Making of an Asia-Pacific High-Tech Hub

Reflections on the Large-Scale Business Site Development Projects of the Osaka City and the Osaka Prefecture

Dr. Ari-Veikko Anttiroiko, Adjunct Professor
Department of Regional Studies, University of Tampere
FIN-33014 University of Tampere, Finland
E-mail: Ari-Veikko.Anttiroiko@uta.fi

First received: August 2005

Accepted: July 2007

Osaka City and Osaka Prefecture introduced several large-scale business site and technopole development projects in the 1980s and 1990s, which appeared to be failures. This development was designed by the politico-administrative establishment of Osaka area in order to claim their share of anticipated global economic growth. The case of Osaka suggests that business site developments need to be built on premises that match the requirements of global knowledge economy. In 2000s Osaka started to create more balanced strategy and a new vision, in which Osaka as a knowledge intensive lifestyle city is the centre of interaction of the Kansai region.

10 La ville et la préfecture d'Osaka ont lancé dans les années 1980 et 1990 d'importants projets
11 de développement de sites industriels et de technopoles qui semblent avoir été voués à
12 l'échec. Ces travaux avaient été conçus par les instances politico-administratives d'Osaka qui
13 demandaient leur part de la croissance économique globale escomptée. Le cas d'Osaka laisse
14 à penser que les projets de développement de sites industriels doivent être réalisés dans des
15 conditions qui correspondent aux exigences de l'économie globale de la connaissance. Dans
16 les années 2000, Osaka a commencé à élaborer une stratégie plus équilibrée ainsi qu'une
17 vision nouvelle où la ville en tant que cité de la connaissance se trouve au centre des
18 interactions actions de la région de Kansai.

42
43

44 Die Stadtverwaltung und die Präfektur von Osaka führten in den achtziger und
45 neunziger Jahren mehrere umfangreiche Entwicklungsprojekte für Gewerbegebiete
46 und Technologiezentren durch, die offenbar gescheitert sind. Die Entwicklung wurde
47 von der etablierten politischen Verwaltung des Gebiets Osaka ins Leben gerufen,
48 um einen Anteil am erwarteten weltweiten Wirtschaftswachstum geltend zu machen.
49 Der Fall Osaka legt nahe, dass die Entwicklung von Gewerbegebieten auf
50 Prämissen gründen muss, die an den Anforderungen der weltweiten
51 Wissenswirtschaft ausgerichtet sind. Im ersten Jahrzehnt des 21. Jahrhunderts
52 entwickelte Osaka eine ausgeglichene Strategie und neue Vision, in der Osaka als
53 wissensintensive Lifestyle-Stadt im Mittelpunkt der Wechselwirkungen in der Kansai-
54 Region steht.

Consideraciones sobre los proyectos de desarrollo en zonas comerciales a gran escala en la ciudad de Osaka y la Prefectura de Osaka

Dr. Ari-Veikko Anttiroiko

La ciudad de Osaka y la Prefectura de Osaka introdujeron varios centros comerciales a gran escala y proyectos de desarrollo de tecnopolos en los ochenta y noventa, que parece que fracasaron. Este desarrollo fue diseñado por la clase dirigente político-administrativa de la zona de Osaka con el objetivo de reclamar su participación en el crecimiento económico global anticipado. El caso de Osaka indica que los desarrollos de zonas comerciales necesitan ser construidos en lugares que se adaptan a las necesidades de la economía global del conocimiento. En los primeros años del nuevo milenio Osaka empezó a crear una estrategia más equilibrada y una nueva visión, en la que Osaka como ciudad con un estilo de vida que demanda mucho conocimiento es el centro de la interacción en la región de Kansai.

Creating a business site that is able to attract global flows of ideas, knowledge, people and capital and even to become a trend-setting high-tech hub has been a dream of urban and regional developers for decades. Such sites of innovation and industrial development are in most cases results of consciously designed development policies, varying from purely private real estate investments to public-private partnership-based developments to university-based science parks and further to science cities initiated by central governments. (Cf. CASTELLS and HALL, 1994.)

This article discusses technopolitan planning or high-tech-oriented business site development, i.e. deliberate attempts to plan and promote, within a concentrated area, the creation of innovation, technopreneurship and technologically innovative production (CASTELLS and HALL, 1994; KOMNINOS, 2002; ANTTIROIKO, 2004). Special attention is paid to the role of synergy between government, business and universities and of innovation governance in large-scale high-tech and internationally oriented business site development projects. The empirical section presented here comprises three business site development projects in Osaka area or Kansai in Japan: Technoport Osaka, Rinku Town and Kansai Science City.

2. Methodology

In this article conventional case study methodology is applied. The empirical case description is based on official documents and websites of Osaka City and Osaka Prefecture and their selected departments and project organisations. These are supplemented by interviews with

1
2
3 officials of the city and prefectural governments of Osaka (ITO, 2004b; SAITO, 2004;
4
5 NAKAMURA, 2004; HAYAMI, 2004; TAKE, 2004; YOSHIDA, 2004; TATSUMI, 2006a)
6
7
8 and focussed e-interviews with academics (MORI, 2005; KAMO, 2006; SHIKATANI and
9
10 NAJIMA, 2006) and administrators (MIYAZAKI, 2006; TATSUMI, 2006b; NAKAMICHI,
11
12 2006). Study visits by the author to Osaka took place in July 2001, June 2003, January 2004
13
14 and July 2006.

20 3. Perspectives on high-tech business site development 21 22 23

24 Large-scale business site development projects may be referred to as ‘megaprojects’ as most
25
26 of them have been based on huge public investment. As to the concept of a *megaproject*,
27
28 suffice it to say that they usually refer to large-scale infrastructure investments, such as
29
30 railways, big bridges, airports and the like. Why this article does not discuss the large-scale
31
32 business site developments within a genuine megaproject framework is because the interest
33
34 here is directed more to the institutional synergy and high-tech-related aspects of urban-
35
36 regional development policy rather than actual project management issues. Nevertheless,
37
38 megaproject analyses as such reveal many aspects that can be applied to business site
39
40 developments in Osaka too, such as occasional strategic ‘misrepresentations’ in the
41
42 motivation of the projects, misleading cost estimates and related cost overruns and a
43
44 secondary role given to the actual usefulness and functionality of the infrastructure or service
45
46
47
48
49
50
51 itself.
52
53
54
55
56
57
58
59
60

1
2
3 Analysing business site-related megaprojects in Osaka area could be based on conventional
4 *business park management* with a property management perspective or more focussed theory
5
6 of *science park management*, but both of them are insufficient for the purposes of this study
7
8 (On the science park management assessment paradigm see CABRAL, 1998). The issue of
9
10 high-tech business site development is discussed here as a meso level policy issue, with
11
12 special reference to triple helix collaboration. Thus, to broaden the perspective the
13
14 framework applied is built upon selected contextual, institutional and managerial elements,
15
16 which are illustrated in Figure 1.
17
18
19
20
21
22
23
24
25
26
27
28

[FIGURE 1 SOMEWHERE HERE]

29
30 The idea of a triple helix reflects the expansion of the role of knowledge in society and of the
31
32 university in economy (ETZKOWITZ, 2002). An institutional setting formed by
33
34 governments, universities and business has been identified as a critical element of national
35
36 and regional development. It brings together three institutional contexts and their complex
37
38 interrelations. Governments' dilemma in the setting is to find best ways to facilitate
39
40 interaction between these three sectors in order to create synergy and competitiveness in
41
42 global knowledge economy. (ETZKOWITZ et al., 1998; SUTZ, 1997; ETZKOWITZ and
43
44 LEYDENSORFF, 1997.)
45
46
47
48
49
50

51 What is essential in the functioning of triple helix is the increased complexity of organising
52
53 the work and relations of participating institutions. The model itself does not work properly if
54
55 any of the key actors does not possess the capability and power to play its role effectively
56
57
58
59
60

1
2
3 (SAAD, 2004). The construction of a triple helix includes the creation of institutions for the
4
5 production and transmission of knowledge. The creation of intermediary offices, joint
6
7 ventures, science parks and other interface mechanisms has raised a new set of issues about
8
9 the role of different institutions and academia in particular in knowledge-oriented urban-
10
11 regional development policy. (ETZKOWITZ et al., 1998; CASTELLS and HALL, 1994.)
12
13

14 However, the triple helix model itself goes beyond the simple idea of institutional mediation.

15
16 In an ideal sense the triple helix model improves the conditions for innovation and
17
18 entrepreneurship in a knowledge-based society by (a) assigning the universities a more
19
20 prominent role in innovation, (b) facilitating collaborative relationships among the three
21
22 institutional spheres, which contributes to integrated innovation policy, and (c) encouraging
23
24 each institutional sphere to assume the role of the other in order to improve their performance
25
26 and to create fruitful soil for cross-sectoral collaboration.
27
28
29
30
31

32
33
34 At a general level the triple helix developments in different parts of the world tend to
35
36 converge into a common format: the process starts from a government-dominated model,
37
38 evolves towards the model of separate institutional spheres, and develops further towards the
39
40 model of overlapping institutional spheres, the latter being referred to as Triple Helix III.
41
42

43 (ETZKOWITZ, 2003.)
44
45

46
47
48 The primary perspective on megaprojects in Osaka in this article is based on this framework,
49
50 with a special view of the development policies of local and regional governments, regional
51
52 innovation system governance, the creation of innovation milieu, and the nature of
53
54 university-business-government collaboration.
55
56
57
58
59
60

4. Internationalisation efforts in the Osaka area

4.1. The Japanese economy and development in Osaka

The Japanese economy boomed for many decades after the World War II, due to its ability to adjust its industrial structure and performance to the requirements of opening and expanding global markets. The structure of the Japanese economy started to change due to two oil crises in the 1970s. During the high-growth period Japanese companies had invested in heavy industries, such as steel, nonferrous metals, chemicals, oil refining, shipbuilding industries and the like. In due course these industries started to lose their role as the engine of growth. It became clear that new industries should emerge to maintain the growth of the Japanese economy. Attention was paid to such emerging areas as high-tech industries and the service sector. (SUZUKI, 2004.)

The 1980s was a decade of fairly good economic performance. Everything started to change in 1989, however. What were waiting behind the corner were severe and persistent economic difficulties, which retrospectively made the 1990s look like a lost decade for Japan. In short, due to the bursting of the 'bubble economy' Japan faced the most severe economic crisis since World War II. (SAXONHOUSE and STERN, 2004; MORIOKA, 1999.)

The bursting of the bubble affected Osaka dramatically, resulting in a fall in local tax revenues, especially from the financial, securities, insurance and real estate sectors, together

1
2
3 with the slump in the manufacturing industries – such as steel, machinery, metals and
4
5 electrical equipment – that were vital to the regional economy. Many large-scale business site
6
7 projects were initiated before the bursting of the bubble, but apparently the downturn caused
8
9 hardly any changes in the policy and its implementation. As explained by Shigemori (1999,
10
11 72): “[...] in response to the hope of Kansai financial circles for an escape from the decline
12
13 of real estate prices, large projects were started, such as the construction of the New Kansai
14
15 International Airport, Rinku Town, Izumisano Cosmopolis, International and Cultural Park
16
17 City, a rapid railway, and an automobile expressway.” (On public investments in Japan, see
18
19 MORI, 1997.)
20
21
22
23
24
25
26

27 4.2. Development path of Osaka

28
29
30
31

32 In the first decades of the 20th century Osaka’s economic performance was approximately
33
34 equal to that of Tokyo. The change of balance became visible in economic terms as late as
35
36 around the 1930s. Thereafter Osaka’s relative position declined in every respect.
37

38 Traditionally, Osaka area has been a home to the textile and other light industries and to
39
40 shipbuilding, as well as to iron- and metal-casting factories. These industries and textiles in
41
42 particular were important in the pre-war era, making Osaka the heartland of the nation’s
43
44 industrialisation, a ‘Manchester of the Orient’, as they used to say. Yet, many of these
45
46 industries became obsolete in the post-war years. (KAMO, 2000.)
47
48
49
50

51
52
53 The Osaka area got a new strategy in the 1980s, emphasising internationalisation and high-
54
55 tech development. This happened during the same period when Tokyo’s pre-eminence as a
56
57
58
59
60

1
2
3 global city and a national pride was becoming more visible than ever (see MASAI, 1989). It
4
5 is illuminating how the Nakasone administration proposed in the Fourth National
6
7 Comprehensive Development Plan in 1987 to enhance the world city functions of Tokyo in
8
9 order to create a locus in Japan that was able to serve as a centre of the global economy. This
10
11 policy was criticised by the establishment of the Osaka and wider Kansai area for
12
13 understandable reasons. The counter-policy created in the Kansai area was based on an idea
14
15 that Tokyo should share some of the world city functions with Kansai. Some of the huge
16
17 projects, such as Kansai International Airport and Kansai Science City, were the outgrowth
18
19 of this process. (KAMO, 2000.)
20
21
22
23
24
25
26

27 Since the mid-1980s Kansai's development boosted with the help of a deliberate high
28
29 investment strategy, even to the extent that the total scale of development projects in the area
30
31 surpassed those in the Tokyo area in terms of the assumed amount of investment. This gave
32
33 reason even to speak of a 'Kansai Renaissance'. Everything changed due to the bursting of
34
35 the bubble economy in the early 1990s, however. The economic degeneration of Kansai area
36
37 was exceptionally severe. In fact, Kansai's situation turned out to be the worst in the nation.
38
39 (KAMO, 2000.)
40
41
42
43
44
45

46 4.3. Internationalisation strategies 47 48 49

50
51 Osaka's policies toward internationalisation started to flourish in the 1980s and continued to
52
53 the next decade. One of the cornerstone was "The General Development Plan for the 21st
54
55 Century" approved in 1990 by the Osaka 21st Century Association, financially backed up by
56
57
58
59
60

1
2
3 the Osaka City, Osaka Prefecture and local companies (BORJA and CASTELLS, 1999). This
4
5 was supplemented by “The Basic Guideline for the Promotion of Internationalisation of
6
7
8 Osaka – Osaka Contributing to the Global Society”, formulated by the Osaka Prefectural
9
10 Government in May 1992. It expressed Osaka’s long-term vision for the early part of the 21st
11
12 century. (OSAKA PREFECTURAL GOVERNMENT, 2003.)
13
14

15
16
17 The main lines of the development policy of Osaka City are close to those adopted by Osaka
18
19 Prefecture: *internationalisation and high technology*. The City reacted to the global challenge
20
21 by drafting in 1997 guidelines for internationalisation of Osaka. One part of this plan was
22
23 ‘International exchange city’, which aimed at promoting intercity economic networking
24
25 arrangements with eight cities of the Asia-Pacific. The city government constructed in the
26
27 first half of the 1990s the Asia and Pacific Trade Centre (ATC) in order to provide a basis for
28
29 such exchange and business on Japanese soil. This policy reflects the fact that import to and
30
31 export from other Asian countries is higher in Kansai than what it is in average in Japan.
32
33
34
35
36 (KAMO, 2000.)
37
38

39
40
41 Let us now take a closer look at the large-scale business site development projects of Osaka
42
43 City and Osaka Prefecture which were established to make the Osaka area an attractive
44
45 internationally-oriented high-tech hub in the Asia-Pacific.
46
47
48

49 50 51 5. A glance at three megaprojects 52

53 54 55 5.1. Megaproject number one: Technoport Osaka 56 57 58 59 60

1
2
3
4
5
6 In the Osaka Bay Area there are three manmade islands, built by the city government as the
7
8 site for growing international business, or as stated by the developers of the area, as a site for
9
10 “people, goods and money”. This huge project is known as the *Technoport Osaka*, which was
11
12 introduced in the heyday of the bubble economy in 1988 based on an anticipated yearly
13
14 growth rate of 4%. The purpose was to build and develop three manmade islands in the port
15
16 of Osaka, in Suminoe ward, each having a special role: *Sakishima* island was to become a
17
18 centre of international trade, *Maishima* a sports island and *Yumeshima* mainly a residential
19
20 island. The area was to form a new centre of international and domestic business
21
22 (NINOMIYA, 1992). The project focused on three strategic areas: international trade,
23
24 advanced information and communication facilities, and leading-edge technological
25
26 developments. The total budget at that time was astronomic 2.2 trillion yen.
27
28
29
30
31
32
33

34 A final decision on the Technoport Osaka Project was made by the Osaka City Council,
35
36 which gave its approval to the project in the comprehensive development plan of the city of
37
38 1990. Concrete operations were managed by different bureaus of the city government, the
39
40 Port and Harbour Bureau having the main responsibility by providing land for three artificial
41
42 islands and constructing one of the high-rise buildings in the area, the Cosmo Tower. (ITO,
43
44 2004a; SAITO, 2004.)
45
46
47
48
49

50 Sakishima island in the district known as Nanko was under construction for decades and was
51
52 completed in the mid-1980s. It is the most important of the three artificial islands. As a
53
54 business site development it centres around Cosmosquare, in which the landmark and symbol
55
56
57
58
59
60

1
2
3 of the area is the *Osaka World Trade Center Building* or ‘Cosmo Tower’, inaugurated in
4
5 April 1995. Cosmo Tower houses the activities of World Trade Center Osaka (WTCO), but
6
7 most of the building is used by the city government. It was originally designed to be 150 m
8
9 high, but due to the competition between it and the Rinku Tower of Osaka Prefecture, its
10
11 height was increased to 256 m with 55 storeys, resulting in a considerable increase in
12
13 construction costs (ITO, 2004b). Two other major facilities established by Osaka City are
14
15 one of the largest international exhibition centres of Japan, *INTEX Osaka*, which was opened
16
17 in the mid-1980s, and *The Asia and Pacific Trade Centre* (ATC) with two facilities: the 12-
18
19 storey International Trade Mart (ITM) and the amenity zone known as O’s. ATC was opened
20
21 in April 1994.
22
23
24
25
26
27
28

29 There are also various other buildings, facilities and attractions on the island. Business
30
31 support and research organisations operating there include Osaka International Business
32
33 Promotion Center (IBPC Osaka), Incubator for Multimedia Industry Osaka (iMedio),
34
35 Multimedia Advanced Development Organization (MADO) and Osaka Visual Media
36
37 Support Center. Major companies operating in Cosmosquare District include IBM Japan,
38
39 Sumitomo Life Insurance, the Nomura Research Institute, Hitachi Zosen, NTT DoCoMo
40
41 Kansai, Fujisawa Pharmaceutical and many others. Beside these, there are still harbour
42
43 activities, ferry terminals and warehouses in the bay area, the largest wharf areas located in
44
45 Sakishima island.
46
47
48
49
50
51
52

53 In spite of all the huge investments made by the Osaka City Government, local companies
54
55 did not find the area attractive enough, as there is neither local demand nor sufficient
56
57
58
59
60

1
2
3 agglomeration of business in the area (SAITO, 2004). Furthermore, it was even less attractive
4
5 from the point of view of international companies. It became a 'maritime edge city' or a
6
7 waterfront business district with a few half-empty buildings and vacant lots. It still suffers
8
9 from a fairly long distance to the city centre as perceived by local customers and business
10
11 people.
12
13

14
15
16
17 Only 6 % of the land planned to be sold on Sakishima island was actually sold, which left the
18
19 area full of vacant lots. At the time of its opening some 33% of the space of the WTC were
20
21 occupied, but the number of private sector tenants diminished considerably by the end of
22
23 1999. The result was that the city government placed some of its own departments in the
24
25 Cosmo Tower, which gave it an ironic nickname 'the second city hall of Osaka'. As the
26
27 organisations affiliated to the City of Osaka occupy most of the office space of the building,
28
29 the WTC became a financially unviable enterprise and a source of a huge deficit to the city
30
31 government. Similarly the ATC never attracted the international wholesale companies as
32
33 expected, which turned it eventually into a rather conventional shopping centre, with three
34
35 storeys in the building reserved for just one Japanese furniture retail company Otsuka/iDC.
36
37 Eventually both the WTC and the ATC went through a "special mediation" between city
38
39 government and creditors, which resulted in long-term business and financial plans and
40
41 renegotiation of loans. This rearrangement was approved by the Court in the early 2004
42
43 (MORI, 2005).
44
45
46
47
48
49
50
51
52

53 5.2. Rinku Town

54
55
56
57
58
59
60

1
2
3 Rinku Town was a flagship project of the Osaka Prefecture. It was built for the purpose of
4
5 utilising the close proximity of the Kansai International Airport, which was supposed to
6
7 generate a lot of new businesses, indirectly from increased international exchanges and
8
9 directly from services related to the airport activities.
10
11

12
13
14
15 The idea of Rinku Town arose in the years of booming business and globalisation of
16
17 economy. The story began in the late 1970s, when feasibility studies were conducted with
18
19 regard to reclaiming land on the opposite shore of the *Kansai International Airport* (KIX).
20
21 The airport itself was built on a manmade island; work started in September 1994.
22
23
24

25
26
27 The planning of Rinku Town began in the early years of the 1980s, under the name South
28
29 Osaka Coastal Development Project. 'Rinku' was adopted as a nickname for the project in
30
31 1987. The Rinku Town project outline was made public in 1989. Around that time the total
32
33 costs of this ambitious project had already risen from 170 to 550 billion yen. What was then
34
35 envisioned was a coastal high-profile business attraction housing high-tech firms and
36
37 financial institutions, making it a kind of Wall Street of Osaka region. As said, much of all
38
39 these hopes rested on the attractiveness of the international airport, which eventually proved
40
41 to be an illusion.
42
43
44

45
46
47
48 The critical phase was the lot sale outline, which was made public in April 1990. In
49
50 December in the same year corporations had been accepted for location on 15 lots. Yet, by
51
52 1992 most of these companies had encountered difficulties due to economic turmoil, which
53
54 first led to delays in entering the area and then finally to total withdrawal from the project.
55
56
57
58
59
60

1
2
3 By the mid-1990s it had become clear that the project had faced enormous difficulties. A
4 review of the income and expenditure was made, resulting significant changes in the plans.
5
6 The total project costs were raised from 550 to 740 billion yen. The development period was
7
8 extended to 2012. Another review of income and expenditure was made at the end of the
9
10 decade, in which the project costs were reduced from 740 to 643 billion yen. Later in 2001
11
12 this figure was slightly reduced, to 620 billion yen together with the extension of the
13
14 development period to 2025.
15
16
17
18
19

20
21
22 In its present form Rinku Town, even if it includes some modern high-rise buildings, gives
23
24 an impression of a beautiful but deserted and lifeless suburban business site on the
25
26 waterfront. Rinku Town was built around *Rinku Gate Tower Building* or Rinku Tower with
27
28 55 storeys above the ground, making it the highest building (256 m) in Western Japan
29
30 together with Cosmo Tower in the Osaka Bay Area. It was built to provide intelligent office
31
32 space and related facilities mainly for international business. However, business did not want
33
34 to locate in the coastal area near the airport, but was attracted by the central business district
35
36 of the City of Osaka and the adjacent areas. Another important point is that the railway
37
38 connections to Rinku Town are not frequent enough by Japanese standards.
39
40
41
42
43
44

45
46 Rinku Town was born in the heyday of the bubble economy in the last years of the 1980s.
47
48 After the bursting of the bubble around 1992, private corporations cancelled their initial
49
50 contracts with Rinku Town. A business site that was to become a symbol of the
51
52 internationalisation and IT boom for Osaka Prefecture, in a year or so became a place that
53
54 had lost hope for the future. (see NAKAMURA, 2004; HAYAMI, 2004.)
55
56
57
58
59
60

1
2
3
4
5
6 The future of Rinku Town is uncertain. Investments have been made and the bill for the
7
8 project is to be paid. It will be a long process, which means that the prefectural government
9
10 will have prolonged financial difficulties. A recent move to improve the situation has been
11
12 the rehabilitation of Rinku Gate Tower Building Company in April 2005 under the
13
14 Corporation Reorganisation Act. This aimed at improving the company's financial standing
15
16 on the basis of the formal agreement between creditors, shareholders and other parties
17
18
19
20 (MORI, 2005).
21
22
23

24 5.3. Kansai Science City and Tsuda Science Hills 25 26 27 28

29 Another ambitious project in which Osaka Prefecture has been involved is Kansai Science
30
31 City, established in collaboration between the prefectures of Osaka, Kyoto and Nara. It is a
32
33 wide development area around Keihanna Hill surrounded by cities of Osaka, Kyoto, and
34
35 Nara. This is why it is sometimes called Keihanna Science City.
36
37
38
39

40
41 Kansai Science City consists of six cities and two towns in all, spreading through the three
42
43 abovementioned prefectures. It was meant to be a pilot model city for the 21st century with
44
45 facilities for advanced academic research, information centres, international exchange and
46
47 the development of cutting-edge technology. The idea of the new model city arose in the late
48
49 1970s. A study committee chaired by Azuma Okuda, former President of Kyoto University,
50
51 was established in 1978. The Association of Kansai Science City was established in 1983,
52
53 and the other key coordinating institution, the Kansai Research Institute, was established in
54
55
56
57
58
59
60

1
2
3 1986. All the necessary plans and official actions were taken in the first half of the 1980s by
4
5 the prefectures, followed by discussions with and decisions of national government. The
6
7 Kansai Science City Promotion Act was passed in 1987, making it a national project with
8
9 special tax incentives, followed by the approval of the construction plans by the central
10
11 government in the following year (CASTELLS and HALL, 1994). The cultural and scientific
12
13 exchange facility known as Keihanna Plaza (in Kyoto), was opened in April 1993.
14
15
16
17
18
19

20 The objectives of this huge project were ambitious, reflecting a high sentiment that Kansai
21
22 region needed to develop a new hub equipped with advanced educational and R&D facilities
23
24 in order to take a role in the development of global high-profile academic activities and
25
26 related value-adding functions. Another characteristic feature of the project was the high
27
28 importance attached to culture in the original plan of the science city. It was to become a hub
29
30 of both cultural and scientific research. Eventually, however, the bursting of the bubble
31
32 economy and the following prolonged stagnation of the Japanese economy resulted in severe
33
34 setbacks in its realisation. Due to this unfortunate turn some aspects of its policies were
35
36 revised in the latter half of the 1990s. (ANTTIROIKO, 2004.) Several educational and
37
38 research institutions are spread over the area of the science city. In a nutshell, these include
39
40 six national and municipal institutes, some private institutes and research centres, and six
41
42 universities and colleges.
43
44
45
46
47
48
49
50

51 There are three cultural and scientific research districts in the Osaka side of the science city:
52
53 Himuro-Tsuda, Kiyotaki-Muroike and Tawara. The Himuro-Tsuda district of Kansai science
54
55 city is for promotional purposes usually referred to as *Tsuda Science Hills*. It is about 25 km
56
57
58
59
60

1
2
3 from Osaka and 15 km from Kyoto. Tsuda Science Hills aimed to form a center of research
4 and development through the gathering of research and educational facilities in the wide field
5
6 of technology. In this respect the most important institutes of the site are Ion Engineering
7
8 Center Corporation (IECC, opened in July 1990) and its affiliate known as the Ion
9
10 Engineering Research Institute Corporation as well as the Institute of Free Electron Laser
11
12 Graduate School of Engineering of Osaka University, opened in April 2000. Necessary
13
14 facilities, such as restaurants, conference rooms, exhibition space and salons for common
15
16 use, are provided by Tsuda Science Center. The idea was to even expand the area when
17
18 certain conditions were met. However, conditions never reached the level that was
19
20 satisfactory for such an expansion. Actually, the area has hardly reached a sufficient level of
21
22 functionality.
23
24
25
26
27
28
29
30
31

32 What characterises the development efforts of Kansai Science City is that in contrast to most
33
34 other science cities it attempts an inter-municipal and multi-nucleus scheme which is based
35
36 on 12 Culture and Scientific Research Districts linked by transportation and information
37
38 networks. Yet the reality looks rather different than what is presented in the science city
39
40 blueprint, for Kansai Science City is hard to reach, lacks broadband cable infrastructure and
41
42 suffers from a poor environment for social interaction and from an absence of a rooted
43
44 community (STEWART, 2001). The other core element was originally the significance of
45
46 private sector involvement in the project, which did not materialise the way the developers
47
48 expected. (ANTTIROIKO, 2004. On Kansai Science City, see CASTELLS and HALL,
49
50 1994.)

57
58
59
60

6. Analysis of large-scale business site development projects in Osaka

The bursting of the bubble economy and the stagnation that followed in Japan were certainly decisive factors that caused severe problems for the megaprojects of Osaka City and Osaka Prefecture. Yet bad luck with timing and economic conjunctures are not enough to explain all the problems discussed in previous chapters. Rather, the explanation needs to be sought from the political leadership and the administrative culture, on the one hand, and from the very nature of the megaprojects themselves, on the other.

6.1. Public investments and one-dimensional growth image

The development efforts in Osaka concentrated on constructing premises and facilities, which evidently was not a sufficient condition for attracting businesses or industries in the area. This is what the case of Osaka shows clearly (SAITO, 2004). A likely explanation is that politicians and developers in Osaka relied on too rosy a 'growth image' which was rooted in such universal symbols of success as Wall Street and Silicon Valley, flavoured with rhetoric on the internationalisation of business, high-tech production and financial services. These dreams guided the vision, but they were not accompanied by analyses of the premises and dynamics of real-life mechanisms and developments. In the strategy-making process local conditions were given a marginal role vis-à-vis global growth images and trends. In addition to this, the urban-regional political forces that in principle had a potential to counter the dominance of exogenously inspired economic growth targets, simply legitimised and catalysed this growth strategy. (Cf. MOULAERT and SEKIA, 2003.) The result was that

1
2
3 such aspects of high-tech business site development as growth mechanisms and global
4
5 market integration were given insufficient attention (cf. KOH et al., 2005).
6
7

8
9
10 Projects like Rinku Town and the World Trade Center Osaka at the Osaka Bay Area lacked
11
12 the kind of milieu that would have attracted high-tech and knowledge-intensive firms and
13
14 created a growing agglomeration of high-tech and innovation activities. It is self-evident that
15
16 these megaprojects suffered from bad timing, but this cannot be used as an excuse of the lack
17
18 of sensitivity to global trends and the logic of the location of high-tech businesses and
19
20 advanced business services.
21
22
23

24
25
26 This explanatory scheme boils down to a new version of the growth machine thesis in the
27
28 Japanese context (see LOGAN and MOLOTCH, 1987). First, these high-profile development
29
30 projects were quite similar to uncompetitive public works projects aiming at building
31
32 impressive facilities without sufficient management capacity and realist assessment of the
33
34 numbers of users of the facilities, leading eventually to rising running costs and maintenance
35
36 problems and also to a decrease in the attractiveness of the site. This phenomenon is
37
38 cynically called in Japanese “hakomono gyosei”, a syndrome of egoistic administration.
39
40
41 (SAMURA, 2004.)
42
43
44
45

46
47
48 Second, the other side of the Osakan growth machine is an active and powerful business
49
50 community. Construction companies and property owners and other influential
51
52 representatives of the business community seemed to pursue their short-term business
53
54 interests through public development policies, which resulted in real estate-oriented business
55
56
57
58
59
60

1
2
3 site construction projects at the expense of serious innovation milieu development. This has a
4
5 connection to the national development policy, for in a wider picture, it was the central
6
7 government that over-invested in development projects. (KAMO, 2000.) It goes without
8
9 saying that such a one-dimensional approach neither encouraged a careful consideration of
10
11 the growth conception nor the means for sustainable growth (see e.g. SAVITCH and
12
13 KANTOR, 2003).
14
15
16
17
18
19

20 6.2. Defective triple helix

21
22
23

24 Japanese universities have traditionally been insulated from the market forces that feature
25
26 prominently in the new mode of knowledge production. They used to seeing this issue
27
28 against the principle of academic freedom, which has caused some inertia in the evolution of
29
30 triple helix connections (KAMO, 2006). Moreover, the Ministry of Education used to
31
32 emphasise that national universities conform to ministerial guidelines rather than show
33
34 academic entrepreneurship, which created a natural control-orientation to the government-
35
36 university relationship. In fact, it has been claimed that the national conformity and
37
38 underdeveloped university-industry linkages have continued to cause tensions arising when
39
40 local and regional authorities have promoted science parks, technopolises and science cities,
41
42 educational institutions ostensibly as their core component. (LOW, 1997.) Even if the
43
44 attitudes have been changing in this respect, university-industry linkages do not work as
45
46 smoothly as they should. This is evident in Tsuda Science Hills, in which the triple helix
47
48 connections have in many respects remained underdeveloped.
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 In a usual case the university side of triple helix rests in Japan on the individual professors
4 participating in policy networks or certain policy-making committees. One well-known
5
6 exception to this rule is Tohoku University, which had a decisive role in establishing triple
7
8 helix connections in Tohoku area, much influenced by Dr. Junichi Nishizawa, who was the
9
10 President of the university from 1990 to 1996. The same entrepreneurial spirit has
11
12 characterised the university's strategies in the 2000s. (JIANG et al., 2006.) Kansai area is a
13
14 multi-polar region with many renowned universities, but its triple helix system remained
15
16 fragmented. (KAMO, 2006.) Consequently, some individual distinguished universities, such
17
18 as Osaka University or Kyoto University, have for long time had close connections to
19
20 businesses, but some others, like small universities with a Buddhist background in Kyoto,
21
22 have not actively contributed to the functioning of the triple helix or to regional development.
23
24 In all, the universities' impact on regional high-tech development and internationalisation of
25
26 Kansai area has been modest. Part of the explanation is "hakomono gyosei", for in the
27
28 booming economy developers considered it sufficient to built luxurious facilities, without
29
30 knowledge networks, innovation milieu or active participation of universities. The very same
31
32 syndrome made the projects "faceless", causing a lack of managerial and entrepreneurial
33
34 capacity in the management of these new facilities. (NAKAMICHI, 2006.) Even if path
35
36 dependency kept the policy much on the same track after the collapse of the bubble economy,
37
38 this picture has gradually started to change (TATSUMI, 2006).
39
40
41
42
43
44
45
46
47
48
49
50
51
52
53
54
55
56
57
58
59
60

When assessed within the triple helix framework, it seems that megaproject management in Osaka reflected the Triple Helix I model, which emphasises the role of government as a key organiser and mediator. In fact, we may claim that none of the key elements of the ideal

1
2
3 triple helix model were fully developed in Osaka. First, *universities* were not given a
4 prominent role in any of the high-profile business site development projects. Second,
5 megaprojects were not based on *cross-sectoral collaborative relationships* but on a “growth
6 machine” orientation, which highlights the role of the real estate business and its connections
7 to the urban-regional governance system. In such a model regional innovation policy is seen
8 as an outcome of a prescription from government and partly also an internal development
9 within industry, rather than that of interactions among three major institutional spheres.
10
11 Third, it seems that institutional spheres are only slowly taking each other’s roles in the case
12 of Osaka, which suggests that there is a long way to go before the full realisation of the
13 Triple Helix III model. Thus, we may reasonably conclude that megaprojects in Osaka were
14 developed in the context of defective triple helix. (On the problems of triple helix initiatives
15 in regions with poor structural preconditions, see e.g. JENSEN and TRAGARDH, 2004; see
16 also ETZKOWITZ, 2003.)
17
18
19
20
21
22
23
24
25
26
27
28
29
30
31
32
33
34
35

36 There is need to emphasise that much has happened since the early 2000s. The budget
37 funding for universities has continued to decline and competition among universities
38 intensified due to budget constraints and demographic trends. Concrete signs of change
39 include a new evaluation system established in the early 2000s. That is the time when
40 university-business-government collaboration was taken explicitly onto the national agenda.
41
42 For example, the Conference for the Promotion of Collaboration among Business, Academia
43 and Government sponsored by the Japanese Government has been held yearly since 2002.
44
45 There are also measures that are designed to directly promote academic entrepreneurship,
46 such as providing funding for approved Technology Licensing Offices (TLOs) on the basis
47
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 of the 1998 Law on Promoting Technology Transfer from Universities to Industry, which
4 aimed at encouraging university-based venture start-ups. The legal status of national
5 universities changed in 2004 into that of independent public corporations, which may also
6 encourage entrepreneurship. (MIYAZAKI, 2006.) These changes are expected to change
7 Japanese universities and their external relations in many ways. However, it seems that
8 especially a higher degree of flexibility, spontaneity and entrepreneurship is needed to make
9 the Japanese triple helix function optimally.
10
11
12
13
14
15
16
17
18
19
20
21

22 6.3. Benchmarking high-tech centres in Japan 23 24 25 26

27 Prolonged stagnation in regional development in Osaka has partly been due to the fact that it
28 is difficult to create a boom in a sluggish national economic context. Yet, even in such a
29 situation there were also cases that were considered to be at least relatively successful, which
30 are worth describing here to provide comparisons to the case of Osaka.
31
32
33
34
35
36
37
38

39 A good case of a Government-sponsored high-profile science city project is Tsukuba Science
40 City, which was the first Asian science city, and has maintained its position through hard
41 times mainly due to the location of national R&D institutes in the city and continuous
42 support from national Government (ANTTIROIKO 2004, 409; CASTELLS and HALL,
43 1994). This is the feature that makes it very different from the case of Kansai Science City.
44
45
46
47
48
49
50
51
52

53 In the area of local and regional innovation policy even the much criticised national
54 Technopolis Plan originating in the early 1980s helped cases like Hamamatsu in Shizuoka
55
56
57
58
59
60

1
2
3 Prefecture to gain a reputation as a successful technopolis. It started in the late 1990s to
4
5 create an internationally competitive optical industry cluster by integrating new optical
6
7 technology in the automotive and machinery industries. ‘Reinventing triple helix’ has been a
8
9 visible part of Hamamatsu’s recent development policy. Suffice it to say that the Technopolis
10
11 Plan itself was more or less like swimming against the tide and was eventually terminated in
12
13 1998. (SUZUKI, 2004; cf. PARK, 1997.) In fact, Tohoku and a number of other Japanese
14
15 cities and regions have shown innovativeness and determination in their cluster policies and
16
17 emerging triple helix collaboration.
18
19
20
21
22
23

24
25 In recent years Japan’s pride in regional development has been Toyota City in Aichi
26
27 Prefecture, the “Motown of Japan” or the “Detroit of the Far East”. At the heart of the Toyota
28
29 phenomenon is Toyota Motor Corporation and its headquarters in Toyota City, which
30
31 epicentres a network of twelve manufacturing plants and supplier facilities located within a
32
33 30 km radius. It has been estimated that some 3/4 of adults in the area work for Toyota or its
34
35 suppliers. What is essential here is that the development of Toyota City is not a result of local
36
37 or regional development policy. The city government, however, has been very sensitive to
38
39 Toyota’s needs, starting from the change of the name of the city of Koromo in 1959 into
40
41 Toyota. Toyota City represents a case of a “headquarters city” dominated by one of the
42
43 world’s largest companies, which started to create a regional cluster around it. Not only
44
45 Toyota City, but also other major cities in Aichi prefecture have continued to thrive. The
46
47 capital of Aichi Prefecture is Nagoya, Japan’s fourth largest city. It had a low profile until
48
49 recent years, for it followed a more cautious and low-profile policy during the bubble
50
51 economy than let’s say Osaka. In general, Aichi Prefecture has shown signs of above-average
52
53
54
55
56
57
58
59
60

1
2
3 success and attracted increasing attention from experts and developers from Japan and
4
5 abroad. (Cf. JACOBS, 2002.)
6
7
8
9

10 These examples suggest that the source of recent regional success in Japan have been based
11
12 mainly on strong support from central government, productive triple helix collaboration or
13
14 the involvement of exceptionally successful global companies. In this comparison Osaka's
15
16 strategy was different from these as it was mainly a large-scale public investment strategy
17
18 that ignored to some extent the development of internal dynamism, which as a whole became
19
20 counter-productive after the burst of the bubble economy and the following stagnation.
21
22
23
24
25
26

27 7. Searching for success in Osaka in 2000s 28 29 30 31

32 After encountering persistent problems with megaprojects, both the City of Osaka and the
33
34 Prefecture of Osaka started to make the necessary changes in their policies in order to cure
35
36 their budgetary deficits and to fine-tune their development policies. The national policies
37
38 supported this turn by leaving the technopolis-scheme behind and focussing more on the
39
40 promotion of venture business and support for triple helix linkages (SUZUKI, 2004). The
41
42 strategic focus remains to become an Asian trade hub with close connections especially to
43
44 China and Korea.
45
46
47
48
49

50 The Osaka Bay Area is persistently developed and promoted by providing land for
51
52 manufacturing and other functions. Sakishima island and its Cosmosquare waterfront area are
53
54 in the focus of these efforts. Cosmosquare is currently planned to become a 24-hour lifestyle
55
56
57
58
59
60

1
2
3 zone which is attractive for research-based business and university-industry collaboration.
4
5 The central government designated Cosmosquare a Priority Urban Redevelopment Area in
6
7
8 2002. In addition, the City of Osaka incorporated Cosmosquare into its Urban Revitalisation
9
10 Programme of 2003. The idea is to build upon such unique features of the island as its
11
12 waterside location and various leisure facilities, in which Osaka may seek inspiration from
13
14 places like Dubai, Barcelona or Singapore. (OSAKA CITY URBAN REVITALIZATION
15
16 TASK FORCE, 2004.)
17
18
19

20
21
22 Even if Osaka may be regarded as an “industrial city” rather than a “capital exporter” or
23
24 “command-and-control centre” like Tokyo, Taipei or Seoul in the functional city system in
25
26 Asia (cf. MARCOTULLIO, 2004), it seems to be firmly on its way towards becoming a
27
28 knowledge intensive lifestyle city. Osaka’s failure to take a quick grasp of the global
29
30 economic development is now turning into a more balanced strategy. One expression of these
31
32 efforts is an attempt to better combine urban planning and development with industrial
33
34 promotion, of which the establishment of the *Office of Urban Revitalization and Promotion*
35
36 is a good sign, as pointed out by Director Yasuo Tatsumi (2006a).
37
38
39
40
41
42

43
44 Osaka’s new policy was formulated in the previously mentioned revitalisation plan of 2003,
45
46 which identifies three targets: to promote intellectual business, to ensure attractive urban
47
48 development and to develop cultural and touristic activities. Maybe the most important new
49
50 development project that resembles earlier megaprojects is the redevelopment of the freight
51
52 yard next to JR Osaka Station. Such an undeveloped area at the heart of the city centre,
53
54 similar to what Shiodome was in Tokyo, is unique and provides a great opportunity for urban
55
56
57
58
59
60

1
2
3 developers. The area is planned to become the centre of interaction of the Kansai region,
4
5 surrounded by big cities and various high-tech and business centres, including Cosmosquare
6
7 and Rinku Town. These ideas became a bold and innovative Knowledge-Capital Project
8
9 which was launched in 2005. This time the location is on the side of developers, but whether
10
11 they pay sufficient attention to the creation of an innovative milieu, triple helix and growth
12
13 mechanisms remains to be seen.
14
15
16
17
18
19

20 8. Conclusion

21
22
23

24 Osaka City and Osaka Prefecture have had ambitious plans to develop the city and the region
25
26 with strong support from the business community. Close links with political and business
27
28 elites may be seen as a strength but they have also led to problems, which were seen in the
29
30 form of excessively speculative investments in business site development projects.
31
32
33
34
35

36 What we may learn from the case of Osaka is that in large-scale business site development
37
38 projects risk assessment and cost-benefit analyses should always play a role. Another
39
40 message is that if the site is intended to attract high-tech and knowledge-intensive activities
41
42 and international companies in particular, such projects cannot be based on a conventional
43
44 property-oriented business park concept, for it is not attractive enough from the point of view
45
46 of leading IT firms. Osaka seemed to become trapped, for it was not able to provide cheap
47
48 labour, but it also failed to develop a well-functioning innovation milieu resulting in a weak
49
50 position in the global competition of high-tech centres. Insufficient integration of spin-offs
51
52 and startups into the new sites made them even less attractive to IT firms. Thus, the rhetoric
53
54
55
56
57
58
59
60

1
2
3 in the cases of Rinku Town and Technoport Osaka was about high-tech business site
4
5 development, but the reality was about property-based business parks. The problems of
6
7 Tsuda Science Hills resembled this style to some extent, but had also special problems in
8
9 logistics, telecommunications and institutional synergy.
10
11

12
13
14
15 What is stated above implies that the fewer elements of innovation milieu and local synergy,
16
17 the less the site has to offer knowledge-intensive firms. We may also hypothesise that this
18
19 feature makes the difference in times of economic downturn, for it is critical innovation
20
21 activities and advanced business services that have in recent decades proved to be vital for
22
23 sustainability in high-tech centres. Due to deficiencies in its innovation milieu and the
24
25 functioning of triple helix, Osaka did not have the capacity for focused 'micro-restructuring',
26
27 which partly resulted in weakening prospects in regional development. As there are new
28
29 elements in the regional development policy in Osaka, it remains to be seen how much
30
31 developers in Osaka have learned from these lessons and what the Asia-Pacific high-tech hub
32
33 in Kansai will look like after ten years or so.
