Abstract

The infrared spectrum of $^{13}\text{C}_2\text{HD}$ has been investigated by high-resolution Fourier transform infrared spectroscopy. A large number of ro-vibrational transitions in the spectral region $1000\text{--}6600\text{ cm}^{-1}$ have been recorded and assigned. This paper is focused only on the vibrational bands involving pure stretching, stretching-bending or stretching-stretching modes. In total, 78 bands have been identified and assigned, 29 related to ν_1 (CH stretch), 27 to ν_2 (CC stretch), and 22 to ν_3 (CD stretch). The data pertaining to each stretching mode have been fitted simultaneously in order to obtain accurate sets of rotational and vibrational parameters for the excited states.

1. Introduction

In our previous paper on $^{13}\text{C}_2\text{HD}$ [1] we pointed out that, among the possible isotopologues of acetylene, this one had been poorly investigated. Indeed, only two experimental works were published on $^{13}\text{C}_2\text{HD}$ [2,3]. The $\nu_5 \leftarrow \text{GS}$ and $\nu_3 \leftarrow \text{GS}$ fundamentals, with band origins at 674.229 and 2547.589 cm^{-1} , respectively, and the $\nu_3 + \nu_4 \leftarrow \nu_4$ and $\nu_3 + \nu_5 \leftarrow \nu_5$ hot bands, with origins at 2533.281 and 2544.843 cm^{-1} , respectively, were detected [2]. In Ref. [3] only the $\nu_1 \leftarrow \text{GS}$ was analysed. The study of the high-resolution infrared spectra up to 2100 cm^{-1} was reported in Ref. [1]. The analyzed bands involved various combinations of bending states only. From the final fit, a large set of rotational and vibrational parameters was obtained. In this paper, the stretching and stretching-bending transitions up to the overtone region around 6600 cm^{-1} are considered. A few bands involving stretching-stretching modes are also reported. All these data have been analyzed and a number of rovibrational parameters characterising the excited states have been determined with great accuracy.

2. Experimental details

1
2
3 The details about the syntheses of the $^{13}\text{C}_2\text{HD}$ isotopically
4 enriched sample were given in Ref. [1].
5
6

7
8 The spectra were recorded in the region between 900 and
9
10 6650 cm^{-1} using a Bomem DA3.002 Fourier transform
11 spectrometer equipped with a Globar source, a KBr
12 beamsplitter, and HgCdTe and InSb detectors. The resolution
13 ranged between 0.006 and 0.010 cm^{-1} . Several hundred scans
14
15 (up to 1000) were co-added in order to improve the quality
16
17 of the spectra. The pressures ranged between 1 and 10 Torr
18
19 and the optical pathlength was either 8 or 10 meters.
20
21

22 The spectra were calibrated by means of CO_2 and H_2O lines as
23
24 reported in [4]. Occasionally, spectra of $^{13}\text{C}_2\text{H}_2$, present as
25
26 an impurity, were also used. All the spectra, namely the
27
28 spectra of this work and of Ref. [1], were recorded within
29
30 a couple of months from receiving a fresh sample.
31
32
33

34 The wavenumber precision of the spectra is about 0.3×10^{-3}
35
36 cm^{-1} , the wavenumber accuracy is about $0.5 \times 10^{-3} \text{ cm}^{-1}$ [4].

48 **3. Results and discussion**

49 **3.1 Analysis of the data**

50
51 The spectrum of $^{13}\text{C}_2\text{HD}$ in the region between 1000 and 6650
52
53 cm^{-1} is dominated by the fundamental CH and CD stretching
54
55 bands around 3300 and 2500 cm^{-1} , respectively, and by their
56
57
58
59
60

1
2
3 first overtone and combination transitions. The CC
4 stretching band is centred around 1808 cm^{-1} . A large number
5
6 of overtone and stretching-bending combination bands
7
8 associated to these transitions could be detected and a
9
10 total of 78 bands were analysed. They are collected in
11
12 Table 1, together with the symmetry of the vibrational
13
14 states involved in the transitions, the band centre, the
15
16 observed range of J'' values for the various subbands, the
17
18 number of fitted and assigned lines and the RMS error
19
20 resulting from the simultaneous least-squares analysis
21
22 described below.

32
33
34
35

36 In Fig. 1, an overview of the spectral region between 4900
37
38 and 6600 cm^{-1} is shown, while in Figs. 2 and 3 some details
39
40 about the recorded infrared spectrum are illustrated. The
41
42 intensity pattern shown in fig. 1 is consistent with the
43
44 intensities measured for $^{12}\text{C}_2\text{HD}$ (see table 2 of Ref. [5]).

50 [insert Figs. 1 to 3 about here]
51
52
53

54 Initially, the transition wavenumbers for each band were
55
56 fitted separately to the upper state ro-vibrational
57
58
59
60

parameters, in order to check the correctness of the assignments and to extend the data set. The data were analysed using the basic Hamiltonian of a linear molecule, with distortion corrections up to high power in the rotational angular momentum. For the transitions involving doubly degenerate states, the ℓ -doubling energy contributions containing q_v and q_v^J coefficients were included in the model.

The ro-vibrational energy term values are given by

$$T^0(v, J) = G_c^0(v) + B_v J(J+1) - D_v [J(J+1)]^2 + H_v [J(J+1)]^3 + \dots \mp \frac{1}{2} \{ q_v [J(J+1)] + q_v^J [J(J+1)]^2 \} \quad (1)$$

with the - and + signs related to the e and f levels, respectively, and the centre energy $G_c^0 = G_v^0 - B_v k^2 - D_v k^4$, with G_v^0 the pure vibrational term value and $k = \ell_4 + \ell_5$.

The band centre is defined as

$$\nu_c = G_v^0 - B_v k^2 - D_v k^4 - (G_{v''}^0 - B_{v''} k^2 - D_{v''} k^4) \quad (2)$$

where G_v^0 and $G_{v''}^0$ represent the purely vibrational energy of the upper and lower states.

1
2
3 Identical unitary weights were assigned to all the
4
5 transitions, except for the overlapped or very weak lines,
6
7 which were given zero weight. The values of the
8
9 spectroscopic parameters of the lower states were kept
10
11 constrained. Those for the ground state were determined
12
13 from the simultaneous fit of ground state combination
14
15 differences calculated using P and R transitions of the ν_4
16
17 and ν_5 bands. The values for the $\nu_4 = 1$, $\nu_5 = 1$, $\nu_4 = 2$, $\nu_4 =$
18
19 $\nu_5 = 1$ and $\nu_5 = 2$ states, were obtained from the fits of the
20
21 corresponding bands from the ground state.
22
23
24
25

26
27 The analysis described above revealed that some bands are
28
29 affected by perturbations. They will be described in the
30
31 next section.
32
33

34 Once this procedure was completed, the wavenumbers relative
35
36 to a specific stretching mode and to all its overtone, hot,
37
38 and combination bands were fitted together. In this way, we
39
40 obtained three independent fits, and therefore three sets
41
42 of spectroscopic parameters, for the three stretching
43
44 modes.
45
46

47
48 The data were fitted to the following expressions, where
49
50 the vibrational and rotational diagonal contributions are
51
52 $G^0(\nu, l)$ and $F(\nu, l, J)$, respectively.
53
54
55
56
57
58
59
60

$$\begin{aligned}
G^0(v,l) = & \sum_{i=1,5} \alpha_i^0 v_i + \sum_{i \leq j} x_{ij}^0 v_i v_j + \sum_{b \leq b'=4,5} g_{l_b l_{b'}}^0 l_b l_{b'} + \sum_{i \leq j \leq m} y_{ijm}^0 v_i v_j v_m + \sum_{i,b \leq b'} y_i^{l_b l_{b'}} v_i l_b l_{b'} \\
& + \sum_{i \leq j \leq m \leq n} z_{ijmn} v_i v_j v_m v_n + \sum_{i \leq j, b \leq b'} z_{ij}^{l_b l_{b'}} v_i v_j l_b l_{b'}
\end{aligned} \quad (3)$$

$$\begin{aligned}
F(v,l,J) = & \left[B_0 - \sum_i \alpha_i^0 v_i + \sum_{i \leq j} \gamma_{ij}^0 v_i v_j + \sum_{b \leq b'=4,5} \gamma^{l_b l_{b'}} l_b l_{b'} + \sum_{i \leq j \leq m} \varepsilon_{ijm} v_i v_j v_m + \sum_{i,b \leq b'=4,5} \varepsilon_i^{l_b l_{b'}} v_i l_b l_{b'} \right] \\
& [M - k^2] - \left[D_0 + \sum_i \beta_i^0 v_i + \sum_{i \leq j} \delta_{ij}^0 v_i v_j + \sum_{b \leq b'} \delta^{l_b l_{b'}} l_b l_{b'} + \sum_{i \leq j \leq m} \theta_{ijm} v_i v_j v_m + \sum_{i,b \leq b'=4,5} \theta_i^{l_b l_{b'}} v_i l_b l_{b'} \right] \\
& [M - k^2]^2 + \left[H_0 + \sum_i h_i v_i \right] [M - k^2]^3
\end{aligned} \quad (4)$$

Vibrational and rotational l -type resonance contributions are expressed by off-diagonal matrix elements containing the following parameters (see Table 1 of Ref. [6]):

$$r_{45} = r_{45}^0 + r_{45}^J M, \quad (5)$$

$$q_t = q_t^0 + q_{tt} v_t + q_{tt'} v_{t'} + q_t^J M + q_t^{JJ} M^2 + q_t^k (k \pm 1)^2, \quad (6)$$

$$\rho_t = \rho_t^0 + \rho_{tt} v_t + \rho_{tt'} v_{t'} + \rho_t^J M \quad (7)$$

and ρ_{45}^0 .

Moreover, the r , q , and ρ parameters for the energy levels involving one quantum of a stretching mode v_s ($s = 1, 2, 3$) in addition to the excitation of the bending modes, are given by the expressions

$$q_{st} = q_{st}^0 + q_{stt}v_t + q_{stt'}v_{t'} + q_{ss't}v_s v_t + q_{st}^J M, \quad (8)$$

$$\rho_{st} = \rho_{st}^0 + \rho_{st}^J M, \quad (9)$$

$$r_{s45} = r_{s45}^0 + r_{s45}^J M, \quad (10)$$

$$\rho_{s45} = \rho_{s45}^0, \quad (11)$$

with $M = J(J+1)$ and $t, t' = 4$ or 5 .

The stretching-stretching combination bands, $\nu_1 + \nu_3 \leftarrow \text{GS}$ and $\nu_2 + \nu_3 \leftarrow \text{GS}$ with associated hot bands, $\nu_2 + \nu_3 + \nu_4 \leftarrow \nu_4$ and $\nu_2 + \nu_3 + \nu_5 \leftarrow \nu_5$, were fitted separately. All the parameters related to the $\nu_s = 1$ ($s = 1, 2, 3$) states in eqs. 3 and 4, i.e. $\omega_s^0, x_{ss'}^0, \alpha_s^0, \beta_s^0$, etc., were constrained to the values reported in tables 2 to 4.

Identical unitary weights were assigned to all the transitions, except for lines of very weak bands, which were given a 100 times reduced weight, or overlapped lines, which were given zero weight. In addition, transition wavenumbers that differed from the corresponding calculated values by more than a chosen limit (0.001, 0.002, or 0.01 cm^{-1} , depending on the band) were excluded from the last cycle of the least squares procedure.

1
2
3 In the simultaneous fits the ground state and the pure
4 bending state parameters were held fixed to values obtained
5 from a previous analysis of the bending states up to $\nu_4 + \nu_5$
6
7
8
9
10
11 = 3 [1].

12
13 The choice of the refined parameters in each simultaneous
14 fit was dictated by the structure of the data set. Because
15 of the lower number of excited vibrational states analysed,
16
17
18
19
20
21
22
23

a smaller number of constants of the ν_2 band system could be
determined, compared to ν_1 and ν_3 . Particular care has been
devoted to the refinement of additional parameters, since
they must: a) correspond to lower-order ones previously
refined, b) be statistically determined, c) improve the
quality of the fit. The adequacy of the Hamiltonian model
adopted was tested by comparing the results of the
simultaneous analysis to those achieved in the single band
fits mentioned above.

The parameters obtained in the simultaneous fits are listed
in tables 2 to 5. They are statistically well determined
and, in most cases, with low internal correlation.

[insert tables 2 to 5]

1
2
3 For most of the parameters the estimated uncertainties are
4 several orders of magnitude smaller than their values. The
5 least precisely determined ones are some higher order
6 constants, ϵ_3^{55} , β_3^0 , and δ_{13} , whose uncertainties are about 30%
7 of their values.
8

9
10 The ro-vibrational parameters characterizing the stretching
11 modes in tables 2 to 4 can be compared with those of $^{12}\text{C}_2\text{HD}$
12 (see tables 2 to 4 in Ref. [7]). Since the number of
13 excited states investigated is larger for $^{13}\text{C}_2\text{HD}$ than for
14 $^{12}\text{C}_2\text{HD}$, fewer parameters were determined for $^{12}\text{C}_2\text{HD}$, lacking
15 in particular higher order corrections. In addition, the
16 choice of the refined parameters is slightly different for
17 the two isotopologues. However, most of the corresponding
18 parameters are comparable in magnitude, uncertainty and
19 sign, and follow the expected trend for isotopic
20 substitution. This is particularly true for the lower order
21 constants, x_{st}^0 , α_s^0 , q_{st}^0 , ρ_{st}^0 , r_{s45}^0 , ρ_{s45}^0 , whose values differ in the
22 range 2-20% for the two isotopologues.
23
24

25
26 The centre term values, G_c^0 , of all the vibrationally
27 excited states involved in the analysed transitions have
28 been collected in table 6. They can be compared with those
29 of $^{12}\text{C}_2\text{HD}$ (see table 5 in Ref. [7]). A comparison between
30 the term values of the first excited state of the

45
46

47 **3.2 Perturbations**

48
49 The rovibrational structure of a few bands shows evidences
50
51 of the effect of perturbations. The mostly affected bands
52
53 are $2\nu_3 \leftarrow \text{GS}$ (see fig. 3) and $\nu_2 + \nu_3 \leftarrow \text{GS}$, which show
54
55
56
57
58
59
60

1
2
3 increasing residuals in the fit, approximately from $J' \geq 10$
4
5
6 and $J' \geq 18$, respectively.
7

8 Although both vibrational and ro-vibrational (Coriolis)
9 perturbations can occur, the following discussion is
10 limited to purely vibrational resonances. In such a case,
11
12 the interacting states must be of the same symmetry, Σ^+ in
13 this case. Therefore, only combinations of pure stretching
14 modes or stretching and bending modes with an even number
15 of bendings are allowed.
16
17

18 The $2\nu_3 \leftarrow$ GS band origin ν_c is about 5049 cm^{-1} . Possible
19
20 interacting states are $\nu_1 = \nu_2 = 1$ (calculated $G_c = 5120$
21
22 cm^{-1}) and $\nu_3 = \nu_4 = 1, \nu_5 = 3, \ell_4 = 1, \ell_5 = -1$ (calculated G_c
23
24 $= 5030 \text{ cm}^{-1}$). The combination of two stretching modes is
25 favourable from the point of view of the interaction
26 Hamiltonian, H_{40} compared to H_{50} of the bending-stretching
27 combination, but less favourable from the point of view of
28 the energy. It is possible to estimate an order of
29 magnitude of the perturbation on the basis of the Nielsen's
30 parameter [8] $\epsilon = (B/\omega)^{1/2}$, where B and ω are mean values of
31 the rotational and vibrational constants, respectively. In
32 the case of $^{13}\text{C}_2\text{HD}$, where $B \approx 0.95 \text{ cm}^{-1}$ and $\omega \approx 5100 \text{ cm}^{-1}$, the
33 ratio H_{40}/H_{50} is proportional to $\epsilon^{-1/2}$, which is about 73. In
34 principle, both perturbation channels can be important but
35

57
58
59
60

1
2
3 we believe that an interaction with $\nu_3 = \nu_4 = 1, \nu_5 = 3$ (also
4 known as 3/4555) is more effective. Also, the interaction
5
6 between the $\nu_3 = 2$ and $\nu_1 = \nu_2 = 1$ states resulted to be not
7
8 relevant in a global analysis of 115 vibrational states up
9
10 to 25000 cm^{-1} in $^{12}\text{C}_2\text{HD}$ [9]. We calculated the term value
11
12 differences $\nu_3 = 1 - (\nu_4 = 1, \nu_5 = 3)$ and $\nu_3 = 3 - (\nu_3 = 2, \nu_4$
13
14 $= 1, \nu_5 = 3)$ obtaining 50 and 4 cm^{-1} , respectively. The $\nu_3 \leftarrow$
15
16 GS fundamental band is found to be unaffected by the
17
18 interaction. The $3\nu_3 \leftarrow$ GS band falls in the wavenumber
19
20 region above 6600 cm^{-1} , which is under investigation and
21
22 will be reported in a further paper.

23
24 For the $\nu_2 + \nu_3 \leftarrow$ GS band, with band origin at about 4338
25
26 cm^{-1} , the closest interacting state is $\nu_2 = \nu_4 = 1, \nu_5 = 3, \ell_4$
27
28 $= 1, \ell_5 = -1$ (calculated $G_c = 4299 \text{ cm}^{-1}$), and the
29
30 interaction term is the same H_{50} mentioned before. Again,
31
32 this interaction is labelled as 3/4555.

33
34 Another evident anomaly in the spectra concerns the $\nu_3 + \nu_4$
35
36 \leftarrow GS, centred around 3042.8 cm^{-1} . The least-squares single
37
38 band fit shows again increasing discrepancies between
39
40 observed and calculated values, with the $Q(28)$ transitions
41
42 that disappears almost completely from the spectrum. The
43
44 probable interacting state can be identified as $(\nu_4 = 2, \nu_5$
45
46
47
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 = 3, $^1\Pi$), whose origin can be calculated at 3015.34 cm^{-1} .
4
5
6 Also in this case, the interaction Hamiltonian (3/4555) is
7
8 of the H_{50} type.
9

10
11 None of the possible interacting state above mentioned has
12
13 been identified in the spectrum. This is surprising for $\nu_1 +$
14
15 ν_2 , but not entirely unexpected since this band was not
16
17 detected also for $^{12}\text{C}_2\text{HD}$ [5].

19

20 21 22 23 24 25 **4. Conclusions**

26
27 The infrared spectrum of $^{13}\text{C}_2\text{HD}$ has been studied by high-
28
29 resolution Fourier transform spectroscopy. The spectral
30
31 region investigated ranged between 1000 and 6600 cm^{-1} . A
32
33 total of 78 bands, involving the CH, CD, and CC stretching
34
35 modes, were identified, some of them showing local
36
37 resonances. The stretching fundamentals and their
38
39 associated overtones, hot, and combination bands were
40
41 analysed individually, yielding four sets of parameters.
42
43 These are the most accurate and complete available data for
44
45 $^{13}\text{C}_2\text{HD}$ and include all the first order stretching
46
47 anharmonicity constants, but x_{12} . The spectral region above
48
49 6600 cm^{-1} will be the subject of a further paper. Once more
50
51 information will be available we will attempt a global fit.

Acknowledgements

The authors acknowledge the Università di Bologna and the Ministero della Ricerca e dell'Università, PRIN 'Trasferimento di energia e di carica: dalle collisioni ai processi dissipativi', for financial support. The authors also thank Prof. G. Di Lonardo for helping during the recording and the analysis of the spectra.

TABLE CAPTIONS

Table 1. Bands of $^{13}\text{C}_2\text{HD}$ included in the least-squares fitting procedure.

Table 2. Spectroscopic parameters (cm^{-1}) of $^{13}\text{C}_2\text{HD}$ obtained from the fit of the ν_1 fundamental and its associated hot bands.

Table 3. Spectroscopic parameters (cm^{-1}) of $^{13}\text{C}_2\text{HD}$ obtained from the fit of the ν_2 fundamental and its associated hot bands.

Table 4. Spectroscopic parameters (cm^{-1}) of $^{13}\text{C}_2\text{HD}$ obtained from the fit of the ν_3 fundamental and its associated hot bands.

Table 5. Spectroscopic parameters (cm^{-1}) of $^{13}\text{C}_2\text{HD}$ obtained from the fits of the $\nu_1 + \nu_3$, $\nu_2 + \nu_3$ and its associated hot bands.

Table 6. Vibrational term values G_c (cm^{-1})^a of the observed levels involving stretching modes in $^{13}\text{C}_2\text{HD}$.

FIGURE LEGENDS

Figure 1

The infrared spectrum of $^{13}\text{C}_2\text{HD}$ between 4900 and 6600 cm^{-1} .
Experimental conditions: pressure 107 Pa, absorption path length 8 m, resolution 0.01 cm^{-1} , 230 scans.

Figure 2

a) A portion of the infrared spectrum of $^{13}\text{C}_2\text{HD}$ between 3940 and 3980 cm^{-1} . b) an expanded view of a) between 3969 and 3976 cm^{-1} . Experimental conditions: pressure 133 Pa, absorption path length 10 m, resolution 0.008 cm^{-1} , 250 scans.

Figure 3

A portion of the infrared spectrum of $^{13}\text{C}_2\text{HD}$ between 4372 and 4382 cm^{-1} . Lines marked with an asterisk belong to the perturber. Experimental conditions: pressure 1.293 kPa, absorption path length 10 m, resolution 0.008 cm^{-1} , 1000 scans.

^a In cm^{-1} . For the definition of the band centre ν_C see text.

^b σ (in cm^{-1}) corresponds to the RMS value of the residuals for the various assigned lines resulting from the simultaneous fit (see text).

^c Perturbation allowed transition.

Table 2. Spectroscopic parameters (cm^{-1}) of $^{13}\text{C}_2\text{HD}$ obtained from the fit of the ν_1 fundamental and its associated hot bands.

rms = 0.00036 cm⁻¹

^a Observed wavenumbers identified by an asterisk have not been included in the fit. Transitions identified by a dagger have been discarded because they do not satisfy the rejection limit criterion (see text).

rms = 0.00038 cm⁻¹

^a Observed wavenumbers identified by an asterisk have not been included in the fit.
Transitions identified by a dagger have been discarded because they do not satisfy the rejection limit criterion (see text).

rms = 0.00031 cm⁻¹

^a Observed wavenumbers identified by an asterisk have not been included in the fit.
Transitions identified by a dagger have been discarded because they do not satisfy the rejection limit criterion (see text).
