HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Enhancing Grid Infrastructures with
Virtualization and Cloud Technologies

StratusLab Toolkit 1.0

Deliverable D4.2 (V1.0)
15 June 2011

Abstract

The document describes StratusLab Toolkit v1.0, a full “Infrastructure as a Service” (IaaS) cloud distribution. The release is composed of a set of services, user and system administrator utilities, and tools developed and integrated by the project, such that it can be used as complete cloud solution.

StratusLab is co-funded by the
European Community's Seventh
Framework Programme (Capacities)
Grant Agreement INFSO-RI-261552.

1 Executive Summary

StratusLab provides a complete, open-source solution for deploying an “Infrastructure as a Service” cloud infrastructure. The document presents the composition of the StratusLab v1.0 distribution. The distribution is presented as a set of services, the user client utilities and the system administrator tools. Concretely, the distribution consists of Registration Web Application, Marketplace, Appliance Repository, Web Monitor, OpenNebula, OpenNebula Proxy, StratusLab OpenNebula extensions and drivers, Registration Application, Persistence Storage Application and the Claudia service manager.

2 Introduction

During the course of the first year of the project, a dozen services and client tools were developed and/or integrated to create StratusLab Toolkit v1.0. This software distribution consists of a set of user client utilities for instantiation of machine and disk images (managed through OpenNebula), virtual machine instance life-cycle monitoring, and image manipulation (creation, signing, upload to and registration to an Appliance Repository and Marketplace), as well as system administrator tools for the deployment and configuration of the services provided as part of the StratusLab distribution. The distribution consists of Registration Web Application, Marketplace, Appliance Repository, Web Monitor, OpenNebula, OpenNebula Proxy, StratusLab OpenNebula extensions and drivers, Registration Application, Persistence Storage Application and Claudia.

StratusLab v1.0 is the fifth public release, having been field tested by a number of users, inside and outside the StratusLab collaboration, which gives us the confidence that it will meet the expectations for production use.

3 StratusLab Distribution (Toolkit) v1.0

In Figure 3.1, you can see the services and components, which compose the full StratusLab solution once deployed. Grey boxes show components and services developed and/or integrated by StratusLab with the specific purpose of providing a fully functional cloud service. The white boxes show runtime dependencies installed and configured by StratusLab's installation tools. The boxes with dotted lines show external services not managed by StratusLab, but required for the connected services to function correctly. The configuration parameters for these external services are also managed by StratusLab's configuration system.

No attempt in Figure 3.1 is made to show the mapping of these services to physical resources, as this is largely left to the system administrator during configuration time.

The following list gives a brief description of the different services and components developed or integrated as identified in Figure 3.1:

Registration Web Application Provides on-site registration of users to the StratusLab service by collecting simple identification information (name, email address, etc.) as well as requiring that the user agrees to existing Acceptable Use and Security Policies. The information is kept in an LDAP server which is compatible with the StratusLab authentication services, allowing access via username/password pairs and X509 certificates.

Marketplace Serves as a searchable registry for shared machine and disk images. It is at the center of the image handling mechanisms in the StratusLab distribution.

Appliance Repository Repository that stores virtual appliances (machine and disk images).

User Command-Line Client Provides means for remote instantiation of machine and disk images via OpenNebula, virtual machine instance life-cycle monitoring and image manipulation (creation, signing, upload to and registration in the Appliance Repository and Marketplace).

Persistent Storage (iSCSI and/or NFS) Provides on-site management of persistent storage areas (à la Amazon Elastic Block Store) allowing users to create

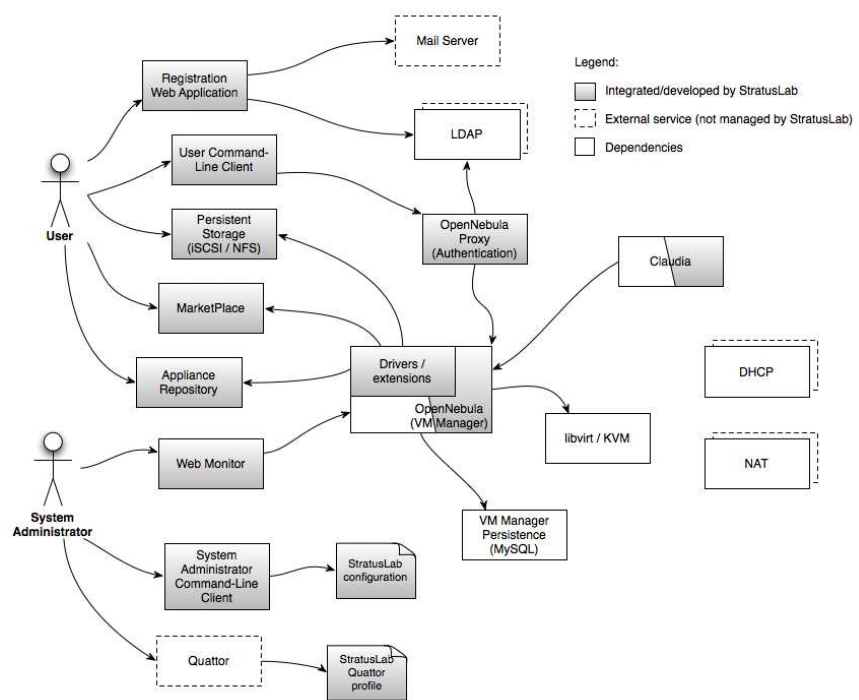

Figure 3.1: StratusLab Services and Components

disks of a given size, to launch a machine with the disks attached, and to persist the disks after their use, so that the disks are available for use by another machine instance.

Web Monitor Provides live monitoring of the state of virtual images and physical hosts in the StratusLab cloud service.

System Administrator Command-Line Client A set of utilities facilitating installation and configuration of StratusLab cloud service at a site.

StratusLab configuration Manages configuration parameters of the StratusLab cloud and external services.

StratusLab Quattor profiles A set of Quattor profiles for automated deployment and maintenance of StratusLab cloud service.

OpenNebula OpenNebula is a virtual infrastructure manager with enhancements to address the requirements of the StratusLab project, such as integration with Ganglia, fault tolerance functionality, and virtual network improvements.

OpenNebula Proxy A proxy service allowing authentication of users using range of credentials, including X509-based certificate and username/password, possibly based on LDAP service.

StratusLab OpenNebula extensions and drivers Extend OpenNebula to allow a seamless integration of services and components developed by StratusLab, for example use of virtual appliances Marketplace IDs to refer to images to be instantiated, hooks to use on-site Persistent Storage for user appliances, and a quarantine strategy to aid forensic analysis.

Claudia The Claudia platform is an advanced service management toolkit that allows service providers to dynamically control the service provisioning and scalability in an IaaS cloud. Claudia manages services as a whole, controlling the configuration of multiple VM components, virtual networks and storage support by optimizing their usage and by dynamically scaling up/down services applying elasticity rules, SLAs and business rules.

4 Conclusion

The StratusLab v1.0 distribution (toolkit) offers a set of services and components able to deliver a complete “Infrastructure as a Service” (IaaS) cloud service. A certified grid site within the European Grid Infrastructure has been deployed over a StratusLab cloud, demonstrating its completeness and stability. System administrators can also use it to expose their resources as a cloud to their users; users can then remotely and seamlessly access these resources. Concretely, the StratusLab v1.0 distribution offers:

- System administrators the means for manual and/or automated deployment and maintenance of the StratusLab-based cloud solution
- Users with the capability to instantiate machine and disk images on a private IaaS cloud, to control virtual machine instances throughout their life-cycle, and to manipulate machine and disk images (creation, signing, upload to and registration in the StratusLab Appliance Repository and Marketplace).

Subsequent versions will build on this release to provide more functionality and to improve further the robustness of the distribution.
