#### Abstract

We study certain multiple ergodic averages of an iterated functions system generated by two contractions on the unit interval. By using the dynamical coding $\{0,1\}^{\mathbb{N}}$ of the attractor, we compute the Hausdorff dimension of the set of points with a given frequency of the pattern 11 in positions $k, 2 k$.

## 1 Introduction and statement of results

Initiated by the paper of Fan Liao and Ma [FLM], the study of the multiple ergodic average from a point view of multifractal analysis have attracted much attention. The major achievements have been made by Fan, Kenyon, Peres, Schmeling, Seuret, Solomyak, Wu and et al. ([KPS11, FSW11, KPS12,

[^0]PS12a, PS12b, FSW12a, FSW12b, PSSS12]). For a short history, we refer the readers to the paper of Peres and Solomyak [PS12b].

Considered the symbolic space $\Sigma=\{0,1\}^{\mathbb{N}}$ with the metric $d(x, y)=$ $2^{-\min \left\{n: x_{n} \neq y_{n}\right\}}$. In [FLM], the authors proposed to calculate the Hausdorff dimension spectrum of level sets of multiple ergodic averages. Among others, they asked the Hausdorff dimension of

$$
\begin{equation*}
A_{\alpha}:=\left\{\left(\omega_{k}\right)_{1}^{\infty} \in \Sigma: \lim _{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^{n} \omega_{k} \omega_{2 k}=\alpha\right\} \quad(\alpha \in[0,1]) . \tag{1.1}
\end{equation*}
$$

As a first step to solve the question, they also suggested to study a subset of $A_{0}$ :

$$
\begin{equation*}
A:=\left\{\left(\omega_{k}\right)_{1}^{\infty} \in \Sigma: \omega_{k} \omega_{2 k}=0 \quad \text { for all } k \geq 1\right\} . \tag{1.2}
\end{equation*}
$$

The Hausdorff dimension of $A$ was later given by Kenyon, Peres and Solomyak [KPS12].

Theorem 1.1 (Kenyon-Peres-Solomyak). We have

$$
\operatorname{dim}_{H} A=-\log (1-p),
$$

where $p \in[0,1]$ is the unique solution of the equation

$$
p^{2}=(1-p)^{3} .
$$

Enlightened by the idea of [KPS12], the question about $A_{\alpha}$ was finally answered by Peres and Solomyak [PS12b], and independently by Fan, Schmeling and Wu [FSW12a].

Theorem 1.2 (Peres-Solomyak, Fan-Schmeling-Wu). For any $\alpha \in[0,1]$, we have

$$
\operatorname{dim}_{H} A_{\alpha}=-\log (1-p)-\frac{\alpha}{2} \log \frac{q(1-p)}{p(1-q)}
$$

where $(p, q) \in[0,1]^{2}$ is the unique solution of the system

$$
\left\{\begin{array}{l}
p^{2}(1-q)=(1-p)^{3}, \\
2 p q=\alpha(2+p-q) .
\end{array}\right.
$$

We remark that a more general result on the Hausdorff dimension spectrum of level sets of multiple ergodic averages for a function depending only on one coordinate in $\Sigma$ has been obtained in [FSW12a].

However, since the Lyapunov exponent is constant for the shift transformation on the symbolic space, what is obtained is in fact the entropy
spectrum, i.e., the entropy (Bowen's definition see [Bow73]) of level sets of the multiple ergodic averages.

Consider a piecewise linear map $T$ on the unit interval with two branches. Let $I_{0}, I_{1} \subset[0,1]$ be two closed intervals intersecting at most on one point. Let us also assume that $0 \in I_{0}$ and $1 \in I_{1}$. Suppose that on $I_{0}, I_{1}$, the map $T$ is bijective and linear onto $[0,1]$ with slops $e^{-\lambda_{0}}=1 /\left|I_{0}\right|$ and $e^{-\lambda_{1}}=1 /\left|I_{1}\right|$ ( $\lambda_{0}, \lambda_{1}>0$ ) correspondingly. Let

$$
J_{T}:=\cap_{n=1}^{\infty} T^{-n}[0,1] .
$$

Then $\left(J_{T}, T\right)$ becomes a dynamical system. Similarly to [FLM, PS12b, FSW12a], We would like to study the following sets

$$
L:=\left\{x \in[0,1]: 1_{I_{1}}\left(T^{k} x\right) 1_{I_{1}}\left(T^{2 k} x\right)=0, \quad \text { for all } k\right\}
$$

and

$$
L_{\alpha}:=\left\{x \in[0,1]: \lim _{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^{n} 1_{I_{1}}\left(T^{k} x\right) 1_{I_{1}}\left(T^{2 k} x\right)=\alpha\right\} \quad(\alpha \in[0,1]) .
$$

For convenience, we will study a corresponding iterated function system and its natural coding. Let $\left\{f_{0}, f_{1}\right\}$ be an iterated function system on $[0,1]$ given by

$$
f_{0}(x)=e^{-\lambda_{0}} x, \quad f_{1}(x)=e^{-\lambda_{1}} x+1-e^{-\lambda_{1}}, \quad\left(\lambda_{0}, \lambda_{1}>0\right)
$$

satisfying the open set condition, i.e., $e^{-\lambda_{0}}+e^{-\lambda_{1}} \leq 1$. It has the usual symbolic description by $\Sigma=\{0,1\}^{\mathbb{N}}$ with a natural projection

$$
\pi(\omega)=\lim _{n \rightarrow \infty} f_{\omega_{1}} \circ f_{\omega_{2}} \circ \ldots \circ f_{\omega_{n}}(0)
$$

Let us define in $\Sigma$ the subsets $A$ and $A_{\alpha}$ by (1.1), (1.2). Up to a countable set, the sets $L, L_{\alpha}$ can be written as

$$
L=\pi(A), \quad L_{\alpha}=\pi\left(A_{\alpha}\right) .
$$

We remark that if $\lambda_{0}=\lambda_{1}=\lambda$, i.e., the Lyapunov exponent is constant, then

$$
\operatorname{dim}_{H} L=\frac{\operatorname{dim}_{H} A}{\lambda / \log 2}, \quad \operatorname{dim}_{H} L_{\alpha}=\frac{\operatorname{dim}_{H} A_{\alpha}}{\lambda / \log 2} .
$$

Furthermore, if $\lambda_{0}=\lambda_{1}=\log 2$, then $\pi(\Sigma)=[0,1]$, and the Hausdorff dimensions of $L, L_{\alpha}$ are the same as those of $A, A_{\alpha}$. Our goal is to calculate the Hausdorff dimension of sets $L$ and $L_{\alpha}$ for $\lambda_{0} \neq \lambda_{1}$.

Our results are as follows:

Theorem 1.3. We have

$$
\operatorname{dim}_{H} L=\operatorname{dim}_{H} L_{0}=-\frac{\log (1-p)}{\lambda_{0}}
$$

where $p \in[0,1]$ is the unique solution of the equation

$$
p^{2 \lambda_{0}}=(1-p)^{2 \lambda_{1}+\lambda_{0}} .
$$

For any $\alpha \in(0,1]$, we have

$$
\operatorname{dim}_{H} L_{\alpha}=\frac{\alpha \log \frac{p(1-q)}{(1-p) q}-2 \log (1-p)}{2 \lambda_{0}}
$$

where $(p, q) \in[0,1]^{2}$ is the unique solution of the system

$$
\left\{\begin{array}{l}
\alpha\left(\lambda_{1}-\lambda_{0}\right) \log \frac{p(1-q)}{(1-p) q}+\lambda_{0} \log \frac{p^{2}(1-q)}{1-p}-2 \lambda_{1} \log (1-p)=0 \\
2 p q=\alpha(2+p-q)
\end{array}\right.
$$

The paper is strongly related to [PS12b], we mostly repeat the calculations there in a more complicated situation. For the lacking details, in particular for [PS12b, Lemma 2] we refer the reader there. In the following two sections we calculate the lower bound: in Section 2 we introduce a family of measures and then we find the measure in this family that is supported on the set $L_{\alpha}$ and has maximal Hausdorff dimension, in Section 3 we find a formula for this dimension. In Section 4 we check that this formula is also the upper bound for the dimension of $L_{\alpha}$.

## 2 Telescopic product measures

The same measures that were used to calculate the entropy spectrum (see [PS12b]) will be useful for the Hausdorff spectrum as well.

Let us start from the multiplicative golden shift case. Given $p \in[0,1]$, let $\mu_{p}$ be a probability measure on $S$ given by

- if $k$ is odd then $\omega_{k}=1$ with probability $p$,
- if $k$ is even and $\omega_{k / 2}=0$ then $\omega_{k}=1$ with probability $p$,
- if $k$ is even and $\omega_{k / 2}=1$ then $\omega_{k}=0$.

Precisely, let $\left(p_{0}, p_{1}\right):=(1-p, p)$ and let

$$
\left(\begin{array}{ll}
p_{00} & p_{01} \\
p_{10} & p_{11}
\end{array}\right):=\left(\begin{array}{cc}
1-p & p \\
1 & 0
\end{array}\right) .
$$

Then the measure $\mu_{p}$ of a cylinder is given by

$$
\mu_{p}\left(\left[\omega_{1} \cdots \omega_{n}\right]\right)=\prod_{k=1}^{\lceil n / 2\rceil} p_{\omega_{2 k-1}} \cdot \prod_{k=1}^{\lfloor n / 2\rfloor} p_{\omega_{k} \omega_{2 k}}
$$

where $\lceil\cdot\rceil,\lfloor\cdot\rfloor$ denote the ceiling function and the integer part function correspondingly.

Let $\nu_{p}=\pi_{*} \mu_{p}$. The Hausdorff dimension of $L$ will turn out to be the supremum of Hausdorff dimensions of $\nu_{p}$.

Similarly, to deal with the spectrum of the sets $L_{\alpha}$ we will define a family of probabilistic measures of two parameters. Given $p, q \in[0,1]$ we define a measure $\mu_{p, q}$ on $\Sigma$ as

- if $k$ is odd then $\omega_{k}=1$ with probability $p$,
- if $k$ is even and $\omega_{k / 2}=0$ then $\omega_{k}=1$ with probability $p$,
- if $k$ is even and $\omega_{k / 2}=1$ then $\omega_{k}=1$ with probability $q$.

Similarly, if we let $\left(p_{0}, p_{1}\right):=(1-p, p)$ and let

$$
\left(\begin{array}{ll}
p_{00} & p_{01} \\
p_{10} & p_{11}
\end{array}\right):=\left(\begin{array}{ll}
1-p & p \\
1-q & q
\end{array}\right),
$$

then we have

$$
\mu_{p, q}\left(\left[\omega_{1} \cdots \omega_{n}\right]\right)=\prod_{k=1}^{\lceil n / 2\rceil} p_{\omega_{2 k-1}} \cdot \prod_{k=1}^{\lfloor n / 2\rfloor} p_{\omega_{k} \omega_{2 k}} .
$$

Once again, let $\nu_{p, q}=\pi_{*} \mu_{p, q}$. Please note that this notation is a little bit different from that in [PS12b]. Note also that $\mu_{p}=\mu_{p, 0}$.

Lemma 2.1. We have

$$
\mu_{p, q}\left(S_{\alpha}\right)=1
$$

for

$$
\alpha=\frac{2 p q}{2+p-q} .
$$

Proof. This lemma is proven in [PS12b, Lemma 3]. However, we will need this proof as a starting point for the proof of Lemma 2.2.

Denote

$$
x_{n}(\omega)=\frac{2}{n} \sum_{k=n / 2+1}^{n} \omega_{k} .
$$

For a $\mu_{p, q^{-}}$-typical $\omega$ the Law of Large Numbers implies

$$
x_{2 n}(\omega)=\frac{1}{2} p+\frac{x_{n}(\omega)}{2} q+\frac{1-x_{n}(\omega)}{2} p+o(1) .
$$

Hence, as $k \rightarrow \infty$,

$$
x_{2^{k} n}(\omega) \rightarrow \frac{2 p}{2+p-q} .
$$

By [PS12b, Lemma 5], it implies that $\mu_{p, q}$-almost surely

$$
\begin{equation*}
\lim _{n \rightarrow \infty} x_{n}(\omega)=\frac{2 p}{2+p-q} . \tag{2.1}
\end{equation*}
$$

Then, for $\mu_{p, q^{-}}$a.e. $\omega$,

$$
\frac{2}{n} \sum_{k=n / 2+1}^{n} \omega_{k} \omega_{2 k}=x_{n}(\omega)(q+o(1)) \rightarrow \frac{2 p q}{2+p-q} .
$$

Thus the assertion follows.
Let us denote

$$
H(p)=-p \log p-(1-p) \log (1-p)
$$

with convention $H(0)=H(1)=0$.
Lemma 2.2. We have

$$
\operatorname{dim}_{H} \nu_{p}=\frac{2 H(p)}{2 p \lambda_{1}+(2-p) \lambda_{0}},
$$

and

$$
\operatorname{dim}_{H} \nu_{p, q}=\frac{(2-q) H(p)+p H(q)}{2 p \lambda_{1}+(2-p-q) \lambda_{0}}
$$

Proof. As $\nu_{p}=\nu_{p, 0}$, it is enough to prove the second part of the assertion. For $\omega \in \Sigma$ denote

$$
C_{n}(\omega)=\left\{\tau \in \Sigma ; \tau_{k}=\omega_{k} \forall k \leq n\right\} .
$$

Let

$$
h_{n}(\omega):=\log \mu_{p, q}\left(C_{2 n}(\omega)\right)-\log \mu_{p, q}\left(C_{n}(\omega)\right)
$$

and

$$
\lambda_{n}(\omega):=\log \operatorname{diam} \pi\left(C_{2 n}(\omega)\right)-\log \operatorname{diam} \pi\left(C_{n}(\omega)\right)
$$

By the Law of Large Numbers, for $\mu_{p, q^{-}}$-typical $\omega$ and for big enough $n$ we have
$\frac{2}{n} h_{n}(\omega)=\left(2-x_{n}(\omega)\right)(p \log p+(1-p) \log p)+x_{n}(\omega)(q \log q+(1-q) \log (1-q))+o(1)$ and
$\frac{2}{n} \lambda_{n}(\omega)=\left(2-x_{n}(\omega)\right)\left(-p \lambda_{1}-(1-p) \lambda_{0}\right)+x_{n}(\omega)\left(-q \lambda_{1}-(1-q) \lambda_{0}\right)+o(1)$.
Thus, by (2.1)

$$
\frac{h_{n}(\omega)}{\lambda_{n}(\omega)} \rightarrow \frac{(2-q) H(p)+p H(q)}{2 p \lambda_{1}+(2-p-q) \lambda_{0}} \quad \mu_{p, q}-\text { a.e. }
$$

Hence, for $\mu_{p, q^{-}}$-a.e. $\omega$ we have

$$
\lim _{n \rightarrow \infty} \frac{\log \nu_{p, q}\left(\pi\left(C_{n}(\omega)\right)\right)}{\log \operatorname{diam} \pi\left(C_{n}(\omega)\right)}=\frac{(2-q) H(p)+p H(q)}{2 p \lambda_{1}+(2-p-q) \lambda_{0}} .
$$

We will denote

$$
\gamma_{\alpha}=\left\{(p, q) \in[0,1]^{2}: \alpha=\frac{2 p q}{2+p-q}\right\} .
$$

Lemma 2.3. The maximal Hausdorff dimension among measures $\nu_{p}$ is achieved for $p$ satisfying

$$
\begin{equation*}
p^{2 \lambda_{0}}=(1-p)^{2 \lambda_{1}+\lambda_{0}} . \tag{2.2}
\end{equation*}
$$

For $\alpha \in(0,1)$, the maximal Hausdorff dimension among measures $\left\{\nu_{p, q}\right.$ : $\left.(p, q) \in \gamma_{\alpha}\right\}$ is achieved for $(p, q)$ satisfying

$$
\begin{equation*}
\alpha\left(\lambda_{1}-\lambda_{0}\right) \log \frac{p(1-q)}{(1-p) q}+\lambda_{0} \log \frac{p^{2}(1-q)}{1-p}-2 \lambda_{1} \log (1-p)=0 . \tag{2.3}
\end{equation*}
$$

Such $(p, q)$ is unique in $\gamma_{\alpha}$ and is always in $(0,1)^{2}$.

Proof. Let us start from the second part of assertion. We need to find the maximum of the function

$$
D(p, q)=\frac{(2-q) H(p)+p H(q)}{2 p \lambda_{1}+(2-p-q) \lambda_{0}}
$$

over the curve $\gamma_{\alpha}$. For $\alpha>0$ this curve's endpoints are $(1,3 \alpha /(2+\alpha))$ and $(\alpha /(2+\alpha), 1)$. Moreover, we have

$$
\mathrm{d} \alpha=\frac{2}{(2+p-q)^{2}}(q(2-q) \mathrm{d} p+p(2+p) \mathrm{d} q)
$$

Hence, we need to solve the equation

$$
p(2+p) \frac{\partial D}{\partial p}-q(2-q) \frac{\partial D}{\partial q}=0 .
$$

After expanding the left hand side and collecting the terms, it turns out that it is divisible by $p(2-q)$. We get

$$
\begin{align*}
& \left(2 p q \lambda_{1}+(4+2 p-2 q-2 p q) \lambda_{0}\right) \cdot \log p \\
+ & \left((-4-2 p+2 q-2 p q) \lambda_{1}+(-2-p+q+2 p q) \lambda_{0}\right) \cdot \log (1-p) \\
+ & \left(-2 p q \lambda_{1}+2 p q \lambda_{0}\right) \cdot \log q  \tag{2.4}\\
+ & \left(2 p q \lambda_{1}+(2+p-q-2 p q) \lambda_{0}\right) \cdot \log (1-q)=0 .
\end{align*}
$$

It will be convenient to use $\beta=2 / \alpha$. As $(p, q) \in \gamma_{\alpha}$, we have

$$
2+p-q=\beta p q .
$$

Substituting this into (2.4), we get

$$
\begin{align*}
& \left(2 \lambda_{1}+(2 \beta-2) \lambda_{0}\right) \log p+\left((-2 \beta-2) \lambda_{1}+(-\beta+2) \lambda_{0}\right) \log (1-p)  \tag{2.5}\\
+ & \left(-2 \lambda_{1}+2 \lambda_{0}\right) \log q+\left(2 \lambda_{1}+(\beta-2) \lambda_{0}\right) \log (1-q)=0
\end{align*}
$$

and (2.3) follows.
To get the first part of assertion it is enough to remove all terms with $q$ and substitute $\alpha=0$ into (2.3).

What remains is the third part of the assertion. Denoting by $F(p, q)$ the left hand side of (2.5), we have

$$
F(1,3 \alpha /(2+\alpha))=\infty
$$

and

$$
F(\alpha /(2+\alpha), 1)=-\infty .
$$

We will check that $F$ restricted to $\gamma_{\alpha}$ is strictly monotone. We have

$$
p(p+2) \frac{\partial F}{\partial p}-q(2-q) \frac{\partial F}{\partial q}=\lambda_{0}((2 \beta-2)(p+2)-2(2-q))+\mathrm{spt},
$$

where spt stands for some positive terms (in particular, all the terms with $\lambda_{1}$ are positive). However, as

$$
(2 \beta-2)(p+2)-2(2-q)=2 p+2 q+2(\beta-2)(p+2)>0,
$$

the coefficient for $\lambda_{0}$ is also positive. Hence, $F$ restricted to $\gamma_{\alpha}$ indeed has no extrema, so it must have only one zero.

Remark. When $\alpha=0$, the curve $\gamma_{0}$ degenerates into two segments : $p=0$ and $q=0$. On the first segment, the dimension of $\operatorname{dim}_{H} \nu_{0, q}$ is zero. On the second segment, we have the assertion on $\nu_{p, 0}=\nu_{p}$ in Lemma 2.3. When $\alpha=1$, the curve $\gamma_{1}$ degenerates into one point $(1,1)$, and we have $\operatorname{dim}_{H} \nu_{1,1}=0$.
Remark. The curves $\gamma_{\alpha}$ cover whole $(0,1)^{2}$. However, not all pairs $(p, q) \in$ $(0,1)^{2}$ are solutions of (2.5) for any $\lambda_{1}, \lambda_{0}$. Indeed, we can write (2.5) in the form

$$
\frac{\lambda_{1}}{\lambda_{0}} a_{1}+a_{2}=0
$$

with

$$
a_{1}=\alpha \log p+(-2-\alpha) \log (1-p)-\alpha \log q+\alpha \log (1-q)
$$

and

$$
a_{2}=(2-\alpha) \log p+(\alpha-1) \log (1-p)+\alpha \log q+(1-\alpha) \log (1-q) .
$$

Both $a_{1}$ and $a_{2}$ converge to $\infty$ as $p \rightarrow 1$ and to $-\infty$ as $q \rightarrow 1$. They are also both strictly monotone on $\gamma_{\alpha}$, which can be checked like in the third part of the proof of Lemma 2.3 (using $(2-\alpha)(p+2)>\alpha(2-q)$ in case of $a_{2}$ ), so they both have unique zeros. As the equation

$$
r a_{1}+a_{2}=0
$$

can have positive solution only if $a_{1}$ and $a_{2}$ have different signs, only those $(p, q) \in \gamma_{\alpha}$ between zeros of $a_{1}$ and $a_{2}$, or equivalently satisfying

$$
\alpha \log \frac{p(1-q)}{(1-p) q}>\max \left(2 \log (1-p), \log \frac{p^{2}(1-q)}{1-p}\right)
$$

are solutions of (2.5) for some choice of $\lambda_{1}, \lambda_{0}$.

Remark. The measures $\mu_{p, q}$ for $p=q$ are Bernoulli. Each $\gamma_{\alpha}$ intersects the diagonal $\{p=q\}$ in exactly one point $\left(\alpha^{1 / 2}, \alpha^{1 / 2}\right)$ and at this point $a_{1}>0, a_{2}<0$. So, (2.5) has a Bernoulli measure as a solution for each $\alpha \in(0,1)$. It happens when

$$
\lambda_{0} \log p=\lambda_{1} \log (1-p),
$$

that is, when $\nu_{\alpha^{1 / 2}, \alpha^{1 / 2}}$ is the Hausdorff measure (in dimension $\operatorname{dim}_{H} \pi(\Sigma)$ ) on $\pi(\Sigma)$.

## 3 Exact formulas

To be able to provide the upper bounds in the following section, we need to substitute the results of Lemma 2.3 to Lemma 2.2 and obtain simpler formulas for our lower bound. We start with the golden shift case. Given $\lambda_{1}, \lambda_{0}$ let $p$ be given by (2.2).

Lemma 3.1. We have

$$
\operatorname{dim}_{H} \nu_{p}=-\frac{\log (1-p)}{\lambda_{0}}
$$

Proof. By Lemma 2.2,

$$
\operatorname{dim}_{H} \nu_{p}=\frac{2 H(p)}{2 p \lambda_{1}+(2-p) \lambda_{0}}
$$

Applying (2.2) it is easy to check that

$$
\left(2 p \lambda_{1}+(2-p) \lambda_{0}\right) \log (1-p)=-2 H(p) \lambda_{0}
$$

and the assertion follows.
The calculations for the multifractal case are a little bit more complicated. Given $\lambda_{1}, \lambda_{0}$, and $\alpha$, let $p, q$ be given by (2.3).
Lemma 3.2. We have

$$
\begin{equation*}
\operatorname{dim}_{H} \nu_{p, q}=\frac{\alpha \log \frac{p(1-q)}{(1-p) q}-2 \log (1-p)}{2 \lambda_{0}} . \tag{3.1}
\end{equation*}
$$

If $\lambda_{1} \neq \lambda_{0}$ then we have another formula:

$$
\begin{equation*}
\operatorname{dim}_{H} \nu_{p, q}=\frac{\log \frac{p^{2}(1-q)}{(1-p)^{3}}}{2\left(\lambda_{0}-\lambda_{1}\right)} . \tag{3.2}
\end{equation*}
$$

Proof. By Lemma 2.2,

$$
\operatorname{dim}_{H} \nu_{p, q}=\frac{(2-q) H(p)+p H(q)}{2 p \lambda_{1}+(2-p-q) \lambda_{0}}
$$

Using (2.3) one can check that
$\left(2 p \lambda_{1}+(2-p-q) \lambda_{0}\right)\left(\alpha \log \frac{p(1-q)}{(1-p) q}-2 \log (1-p)\right)=2 \lambda_{0}((2-q) H(p)+p H(q))$.
This gives (3.1). Applying (2.3) once again we get

$$
\begin{equation*}
\operatorname{dim}_{H} \nu_{p, q}=\frac{\alpha \log \frac{p(1-q)}{(1-p) q}+\log \frac{1-p}{p^{2}(1-q)}}{2 \lambda_{1}} \tag{3.3}
\end{equation*}
$$

Together with (3.1) this gives (3.2).

## 4 Upper bounds

The last part of the proof is the upper bound.
Lemma 4.1. We have

$$
\operatorname{dim}_{H} L \leq \sup _{p} \operatorname{dim}_{H} \nu_{p},
$$

and for all $\alpha \in[0,1]$,

$$
\operatorname{dim}_{H} L_{\alpha} \leq \sup _{(p, q) \in \gamma_{\alpha}} \operatorname{dim}_{H} \nu_{p, q}
$$

Proof. As $L \subset L_{0}$, it is enough to prove the second part of the assertion. Fix $\alpha$ and let $\omega \in S_{\alpha}$. Let $p, q$ be as in (2.3). We denote for all $n \in \mathbb{N}$

$$
X_{1}^{n}=\sharp\left\{k \in[1, n]: \omega_{k}=1\right\}
$$

and for all even $n \in \mathbb{N}$

$$
X_{11}^{n}=\sharp\left\{k \in[1, n / 2]: \omega_{k}=\omega_{2 k}=1\right\} .
$$

We also denote

$$
\tilde{h}_{n}=-\log \mu_{p, q}\left(C_{n}(\omega)\right)
$$

and

$$
\tilde{l}_{n}=-\log \operatorname{diam} \pi\left(C_{n}(\omega)\right) .
$$

For any even $n$ we have (see [PS12b, Section 4])

$$
-\tilde{h}_{n}=n \log (1-p)+X_{1}^{n / 2} \log \frac{1-q}{1-p}+X_{1}^{n} \log \frac{p}{1-p}-X_{11}^{n} \log \frac{p(1-q)}{(1-p) q} .
$$

We also have

$$
\tilde{l}_{n}=\left(\lambda_{1}-\lambda_{0}\right) X_{1}^{n}+n \lambda_{0} .
$$

Substituting (3.1) and (3.2) we get

$$
\tilde{l}_{n} \operatorname{dim}_{H} \nu_{p, q}=-\frac{1}{2} X_{1}^{n} \log \frac{p^{2}(1-q)}{(1-p)^{3}}+\frac{n}{2}\left(\alpha \log \frac{p(1-q)}{(1-p) q}-2 \log (1-p)\right) .
$$

Hence,
$\frac{1}{n}\left(\tilde{l}_{n} \operatorname{dim}_{H} \nu_{p, q}-\tilde{h}_{n}\right)=\left(\frac{\alpha}{2}-\frac{X_{11}^{n}}{n}\right) \log \frac{p(1-q)}{(1-p) q}+\frac{1}{2}\left(\frac{X_{1}^{n / 2}}{n / 2}-\frac{X_{1}^{n}}{n}\right) \log \frac{1-q}{1-p}$.
As the first summand converges to 0 and the second telescopes,

$$
\liminf _{n \rightarrow \infty} \frac{1}{n}\left(\tilde{l}_{n} \operatorname{dim}_{H} \nu_{p, q}-\tilde{h}_{n}\right) \leq 0
$$

and we are done.
