{\prime}, s}^{(\rho)}\right)_{\rho \leq \eta_{s^{\prime}}^{\varepsilon, \varepsilon^{\prime}}}$, the ordinals $\rho\left(\varepsilon, \varepsilon^{\prime}, s, \vec{s}\right)$. Instead of considering the set $P_{q}(s)$, we will consider $P_{q}^{\varepsilon, \varepsilon^{\prime}}(s) \cap D_{\varepsilon^{\prime}}^{\varepsilon}$. If $\vec{t} \in D_{\varepsilon^{\prime}}^{\varepsilon}$, then we set $\vec{w}(\vec{t}):=\vec{w}_{\varepsilon^{\prime}}^{\varepsilon}$. This allows us to define $s(\vec{t}) \in \mathfrak{T}(\vec{w}(\vec{t}))$ and $S(\vec{t}) \in \mathcal{M}_{\vec{w}(\vec{t}}$. We also set

$$
\vec{v}(\vec{t}):=\left\{\begin{array}{l}
\left(\bar{\alpha}, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \text { if } \vec{t} \in D_{0}^{0} \cup D_{1}^{1}, \\
\left(\bar{\alpha}, a_{1}, a_{0}, \underline{a}_{0}, \underline{a}_{1}, r\right) \text { if } \vec{t} \in D_{1}^{0} \cup D_{0}^{1} .
\end{array}\right.
$$

The other modifications to make in the conditions (1)-(6) are as follows. In condition (4), we ask for the inclusion $U_{\vec{t}} \subseteq R(S(\vec{t}))$ only if $\vec{t} \notin D$. If $\vec{t} \in D$, then we want that $U_{\vec{t}} \subseteq R^{\prime}\left(\alpha, a_{0}, a_{1}\right)$. Condition (6) was described when $\vec{s}, \vec{t} \in D_{\varepsilon^{\prime}}^{\varepsilon}$. If $\vec{s}, \vec{t} \in D$, then we also want that $U_{\vec{t}} \subseteq U_{\vec{s}}$.

The sequence $\mathcal{F}(\vec{\beta})$ is defined if $\beta \in C_{0}^{0} \cup C_{1}^{0} \cup C_{0}^{1} \cup C_{1}^{1}$. If $\beta \notin C_{0}^{0} \cup C_{1}^{0} \cup C_{0}^{1} \cup C_{1}^{1}$, then $\vec{\beta} \mid k \in D$ for each integer $k$, and $\mathcal{F}(\vec{\beta})$ is also defined. The definition of $\vec{v}(\vec{t})$ ensures that $T^{\varepsilon} \subseteq\left(\Pi_{i \in d} f_{i}\right)^{-1}\left(A_{\varepsilon}\right)$.

The defintion of $\Psi(\overrightarrow{t m})$ is done if $\overrightarrow{t m} \notin D$. If $\overrightarrow{t m} \in D$, then we simply set

$$
\Psi(\overrightarrow{t m}):=U_{\vec{t}} \cap\left(\Pi_{i \in d} X_{i}\right) .
$$

Then we conclude as in the proof of Theorem 6.9.
(2) Let $C_{p}^{\varepsilon} \in \boldsymbol{\Sigma}_{1}^{0}\left(\left\lceil T_{d}\right\rceil\right)$ and $A_{p}^{\varepsilon} \in \boldsymbol{\Gamma}_{c\left(\left(\alpha^{\prime}\right)_{p}\right)}\left(\left\lceil T_{d}\right\rceil\right)$ such that $S^{\varepsilon}=\bigcup_{p \geq 1}\left(A_{p}^{\varepsilon} \cap C_{p}^{\varepsilon}\right)$. We reduce the family $\left(C_{1}^{0}, C_{2}^{0}, \ldots, C_{1}^{1}, C_{2}^{1}, \ldots\right)$ into a family $\left(O_{1}^{0}, O_{2}^{0}, \ldots, O_{1}^{1}, O_{2}^{1}, \ldots\right)$ of open subsets of $\left\lceil T_{d}\right\rceil$. Note that $S^{\varepsilon} \subseteq T^{\varepsilon}:=\left(A_{1}^{\varepsilon} \cap O_{1}^{\varepsilon}\right) \cup \bigcup_{p \geq 1}\left(\left(\neg A_{p}^{1-\varepsilon} \cap O_{p}^{1-\varepsilon}\right) \cup\left(A_{p+1}^{\varepsilon} \cap O_{p+1}^{\varepsilon}\right)\right)$. We will in fact ensure that $\left(\left(\Pi_{i}^{\prime \prime}\left\lceil T_{d}\right\rceil\right)_{i \in d}, T^{0}, T^{1}\right) \leq\left(\left(\omega^{\omega}\right)_{i \in d}, A_{0}, A_{1}\right)$ if (a) does not hold, which will be enough.

The proof is similar. We can assume that $\left|\left(\left(\alpha^{\prime}\right)_{p}\right)_{0}\right| \geq 1$ for each $p \geq 1$, since $\left(\boldsymbol{\Gamma}_{c\left(\left(\alpha^{\prime}\right)_{p}\right)}\right)_{p \geq 1}$ is strictly increasing. So there is no Subcase 1. We set

$$
\vec{v}(\vec{t}):=\left\{\begin{array}{l}
\left(\bar{\alpha}, a_{0}, a_{1}, \underline{a}_{0}, \underline{a}_{1}, r\right) \text { if } \vec{t} \in \bigcup_{p \geq 1} D_{p}^{0}, \\
\left(\bar{\alpha}, a_{1}, a_{0}, \underline{a}_{0}, \underline{a}_{1}, r\right) \text { if } \vec{t} \in \bigcup_{p \geq 1} D_{p}^{1} .
\end{array}\right.
$$

We conclude as in Case 1.

## 7 Injectivity complements

In the introduction, we saw that G. Debs proved that we can have the $f_{i}$ 's one-to-one in Theorem 1.3 when $d=2, \boldsymbol{\Gamma} \in\left\{\boldsymbol{\Pi}_{\xi}^{0}, \boldsymbol{\Sigma}_{\xi}^{0}\right\}$ and $\xi \geq 3$.

- This cannot be extended to higher dimensions, even if we replace $\left(d^{\omega}\right)^{d}$ with $\Pi_{i \in d} Z_{i}$, where $Z_{i}$ is a sequence of Polish spaces.

Indeed, we argue by contradiction. Recall the proof of Theorem 3.1. We saw that there is $C_{\xi}$ in $\boldsymbol{\Sigma}_{\xi}^{0}\left(2^{\omega}\right) \backslash \boldsymbol{\Pi}_{\xi}^{0}$ such that $\mathbb{S}_{\xi}^{3}:=\left\{\vec{\alpha} \in\left\lceil T_{3}\right\rceil \mid \mathcal{S}\left(\alpha_{0} \Delta \alpha_{1}\right) \in C_{\xi}\right\}$ is not separable from $\left\lceil T_{3}\right\rceil \backslash \mathbb{S}_{\xi}^{3}$ by a pot $\left(\boldsymbol{\Pi}_{\xi}^{0}\right)$ set. We set

$$
\begin{aligned}
B^{0} & :=\left\{\vec{\alpha} \in 3^{\omega} \times 3^{\omega} \times 1 \mid \mathcal{S}\left(\alpha_{0} \Delta \alpha_{1}\right) \in C_{\xi}\right\}, \\
B^{1} & :=\left\{\vec{\alpha} \in 3^{\omega} \times 1 \times 3^{\omega} \mid \mathcal{S}\left(\alpha_{0} \Delta \alpha_{2}\right) \in C_{\xi}\right\}, \\
B^{2} & :=\left\{\vec{\alpha} \in 1 \times 3^{\omega} \times 3^{\omega} \mid \mathcal{S}\left(\alpha_{1} \Delta \alpha_{2}\right) \in C_{\xi}\right\} .
\end{aligned}
$$

Let $O: 3^{\omega} \rightarrow 1$. As $\mathbb{S}_{\xi}^{3}:=\left(\operatorname{Id}_{3 \omega} \times \operatorname{Id}_{3 \omega} \times O\right)^{-1}\left(B^{0}\right) \cap\left\lceil T_{3}\right\rceil, B^{0} \notin \operatorname{pot}\left(\boldsymbol{\Pi}_{\xi}^{0}\right)$. Similarly, $B^{1}, B^{2} \notin \operatorname{pot}\left(\boldsymbol{\Pi}_{\xi}^{0}\right)$. This implies that the $Z_{i}$ 's have cardinality at most one, and $\mathbb{S}_{0} \in \boldsymbol{\Delta}_{1}^{0}$. Thus $\mathbb{S}_{0}$ is separable from $\mathbb{S}_{1}$ by a $\operatorname{pot}\left(\boldsymbol{\Pi}_{\xi}^{0}\right)$ set, which is absurd.

- If $d=\omega, \boldsymbol{\Gamma}=\boldsymbol{\Pi}_{\xi}^{0}$ and $\xi \geq 3$, then we cannot ensure that at least two of the $f_{i}$ 's are one-to-one. Indeed, we again argue by contradiction. Consider $X_{i}:=\omega$, and $B_{\xi} \in \boldsymbol{\Sigma}_{\xi}^{0}\left(\omega^{\omega}\right) \backslash \boldsymbol{\Pi}_{\xi}^{0}$. Then $B_{\xi}$ is not $\operatorname{pot}\left(\boldsymbol{\Pi}_{\xi}^{0}\right)$ since the topology on $\omega$ is discrete. This implies that two of the $Z_{i}$ 's at least are countable, say $Z_{0}, Z_{1}$ for example. Consider now $A_{0}:=\mathbb{S}_{\xi}^{\omega}$ and $A_{1}:=\left\lceil T_{\omega}\right\rceil \backslash \mathbb{S}_{\xi}^{\omega}$. Then $\left(f_{i} \circ \Pi_{i}\right)\left[\mathbb{S}_{0}\right]$ is countable for each $i \in 2$. Thus $P:=\left(\Pi_{i \in d} f_{i}\right)\left[\mathbb{S}_{0}\right] \subseteq \mathbb{S}_{\xi}^{\omega} \subseteq\left\lceil T_{\omega}\right\rceil$ is countable since an element of $\left\lceil T_{\omega}\right\rceil$ is completely determined by two of its coordinates. Thus $P \in \operatorname{pot}\left(\Sigma_{2}^{0}\right) \subseteq \operatorname{pot}\left(\Pi_{\xi}^{0}\right)$. Therefore $\left(\Pi_{i \in d} f_{i}\right)^{-1}(P)$ is a $\operatorname{pot}\left(\boldsymbol{\Pi}_{\xi}^{0}\right)$ set separating $\mathbb{S}_{0}$ from $\mathbb{S}_{1}$, which is absurd.
- However, if $\boldsymbol{\Gamma} \in\left\{\boldsymbol{\Pi}_{\xi}^{0}, \boldsymbol{\Sigma}_{\xi}^{0}, \boldsymbol{\Delta}_{\xi}^{0}\right\}$ and $\xi \geq 3$, then we can ensure that $\left(\Pi_{i \in d} f_{i}\right)_{\mathbb{S}_{0} \cup \mathbb{S}_{1}}$ is one-to-one, using G. Debs's proof and some additional arguments. This is also true if $\boldsymbol{\Gamma}=\boldsymbol{\Gamma}_{u}$ is a non self-dual Wadge class of Borel sets with $u(0) \geq 3$. This leads to the following notation. Let $\left(Z_{i}\right)_{i \in d},\left(X_{i}\right)_{i \in d}$ be sequences of Polish spaces, and $S_{0}, S_{1}$ (resp., $A_{0}, A_{1}$ ) disjoint analytic subsets of $\Pi_{i \in d} Z_{i}$ (resp., $\left.\Pi_{i \in d} X_{i}\right)$. Then

$$
\begin{aligned}
&\left(\left(Z_{i}\right)_{i \in d}, S_{0}, S_{1}\right) \sqsubseteq\left(\left(X_{i}\right)_{i \in d}, A_{0}, A_{1}\right) \Leftrightarrow \forall i \in d \exists f_{i}: Z_{i} \rightarrow X_{i} \text { continuous such that } \\
&\left(\Pi_{i \in d} f_{i}\right)_{\mid S_{0} \cup S_{1}} \text { is one-to-one and } \forall \varepsilon \in 2 S_{\varepsilon} \subseteq\left(\Pi_{i \in d} f_{i}\right)^{-1}\left(A_{\varepsilon}\right) .
\end{aligned}
$$

Theorem 7.1 There is no tuple $\left(\left(Z_{i}\right)_{i \in 2}, S_{0}, S_{1}\right)$, where the $Z_{i}$ 's are Polish spaces and $S_{0}$, $S_{1}$ disjoint analytic subsets of $\Pi_{i \in 2} Z_{i}$, such that for any tuple $\left(\left(X_{i}\right)_{i \in 2}, B_{0}, B_{1}\right)$ of the same type exactly one of the following holds:
(a) The set $B_{0}$ is separable from $B_{1}$ by a pot $\left(\Pi_{1}^{0}\right)$ set.
(b) The inequality $\left(\left(Z_{i}\right)_{i \in 2}, S_{0}, S_{1}\right) \sqsubseteq\left(\left(X_{i}\right)_{i \in 2}, B_{0}, B_{1}\right)$ holds.

One can prove this result using the Borel digraph $B_{0}:=\bigcup_{n \in \omega} \operatorname{Gr}\left(g_{n \mid 2^{\omega} \backslash M}\right)$ considered in [L5] (see Section 3), which has countable vertical sections but is not locally countable. We give here another proof which moreover shows that we cannot hope for a positive result, even if $B_{0}$ is locally countable. This has to be noticed, since the locally countable sets have been considered a lot in the last decades.

Lemma 7.2 Let $\boldsymbol{\Gamma}$ be a Borel class, and $\left(\left(Z_{i}\right)_{i \in 2}, S_{0}, S_{1}\right)$ as in the statement of Theorem 5.1 such that $S_{0}$ is not separable from $S_{1}$ by a pot $(\boldsymbol{\Gamma})$ set. Then $S_{0} \cap\left(\Pi_{0}^{\prime \prime} S_{1} \times \Pi_{1}^{\prime \prime} S_{1}\right)$ is not separable from $S_{1}$ by a pot $(\boldsymbol{\Gamma})$ set. Moreover, $S_{0}$ is not separable from $S_{1} \cap\left(\Pi_{0}^{\prime \prime} S_{0} \times \Pi_{1}^{\prime \prime} S_{0}\right)$ by a pot $(\boldsymbol{\Gamma})$ set.

Proof. We prove the first assertion by contradiction, which gives $P \in \operatorname{pot}(\boldsymbol{\Gamma})$. The first reflection theorem gives Borel sets $C_{0}, C_{1}$ such that $\Pi_{i}^{\prime \prime} S_{1} \subseteq C_{i}$ and $S_{0} \cap\left(C_{0} \times C_{1}\right) \subseteq P$. Now

$$
S_{0} \subseteq P \cup\left(\neg C_{0} \times Z_{1}\right) \cup\left(Z_{0} \times \neg C_{1}\right) \subseteq \neg S_{1},
$$

which contradicts the fact that $S_{0}$ is not separable from $S_{1}$ by a $\operatorname{pot}(\boldsymbol{\Gamma})$ set.
We prove the second assertion using the first one, passing to complements.
Lemma 7.3 Let $\left(\left(Z_{i}\right)_{i \in 2}, S_{0}, S_{1}\right)$ and $\left(\left(X_{i}\right)_{i \in 2}, B_{0}, B_{1}\right)$ be as in the statement of Theorem 5.1 such that $\left(\left(Z_{i}\right)_{i \in 2}, S_{0}, S_{1}\right) \sqsubseteq\left(\left(X_{i}\right)_{i \in 2}, B_{0}, B_{1}\right),\left(f_{i}\right)_{i \in 2}$ witnesses for this inequality, and $\varepsilon_{0} \in 2$ such that $B_{\varepsilon_{0}}$ is Borel locally countable. Then $f_{i \mid \Pi_{i}^{\prime \prime} S_{\varepsilon_{0}}}$ is countable-to-one for each $i \in 2$ and $S_{\varepsilon_{0}}$ is locally countable.

Proof. The inequality $\left(\left(Z_{i}\right)_{i \in 2}, S_{0}, S_{1}\right) \sqsubseteq\left(\left(X_{i}\right)_{i \in 2}, B_{0}, B_{1}\right)$ gives $f_{i}: Z_{i} \rightarrow X_{i}$ continuous such that $\left(\Pi_{i \in 2} f_{i}\right)_{\mid S_{0} \cup S_{1}}$ is one-to-one, and also $S_{\varepsilon} \subseteq\left(\Pi_{i \in 2} f_{i}\right)^{-1}\left(B_{\varepsilon}\right)$ for each $\varepsilon \in 2$.

- By the Lusin-Novikov theorem and Lemma 2.4.(a) in [L2] we can find Borel one-to-one partial functions $b_{n}$ with Borel domain such that $B_{\varepsilon_{0}}=\bigcup_{n \in \omega} \operatorname{Gr}\left(b_{n}\right)$. Let us prove that

$$
\left.\left.f_{i \mid \Pi_{i}\left[S _ { \varepsilon _ { 0 } } \cap \left(\Pi_{i \in 2}\right.\right.} f_{i}\right)^{-1}\left(\operatorname{Gr}\left(b_{n}\right)\right)\right]
$$

is one-to-one for each $i \in 2$.
Assume for example that $i=0$. Let $z \neq z^{\prime} \in \Pi_{0}\left[S_{\varepsilon_{0}} \cap\left(\Pi_{i \in 2} f_{i}\right)^{-1}\left(\operatorname{Gr}\left(b_{n}\right)\right)\right]$, and $y, y^{\prime} \in Z_{1}$ such that $(z, y),\left(z^{\prime}, y^{\prime}\right) \in S_{\varepsilon_{0}} \cap\left(\Pi_{i \in 2} f_{i}\right)^{-1}\left(\operatorname{Gr}\left(b_{n}\right)\right)$. As $(z, y) \neq\left(z^{\prime}, y^{\prime}\right)$, we get

$$
\left(f_{0}(z), f_{1}(y)\right) \neq\left(f_{0}\left(z^{\prime}\right), f_{1}\left(y^{\prime}\right)\right) .
$$

But $b_{n}\left(f_{0}(z)\right)=f_{1}(y), b_{n}\left(f_{0}\left(z^{\prime}\right)\right)=f_{1}\left(y^{\prime}\right)$, so that $f_{0}(z) \neq f_{0}\left(z^{\prime}\right)$ since $b_{n}$ is a partial function. If $i=1$, then we use the fact that $b_{n}$ is one-to-one to see that $f_{i \mid \Pi_{i}\left[S_{\varepsilon_{0}} \cap\left(\Pi_{i \in 2} f_{i}\right)^{-1}\left(\operatorname{Gr}\left(b_{n}\right)\right)\right]}$ is also one-to-one.

- This proves that $f_{i \mid \Pi_{i}^{\prime \prime} S_{\varepsilon_{0}}}$ is countable-to-one since $S_{\varepsilon_{0}}=\bigcup_{n \in \omega} S_{\varepsilon_{0}} \cap\left(\Pi_{i \in 2} f_{i}\right)^{-1}\left(\operatorname{Gr}\left(b_{n}\right)\right)$.
- Now $S_{\varepsilon_{0}}$ is locally countable since $S_{\varepsilon_{0}} \subseteq\left(\Pi_{i \in 2} f_{i \mid \Pi_{i}^{\prime \prime} S_{\varepsilon_{0}}}\right)^{-1}\left(B_{\varepsilon_{0}}\right), B_{\varepsilon_{0}}$ is locally countable and $f_{i \mid \Pi_{i}^{\prime \prime} S_{\varepsilon_{0}}}$ is countable-to-one for each $i \in 2$.

Lemma 7.4 Let $Y$ be a Polish space, $C$ a Borel subset of $Y$ and $\left(m_{n}\right)_{n \in \omega}$ a sequence of Borel partial functions from a Borel subset of $C$ into $C$. We assume that $M:=\bigcup_{n \in \omega} \operatorname{Gr}\left(m_{n}\right)$ is disjoint from $\Delta(C)$, but not separable from $\Delta(C)$ by a pot $\left(\Pi_{1}^{0}\right)$ set. Then there are integers $n<p$ and $y \in C$ such that $m_{n}(y)$ and $m_{n}\left(m_{p}(y)\right)$ are defined.

Proof. We may assume that $Y$ is recursively presented and $C, M$ and the $m_{n}$ 's are $\Delta_{1}^{1}$. We put

$$
V:=\bigcup\left\{D \in \Delta_{1}^{1}(Y) \mid D^{2} \cap M \text { has finite vertical sections }\right\} .
$$

Then $V \in \Pi_{1}^{1}(Y)$.

Case 1. $V=Y$.
We can find a sequence $\left(D_{n}\right)_{n \in \omega}$ of $\Delta_{1}^{1}$ subsets of $Y$ such that $Y=\bigcup_{n \in \omega} D_{n}$ and $D_{n}^{2} \cap M$ has finite vertical sections. By Theorem 3.6 in [Lo2], $D_{n}^{2} \cap M$ is $\operatorname{pot}\left(\boldsymbol{\Pi}_{1}^{0}\right)$, so that $D_{n}^{2} \backslash M$ is $\operatorname{pot}\left(\boldsymbol{\Sigma}_{1}^{0}\right)$. Thus $\Delta(C) \subseteq \bigcup_{n \in \omega} D_{n}^{2} \backslash M \subseteq \neg M$ and $\Delta(C)$ is separable from $M$ by a pot $\left(\boldsymbol{\Sigma}_{1}^{0}\right)$ set, which is absurd.

Case 2. $V \neq Y$.
The first reflection theorem proves that for each nonempty $\Sigma_{1}^{1}$ subset $S$ of $Y$ contained in $Y \backslash V$ there is $y \in S$ such that $\left(S^{2} \cap M\right)_{y}$ is infinite. So there is an integer $n$ such that $(Y \backslash V)^{2} \cap \operatorname{Gr}\left(m_{n}\right) \neq \emptyset$. In particular, $S:=(Y \backslash V) \cap m_{n}^{-1}(Y \backslash V)$ is a nonempty $\Sigma_{1}^{1}$ subset of $Y$, which gives $y \in S$ such that $\left(S^{2} \cap M\right)_{y}$ is infinite. This proves the existence of $p>n$ such that $\left(y, m_{p}(y)\right) \in S^{2}$. Note that $y \in C$ since $Y \backslash C \subseteq V$. Now it is clear that $n, p$ and $y$ are suitable.

Lemma 7.5 Let $i \in 2, Y_{i}$ a Polish space, $\delta_{i}$ a Borel subset of $Y_{i}, c: \delta_{0} \rightarrow \delta_{1}$ a Borel isomorphism, $n \in \omega$, $c_{n}$ a Borel one-to-one partial function from $Y_{0}$ into $Y_{1}$ with Borel domain, and $C_{0}:=\bigcup_{n \in \omega} \operatorname{Gr}\left(c_{n}\right)$. We assume that $C_{0} \cap\left(\delta_{0} \times \delta_{1}\right)$ is disjoint from $\operatorname{Gr}(c)$, but not separable from $\operatorname{Gr}(c)$ by a pot $\left(\Pi_{1}^{0}\right)$ set. Then there are integers $n<p$ and $y_{0} \in Y_{0}$ such that $\left(c c_{n}^{-1} c_{p}\right)\left(y_{0}\right)$ and $\left(c c_{n}^{-1} c\right)\left(y_{0}\right)$ are defined and different.

Proof. We set $c_{n}^{\prime}:=c_{n \mid \delta_{0} \cap c_{n}^{-1}\left(\delta_{1}\right)}$, so that $C_{0} \cap\left(\delta_{0} \times \delta_{1}\right)=\bigcup_{n \in \omega} \operatorname{Gr}\left(c_{n}^{\prime}\right)$. Now we consider the pre-images

$$
\Delta\left(\delta_{1}\right)=\left(c^{-1} \times \operatorname{Id}_{\delta_{1}}\right)^{-1}(\operatorname{Gr}(c))
$$

and $\operatorname{Gr}\left(c_{n}^{\prime \prime}\right)=\left(c^{-1} \times \operatorname{Id}_{\delta_{1}}\right)^{-1}\left(\operatorname{Gr}\left(c_{n}^{\prime}\right)\right)$, where $c_{n}^{\prime \prime}:=c_{n}^{\prime} \circ c_{\mid c\left[\delta_{0} \cap c_{n}^{-1}\left(\delta_{1}\right)\right]}^{-1}$. Note that $c_{n}^{\prime \prime}$ is a Borel one-toone partial function with Borel domain and that $C_{0}^{\prime \prime}:=\bigcup_{n \in \omega} \operatorname{Gr}\left(c_{n}^{\prime \prime}\right)$ is not separable from $\Delta\left(\delta_{1}\right)$ by a pot $\left(\Pi_{1}^{0}\right)$ set. This implies that $\bigcup_{n \in \omega} \operatorname{Gr}\left(\left(c_{n}^{\prime \prime}\right)^{-1}\right)$ is not separable from $\Delta\left(\delta_{1}\right)$ by a pot $\left(\Pi_{1}^{0}\right)$ set.

By Lemma 7.4 there are integers $n<p$ and $y_{1} \in \delta_{1}$ such that $\left(c_{n}^{\prime \prime}\right)^{-1}\left(y_{1}\right)$ and $\left(c_{n}^{\prime \prime}\right)^{-1}\left(\left(c_{p}^{\prime \prime}\right)^{-1}\left(y_{1}\right)\right)$ are defined. We set $y_{0}:=\left(c_{p}^{\prime}\right)^{-1}\left(y_{1}\right)$, so that $\left(c\left(c_{n}^{\prime}\right)^{-1} c_{p}^{\prime}\right)\left(y_{0}\right)$ and $\left(c\left(c_{n}^{\prime}\right)^{-1} c\right)\left(y_{0}\right)$ are defined and equal respectively to $\left(c c_{n}^{-1} c_{p}\right)\left(y_{0}\right)$ and $\left(c c_{n}^{-1} c\right)\left(y_{0}\right)$. Now note that $y_{1} \neq\left(c_{p}^{\prime \prime}\right)^{-1}\left(y_{1}\right)$ for each $y_{1}$ in the range of $c_{p}^{\prime \prime}$. This implies that $\left(c_{n}^{\prime \prime}\right)^{-1}\left(y_{1}\right) \neq\left(c_{n}^{\prime \prime}\right)^{-1}\left(\left(c_{p}^{\prime \prime}\right)^{-1}\left(y_{1}\right)\right)$,

$$
\left(c\left(c_{n}^{\prime}\right)^{-1}\right)\left(y_{1}\right) \neq\left(c\left(c_{n}^{\prime}\right)^{-1} c\left(c_{p}^{\prime}\right)^{-1}\right)\left(y_{1}\right)
$$

$\left(c\left(c_{n}^{\prime}\right)^{-1} c_{p}^{\prime}\right)\left(y_{0}\right) \neq\left(c\left(c_{n}^{\prime}\right)^{-1} c\right)\left(y_{0}\right)$ and $\left(c c_{n}^{-1} c_{p}\right)\left(y_{0}\right) \neq\left(c c_{n}^{-1} c\right)\left(y_{0}\right)$.
Lemma 7.6 Let $Y$ be a Polish space, $n \in \omega, c$ and $c_{n}$ continuous open partial functions from $Y$ into $Y$ with open domain, $\varepsilon \in 2, C^{\varepsilon}:=\bigcup_{n \in \omega} \operatorname{Gr}\left(c_{2 n+\varepsilon}\right)$. We assume that $C^{0}$ is disjoint from $C^{1} \cup G r(c)$, but $\emptyset \neq G r(c) \subseteq \overline{C^{0}} \cap \overline{C^{1}}$. Then $C^{0}$ is not separable from $C^{1}$ by a pot $\left(\boldsymbol{\Delta}_{1}^{0}\right)$ set, and $C^{0}$ is not separable from $\operatorname{Gr}(c)$ by a pot $\left(\Pi_{1}^{0}\right)$ set. If moreover the domains $\operatorname{Dom}\left(c_{n}\right)$ are dense, then $C^{0} \cap\left(\bigcap_{n \in \omega} \operatorname{Dom}\left(c_{n}\right) \times 2^{\omega}\right)$ is not separable from $C^{1} \cap\left(\bigcap_{n \in \omega} \operatorname{Dom}\left(c_{n}\right) \times 2^{\omega}\right)$ by a pot $\left(\boldsymbol{\Delta}_{1}^{0}\right)$ set.

Proof. We argue by contradiction, which gives $P \in \operatorname{pot}\left(\boldsymbol{\Delta}_{1}^{0}\right)$. Let $G_{i}$ be a dense $G_{\delta}$ subset of $Y_{i}$ such that $P \cap\left(G_{0} \times G_{1}\right) \in \boldsymbol{\Delta}_{1}^{0}\left(G_{0} \times G_{1}\right)$. The proof of Lemma 3.5 in [L1] shows the inclusion $\operatorname{Gr}(c) \subseteq \overline{\operatorname{Gr}(c) \cap\left(G_{0} \times G_{1}\right)}$, and similarly with $c_{n}$. Thus

$$
\begin{aligned}
\operatorname{Gr}(c) & \subseteq \overline{\overline{C^{0}} \cap \overline{C^{1}} \cap\left(G_{0} \times G_{1}\right)} \subseteq \overline{\overline{C^{0} \cap\left(G_{0} \times G_{1}\right)}} \cap \overline{C^{1} \cap\left(G_{0} \times G_{1}\right)} \cap\left(G_{0} \times G_{1}\right) \\
& \subseteq \overline{\left(P \cap\left(G_{0} \times G_{1}\right)\right) \backslash\left(P \cap\left(G_{0} \times G_{1}\right)\right)}=\emptyset
\end{aligned}
$$

which is absurd. The last assertion follows since we may assume that $G_{0} \subseteq \bigcap_{n \in \omega} \operatorname{Dom}\left(c_{n}\right)$. The proof of the second assertion is similar and simpler.

Lemma 7.7 There is a tuple $\left(\left(Y_{i}\right)_{i \in 2}, C_{0}, C_{1}\right)$ such that
(a) $Y_{0}$ and $Y_{1}$ are Polish spaces.
(b) $C_{0}=\bigcup_{n \in \omega} \operatorname{Gr}\left(c_{n}\right) \subseteq \Pi_{i \in 2} Y_{i}$, for some Borel one-to-one partial functions $c_{n}$ with Borel domain.
(c) $C_{1}=\operatorname{Gr}(c)$, for some Borel function $c: Y_{0} \rightarrow Y_{1}$.
(d) $C_{0}$ is disjoint from $C_{1}$, but not separable from $C_{1}$ by a pot $\left(\Pi_{1}^{0}\right)$ set.
(e) We set $C_{0}^{\varepsilon}:=\left(\bigcup_{n \in \omega} \operatorname{Gr}\left(c_{2 n+\varepsilon}\right)\right) \cap\left(\bigcap_{n \in \omega} \operatorname{Dom}\left(c_{n}\right) \times 2^{\omega}\right)$, for $\varepsilon \in 2$. Then $C_{0}^{0}$ is disjoint from $C_{0}^{1}$, but not separable from $C_{0}^{1}$ by a pot $\left(\boldsymbol{\Delta}_{1}^{0}\right)$ set, and $\overline{C_{0}^{0}} \cap \overline{C_{0}^{1}} \cap\left(\bigcap_{n \in \omega} \operatorname{Dom}\left(c_{n}\right) \times 2^{\omega}\right) \subseteq \operatorname{Gr}(c)$.
(f) The equality $\left(c c_{n}^{-1} c_{p}\right)\left(y_{0}\right)=\left(c c_{n}^{-1} c\right)\left(y_{0}\right)$ holds as soon as the two members of the equality are defined and $n<p$.

Proof. We set $Y_{i}:=2^{\omega}$ and $c(\alpha)(k):=\alpha(2 k)$.

- We first build an increasing sequence $\left(S_{n}\right)_{n \in \omega}$ of co-infinite subsets of $\omega$, a sequence $\left(\psi_{n}\right)_{n \in \omega}$ of bijections, and a sequence $\left(h_{n}\right)_{n \in \omega}$ of homeomorphisms of $2^{\omega}$ onto itself. We do it by induction on $n$. We set $S_{0}:=\emptyset, \psi_{0}:=\operatorname{Id}_{\omega}$ and $h_{0}:=\operatorname{Id}_{2 \omega}$. Assume that $\left(S_{q}\right)_{q \leq n},\left(\psi_{q}\right)_{q \leq n}$ and $\left(h_{q}\right)_{q \leq n}$ are constructed, which is the case for $n=0$. We define a map $\varphi_{n}: \omega \rightarrow \omega$ by

$$
\varphi_{n}(k):=\left\{\begin{array}{l}
\psi_{n}^{-1}(k) \text { if } k \notin 2 S_{n}, \\
\frac{k}{2} \text { if } k \in 2 S_{n} .
\end{array}\right.
$$

Note that $\varphi_{n}$ is a bijection. We set $S_{n+1}:=\varphi_{n}[2 \omega] \cup(n+1)$, which is co-infinite. The sequence $\left(S_{n}\right)_{n \in \omega}$ is increasing since $S_{n}=\varphi_{n}\left[2 S_{n}\right] \subseteq S_{n+1}$. As $S_{n+1}$ is co-infinite we can build the bijection $\psi_{n+1}: \omega \backslash S_{n+1} \rightarrow \omega \backslash 2 S_{n+1}$ in such a way that $\psi_{n+1}(k) \neq \psi_{q}(k)$ for infinitely many $k \notin S_{n+1}$, for each $q \leq n$. We set

$$
h_{n+1}(\alpha)(k):=\left\{\begin{array}{l}
c(\alpha)(k) \text { if } k \in S_{n+1}, \\
\alpha\left(\psi_{n+1}(k)\right) \text { if } k \notin S_{n+1} .
\end{array}\right.
$$

As $h_{n+1}$ permutes the coordinates, it is an homeomorphism.

- We set $D_{n}:=\left\{\alpha \in 2^{\omega} \mid c(\alpha) \neq h_{n}(\alpha) \wedge \forall q<n \quad h_{n}(\alpha) \neq h_{q}(\alpha)\right\}$, so that $D_{n}$ is an open subset of $2^{\omega}$. We set $c_{n}:=h_{n \mid D_{n}}$, so that $c_{n}$ is an homeomorphism from $D_{n}$ onto its open range, $C_{0}$ is disjoint from $C_{1}$, and $C_{0}^{0}$ is disjoint from $C_{0}^{1}$.

Let us prove that $D_{n}$ is dense for each integer $n$. Note that $D_{0}=\left\{\alpha \in 2^{\omega} \mid \exists k \in \omega \alpha(2 k) \neq \alpha(k)\right\}$, which is clearly dense. Now $D_{n+1}$ contains

$$
\left\{\alpha \in 2^{\omega} \mid \exists k \notin S_{n+1} \quad \alpha(2 k) \neq \alpha\left(\psi_{n+1}(k)\right)\right\} \cap \bigcap_{q<n}\left\{\alpha \in 2^{\omega} \mid \exists k \notin S_{n+1} \quad \alpha\left(\psi_{n+1}(k)\right) \neq \alpha\left(\psi_{q}(k)\right)\right\}
$$

The set $\left\{\alpha \in 2^{\omega} \mid \exists k \notin S_{n+1} \alpha(2 k) \neq \alpha\left(\psi_{n+1}(k)\right)\right\}$ is open dense since the odd integers are in $\psi_{n+1}\left[\omega \backslash S_{n+1}\right]$. The set $\left\{\alpha \in 2^{\omega} \mid \exists k \notin S_{n+1} \quad \alpha\left(\psi_{n+1}(k)\right) \neq \alpha\left(\psi_{q}(k)\right)\right\}$ is open dense by construction of $\psi_{n+1}$. This proves that $D_{n+1}$ is dense.

- Note that $\operatorname{Gr}(c) \subseteq \overline{C_{0}^{0}} \cap \overline{C_{0}^{1}}$ since $c(\alpha)\left|n=h_{n}(\alpha)\right| n, D_{n}$ is dense and $c$ is continuous. Lemma 7.6 proves the non-separation assertions. We also have $\overline{C_{0}^{0}} \cap \overline{C_{0}^{1}} \cap\left(\bigcap_{n \in \omega} \operatorname{Dom}\left(c_{n}\right) \times 2^{\omega}\right) \subseteq \operatorname{Gr}(c)$ since $c(\alpha)\left|n=h_{n}(\alpha)\right| n$ and $c_{n}$ is continuous.
- Now it is enough to prove that $c h_{n}^{-1} h_{p}=c h_{n}^{-1} c$ if $n<p$. We have

$$
h_{n}^{-1}(\beta)(j):=\left\{\begin{array}{l}
\beta(k) \text { if } j=2 k \in 2 S_{n}, \\
\beta\left(\psi_{n}^{-1}(j)\right) \text { if } j \notin 2 S_{n} .
\end{array}\right.
$$

Thus

$$
\left(c h_{n}^{-1} c\right)(\alpha)(k)=c\left(\left(h_{n}^{-1} c\right)(\alpha)\right)(k)=\left(h_{n}^{-1} c\right)(\alpha)(2 k)=\left\{\begin{array}{l}
c(\alpha)(k) \text { if } k \in S_{n} \\
c(\alpha)\left(\psi_{n}^{-1}(2 k)\right) \text { if } k \notin S_{n}
\end{array}\right.
$$

Similarly,

$$
\left(c h_{n}^{-1} h_{p}\right)(\alpha)(k)=\left\{\begin{array}{l}
h_{p}(\alpha)(k) \text { if } k \in S_{n} \\
h_{p}(\alpha)\left(\psi_{n}^{-1}(2 k)\right) \text { if } k \notin S_{n}
\end{array}\right.
$$

Note that $S_{n}=\varphi_{n}\left[2 S_{n}\right] \subseteq S_{n+1}$, so that $S_{n} \subseteq S_{p}$. Thus $\left(c h_{n}^{-1} h_{p}\right)(\alpha)(k)=\left(c h_{n}^{-1} c\right)(\alpha)(k)$ if $k \in S_{n}$. If $k \notin S_{n}$, then $2 k \notin 2 S_{n}$ and $\varphi_{n}(2 k)=\psi_{n}^{-1}(2 k) \in S_{n+1} \subseteq S_{p}$. Thus

$$
\left(c h_{n}^{-1} h_{p}\right)(\alpha)(k)=h_{p}(\alpha)\left(\psi_{n}^{-1}(2 k)\right)=c(\alpha)\left(\psi_{n}^{-1}(2 k)\right)=\left(c h_{n}^{-1} c\right)(\alpha)(k)
$$

This finishes the proof.
Proof of Theorem 7.1. We argue by contradiction. Note that $S_{0}$ is not separable from $S_{1}$ by a pot $\left(\boldsymbol{\Pi}_{1}^{0}\right)$ set since (b) holds. By Lemma 7.2 we may assume that the inequality $S_{1} \subseteq \Pi_{0}^{\prime \prime} S_{0} \times \Pi_{1}^{\prime \prime} S_{0}$ holds.

- Recall the digraph $A_{1}$ in [L5]. If we take $X_{i}:=2^{\omega}, B_{0}:=A_{1}$ and $B_{1}:=\Delta\left(2^{\omega}\right)$, then by Corollary 12 in [L5], $B_{0}$ is Borel locally countable, not $\operatorname{pot}\left(\Pi_{1}^{0}\right)$, and $B_{1}=\overline{B_{0}} \backslash B_{0}$. It follows that $B_{0}$ is not separable from $B_{1}$ by a $\operatorname{pot}\left(\boldsymbol{\Pi}_{1}^{0}\right)$ set $Q$, since otherwise we would have $B_{0}=Q \cap \overline{B_{0}} \in \operatorname{pot}\left(\boldsymbol{\Pi}_{1}^{0}\right)$. This implies that $\left(\left(X_{i}\right)_{i \in 2}, B_{0}, B_{1}\right)$ satisfies condition (b) in Theorem 7.1. By Lemma 7.3, $f_{i \mid \Pi_{i}^{\prime \prime} S_{0}}$ is countable-to-one for each $i \in 2$ and $S_{0}$ is locally countable.
- Lemma 7.7 gives a tuple $\left(\left(Y_{i}\right)_{i \in 2}, C_{0}, C_{1}\right)$. Note that $\left(\left(Y_{i}\right)_{i \in 2}, C_{0}, C_{1}\right)$ satisfies condition (b) in Theorem 7.1, which gives $g_{i}: Z_{i} \rightarrow Y_{i}$. Lemma 7.3 implies that $g_{i \mid \Pi_{i}^{\prime \prime} S_{0}}$ is countable-to-one for each $i \in 2$. The first reflection theorem gives a Borel set $O_{i} \supseteq \Pi_{i}^{\prime \prime} S_{0}$ such that $f_{i \mid O_{i}}$ and $g_{i \mid O_{i}}$ are countable-to-one, for each $i \in 2$. By Lemma 2.4.(a) in [L2] we can find a partition $\left(O_{n}^{i}\right)_{n \in \omega}$ of $O_{i}$ into Borel sets such that $f_{i \mid O_{n}^{i}}$ and $g_{i \mid O_{n}^{i}}$ are one-to-one, for each $i \in 2$.
- We set $S_{\varepsilon}^{\prime \prime}:=\left(\Pi_{i \in 2} f_{i \mid O_{i}}\right)^{-1}\left(B_{\varepsilon}\right) \cap\left(\Pi_{i \in 2} g_{i}\right)^{-1}\left(C_{\varepsilon}\right)$, for each $\varepsilon \in 2$, so that $S_{\varepsilon}^{\prime \prime}$ is a Borel subset of $\Pi_{i \in 2} Z_{i}$ containing $S_{\varepsilon}$. In particular, $S_{0}^{\prime \prime}$ is not separable from $S_{1}^{\prime \prime}$ by a pot $\left(\Pi_{1}^{0}\right)$ set. We choose integers $n_{0}$ and $n_{1}$ such that $S_{0}^{\prime \prime} \cap\left(\Pi_{i \in 2} O_{n_{i}}^{i}\right)$ is not separable from $S_{1}^{\prime \prime} \cap\left(\Pi_{i \in 2} O_{n_{i}}^{i}\right)$ by a $\operatorname{pot}\left(\Pi_{1}^{0}\right)$ set. We set $D_{\varepsilon}:=\left(\Pi_{i \in 2} f_{i \mid O_{n_{i}}^{i}}\right)\left[S_{\varepsilon}^{\prime \prime} \cap\left(\Pi_{i \in 2} O_{n_{i}}^{i}\right)\right]$, so that $D_{0}$ is a Borel subset of $B_{0}$ which is not separable from $D_{1}$ by a pot $\left(\Pi_{1}^{0}\right)$ set. Note that $D_{1}$ is a Borel subset of $B_{1}=\Delta\left(2^{\omega}\right)$. In particular, there is a Borel subset $D$ of $2^{\omega}$ such that $D_{1}=\Delta(D)$. By Lemma 7.2, $D_{0} \cap D^{2}$ is not separable from $D_{1}$ by a $\operatorname{pot}\left(\boldsymbol{\Pi}_{1}^{0}\right)$ set. Let $h_{i}: D \rightarrow Y_{i}$ be defined by $h_{i}(\alpha):=\left(g_{i} \circ f_{i} \mid O_{n_{i}}^{i}\right)(\alpha)$. Then $h_{i}$ is Borel, one-to-one, and $D_{\varepsilon} \cap D^{2} \subseteq B_{\varepsilon} \cap\left(\Pi_{i \in 2} h_{i}\right)^{-1}\left(C_{\varepsilon}\right)$.
- Note that $\left(\Pi_{i \in 2} h_{i}\right)[\Delta(D)]$ is a Borel subset of $C_{1}$, which proves the existence of a Borel subset $\delta$ of $Y_{0}$ such that $\left(\Pi_{i \in 2} h_{i}\right)[\Delta(D)]=\operatorname{Gr}\left(c_{\mid \delta}\right)$. If $y \neq y^{\prime} \in \delta$, then $(y, c(y))=\left(h_{0}(d), h_{1}(d)\right)$ and

$$
\left(y^{\prime}, c\left(y^{\prime}\right)\right)=\left(h_{0}\left(d^{\prime}\right), h_{1}\left(d^{\prime}\right)\right)
$$

for some $d \neq d^{\prime} \in D$. As $h_{1}$ is one-to-one we get $c(y) \neq c\left(y^{\prime}\right), c_{\mid \delta}$ is one-to-one and $c^{\prime \prime} \delta$ is Borel.
As $D_{0} \cap D^{2} \subseteq\left(\Pi_{i \in 2} h_{i}\right)^{-1}\left(C_{0}\right)$ and $D_{1} \subseteq\left(\Pi_{i \in 2} h_{i}\right)^{-1}\left(\operatorname{Gr}\left(c_{\mid \delta}\right)\right), C_{0}$ is not separable from $\operatorname{Gr}\left(c_{\mid \delta}\right)$ by a $\operatorname{pot}\left(\Pi_{1}^{0}\right)$ set. By Lemma $7.2, C_{0}^{\prime}:=C_{0} \cap\left(\delta \times c^{\prime \prime} \delta\right)$ is not separable from $\operatorname{Gr}\left(c_{\mid \delta}\right)$ by a pot $\left(\Pi_{1}^{0}\right)$ set.

- By Lemma 7.5 applied to $\delta_{0}:=\delta$ and $\delta_{1}:=c^{\prime \prime} \delta$ there are $n<p$ and $y_{0} \in Y_{0}$ such that $\left(c c_{n}^{-1} c_{p}\right)\left(y_{0}\right)$ and $\left(c c_{n}^{-1} c\right)\left(y_{0}\right)$ are defined and different, which contradicts Lemma 7.7.(f).

Remark. We recover the algebraic relation " $g_{n}=g_{n} \circ g_{p}$ if $n<p$ " that was already present in Section 3 of [L5] mentioned just after the statement of Theorem 7.1.

Theorem 7.8 There is no tuple $\left(\left(Z_{i}\right)_{i \in 2}, S_{0}, S_{1}\right)$, where the $Z_{i}$ 's are Polish spaces and $S_{0}, S_{1}$ disjoint analytic subsets of $\Pi_{i \in 2} Z_{i}$, such that for any tuple $\left(\left(X_{i}\right)_{i \in 2}, B_{0}, B_{1}\right)$ of the same type exactly one of the following holds:
(a) The set $B_{0}$ is separable from $B_{1}$ by $\operatorname{apot}\left(\boldsymbol{\Delta}_{1}^{0}\right)$ set.
(b) The inequality $\left(\left(Z_{i}\right)_{i \in 2}, S_{0}, S_{1}\right) \sqsubseteq\left(\left(X_{i}\right)_{i \in 2}, B_{0}, B_{1}\right)$ holds.

Proof. Let us indicate the differences with the proof of Theorem 7.1. This time, $S_{0}$ is not separable from $S_{1}$ by a $\operatorname{pot}\left(\boldsymbol{\Delta}_{1}^{0}\right)$ set.

- Note that $A_{1}=\bigcup_{n \in \omega} \operatorname{Gr}\left(H_{n}\right)$, where $H_{n}: N_{s_{n} 0} \rightarrow N_{s_{n} 1}$ is a partial homeomorphism with clopen domain and range. The crucial properties of $\left(s_{n}\right)_{n \in \omega} \subseteq 2^{<\omega}$ is that it is dense and $\left|s_{n}\right|=n$. We can easily ensure this in such a way that $\left(s_{2 n}\right)_{n \in \omega}$ and $\left(s_{2 n+1}\right)_{n \in \omega}$ are dense. We set $B_{\varepsilon}:=\bigcup_{n \in \omega} \operatorname{Gr}\left(H_{2 n+\varepsilon}\right)$. The previous remark implies that $\Delta\left(2^{\omega}\right)=\overline{B_{\varepsilon}} \backslash B_{\varepsilon}$. By Lemma $7.6, B_{0}$ is not separable from $B_{1}$ by a $\operatorname{pot}\left(\boldsymbol{\Delta}_{1}^{0}\right)$ set. So here again $f_{i \mid \Pi_{i}^{\prime \prime} S_{0}}$ is countable-to-one for each $i \in 2$, and $S_{0}, S_{1}$ are locally countable by Lemma 7.3.
- Lemma 7.7 gives a tuple $\left(\left(\bigcap_{n \in \omega} \operatorname{Gr}\left(c_{n}\right), 2^{\omega}\right), C_{0}^{0}, C_{0}^{1}\right)$. Note that $\left(\left(\bigcap_{n \in \omega} \operatorname{Gr}\left(c_{n}\right), 2^{\omega}\right), C_{0}^{0}, C_{0}^{1}\right)$ satisfies condition (b) in Theorem 7.8.
- We change the topology on $2^{\omega}$ into a finer Polish topology $\tau$ so that the sets $f_{i}^{\prime \prime} O_{n_{i}}^{i}$ become clopen and the maps $\left(f_{i \mid O_{n_{i}}^{i}}\right)^{-1}$ become continuous. Now

$$
{\overline{D_{0}}}^{\tau^{2}} \cap{\overline{D_{1}}}^{\tau^{2}} \subseteq \overline{B_{0}} \cap \overline{B_{1}}=\left(B_{0} \cup \Delta\left(2^{\omega}\right)\right) \cap\left(B_{1} \cup \Delta\left(2^{\omega}\right)\right)=\Delta\left(2^{\omega}\right)
$$

So there is a Borel subset $D$ of $2^{\omega}$ such that ${\overline{D_{0}}}^{\tau^{2}} \cap{\overline{D_{1}}}^{\tau^{2}}=\Delta(D)$, and $D \subseteq \bigcap_{i \in 2} f_{i}^{\prime \prime} O_{n_{i}}^{i}$.

- Let us prove that $D_{0} \cap D^{2}$ is not separable from $D_{1} \cap D^{2}$ by a $\operatorname{pot}\left(\Delta_{1}^{0}\right)$ set.

We argue by contradiction, which gives $P \in \operatorname{pot}\left(\boldsymbol{\Delta}_{1}^{0}\right)$ such that $D_{0} \cap D^{2} \subseteq P \subseteq D^{2} \backslash D_{1}$. The sets ${\overline{D_{0}}}^{\tau^{2}} \cap\left(\neg D \times 2^{\omega}\right)$ and ${\overline{D_{1}}}^{\tau^{2}} \cap\left(\neg D \times 2^{\omega}\right)$ are disjoint, $\operatorname{pot}\left(\boldsymbol{\Pi}_{1}^{0}\right)$, so that they are separable by $\Delta_{l}$ in $\operatorname{pot}\left(\boldsymbol{\Delta}_{1}^{0}\right)$. Similarly, there is $\Delta_{r} \in \operatorname{pot}\left(\boldsymbol{\Delta}_{1}^{0}\right)$ which separates ${\overline{D_{0}}}^{\tau^{2}} \cap\left(2^{\omega} \times \neg D\right)$ from ${\overline{D_{1}}}^{\tau^{2}} \cap\left(2^{\omega} \times \neg D\right)$. Now
$D_{0} \subseteq P \cup\left(D_{0} \cap\left(\neg D \times 2^{\omega}\right)\right) \cup\left(D_{0} \cap\left(2^{\omega} \times \neg D\right)\right) \subseteq P \cup\left(\Delta_{l} \cap\left(\neg D \times 2^{\omega}\right)\right) \cup\left(\Delta_{r} \cap\left(2^{\omega} \times \neg D\right)\right) \subseteq \neg D_{1}$
which is absurd since $P \cup\left(\Delta_{l} \cap\left(\neg D \times 2^{\omega}\right)\right) \cup\left(\Delta_{r} \cap\left(2^{\omega} \times \neg D\right)\right) \in \operatorname{pot}\left(\Delta_{1}^{0}\right)$.

- Let us prove that $D_{0} \cap D^{2}$ is not separable from $\Delta(D)$ by a $\operatorname{pot}\left(\Pi_{1}^{0}\right)$ set.

We argue by contradiction, which gives $Q \in \operatorname{pot}\left(\boldsymbol{\Pi}_{1}^{0}\right)$ such that $D_{0} \cap D^{2} \subseteq Q \subseteq D^{2} \backslash \Delta(D)$. The sets $Q$ and $\Delta(D)$ are disjoint, $\operatorname{pot}\left(\Pi_{1}^{0}\right)$, so that there is $R$ in $\operatorname{pot}\left(\Delta_{1}^{0}\right)$ such that $Q \subseteq R \subseteq D^{2} \backslash \Delta(D)$. The sets ${\overline{D_{0}}}^{\tau^{2}} \cap R$ and ${\overline{D_{1}}}^{\tau^{2}} \cap R$ are disjoint, $\operatorname{pot}\left(\boldsymbol{\Pi}_{1}^{0}\right)$, so that there is $S$ in $\operatorname{pot}\left(\boldsymbol{\Delta}_{1}^{0}\right)$ such that $\overline{D_{0}} \tau^{2} \cap R \subseteq S \subseteq R \backslash \overline{D_{1}} \tau^{2}$. But $S$ separates $D_{0} \cap D^{2}$ from $D_{1} \cap D^{2}$, which contradicts the previous point.

- Note that $\left(\Pi_{i \in 2} h_{i}\right)[\Delta(D)] \subseteq \overline{C_{0}^{0}} \cap \overline{C_{0}^{1}} \cap\left(\bigcap_{n \in \omega} \quad \operatorname{Dom}\left(c_{n}\right) \times 2^{\omega}\right) \subseteq \operatorname{Gr}(c)$. We conclude as in the proof of Theorem 7.1.
