## STRUGGLING WITH SOLUTIONS; A CASE STUDY OF USING ORGANISATION CONCEPTS

### Abstract

Engineers contribute to the constant flow of allegedly new tools and organisation concepts. These tend to be presented as solutions to existing organisational problems. These solutions may become problems themselves, however. We present a longitudinal case of how a truck manufacturer struggled with various similar and dissimilar concepts in realizing organisational changes. Whilst it may seem idiosyncratic, the company's struggles are probably typical for organisational change praxis. Reflecting on the case, we present a model to help practitioners reflect on their use of concepts and tools (thereby arguably contributing to the issue we signal).

**Keywords:** Organisation concepts; Lean production; Management fashions; Tools.

‘The Engineering Industry is as much subject to fashion as any other human activity, and a study of its history reveals a succession of new ideas which have swept into the industrial limelight, each being received as a panacea which is going to revolutionise production, only to make way for some newer idea still. ‘Inspection’; ‘time and motion study’; ‘piece work’; ‘job rating’; ‘stock control’; each has had its day, made some contribution to management thought, and then receded from the limelight. Every idea has added one more layer to the multi decker sandwich which is management today’, wrote John Burbidge more than half a century ago (1957: 175). If we are to believe commentators such as Pascale (1990: 20) and Eccles and Nohria (1992: 1), the supply of what Burbidge referred to as ‘panaceas’ has increased rather than decreased since the 1950s. Organisation concepts, tools matching those concepts and software packages are constantly introduced and promoted, and sometimes succeed in gaining substantial, albeit often passing, attention among practitioners. If so, they are often called ‘fads’, ‘hypes’ or ‘fashions’. Practitioners face at least two difficulties in deciding whether or not to use a particular concept or tool. In the first place, the fear to stay behind competitors may lead to overly hasty adoption, without an adequate analysis of the concept’s suitability. The adoption is then “solution driven”: a concept is intended to solve a problem, but the issue is that the particular problem may not occur in the adopting organisation. Secondly, as concepts tend to lend themselves for various interpretations, practitioners must decide how the concepts fit in their own local situations (Benders and Van Veen, 2001; Giroux, 2006).

As developers and users of tools, engineers need to reflect on the processes behind the

1  
2  
3 development, dissemination and application of concepts and tools. They appear particularly  
4 susceptible to the inclination to develop new tools and hence be 'innovative'. John Burbidge  
5 himself is a case in point: his critical quote starts a book in which he promoted the novel  
6 concept of 'Standard Batch Production' and later he was to become the 'Father of Group  
7 Technology' (Suresh and Kay, 1998: xiii). In general, 'jumping to tools' seems an engineering  
8 trait. The literature is replete with approaches that are held to be 'new'; many papers in IJPR  
9 can serve as examples. For users other than the developers, this may present a problem as the  
10 addition of every single new concept and tool adds to the already protuberant toolbox, thus  
11 further complicating the issue of finding the relevant ideas for the job at hand.

25 In this paper, we first present a case where several concepts and ideas were applied in  
26 a period of over two decades. We focus on how one specific organisation struggled and still  
27 struggles with using a host of concepts and tools. Although the description may come across  
28 as hectic, it is arguably typical for how organisations attempt to make good use of the steady  
29 flow of concepts and tools offered to them (Brunsson and Olsen, 1997). We use the case to  
30 illustrate a model which is intended to help practitioners in applying organisation concepts  
31 and tools.

## 44 2. Lean Production at DAF

45  
46  
47  
48  
49 The following case is based on a variety of data gathered over the last two decades. The first  
50 author started formal research in 1992, using existing informal contacts. In the course of time  
51 there were frequent contacts with several company representatives and several Master  
52 students wrote their graduation thesis within the company. In addition, publications in the  
53 business press as well as company-issued material were used.

5  
6 DAF Trucks is a leading European truck manufacturer with production facilities in  
7  
8 Eindhoven, the Netherlands, and in Westerloo, Belgium. The first signs of attention to 'lean  
9  
10 production' within DAF date back to the second half of 1990. In 1991, DAF publicly  
11  
12 announced to implement 'lean production'. Top management embraced LP: 'LP was the only  
13  
14 idea that got the board enthusiastic in the last ten years', as a respondent formulated it. This  
15  
16 enthusiasm had much to do with DAF's financial difficulties at the time. These were to be  
17  
18 mitigated or even resolved by introducing LP. One respondent stated that the proposed  
19  
20 implementation of LP served as a signal to banks, indicating that DAF was seriously trying to  
21  
22 solve its problems and was still credit worthy. At the time, DAF became increasingly  
23  
24 dependent on the banks for a continuous supply of short-term credit (van Oorschot, 1996).  
25  
26  
27  
28  
29

30 LP was promoted forcefully by the member of the Board of Directors responsible for  
31  
32 manufacturing. One of his subordinate managers was given the assignment of introducing LP  
33  
34 in the organisation. LP's main feature was 'head count reduction' (cf. van Oorschot, 1996:  
35  
36 13).. The man in charge of 'lean production' reportedly had as motto: 'I shall eliminate every  
37  
38 job of which I do not understand the job description'. On November 20, 1990, DAF, the  
39  
40 unions and the works' council reached agreement on cutting the workforce twice by 6 percent  
41  
42 in 1990 and 1991. In September 1992, a board member announced publicly that the first  
43  
44 landmark had been reached in early 1992 and that DAF would be 'lean' by the end of 1993.  
45  
46 The 1991 annual report stated that a 'lean enterprise culture' was to be implemented in 'all  
47  
48 aspects of the organisation'. For the years 1992-1994 an additional headcount reduction of  
49  
50 1,600 people (approximately 12 percent of the total workforce) was announced (Vloet, 1993:  
51  
52 48). . The focus was on directly visible elements. One respondent put it as follows: 'one had  
53  
54 understood LP's slimness, but failed to understand its suppleness'; he meant that there was  
55

hardly an attempt to start working as prescribed in LP-textbooks but that LP was only used to reduce staff numbers.

There are no indications that DAF at that time had worked out a change program to tailor the generic concept of LP to its own organisation. When asked what DAF's version of lean production constituted, the company's spokesman pointed out that the concept entailed 'doing more with less staff' and that there were substantial cuts in indirect departments, but that there was no overall company view.

Besides delayering and downsizing, all kinds of change projects continued to be carried out, yet now often presented as part of the endeavour to become 'lean'. Many managers felt there were many similarities between the previous sociotechnical change program of the 1980s and LP. Vloet (1993) interviewed 12 managers at different levels in manufacturing departments. He concluded that, with exception of three items, DAF managers largely agreed to what MST constitutes. The perceived similarities made it possible to carry out change projects under the label of lean production, which were largely inspired by earlier change program. The existing knowledge of and experience with change processes were carried over in the interpretations and projects in the 'lean period'. These largely identical interpretations can be understood as prima facie the concepts seem to share similarities such as the stress on flow production, team based working and fewer hierarchical levels.

At the same time, a project that clearly fits in lean production was carried out, the 'Single-Minute-Exchange-of-Die' project for the heavy presses (Vroomen, 1992). This, however, was an isolated project, and not incorporated in a 'lean' design philosophy. Similar efforts had been conducted ten years earlier (see more elaborately: Benders, 1999).

All these changes were ultimately unsuccessful in diverting a formal bankruptcy in 1993. However, this did not mean the end of the company. It was continued on a smaller

1  
2  
3 basis. In 1996, it was taken over the US truck manufacturer Paccar and DAF Trucks has been  
4  
5 a wholly owned subsidiary since then. The take-over meant an improved access to financial  
6  
7 resources and investments in new product development and machinery, and organisational  
8  
9 change programs were initiated on a substantial scale. 'World Class Manufacturing' became  
10  
11 the new banner under which improvement activities were started. Many staff went on Six  
12  
13 Sigma training programs. These contributed to quality improvement initiatives throughout the  
14  
15 company. Toyota-trained consultants were involved in setting up programs and monitoring  
16  
17 the progress. In 2006, a brochure entitled 'DAF Production System' was circulated to all staff  
18  
19 (in the Summer of 2007, this was renamed 'Paccar Production System'). It communicated in  
20  
21 an easily understandable fashion some key ideas of the Toyota Production System to all DAF  
22  
23 personnel, most notably shopfloor employees. It contains all key insights from the Toyota  
24  
25 Production System: standardized operating procedures, continuous improvement, zero  
26  
27 defects, the elimination of waste and buffers, continuous flow production and collaborative  
28  
29 working.  
30  
31  
32  
33  
34  
35

36  
37 The combined result of all changes has been impressive in productivity terms: the  
38  
39 number of trucks produced increased by a factor three and a half in between 1993 and 2006  
40  
41 whilst the number of employees has only increased slightly. The company has succeeded in  
42  
43 realizing this within the existing premises, and is further raising the capacity of its production  
44  
45 lines. This does not mean that the basic lean notions are institutionalized throughout the  
46  
47 organisation (cf. Olde Monnickhoff, 2006). Witteveen even reported that in a pilot cell where  
48  
49 continuous improvement was experimented with, shop-floor employee did not conform to  
50  
51 some standard operation procedures as they doubted their efficacy (2007: 62), whereas the  
52  
53 key idea of continuous improvement is that such an issue is reported as an improvement  
54  
55 opportunity. The use of standardized operation procedures is not yet common in all parts of  
56  
57  
58  
59  
60

1  
2  
3 the manufacturing process. Therewith, a crucial basis for continuous improvement à la Toyota  
4 is not yet commonplace, despite the presence of many persons holding Six Sigma belts. Many  
5 difficulties come down to inconsistencies: the Toyota Production System is a complex whole  
6 of basic notions and concrete techniques. Many managerial actions at DAF are inconsistent  
7 with part of the Paccar Production System, leading to contradictory signals to shop-floor  
8 members. For instance, at the end of the month the stress on achieving production targets  
9 often leads to the violation of system principles such as carefully working according to  
10 standard operating procedures. Recently, it was suggested to create procedures to signal such  
11 inconsistencies, so that managers come beware that their own actions often contradict the  
12 ideals of the Paccar Production System (Witteveen, 2007).

### 30 **3. Conclusions: on using concepts**

31  
32  
33  
34 The DAF-case illustrates how organisation concepts may be used to start change programs. It  
35 also shows that organisational change tends to be a cumbersome process. The larger the  
36 changes, the more internal parties are involved, the greater chances that interests are affected,  
37 resistance occurs and the program falters. The failure is often attributed to the concept used,  
38 and scepticism or even cynicism about a specific concepts or even .organisational change in  
39 general is likely to emerge. In the DAF-case, the term “lean” became contaminated as it is  
40 associated with the traumatic events of 1991-1993; within DAF, the term is still associated  
41 with large-scale lay-offs. In such a case, the concept used to start the program easily `wears  
42 out through use' (Benders and Van Veen, 2001): it becomes associated with failure and may  
43 no longer be used to mobilize internal parties to change. If this happens at a considerable  
44 scale, the message of failures spread and the concept may fall into disrepute. If so, this creates  
45  
46  
47  
48  
49  
50  
51  
52  
53

55  
56  
57  
58  
59  
60

1  
2  
3 opportunities at the supply side: commercial actors like management gurus and consultants  
4  
5 are finding it increasingly difficult to generate income from the concept in question, and may  
6  
7 start to 'innovate': come up with 'new' concepts to satisfy the need for fresh and  
8  
9 uncontaminated labels. As the DAF case makes clear, there may be good reasons to shed one  
10  
11 label and replace it by another, whilst retaining core insights. The succession of World Class  
12  
13 Manufacturing and later the DAF / Paccar Production System exemplifies this: their core  
14  
15 ideas are identical. Exactly because concepts are used and changes occur, labels 'wear out'  
16  
17 and need replacement. This erosion is strictly local and thus of paramount importance within  
18  
19 such a context. One should not throw away the baby with the bathwater, however. Local  
20  
21 erosion does not affect the 'classic value' of the underlying ideas. Distinguishing between  
22  
23 labels and the underlying notions allows practitioners and academics alike to separate  
24  
25 bathwater from babies. Only in that case one may accumulate knowledge: recognize that  
26  
27 earlier, and 'locally failed' concepts, may contain a core upon which to build under a different  
28  
29 banner, rather than shedding the ideas altogether.  
30  
31  
32  
33  
34  
35  
36  
37  
38

39 One may reflect on tool use by relating tools to the concepts underpinning them. Figure 1  
40  
41 displays a model distinguishing four different situations of the use and non-use of lean tools  
42  
43 and the underlying concepts.  
44  
45  
46  
47  
48

49 → insert Figure 1 about here  
50  
51  
52

53 The first quadrant, where both the concepts and tools are absent, may seem redundant.  
54

55 However, at a closer look this situation warrants attention. The issue is to consider whether or  
56  
57 not the concepts or tools are suitable to resolve existing issues. Organisational mimicry or  
58  
59  
60

1  
2  
3 essentially “keeping up with the Joneses” is a strong driver for adoption, especially when the  
4 concept is fashionable. In a certain way, DAF benefited from LP’s fashionability in the early  
5

essentially “keeping up with the Joneses” is a strong driver for adoption, especially when the concept is fashionable. In a certain way, DAF benefited from LP’s fashionability in the early 1990s by signalling to creditors that it was still modern and thus worth lending money to. In the case of “lean”, the matter is more complicated. The adjective is often understood as a synonym for ‘superior performance’. This renders the word ‘lean’ essentially meaningless: if any way of improving performance is called ‘lean’, the specific philosophy of the Toyota Production System becomes but one way of doing so, and therewith its specific strengths lose their attractiveness. Thus, ‘lean’ needs to be considered as a means to reaching a goal, rather than becoming a goal in itself. The literature on management fashions shows that in practice, this danger is often materialized. At the same time, however, DAF Trucks’ initial use of ‘lean’ shows that even such decoupled use can very well be functional.

We labelled the use of a concept without the matching tools ‘clumsy’. This clumsiness may easily be remedied by looking for or even developing appropriate tools. A key insight, however, is to learn from existing knowledge, i.e. to use available tools. The ‘not invented here’-syndrome may lead to the reinvention of wheels (Benders and Vermeulen, 2002). If and only if such tools may not be found, it makes sense to develop them internally. The abundance of various labels to disseminate the basic notions of the Toyota Production System alone suggests that this form of waste may be more wide-spread than commonly assumed (as an aside: one manifestation of avoiding waste is to keep tools as simple as possible. This may not appeal to engineers wanting to display their sophisticated skills, yet can be argued to be in the true Toyota spirit. For example, during a site visit to Toyota’s most modern Japanese plant, one of the authors was guided by a senior manager who proudly showed how second-hand material, partly from bicycles, had been used in constructing a device to supply complex and hard-to-handle parts to the final assembly line).

Using tools without the underlying concept is called “unfocused” in Figure 1. An outspoken critic of this unfocused use is Steven Spear (Spear and Bowen, 1999). The risk is that such applications are unfocused. Much of the history of using various approaches at DAF Trucks seem to fit here: concepts and tools are applied continuously throughout the factory to realize local improvements. Without being embedded in a larger whole, the potential gains of such improvements will only be partially captured. At another level, the use of tools and approaches may have unanticipated consequences which could have been foreseen had the larger context been considered. An example is one reason for the early failure of quality control circles to diffuse widely. Improvements due to suggestions from participating employees initially led to efficiency gains and substantial higher labour productivity; where the latter were materialized by firing shop-floor employees, this, quite naturally, turned out to be an effective way of stopping their colleagues to contribute further (Cole, 1995: 6; Hill, 1995). However, a counter-argument is that working out a coherent change program may take an extended and strenuous process, whereas an abundance of local improvement projects may, even without being embedded in a larger framework, still all contribute to efficiency gains and therewith be beneficial.

The simultaneous presence of both concept and matching tools or “aligned use” is, obviously, an ideal. DAF Trucks launched various attempts to do this, most recently in the form of the DAF / Paccar Production System. Yet ideals are often hard to reach. Within Toyota Motors, the philosophy was clear in the 1930s. It then took decades to work this out in a systematic approach (Ohno, 1988; Holweg, 2007). And implementing and putting this into practice is a continuous and difficult process, with ups and downs (Besser, 1996; Benders and Morita, 2004; Pardi, 2007). Over the course of the last three decades, the basic ideas behind the Toyota Production System, including continuous improvement and flow production, have

been published under a wide variety of labels, with 'lean' arguably being the most prominent of them. Before implementing such a concept, practitioners must realize the complexities involved in implementation and the associated pitfalls. At the organisational level, a few critical issues need to be considered:

1. what concrete purposes is 'lean' going to serve?;
2. how is this going to be worked out in an organisation-wide change program?;
3. how can such a generic program be put to use in concrete change projects within the organisation?

To be short: practitioners need concepts and tools, but their well-considered use is as crucial as their availability.
