The Religio-Scientific Frameworks of Pre-service Primary Teachers: An analysis of their influence on their teaching of science.

Abstract

Scientific and religious ways of thinking are central to an individual's cognitive and cultural ways of making sense of the world. This paper explores what foundational concepts pre-service primary teachers are employing when they teach science. The study measured the attitudes to science and religion of 92 pre-service primary teachers. The categories traditionally used to describe the ways individuals' relate science and religion were found to be inadequate when attempting to reflect the attitudes' of the respondents. An alternative, phenomenologically based diagnostic framework was then proposed, constructed as a two dimensional scale on which participant's attitude to science/religion was assessed as either 'epistemic' or 'pragmatic'. Analysis of interviews with a representative sample of eight of the teachers, showed that individual religio-scientific frameworks could be linked to distinct differences in approach to the teaching of science. The impact of identifying the religio-scientific framework of pre-service teachers on the design of future educational programmes was then discussed.

Introduction

What we believe, and the knowledge we act upon, is guided by ways of thinking that mostly go unnoticed or, at the very least, are only reflected on occasionally - perhaps at times of personal crisis. However, one of the many roles a teacher has to perform in her class is to facilitate her pupils to undertake this task explicitly as part of their everyday schooling. The experienced professional would also be expected to reflect upon their own beliefs and values and how they shape their teaching practice as part of their continuing professional development (Reiss 1993, Poole 1998, Cobern 2000).

What of the neophyte teacher? What ways of thinking are they bringing into the profession? What foundational concepts are they employing - perhaps implicitly - in the way they teach? This paper will focus on two particular epistemic strands of thinking: the scientific and religious, which are central to an individual's cognitive and cultural ways of making sense of the world. This paper will describe pre-service primary teachers' attitudes to science-and-religion and their influence on approaches to the teaching of science.

Deleted: epistemological

Why focus on pre-service primary teachers' ways of thinking about science and religion? Teachers of primary-aged (five to eleven years old) children aren't known to be 'scientifically minded' and are more likely to have science backgrounds similar to the lay public than secondary science teachers (Cobern and Loving 2002). Some may even possess belief systems that are alienated from the scientific orthodoxy (Keranto 2001, Lake 2005). So for teacher educators to be able to understand their trainees' beliefs and approaches to the teaching of science one must also look at what might

Formatted: Font: Italic, No underline

1
2 contribute to a teacher's sense of identity. This would allow the development
3
4 of practices that might then enable pre-service teachers to reflect on what
5
6 actually informs their own approach rather than transmitting information, which
7
8 might be verbally accepted but may never completely adopted (Hubbard and
9
10 Abell 2005). An understanding of the conceptual framework based on both
11
12 religious and scientific attitudes should give an insight into a frame of
13
14 reference that has been shown to impact on an individual's scientific
15
16 reasoning (Roth and Alexander 1997, Cobern 2000). Some scholars maintain
17
18 that science and religion are, metaphysically speaking, incompatible and their
19
20 irreconcilability a necessary prerequisite for scientific competence (Mahner
21
22 and Bunge 1996a, 1996b). Whatever the philosophical desirability for their
23
24 estrangement, I agree with Gauld's assertion that scientific and religious
25
26 habits of mind are similar. "In both cases openness to argument and
27
28 evidence, scepticism, rationality and objectivity are all held in high regard; in
29
30 both some ideas are more protected from attack while others are more open
31
32 to challenge; and in both, at any time, there are various degrees of
33
34 commitment to theories from sceptical rejection to passionate endorsement.
35
36 Both habits of mind stem from the same scholarly attitude and any difference
37
38 between them is probably due to differences in what are counted as
39
40 appropriated evidence and good reasons." (Gauld 2005, p. 302)
41
42

43
44 Attempts to rationally delineate what might lie behind observed attitudes to
45
46 teaching science have met with difficulty. Personal views are necessarily
47
48 complex and may lack the internal consistency the researcher hopes to
49
50 identify. The 'teacher' may not always behave as such, with their views
51
52
53
54
55
56
57
58
59
60

1
2 stubbornly refusing to fit into a clearly defined box separate and identifiably
3
4 different from that of their 'student' (Fysh and Lucas 1998), or ideas that may
5
6 be viewed as congenial and trustworthy by an individual may seem
7
8 paradoxical or even self-contradictory to an outside observer (Jackson et al.
9
10 1995).

11
12
13
14 The majority of the previous research has focused on the impact of an
15
16 individual's beliefs on the acceptance or otherwise of the concepts
17
18 underpinning the teaching of the science curriculum. This has been
19
20 particularly the focus of researchers in the United States, since the
21
22 secularisation of the American school curriculum precludes the study of the
23
24 interaction of scientific conceptual development on a student's religious
25
26 education. Tertiary level educational studies have focused on the impact of an
27
28 individual's religious beliefs on their acceptance of standard scientific
29
30 theoretical models such as biological evolution (Cobern 1994, Smith 1994,
31
32 Ayala 2000), or how a student's belief system shapes their understanding of
33
34 the nature of science in general (Brazelton et al. 1999), or particular areas of
35
36 scientific understanding such as astronomy (Brickhouse et al. 2000, Shipman
37
38 et al. 2002). Even a student's future career choice (Esbenshade 1993) has
39
40 been analysed in terms of its potential impact on future science education
41
42 strategies and the likelihood of changes in public perceptions with regards to
43
44 science policy decisions such as those surrounding environmental issues
45
46 (Petersen 1997).
47
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3
4 Work in other countries that have different educational environments to that
5 found in the United States have, nevertheless, focused on very similar issues.
6
7
8 Even where 'religion' refers to public and personal dimensions of Islamic faith,
9
10 in contrast to the broadly Christian context of students in the majority of
11
12 research, the focus is on how scientific education is influenced by the
13
14 prevailing socio-religious context (Anees 1995, Loo 1999, 2001).
15
16

17
18
19 Even more limited is research that focuses specifically on the learning and
20
21 teaching of science-and-religion as an interdisciplinary area with its own
22
23 pedagogical issues and concerns (see Fulljames and Stolberg 2000, Stolberg
24
25 and Fulljames 2003). In 1996, *Science & Education* devoted a complete issue
26
27 to the theme, 'Science, Religion and Education'. The articles focused on the
28
29 appropriate metaphysical basis for the teaching and learning of science, and
30
31 whether a particular approach is still appropriate when the curriculum is
32
33 extended to include discussion of issues within a historical or cultural context.
34
35

36
37 Within the United Kingdom context, research has focused on secondary level
38
39 education. There are a considerable range of common issues that both
40
41 science and religious educators could address concerning the data, nature
42
43 and application of science (Bausor and Poole 2003). However, empirical
44
45 research has been limited to the relationship between students' attitudes
46
47 towards science and attitudes towards religion and the influence on these
48
49 attitudes of particular views of science (scientism) and of religion (creationism)
50
51 (Fulljames et al. 1991, Fulljames 1996), and how these may be different within
52
53
54
55
56
57
58
59
60

1
2 the distinctive religious context of schooling in Northern Ireland (Francis et al.
3
4 2001).
5
6
7

8
9 The objectives of this study are therefore to bring together issues raised by
10 previous research, and to act as a starting point for research into the impact of
11 science-and-religion on learning and teaching in primary education. There are
12 three main aims; firstly, to describe the ways of relating science and religion
13 used by pre-service primary teachers. Secondly, to assess how their way of
14 relating science and religion might influence an individual pre-service primary
15 teacher's views on the nature and purpose of science education. Thirdly, to
16 gather base line data for future research into the influence of science-and-
17 religion in other areas of primary teaching and learning.

28 **Sample**

29
30 The participants were a self-selected sample, all of whom were graduates
31 undertaking a one-year post-graduate initial teacher education qualification to
32 teach primary aged children. The course was based at a large urban
33 university in the multi-culturally diverse English West Midlands.
34
35 Questionnaires and interviews were administered at the end of the course's
36 first semester, during which participants had already observed and taught a
37 limited number of science classes in local primary schools.
38
39
40
41
42
43
44
45
46
47

48 The participant sample reflected the make-up of people undertaking primary
49 initial teacher education at this institution. Out of the 92 trainees who agreed
50 to take part in the study, 11 were male and 81 were female. 19 were aged
51
52
53
54
55
56
57
58
59
60

1
2 between 17 and 21, 67 aged between 22 and 36, and six aged between 37
3
4 and 65. 18 of the respondents had undertaken a higher level course in
5
6 science, achieving a post-16 level qualification whilst at secondary school,
7
8 and six of the trainees had studied science, or a scientifically-related subject
9
10 at degree-level.
11

12
13
14
15 Semi-structured interviews were conducted with eight students. The eight
16
17 students were selected from the 92 trainees who had completed the
18
19 questionnaire on the basis of their willingness to be interviewed and the
20
21 practicability of arranging interviews. Although this is a small sample size, the
22
23 interviewees selected were an accurate reflection of the respondents as a
24
25 whole in terms of their identification with a religious group and use of personal
26
27 prayer. The gender balance of questionnaire respondents was also mirrored
28
29 in the sample with seven of the interviewees being female and one male. The
30
31 only major discrepancy is that half of the interviewees indicate having studied
32
33 science to a higher level than that required for entry onto the initial teacher
34
35 education programme. This is higher than the proportion in the whole cohort,
36
37 which is at only 20%.

40 41 42 **Measures - Questionnaire**

43
44
45 Identification with a religious group was assessed by a four point scale:
46
47 strongly, to some extent, marginally, not at all.
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2 Personal prayer was assessed by a three point scale: regularly, sometimes,
3
4 never.
5

6
7
8 Attitude towards science was measured using a scale of ten items selected
9
10 from a widely used larger scale developed by Menis (1989), the ten item
11
12 scale's validity as an accurate measure was confirmed in subsequent studies
13
14 (Francis et al. 1999, Stolberg and Fulljames 2003). Each item was assessed
15
16 on a five point Likert scale.
17

18
19
20 Scientism was measured using a six item scale which was a modified version
21
22 of the instrument used by Fulljames et al. (1991). The items reflect the view
23
24 that scientific methods and scientific theories can attain to absolute truth.
25

26
27 Each item was assessed on a five point Likert scale.
28

29
30 Ways of relating science and religion were assessed using five independent
31
32 items which detailed the different ways in which the science-religion
33
34 relationship is often described (see Fulljames and Stolberg 2000, Cantor and
35
36 Kenny 2001). Each item was assessed on a five point Likert scale.

the start of the interview that they need only respond to questions in the schedule if he or she wished to do so. That they may, at any time, clarify points they have made or conclude the interview. Confidentiality and anonymity were emphasised, and it was explained that pseudonyms would be used in reports of the research. All the interviews were recorded and at a later date transcribed.

Deleted: Analysis of the data used standard procedures in the analysis of qualitative data and included both literal and interpretative reading of the data.

Results & Discussion

Part 1. Questionnaire

For each section of the questionnaire the frequencies of responses will be presented and the internal consistency of scales tested. It will then be possible to consider the relationships between different ways of relating science and religion and other variables measured by the questionnaire.

Religious commitment: Responses to items about identification with a religious group and personal prayer indicate that there was diversity in the personal religious commitment of the pre-service primary teachers who completed the questionnaire although a majority indicated some level of commitment. 19% identified strongly with a religious group, 23% identified to some extent, 20% marginally and 38% not at all. 22% stated that they prayed regularly, 40% sometimes and 38% never. There was a high positive correlation between identification with a religious group and personal prayer ($r = 0.785, p < 0.001$).

1
2
3 Attitude towards science: table 1 presents responses to items exploring
4
5 attitude towards science. There is widespread agreement with three items that
6
7 focus on the economic benefits of science. At least four-fifths of respondents
8
9 agree that "science is very important for a country's development" and that
10
11 "scientific inventions improve our standard of living", while over three-fifths
12
13 agree that "money spent on science is well worth spending". Four of the items
14
15 are concerned with more a general evaluation of science. About two-thirds of
16
17 respondents reject the statement that "scientific discoveries do more harm
18
19 than good" and almost unanimously accept that "science is useful for solving
20
21 the problems of everyday life". In contrast, only 48% agree with the statement
22
23 "science will help to make the world a better place in the future" and 46%
24
25 disagreeing with the statement "science and technology are the cause of
26
27 many of the world's problems", with almost two-fifths of respondents not sure
28
29 how to respond to these items. Similar high levels of uncertainty are found in
30
31 the responses relating to three items relating to the environment and to
32
33 relationships in society. Nevertheless, a majority of respondents reject the
34
35 statement that "science has ruined the environment", whilst 46% disagree that
36
37 "much of the anxiety in modern society is due to science". The item "scientific
38
39 inventions have increased tensions between people" attracts the highest
40
41 negative evaluation. 56% of respondents agree with this statement while 27%
42
43 are not sure. Overall most respondents seem to have a positive attitude
44
45 towards science but with some ambivalence about the role of science in
46
47 society.

5
6 The internal consistency of the scale of attitude towards science is
7 demonstrated in table 2 by the bivariate relationships between the ten items,
8
9 and is confirmed by the calculation of the alpha coefficient as 0.712. All items
10
11 make a significant positive correlation to at least one other item except for,
12
13 "science has ruined the environment". There is a significant positive three-way
14
15 correlation between the items, "science is very important for a country's
16
17 development", "money spent on science is well worth spending" and "science
18
19 will help to make the world a better place in the future".

25
26
27

28 Scientism: table 3 presents responses to items exploring scientism. Amongst
29
30 pre-service primary teachers there is little support for the view of science
31
32 described as scientism. In particular, there is strong rejection of the
33
34 statements that "nothing should be believed unless it can be proved
35
36 scientifically" (74%) and that "science will eventually give us complete control
37
38 over the world" (72%). The internal consistency of the scale of scientism is
39
40 demonstrated in table 4 by the bivariate relationships between the six items,
41
42 and is confirmed by the calculation of the alpha coefficient as 0.701. There is
43
44 a significant positive correlation between the item, "science will eventually
45
46 give us complete understanding of the world", and "nothing should be believed
47
48 unless it can be proved scientifically" or "science will eventually give us

15
16 Ways of relating science and religion: table 5 presents responses to five

17 independent items in the questionnaire which explored ways in which science

18 and religion may be related. There is a significant (two-thirds) majority of

19 respondents who see conflict as the way to view science and religion, but

20 amost two-thirds of respondents also agree that "interaction between science

21 and religion can be of benefit to both" and "both science and religion are

22 important for human well-being". A minority of the respondents have the views

23 represented by Barbour's categories of independence and integration (see

24 Cantor and Kenny 2001). Only 22% agreed that "science and religion should

25 be kept completely separate" and even fewer (8%) agreed that "deep down

26 science and religion are one and the same", although it may be noted that

27 about one-fifth of the respondents were not sure how to respond to any of the

28 items. It is possible that these respondents might happily subscribe to a

29 coherent epistemic view and yet are aware of important differences between

30 scientific and religious discourses.

1
2
3 These five items are not intended to form a scale and table 6 presents the
4 bivariate relationships between these items. However, the logical consistency
5 of the responses is indicated by the polarization in the attitudes held by pre-
6 service primary teachers. Those respondents who view any relationship
7 between science and religion to be beneficial, whether it be 'hard'
8 epistemological integration or 'softer' social dialogue indicate significant
9 positive consequences for human well-being. There are also those students
10 who would see any interaction as threatening to their religious views and,
11 presumably, scientific convictions. This interpretation is confirmed by the
12 significant negative correlation shown in table 6 between the items
13 representing independence and dialogue ($r = -0.623$, $p < 0.001$).

26
27 It is possible that some trainees are in the process of formulating their position
28 and in terms of the categories used by Shipman et al. (2000) - distinct,
29 convergent, transitional and confrontational - their responses might be
30 regarded as transitional. Alternatively, it may be that many of the pre-service
31 primary teachers distinguish between different aspects of their lives and the
32 relative relevance of their scientific and religious ways of thinking. In these
33 instances scientific and religious epistemologies are orthogonal and so,
34 "science and religion should be kept completely separate" whilst there are
35 other areas where, at the very least, no detrimental consequences are
36 perceivable so, "interaction between science and religion can be of benefit to
37 both" is deemed appropriate, or at least countenanced. If there are substantial
38 numbers of students who think in this way it is questionable whether the
39 general categories - of Barbour or of Shipman - can be of much use in

9
10

11 Relationships between ways of relating science and religion and other

12 variables: It is now possible to consider the relationships between different
13 ways of relating science and religion and other variables measured by the
14 questionnaire. As there is a complex multivariate interaction it is appropriate to
15 introduce the variables in sequence, noting relationships with age, level of
16 science education and religious commitment as well as with other variables
17 already introduced. Because of the small number of male participants in the
18 study, no reliable conclusions can be assigned to the gender difference of the
19 pre-service primary teachers. The sequence will be, firstly attitude towards
20 science, secondly scientism, and then finally the ways of relating science and
21 religion. Table 7 presents the bivariate relationships between age, level of
22 science education, identification with a religious group, attitude towards
23 science, scientism, and four ways of relating science and religion: conflict,
24 independence, integration and dialogue.

2 related to religious commitment, as measured by identification with a religious
3 group, suggesting that religious commitment may be combined with a positive
4 attitude towards science but not necessarily so.
5
6
7
8
9

10 There is only one significant relationship between scientism and any of the
11 other variables - a positive correlation with pre-service primary teachers' views
12 on the independent nature of scientific and religious activities. As most
13 respondents strongly rejected scientism (73%) the range of scores on the
14 scientism scale is limited, so there may need to be caution in the interpretation
15 of this result. Nevertheless, it may be noted that there is no significant
16 relationship with attitude towards science, suggesting that for pre-service
17 primary teachers it is possible to have a positive evaluation of science without
18 accepting that science attains to absolute truth.

30 While there is not a significant relationship between scientism and level of
31 science education of pre-service primary teachers, there is significant
32 negative relationship between one item on the scientism scale, "theories in
33 science can be proved to be definitely true" and the level of science education
34 ($r = -0.393$, $p < 0.001$). This might be indicative of respondents whose own
35 formal science education has enabled them to gain an increased awareness
36 as to the difficulty of making truth claims in science.

51
52
53
54
55
56
57
58
59
60

1
2 responses to the item about conflict and age, level of science education or
3
4 any of the other variables measured.
5
6

7
8 Even though one-third of respondents were either unable or unwilling to say
9
10 whether science and religion are independent activities, the rest of the pre-
11
12 service primary teachers questioned were very clear in their views. Interaction
13
14 and constructive dialogue are highly desirable and would be mutually
15
16 beneficial to both, and our ultimate quest for knowledge and understanding.
17
18 This is especially the case when addressing environmental issues, ($r = -0.464$,
19
20 $p < 0.001$) and is the prevalent position of the younger teachers and those
21
22 who have higher levels of science education - no matter their level of religious
23
24 commitment.
25

26
27 This is however, not the same as thinking that science and religion are one
28
29 and the same. A large majority (64%) of pre-service primary teachers
30
31 disagree that science and religion are essentially the same. Although
32
33 dialogue is desirable, it is especially when the aims and objectives are
34
35 common to both; whether it is "human well-being", ($r = +0.300$, $p < 0.001$) or
36
37 "control over the world" ($r = +0.330$, $p < 0.001$) that science and religion work
38
39 together for the benefit of all.
40
41

42 43 44 **Intermediate conclusions**

45
46 Unsurprisingly, pre-service primary teachers hold a range of views about
47
48 science and religion and, therefore, differences emerge in their ontological
49
50 status. Pre-service primary teachers in this study appear to have made a

Deleted: and the make up of an individual's religio-scientific framework

1
2 judgement as to their role and purpose. This corroborates Roth and
3
4 Alexander's findings that prospective teachers "all showed evidence of a
5
6 strong sense of the context of their own beliefs and attitudes in relation to
7
8 science and religion" (Roth and Alexander 1997, p. 131). As has been stated
9
10 already, it is questionable whether the normal, general categories are of much
11
12 use in interpreting pre-service primary teachers' views of the science-religion
13
14 relationship. How can we therefore to best describe the range of attitudes held
15
16 by pre-service primary teachers?

Deleted: Because there is a

Deleted: views

17
18
19
20
21 If the responses to the questionnaire accurately reflect different and distinctive
22
23 ways of relating science and religion, previous research suggests that this
24
25 should affect their approach to the teaching of science (Cobern 1994, 1996,
26
27 2000a, 2000b; Jackson et al. 1995; Keranto 2001; Cobern and Loving 2002;
28
29 Zeidler et al. 2002; Hubbard and Abell 2005; Lake 2005). I agree with Cobern
30
31 (2000b) that in the everyday practice of teaching and learning of science the
32
33 philosophical distinction between the competing truth claims of knowledge and
34
35 belief are blurred. However, the results of the questionnaire seem to suggest
36
37 that pre-service primary teachers do have differences in the epistemological
38
39 importance they give to the truth claims of science and religion. How might
40
41 these implicit assumptions make themselves apparent in their approaches to
42
43 the teaching of science and how might we be able to distinguish between
44
45 different interactions? Before suggesting a possible means by which this may
46
47 be achieved, I have assumed that the attitudes individual teachers are
48
49 expressions of the meanings they themselves use, as "sensitive people trying
50
51 to feel at home in the "real" world." (Dahlin 2001, p. 453; also Kozoll and

Osborne 2004). Thus this phenomenologically informed approach is an attempt to construct a diagnostic tool to gauge to what extent science/religion occupies a formative position in the lives of these teachers and the influence it might exert on their teaching. If a pre-service primary teacher's attitude has an 'epistemic' dimension, then it becomes integral in shaping the individual's whole thinking, not just in a mere cognitive sense when considering unambiguously scientific or religious issues, but also their morals and values. However, if their attitude is 'pragmatic', science and/or religion may be viewed as very successful and important 'tools' for humanity to solve problems and improve its well being, with little or no meaningful impact on the way they conduct their life. If two similar dimensions are constructed for an individual's religious and scientific frames of mind and drawn orthogonally, (see figure 1) then a point on this two dimensional scale would represent an individual's religio-scientific framework.

Deleted: merely

[insert figure 1 about here]

From the questionnaire it would appear that a proportion of pre-service primary teachers could be positioned in the upper-left quadrant ('epistemic' religion-'pragmatic' science). These are respondents for whom science and religion should necessarily be kept separate, religious commitment is strong and vital, science is important but its role is to help us technically and solve problems some, such as environmental degradation, for which it may have been partly responsible in the first place.

From the questionnaire, it would appear that very few of our pre-service primary teachers would populate the upper-right quadrant ('epistemic' religion-
'epistemic' science) of figure 1, as only seven of the 92 respondents viewed scientific and religious integration as a meaningful enterprise.

Where might the remaining pre-service primary teachers reside? Due to the indecisive nature of many of their responses, one might suggest that they may be clustered about the cross-over point. Is this where we should also locate the atheistic and unscientifically minded pre-service primary teacher? Not necessarily so, from the questionnaire, there were no significant differences found for respondents who indicated no religious commitment and those whose religious commitments are strong. One task of the interviews is therefore to identify how the views of pre-service primary teachers who have no personal religious commitment can be accommodated within a religio-scientific framework.

Part 2. Interviews

There are two stages in the interpretation of the interview data. Firstly, to identify a range of views as to the nature and purpose of science education and secondly, to then give examples of interviewees using the different religio-scientific frameworks and evidence of its ability to discriminate between pre-service primary teachers' approaches to the teaching of science.

1
2 Nature and purpose of science education: Many of the pre-service primary
3
4 teachers see their duty and the role of science education as the didactic
5
6 transference of knowledge and skills, both to act as the foundation for future
7
8 transferable life-skills but also to satisfy their pupils' natural inquisitiveness. It
9
10 would be remiss of teachers (some would go as far as to say negligent) not to
11
12 enable all their pupils to become more cognisant of themselves and the world
13
14 they inhabit. Here is an example from Kim.

15
16
17
18
19 **KIM**: It is important for children to understand the world
20 around them and how it works, because the world largely
21 does go by scientific principles. But not just to give
22 them a better understanding of the world around them, but
23 also of their body - how their body works - nutrition
24 etc. It's important that they're taught about these
25 things from an early age - to get a level of
26 understanding that they can build on.
27

28
29
30
31 For Lucy, unlike some other subjects, it's also democratic and accessible to
32
33 all.

34
35
36
37
38 **LUCY**: It's also one of the few subjects - not like
39 numeracy and literacy, where the focus is on teaching
40 ability groups - that gives you the opportunity to teach
41 mixed ability groups and that gives children more
42 opportunities to excel, because it's not just about
43 writing and arithmetic. So if you've got some children
44 who are not brilliant at numeracy or literacy, then they
45 have a chance to do something practical that they can be
46 good at.
47

48
49
50 The value of a primary science education for these pre-service teachers
51
52 therefore goes beyond just enabling children to learn more scientific facts and
53
54
55
56
57
58
59
60

1
2 skills, but also addresses foundational issues which, as Tracy points out,
3
4 might not be addressed anywhere else but in the science class.
5
6
7

8
9
10 TRACY: In my opinion, science is what explains the world
11 and everything comes down to science. Science gives
12 children an appreciation of just what is around - they
13 can't just neglect it, they can't ignore what's
14 happening.
15

16
17 These pre-service primary teachers are therefore willing advocates for their
18 pupils to learn about science. Most of the reasons given are unquestionably
19 utilitarian but, for some, the teaching of science also enables primary-aged
20 children to engage in a broader educational discourse. Can any variation be
21 at least, in part, explained by the religio-scientific framework of the teacher?
22
23
24

25
26
27 Examples of various frameworks will now be described, as well as evidence of
28 their influence on the interviewees' approach to the teaching of science.

KELLY: I think we tend to categorise science as fact and religion as more “airy-fairy” and not factual, and I think we’ve got our understanding of science and religion a bit wrong. Neither of them is all about facts, a lot of science is just hypothesis and speculation and a lot of religion is as well. When we’re teaching both science and religion we need to be very, very careful giving constantly just fact, fact, fact, but more ideas and discussion. The two are more interrelated than you think, because it’s all about understanding the world around us – that’s what science and religion are all about... They can have similar views on things, but put in slightly different ways. Sometimes they contradict, but not all scientists say the same things, so it’s a very complex issue.

This epistemic equality does appear to influence the way Kelly approaches her science teaching, with an openness that allows a religious engagement with scientific topics, which doesn’t threaten the legitimacy of the scientific conclusions that might be reached by the pupils.

KELLY: I’ll give an example, in looking at the Earth, Moon and the solar system; you could bring in how ideas in religion have influenced their study and how scientific understanding has changed and how people from different religions have viewed the world, so there’s definitely room for mix and match.

For Claire, religion is epistemically of greater significance. This is not to say that scientific ways to knowing are unimportant, just that they are directed by a religious worldview.

Deleted: ologi

Deleted: dominant

Deleted: , with all other ways to knowing, including science, subservient

CLAIRE: I’m actually a Quaker and they integrate science as part of the religion. In Quaker statement of belief, they say that you can draw inspiration from the sciences. If you want someone who sees a clash between science and

1
2 religion, then I'm the wrong person because I don't have
3 a clash. I can't think of a religion that is any more
4 relaxed!
5
6

7
8 As science informs Claire's fundamental beliefs, so her approach to science
9
10 teaching would allow for her pupils to have a more personalised engagement
11
12 with issues.
13
14

15
16
17 **CLAIRE:** My personal view is that everybody should be
18 curious about the world around them... There are also
19 deeper things that are more general, say you were talking
20 about social responsibility and behaviour, then that
21 would go into environmental and health education - drugs
22 use in science. It helps tackle the deeper side of
23 things; it's more about you, more personal, you don't
24 have to read a book to get an answer, it's more about
25 looking inside you.
26
27

28 29 ii) Examples of 'epistemic' religion-'pragmatic' science frameworks

30

31 For three of the interviewees, Kim, Karla and Tracy the role and limits of
32 scientific knowledge are clear and well defined.
33
34

35
36 **KIM:** I personally believe that God created the world and
37 that science is part of that world... The human body is
38 just an incredible thing - it's so amazing the way that
39 it works, that I think that it can't just be to chance
40 and evolution, there must be something higher acting on
41 it; there must be something more going on than just
42 chance.
43

44
45 **KARLA:** In science, certain things have to happen to
46 facilitate other things, but as to the deeper meaning of
47 why something happens, you would probably have to look
48 more towards religion and faith.
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 There is the acknowledgment, even by the agnostic Tracy, that a religious
4 sense of knowing also serves an ontological function.
5
6
7
8

9 TRACY: I have real problems with a lot of religion, purely
10 because I know everything can be explained in certain
11 ways... What I can't understand, which is where religion
12 comes in, is the mystery, and ~~...~~ that could be brought in
13 for a deeper, soul-type explanation of the world.
14
15

Deleted: the magic

Deleted: ..

16 This appreciation of alternative ways of viewing appears to allow a non-
17 dogmatic approach to science teaching.
18
19
20
21

22 KIM: Whatever you teach children, they should be given the
23 chance to decide whether they accept, reject or believe
24 it. They have to have it presented to them in a way to
25 accept or reject it. **What's your role in that process?** Letting them
26 know this is what science is about, and from the start to
27 present it in a way that is not biased, so that from the
28 start they have got that open-mindedness themselves, so
29 that as they develop as people and grow older into
30 teenagers and adults, that's when they can then maybe
31 make proper informed decisions.
32
33
34

35 Their role is therefore to be an unbiased facilitator, presenting science
36 objectively, with the children making up their own minds as to the relative
37 importance of the scientific knowledge presented.
38
39
40
41
42

43 KARLA: As a teacher it is important to try and present
44 children with the known facts, and to try not to put our
45 own views into things if we can and remain one step
46 removed from what we're teaching... I have always been
47 aware that we cannot say with absolute certainty about
48 anything we know in the known world is what we know so
49 far. **Are you as conditional with everything you teach, or just in science?** I
50 would probably like to think that I keep an open mind
51 about all sorts of things - certain things where there is
52
53
54
55
56
57
58
59
60

1
2 an element of human opinion - we should always keep an
3 open mind.
4

5 TRACY: I actually think that children should have access
6 to information to give them the opportunity to challenge
7 what they believe. I don't think you should grow up just
8 believing what your parents have told you, I think you
9 should challenge the world. If you challenge it and still
10 come to the same conclusions, then OK. You should at
11 least have access otherwise who else is going to give it
12 to you? If you're not going to get the scientific
13 explanation on certain things at school, where else are
14 you going to get it from, and I feel, as a teacher, it is
15 my responsibility.
16

17 18 19 iii) Example of a 'pragmatic' religion-'epistemic' science framework

20
21 Only one of the pre-service primary teachers interviewed, Lucy, appears to
22 use this framework. For Lucy science gives the individual some of the
23 necessary life-tools for rational independent thinking and decision making.
24
25 Whereas, as an atheist, religious understanding can only, at its best, enable
26
27 an individual to appreciate cultural similarities and differences to their own, at
28
29 its worst it is limiting and indoctrinating.
30
31
32
33

34
35
36 LUCY: One of my bugbears with religion is that lot of
37 religions, kind of indoctrinate their children from a
38 very early age - it's difficult to change views as you
39 get older. I don't really agree with that, I think people
40 should have a broad awareness of all the different
41 aspects of things and then come to their own conclusions.
42

43
44 When I was very small I had all these things fed to me
45 when I was at Sunday school, there is a little thing that
46 hopes there is something there really, but my scientific
47 mind thinks, no, there probably isn't. Do you see it like that; do
48 you have a 'scientific mind'? Yes, I definitely think so... I have
49 read quite a few books that look back over where some of
50 the Bible stories came from, looking at the historical
51 facts, and I find that fascinating! It kind of put my
52 mind at rest; I can see now that there are historical
53
54
55
56
57
58
59
60

1
2 happenings that could explain lots of these events that
3 are written about in the Bible, and I can understand how
4 people would write them in stories in order to pass them
5 on. Are you rationalizing in a logical way the genesis of those stories? Yes
6 definitely, and that's a reference to my own beliefs.
7
8
9

10 For Lucy, her role as teacher - especially in science - is to empower her
11 pupils' through giving them access to the knowledge and skills they might
12 need for equality of decision making and opportunity later in life - no matter
13 the religious heritage of the child.
14
15
16
17

18
19
20
21 LUCY: I've got a child, and I would like to think that she
22 would grow up being able to make her own decision about
23 things and hopefully, whatever decision she makes, as
24 long as she has a good reason for it, I would be able to
25 support that. I would like to think all children have
26 that opportunity.
27
28

29
30 Lucy appears to be aware of the potential difficulties such an attitude might
31 cause when teaching areas of the curriculum such as sex education. She is,
32 however, very clear as to what her approach would be.
33
34
35

36
37 LUCY: It's the duty of the teacher, to give the children
38 the knowledge and the skills to make their own decisions
39 about things... Sex education is an area where religion
40 impacts on science, and I, personally, don't think that's
41 fair, but then I suppose I should respect the parents'
42 views and religious beliefs. I would try to persuade the
43 parents, because I feel the outcome of not giving them
44 everything might have a negative impact on those
45 children's lives.
46
47

48 iv) Examples of 'pragmatic' religion-'pragmatic' science frameworks

49
50

1
2 Two of the interviewees, Charles and Dawn can be placed in this framework
3
4 but their impacts are strikingly different.
5
6
7
8

9
10 For Charles, both science and religion are sets of facts and skills one is
11 obliged to know *about* rather than learn *from*. This obligation is carried into his
12 approach to the teaching of science, where the content and rationale of a
13 directed National Curriculum determines why and what science is taught.
14
15
16
17
18
19

20
21 **CHARLES:** You have to teach science - it's in the National
22 Curriculum - you have to teach it, so you don't have a
23 choice. You see what I mean, when I say science is like a
24 religion, people believe in it, but it is what everyone
25 is made to believe now, and it does seem a shame to have
26 to teach it, but it is a fact and we know it is the truth
27 - we believe it is the truth. We think that they have to
28 know it, and the government think they do. Do they have to
29 know it? No they don't.
30
31

32 For Dawn, religious and scientific understandings are both useful for probing
33 the diverse nature of peoples and the physical world they inhabit. This
34 pragmatism is reflected in her approach to science teaching which focuses on
35 the utility of scientific enquiry.
36
37
38
39
40
41

42
43 **DAWN:** I think religion isn't just about someone's belief
44 in God, it's so much more about the way people live... I
45 think of religion as a way into worldliness.

46 You can't answer any children's questions - even about
47 simple things - dinosaurs, the planets, ideas drawn from
48 their toys and play - without science. You can start
49 their thinking, by taking their curiosity in a
50 directional way and make them realise that they can be
51 curious about something, you can research something and
52 then get the answer, so learning the process of thinking.

Conclusions & Implications

It would appear to be possible to assign a religio-scientific framework to each of the pre-service primary teachers interviewed and, furthermore, to relate differences in their approach to the teaching of science to their framework.

Deleted: conceptual

Deleted: conceptual

Zeidler [et al.](#) (2002) found differences in the extent to which students' compartmentalized scientific knowledge versus personal knowledge and opinion. Although certain students viewed scientific knowledge as that which is supported by concrete evidence and facts, Zeidler found that they would not consider the use of scientific evidence to convince other people to change their personal opinions. This would chime with a 'pragmatic' religion-'pragmatic' science framework as exemplified by Charles and Dawn, for whom the teaching of science is requisite, but see their role as purveyors of knowledge and skills, rather than advocates of how their pupils might make use of them.

Deleted: conceptual

This arms-length attitude is the direct opposite to those pre-service primary teachers, like Lucy, who see scientific knowledge and skills as essential in allowing an individual to make informed life-choices. Those who use a 'pragmatic' religion-'epistemic' science framework see it as their duty to teach their pupils the science they need to know, no matter their background.

Deleted: conceptual

The pre-eminence of scientific dogma would be rejected by those whose teaching is informed by an 'epistemic' religion-'pragmatic' science framework.

Deleted: conceptual

Pre-service primary teachers such as Kim, Karla and even the agnostic Tracy accept (like all the interviewees) that the teaching of science is necessary and useful but see their role as non-judgemental sources of information but how their pupils' use the scientific knowledge they gain and the scientific skills they develop will be ultimately be mediated by their individual circumstances.

This *laissez-faire* attitude to the usefulness of scientific knowledge would be seen by those teachers who use an 'epistemic' religion-'epistemic' science framework as an opportunity missed. Science is valuable as the means to acquire a deeper and richer appreciation of our physical and material world but also as *one* possible way to examine metaphysical issues. Kelly and Claire might disagree as to the authority that should be given to scientific truth-claims (Lake 2005), but both approach the teaching of science as a potentially life-changing, life-enhancing subject.

Deleted: conceptual

Formatted: Font: Italic, No underline

The implications for teacher education are therefore significant. Teacher educators need to be aware of the personal religio-scientific framework that, in part, governs trainees' and their own (Nyhof-Young 2000) approaches to the teaching of science. For many pre-service primary teachers will have a strong sense of the context of their own beliefs and attitudes in relation to science and religion (Jackson et al. 1995). These may well be based on ideas which have become congenial and trustworthy, and any new ideas that might be

Deleted: conceptual

Formatted: No underline

1
2 introduced as part of a teacher education programme might elicit one of two
3 possible defensive reactions; the recontextualisation of their learning to suit
4 their predispositions (Cobern 1993), or heightened scepticism of any new
5 approach as it is seen as an attempt at indoctrination (Jackson et al. 1995,
6 Roth and Alexander 1997, Shipman 2002). Teacher educators need therefore
7 to be responsive to the diverse nature of the approaches their trainees will
8 have to the teaching and learning of science and not deny the fact that for
9 some there is a *de facto* connection of some scientific conceptions to morals
10 and values; and as Cobern (2000) suggests be made part of the instructional
11 process. How this is to be done is beyond the scope of this study, but will form
12 the basis of future investigations.
