# Dramatic influence of the substitution of alkylidene-5*H*-furan-2-ones in Diels–Alder cycloadditions with *o*-quinonedimethide as diene partner: en route to the CDEF polycyclic ring system of lactonamycin<sup>†</sup>

Sébastien Dubois,<sup>a</sup> Fabien Rodier,<sup>a</sup> Romain Blanc,<sup>a</sup> Raphaël Rahmani,<sup>a</sup> Virginie Héran,<sup>a</sup> Jérôme Thibonnet,<sup>b</sup> Laurent Commeiras<sup>\*a</sup> and Jean-Luc Parrain<sup>\*a</sup>

Received 10th February 2012, Accepted 12th April 2012 DOI: 10.1039/c2ob25299f

An efficient and rapid synthesis of the CDEF ring system of lactonamycinone is reported *via* a highly chemo- and diastereoselective intermolecular Diels–Alder cycloaddition between *trans*-1,2- disilyloxybenzocyclobutene and the appropriate  $\gamma$ -alkylidenebutenolide. The feasibility and the total chemoselectivity of the [4 + 2] cycloaddition for the construction of a spirolactone moiety *via* an intramolecular approach (IMDA) using both partners is also described demonstrating the versatility of the  $\gamma$ -alkylidenebutenolide building block.

#### Introduction

Due to their intrinsic conformational features and their structural implications in biological systems, the preparation of polycyclic structures fused at a central carbon remains an important challenge in organic synthesis.<sup>1</sup> The asymmetric character of the molecule brought by the stereogenic spiro carbon is generally responsible for the biological activities. In this context and over the last two decades, numerous natural spirolactones have been isolated from different sources and some of them exhibit impressive biological activities. Selected examples include abyssomicin C<sup>2</sup> and lactonamycin,<sup>3</sup> two potent antibacterial agents against Gram-positive bacteria, including resistant *Staphylococcus aureus* strains (Fig. 1).

From a structural point of view, lactonamycin presents a spirolactone moiety and a 2,3-dihydronaphthalene-1,4-dione core. The strategy usually used to access a 1,2,3,4-tetrahydronaphthalene substructure is an inter- or intramolecular [4 + 2] reaction using benzocyclobutene derivatives as diene partners.<sup>4</sup> Regarding the spirolactone part, most of the methods reported involve a prior installation of the tertiary alcohol, which is then followed by an intramolecular esterification. Numerous methods for the construction of spirolactones with concomitant formation of the fused quaternary centre have also been reported. Notably, pericyclic reactions have demonstrated to be quite efficient in the synthesis of natural products.<sup>5</sup> Moreover, we recently disclosed a highly chemo- and diastereoselective intermolecular Diels-Alder cycloaddition between trans-1,2-disilyloxybenzocyclobutene 1 and methylprotoanemonine 2 to access the lambertellol backbone 3 (Scheme 1).<sup>6</sup> It transpired from this work that the chemoselectivity of such a transformation was highly dependent on the nature of the substituents onto the lactone. Accordingly,  $\delta$ -substituted alkylidenebutenolides 4 furnished the naphthofuranone moiety 5 whereas the  $\alpha$ -bromo- $\beta$ , $\delta$ -substituted lactones led to the corresponding spiro-cycloadducts 6. However, when the reaction was performed with lactone 7, no cycloadduct was obtained and this is certainly due to both stereoelectronic and steric factors.

It is worth to note that  $\gamma$ -alkylidenebutenolides have been repeatedly used in Diels–Alder reactions,<sup>7–14</sup> however we were the first one to realise a full study of the reactivity of the  $\delta$ -substituted ones in the intermolecular version.<sup>7e,9</sup> In addition, different laboratories have developed their approach to the title natural product,<sup>15</sup> however, only one total synthesis of lactonamycin<sup>16</sup> and one total synthesis of its aglycone<sup>17</sup> have been reported to

Fig. 1 Examples of natural products containing the spirolactone moiety.

date. In connection with our interest in the total synthesis of natural product possessing interesting biological properties and in the development of new methodologies to efficiently prepare spirolactone moiety,<sup>18</sup> we have undertaken the synthesis of the CDEF ring system of lactonamycinone *via* an intermolecular Diels–Alder reaction. An account of the intramolecular silicon tethered [4 + 2] cyclisation between a benzocyclobutene and a  $\gamma$ -alkylidenebutenolide will also be given.

Scheme 1 Diels–Alder cycloaddition between *trans*-1,2-disilyloxybenzocyclobutene 1 and  $\gamma$ -alkylidenebutenolides.

#### **Results and discussion**

As outlined in Scheme 2, our retrosynthesis consists in two main disconnections to access the CDEF polycyclic ring system of lactonamycinone. Accordingly, a late stage intramolecular oxa-Michael addition would allow the formation of the E ring. On the other hand, the CDF tricyclic spirolactone could efficiently be reached *via* an intermolecular [4 + 2] reaction between 1 and the appropriate lactone 8. Our program was started with confidence as our previous results suggested that substituents onto the  $\alpha,\beta$ -double bond of the alkylidenebutenolides prevented the cyclisation onto the endo-cyclic alkene and therefore, favoured reaction onto the exo-cyclic one. Having this in mind, and in connection with our approach toward the CDEF skeleton of lactonamycinone, we thought of using a  $\gamma$ -alkylidenebutenolide decorated with the electron donating methoxy group onto the  $\beta$ position of the lactone. In order to validate this approach, lactone (Z)-8 was chosen as model substrate and was prepared in two steps from methyltetronate  $9^{19}$  and aldehyde 10 (Scheme 3).<sup>20</sup> Addition of the homoenolate of 9 onto aldehyde 10 furnished alcohol 11 in 74% yield as an inseparable 52:48 mixture of diastereomers. Then, compound 11 underwent a dehydration to afford a separable 67:33 mixture of  $\gamma$ -alkylidenebutenolides (Z)-8 and (E)-8 respectively, in 56% yield. As for the dienophilic benzocyclobutene partner 1, it was synthesised on a multigram scale according to methods described by South and Liebeskind<sup>21</sup> and Danishefsky et al.<sup>22</sup> Having the two precursors in hand, we were now ready for the key cyclisation step. Under the conditions previously reported for the  $\alpha$ -bromo- $\beta$ , $\delta$ -substituted lactone (i.e. 50 °C, 4 h in degassed benzene), the cycloaddition

Scheme 5 Intramolecular approach.

only furnished a very small amount (up to 5%) of the expected spirolactone **12**. Starting materials **1** and (*Z*)-**8** were recovered unchanged at the end of the reaction. Gratifyingly, when the reaction time was prolonged from four hours to three days,<sup>23</sup> the Diels–Alder reaction gave the desired spiro-cycloadduct **12** in a quantitative manner and as a 1:1 mixture of diastereomers arising from an *endo-* and an *exo*-approach respectively.

The feasibility of the intermolecular cycloaddition leading to the desired spirolactone moiety thus validated, we next turn our attention to the (*E*)-lactone **8**. Accordingly, the hetero Michael reaction to form the E-ring required the pending primary alcohol onto compound **14** being *cis* to the single carbon–carbon bond of the lactone. The only way to access such a cycloadduct was to start with the (*E*)-double bond onto lactone **8**. Pleasingly, the cycloaddition reaction was not only efficient and provided the expected compound **13** in a quantitative manner, but was also totally diastereoselective in favour of the *endo*-approach. Thereafter, an additional four steps were performed to access the CDEF rings of lactonamicynone (Scheme 4). Deprotection of the PMB group using DDQ in wet  $CH_2Cl_2$  afforded primary alcohol **14** in 94% yield.

The latter underwent the intramolecular oxa-Michael addition under basic conditions to form the last E-ring **15** in 90% yield and as a single diastereomer. Following which, a deprotection of the bis silylether **15** in presence of tetrabutylammonium fluoride gave the corresponding diol **16** in 73% yield. Finally, the sensitive quinone **17** was obtained after oxidation of the diol in the presence of an excess of Dess–Martin periodinane (10 equiv) in a quantitative manner. To summarise, the tetracyclic skeleton of lactonamycinone **17** was diastereoselectively synthesised in 62% yield over five steps from lactone (*E*)-**8**. It goes without saying that the method developed here is a powerful and competitive tool to access rapidly and efficiently the scaffold of natural products containing spirolactone moieties.

As mentioned earlier in the introduction, the  $\delta$ -substituted  $\alpha$ , $\beta$ -unsubstituted alkylidenebutenolides failed to furnish the desired spirolactones and led instead to the corresponding naphthofuranone derivatives **5**. In addition, lactone **7** proved to be unreactive during this intermolecular [4 + 2] process. In order to overturn the limits encountered and thus, to have access to a range of analogs of the lactonamycine core, we envisioned an intermolecular version of the previous strategy using a disposable silicon tether between the two cycloaddition partners. According to numerous reports, such approaches are favoured for entropic reasons and often lead to better chemo-, regio- and stereoselectivities.<sup>23</sup>

The synthesis of the temporary silaketal tether derivative 18 required the prior preparation of alcohols 19 and 20. Monoprotected diol 19 (Scheme 5) was obtained in two steps from benzocyclobutanedione. Bis reduction of the ketones in the presence of NaBH<sub>4</sub> in MeOH followed by treatment of the corresponding crude diol in the presence of one equivalent of TBSCl furnished the desired compound 19 in yields ranging from 33 to 76% yield over two steps. Both alcohols 19 and  $20^{24}$  were then linked together by sequential reaction with iPr<sub>2</sub>SiCl<sub>2</sub> (Scheme 5).<sup>25</sup> Gratifyingly, silaketal 18 was obtained in 71% yield. The silicon tethered molecule 18 was then heated at 55 °C for 4 h in benzene. Unlike its intermolecular counterpart (Scheme 1; lactone 7), silaketal 18 smoothly underwent the [4 + 2] cyclisation in a chemo-, regio- and diastereoselective manner. The desired tetracyclic spirolactone 21 was pleasingly obtained in 57% yield. We then demonstrated the compatibility of the strategy with the more hindered lactone 22 (Scheme 5). The cycloadduct 23 was obtained in 74% yield with total control of the

chemo-, regio- and diastereoselectivity. The relative configurations of 21 and 23 were unambiguously established based on NOESY NMR experiments and through X-ray crystallographic analysis of  $23^{26}$  thus, confirming the *endo*-approach of the intramolecular cycloaddition reaction. Furthermore, we have shown that the chemoselectivity of the intermolecular approach could be overturned thanks to the silvlated tether. Accordingly, when the benzocyclobutene is linked with an  $\alpha,\beta$ -unsubstituted lactone the sole product isolated resulted from the reaction onto the exocyclic double bond of the lactone. No naphthofuranone 5 was observed and the desired spirolactone 25 was obtained in 28% isolated yield over two steps. While 10% of the cycloadduct arising from the E-isomer of the starting lactone 24 was observed in the crude <sup>1</sup>H NMR spectrum, none was observed after purification on silica gel. This is probably due to its instability and might explain why the diastereomer 25 was isolated as the sole product and in modest yield.

#### Conclusion

In summary, a new highly diastereoselective and convergent approach towards the CDEF ring system of lactonamycinone has been reported. The key intermolecular Diels–Alder reaction between *trans*-1,2-disiloxybenzocyclobutene and the appropriate  $\gamma$ -alkylidenebutenolide allowed the concomitant formation of the fused spiro carbon together with the creation of three tertiary stereocentres with total control of the diastereoselectivity and in only 5 steps. In addition, an intramolecular cycloaddition using a disposable silicon tether to reach the desired spirolactone moiety has also been developed when its intermolecular counterpart failed to give the desired spiro-cycloadduct (*i.e.* when  $\delta$ - or  $\beta$ , $\delta$ -substituted were used).

#### **Experimental section**

#### Compounds (Z)-8 and (E)-8

To a stirred solution of THF at -80 °C was added a solution of n-BuLi (7.7 mL, 193 mmol, 1.1 equiv, 2.5 M in hexane). A precooled solution of methyltetronate  $9^{19}$  (2 g, 175 mmol, 1 equiv) in THF (35 mL) was then added dropwise at -80 °C. After 20 min at -80 °C, a precooled solution of aldehyde  $10^{20}$  (3.4 g, 175 mmol, 1 equiv) in THF (17 mL) was added to the mixture and allowed to warm at room temperature. After 2 hours, ice crush followed by diluted aqueous HCl were added to the mixture. The aqueous phase was extracted with Et<sub>2</sub>O. The combined organic phases were dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated under vacuum. The crude product was then purified by flash chromatography (3:7 petroleum ether-ethyl acetate) to afford a inseparable 52:48 mixture of alcohol 11 (3.2 g) in 74% yield. To a stirred solution of alcohol **11** (1.14 g, 3.87 mmol, 1 equiv) in CH<sub>2</sub>Cl<sub>2</sub> (7 mL), was added triethylamine (1.61 mL, 11.6 mmol, 3 equiv) followed by mesylchloride (0.419 mL, 5.43 mmol, 1.4 equiv) were added dropwise. The mixture was heated at reflux overnight. The reaction was then quenched by addition of saturated aqueous solution of NH<sub>4</sub>Cl. The aqueous phase was extracted with CH<sub>2</sub>Cl<sub>2</sub>. The combined organic phases were dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated under vacuum. The crude material was finally purified by flash chromatography

(8:2 petroleum ether-ether) to afford (598 mg, 56% yield) (Z)-8 (404 mg) and (E)-8 (194 mg) in 67/33 ratio. (Z)-8:  $\delta_{\rm H}$ (400 MHz, CDCl<sub>3</sub>) 3.81 (3H, CH<sub>3</sub>), 3.92 (3H, CH<sub>3</sub>), 4.30 (2H, d, J = 6.8 Hz, CH<sub>2</sub>), 4.46 (2H, s, CH<sub>2</sub>), 5.24 (1H, br s, CH), 5.59 (1H, t, J = 6.8 Hz, CH), 6.88 (2H, d, J = 8.5, 2 × CH<sub>Ar</sub>), 7.27 (2H, d, J = 8.5 Hz, 2 × CH<sub>Ar</sub>);  $\delta_{\rm C}$  (75 MHz, CDCl<sub>3</sub>) 55.4 (CH<sub>3</sub>), 59.3 (CH<sub>3</sub>), 63.7 (CH<sub>2</sub>), 72.7 (CH<sub>2</sub>), 89.8 (CH), 106.5 (CH), 114.0 ( $2 \times CH_{Ar}$ ), 129.7 ( $2 \times CH_{Ar}$ ), 130.0 (C), 144.6 (C), 159.5 (C), 168.2 (C), 169.9 (C); HRMS found 277.1074 [M +  $H_{1}^{+}$ ,  $C_{15}H_{17}O_5$  requires 277.1071. #### Compound 17

To a solution of diol 16 (16 mg, 0.055 mmol, 1 equiv) in CH<sub>2</sub>Cl<sub>2</sub> (7 mL), under argon, at 0 °C, was added Dess-Martin periodinane (232 mg, 0.55 mmol, 10 equiv). The reaction mixture was stirred at room temperature and monitored by TLC. After disappearance of the starting material, the mixture was poured into (1/1) mixture of saturated aqueous solution of  $Na_2S_2O_3$  and saturated aqueous solution of NaHCO<sub>3</sub> (25 mL) and shaken vigorously for 5 min. The aqueous layer was extracted with CH<sub>2</sub>Cl<sub>2</sub>. The combined organic layers were washed with a saturated aqueous NaHCO<sub>3</sub> solution, saturated aqueous NaCl, dried over Na2SO4, dried over Na2SO4 and concentrated under vacuum to give the crude product 17 (16 mg, 100%).  $\delta_{\rm H}$  (400 MHz, CDCl<sub>3</sub>) 2.92 (1H, d, J = 16.8 Hz,  $CH_2$ ), 2.99 (1H, d, J = 16.8 Hz, CH<sub>2</sub>), 3.17 (3H, s, CH<sub>3</sub>), 3.80 (1H, dd, J = 8.0 and 3.8 Hz, CH), 4.54 (1H, m, CH<sub>2</sub>), 4.75 (1H, dd, J =9.0 and 3.8 Hz, CH<sub>2</sub>), 7.80-7.85 (2H, m, 2 × CH<sub>Ar</sub>), 8.14-8.21  $(2H, m, 2 \times CH_{Ar}); \delta_C (75 \text{ MHz}, CDCl_3) 36.6 (CH_2), 52.6 (CH),$ 53.7 (CH<sub>3</sub>), 70.4 (CH<sub>2</sub>), 90.7 (C), 113.4 (C), 127.4 (CH<sub>Ar</sub>), 127.7 (CH<sub>Ar</sub>), 134.2 (C<sub>Ar</sub>), 135.0 (CH<sub>Ar</sub>), 135.3 (C<sub>Ar</sub>), 135.4 (CH<sub>Ar</sub>), 171.4 (C), 189.3 (C), 191.9 (C); IR (v<sub>max</sub>/cm<sup>-1</sup>) 2958, 2919, 2850, 1730, 1711, 1668, 1641, 1591, 1563, 1437, 1340, 1328, 1306, 1258, 1245, 1175, 1140, 1087, 1015; HRMS found  $306.0971 [M + NH_4]^+$ ,  $C_{15}H_{16}NO_6$  requires 306.0972.

#### **Compound 19**

To a stirred solution of diketone<sup>21</sup> (500 mg, 3.78 mmol) in methanol (50 mL) at 0 °C was added sodium borohydride (143 mg, 3.78 mmol) portionwise (10 mg per 10 min). After 1 hour, the solvent was removed under vacuum at 0 °C. The crude product (370 mg) was dissolved in DCM (0.1 M) and cooled to 0 °C. Imidazole (157 mg, 2.312 mmol, 0.85 equiv) was added to the mixture and TBSCl (369 mg, 2.45 mmol, 0.9 equiv) dissolved in 20 mL of DCM was added via a seringe pump (3.6 mL  $h^{-1}$ ). After one night at 0 °C, the reaction was quenched by adding water. The aqueous layer was extracted with DCM and the organic phases were dried over Na<sub>2</sub>SO<sub>4</sub> and the solvent removed under high vacuum. The crude product was purified by flash chromatography  $(7:3: EP-Et_2O)$  to give the monoprotected benzocyclobutenediol 19 in variable amount (33–76%).  $\delta_{\rm H}$  (300 MHz, CDCl<sub>3</sub>) 0.2 (6H, s, 2 × CH<sub>3</sub>), 0.97 (9H, s, 3 × CH<sub>3</sub>), 2.33 (1H, OH), 4.92 (1H, s, CH), 4.93 (1H, s, CH), 7.27–7.36 (4H, m,  $4 \times CH_{Ar}$ );  $\delta_C$  (75MHz, CDCl<sub>3</sub>) –4.5 (2  $\times$  CH<sub>3</sub>), 18.4 (C), 26.0 (3  $\times$  CH<sub>3</sub>), 79.9 (2  $\times$  CH), 123.4 (2  $\times$ CH<sub>Ar</sub>), 129.6 (CH<sub>Ar</sub>), 129.9 (CH<sub>Ar</sub>), 143.3 (C<sub>Ar</sub>), 144.3 (C<sub>Ar</sub>); MS: m/z 273 [M + Na]<sup>+</sup>; HRMS found 251.1462 [M + H]<sup>+</sup>, C<sub>14</sub>H<sub>23</sub>O<sub>2</sub>Si requires 251.1462.

#### **Compound 20**

To a stirred solution of the  $\gamma$ -butenolide<sup>27</sup> (400 mg, 1.57 mmol, 1 equiv) in anhydrous THF (8.2 mL) at 0 °C was added a solution of HF-pyridine (121 µL, 70% in pyridine, 4.72 mmol, 3 equiv). The reaction was stirred at room temperature and followed by TLC. After disappearance of the starting material, the reaction was quenched with a saturated aqueous solution of NaHCO<sub>3</sub>. The aqueous phase was extracted with ether and the combined organics layers were dried over anhydrous MgSO<sub>4</sub>, filtered and concentrated in vacuo. The resulting crude product was purified by flash chromatography on silica gel (petroleum ether-ethyl acetate 1:1) to give 20 (157 mg, 71%).  $\delta_{\rm H}$ (400 MHz,  $C_6D_6$ ) 1.27 (3H, d, J = 1.3 Hz,  $CH_3$ ), 4.23 (2H, d, J = 6.8 Hz, CH<sub>2</sub>), 4.94 (1H, CH, td, J = 6.8 and 0.8 Hz, CH), 5.32 (1H, m, CH);  $\delta_{\rm C}$  (100 MHz, C<sub>6</sub>D<sub>6</sub>) 10.9 (CH<sub>3</sub>), 57.3 (CH<sub>2</sub>), 110.5 (CH), 117.1 (CH), 150.4 (C), 154.6 (C), 168.5 (C); MS: m/z (ESI+) 163 (M + Na)<sup>+</sup>.

#### **Compound 21**

To a stirred solution of CH<sub>2</sub>Cl<sub>2</sub> (0.6 mL), imidazole (38 mg, 0.56 mmol, 5 equiv) and  $iPr_2SiCl_2$  (20 µL, 0.11 mmol, 1 equiv) was added dropwise and at room temperature 19 (28 mg, 0.11 mmol, 1 equiv) in CH<sub>2</sub>Cl<sub>2</sub> (0.35 mL). After disappearance of 20 (5 min), lactone 20 (16 mg, 0.11 mmol, 1 equiv) was added to the mixture. The reaction was stirred for 15 min, then quenched with a saturated aqueous solution of NH<sub>4</sub>Cl. The aqueous layer was extracted with CH<sub>2</sub>Cl<sub>2</sub>. The combined organic phase were dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated under vacuum. The crude product was purified by flash chromatography (petroleum ether-diethylether 85:15) to give 18 (40 mg, 71%).  $\delta_{\rm H}$ (300 MHz, CDCl<sub>3</sub>) 0.19 (6H, s, 2 × CH<sub>3</sub>), 0.94 (9H, s, 2 × CH<sub>3</sub>), 1.02–1.06 (3H, m, CH<sub>3</sub>), 1.09–1.16 (11H, m, 3 × CH<sub>3</sub>) and CH), 2.10 (3H, br s, CH<sub>3</sub>), 4.69 (2H, d, J = 6.3 Hz, CH<sub>2</sub>), 5.00 (1H, br s, CH), 5.11 (1H, br s, CH<sub>3</sub>), 5.40 (1H, t, J = 6.3Hz, CH), 5.93 (1H, br s, CH<sub>3</sub>), 7.24–7.34 (4H, m, CH<sub>Ar</sub>); MS: m/z (ESI+) 525 [M + Na]<sup>+</sup>.

The <sup>1</sup>H NMR revealed the formation of the cycloadduct **18**. Thus, no more characterisation was made on this kind of product.

In Schlenk tube, 18 (40 mg) was heated (55 °C) in degassed  $C_6D_6$  (2 mL) for 4 hours. The solution was then concentrated and purified by flash chromatography (petroleum ether-diethylether 85:15) to give **21** (23 mg, 57%).  $\delta_{\rm H}$  (400 MHz, C<sub>6</sub>D<sub>6</sub>) -0.03 (3H, s, CH<sub>3</sub>), 0.20 (3H, s, CH<sub>3</sub>), 0.96 (9H, s, 3 × CH<sub>3</sub>), 1.06 (3H, br s, CH<sub>3</sub>), 1.08–1.13 (14H, m,  $4 \times CH_3$  and  $2 \times CH$ ), 1.96 (1H, td, J = 10.5 and 3.5 Hz, CH), 3.87 (1H, dd, J = 11.5 and 3.5 Hz, CH<sub>2</sub>), 4.40 (1H, t, J = 11.5 Hz, CH<sub>2</sub>), 4.91 (1H, s, CH), 5.13 (1H, d, J = 10.5 Hz, CH), 5.33 (1H, br s, CH), 7.17–7.27 (2H, m, 2 × CH<sub>Ar</sub>), 7.55 (1H, d, J = 7.5 Hz, CH<sub>Ar</sub>), 7.84 (1H, d, J = 7.5 Hz, CH<sub>Ar</sub>);  $\delta_{\rm C}$  (100 MHz, CDCl<sub>3</sub>)  $\delta = -4.8$ (CH<sub>3</sub>), -4.7 (CH<sub>3</sub>), 12.4 (CH<sub>3</sub>), 13.5 (2 × CH), 16.9 (CH<sub>3</sub>), 17.0 (CH<sub>3</sub>), 17.2 (CH<sub>3</sub>), 17.3 (CH<sub>3</sub>), 18.4 (C), 21.1 (3 × CH<sub>3</sub>), 47.7 (CH), 63.4 (CH<sub>2</sub>), 71.2 (CH), 71.7 (CH), 77.8 (CH), 90.9 (C), 118.5 (CH), 122.7 (CH), 123.5 (CH), 127.4 (CH), 127.8 (CH), 127.9 (CH), 134.7 (C), 140.1 (C), 168.3 (C), 171.0 (C); IR  $(v_{\text{max}}/\text{cm}^{-1})$  2953, 2928, 2861, 1771, 1463, 1261, 1133, 1071; MS *m*/*z* (ESI+) 525 [M + Na]<sup>+</sup>; HRMS found 520.2907  $[M + NH_4^+]$ ,  $C_{27}H_{46}NO_5Si_2$  requires 520.2909.

#### **Compound 22**

A dry Schlenk tube equipped with a Teflon-coated magnetic stirrer was charged with anhydrous K<sub>2</sub>CO<sub>3</sub> (1.3 g, 9.40 mmol, 2 equiv) and (Z)- $\alpha$ , $\beta$ -insaturated- $\beta$ -iodide acid (1 g, 4.70 mmol, 1 equiv). The mixture vessel was evacuated and backfilled with argon. Then freshly distilled DMF (15 mL) was added and the suspension was stirred for 15 min at room temperature. The mixture was degassed at 0 °C for 5 min and backfilled with argon. After reaching room temperature, the alkyne (0.461 g, 4.70 mmol, 1 equiv) and CuI (0.9 g, 4.70 mmol, 1 equiv) were added. The Schlenk tube was sealed and then placed in a preheated oil bath at 55 °C. Stirring was allowed for 4 hours. Then, the mixture was placed in an ice bath and a saturated aqueous solution of NH<sub>4</sub>Cl was added. Stirring at 0 °C was allowed for 10 min at which time the reactional mixture was diluted with ether and filtered through a short pad of Celite. The filtrate was washed with brine and the organic layer was dried over anhydrous MgSO<sub>4</sub>, filtered and concentrated in vacuo to yield the expecting  $\gamma$ -butyrolactone 22 (700 mg, 88% yield) which was engaged in the next step without further purifications.  $\delta_{\rm H}$ (400 MHz,  $C_6D_6$ ) 1.20 (3H, br d, J = 1.0 Hz,  $CH_3$ ), 1.36 (6H, s,  $2 \times CH_3$ ), 5.02 (1H, s, CH), 5.24 (1H, m, CH);  $\delta_C$  (100 MHz, C<sub>6</sub>D<sub>6</sub>) 11.0 (CH<sub>3</sub>), 30.2 (2 × CH<sub>3</sub>), 70.3 (C), 116.0 (CH), 118.7 (CH), 148.5 (C), 155.1 (C), 168.0 (C); IR  $(v_{\text{max}}/\text{cm}^{-1})$  3429, 2976, 2932, 2873, 1745, 1664, 1608, 1362, 1341, 1310, 1220, 1135, 1037; HRMS found 186.1129  $[M + NH_4^+]$ , C<sub>9</sub>H<sub>16</sub>NO<sub>3</sub> requires 186.1125.

#### **Compound 23**

To a stirred solution of 22 (17 mg, 0.1 mmol, 1 equiv) in CH<sub>2</sub>Cl<sub>2</sub> (0.5 mL) was added at room temperature imidazole (34 mg, 0.5 mmol, 5 equiv) followed by  $iPr_2SiCl_2$  (17.4  $\mu L$ , 0.1 mmol, 1 equiv) after complete dissolution of imidazole. After disappearance of 22 (2 hours), 19 (25 mg, 0.1 mmol, 1 equiv) in CH<sub>2</sub>Cl<sub>2</sub> (0.3 mL) was added to the mixture. The reaction was stirred for 15 min, then quenched with a saturated aqueous solution of NH<sub>4</sub>Cl. The aqueous layer was extracted with CH<sub>2</sub>Cl<sub>2</sub>. The combined organic phase were dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated under vacuum. The crude product was purified by flash chromatography (petroleum ether-diethylether 8:2) to give the silicon tethered (23 mg, 43%). In Schlenk tube, the silicon tethered (23 mg) was heated (55 °C) in degassed  $C_6D_6$  (1 mL) for 4 hours. The solution was then concentrated and purified by flash chromatography (petroleum ether-diethylether 85:15) to give 23 (17 mg, 74%). mp 161 °C;  $\delta_{\rm H}$ (400 MHz, C<sub>6</sub>D<sub>6</sub>) 0.04 (3H, s, CH<sub>3</sub>), 0.34 (3H, s, CH<sub>3</sub>), 0.91 (3H, br s, CH<sub>3</sub>), 1.00–1.07 (7H, m,  $2 \times$  CH<sub>3</sub> and CH), 1.03 (9H, s, 3 × CH<sub>3</sub>), 1.15–1.18 (7H, m, 2 × CH<sub>3</sub> and CH),), 1.34 (3H, s, CH<sub>3</sub>), 1.73 (3H, s, CH<sub>3</sub>), 2.12 (1H, d, J = 10.5 Hz, CH), 4.85 (1H, s, CH), 5.16 (1H, d, *J* = 10.5 Hz, CH), 5.43 (1H, br s, CH), 7.18 (1H, t, J = 7.5 Hz, CH<sub>Ar</sub>), 7.24 (1H, t, J = 7.5 Hz, CH<sub>Ar</sub>), 7.53 (1H, d, J = 7.5 Hz, CH<sub>Ar</sub>), 7.84 (1H, d, J = 7.5 Hz, CH<sub>Ar</sub>); δ<sub>C</sub> (100 MHz, CDCl<sub>3</sub>) -5.02 (CH<sub>3</sub>), -4.6 (CH<sub>3</sub>), 13.3 (CH), 13.9 (CH<sub>3</sub>), 14.2 (CH), 17.1<sub>6</sub> (CH<sub>3</sub>), 17.2 (CH<sub>3</sub>), 17.4 (CH<sub>3</sub>), 17.5 (CH<sub>3</sub>), 18.5 (C), 26.2 ( $4 \times$  CH<sub>3</sub>), 31.5 (CH<sub>3</sub>), 55.0 (CH), 68.5 (CH), 71.5 (CH), 76.8 (CH), 90.2 (C), 119.5 (CH), 123.3 (CH), 123.4 (CH), 127.3 (CH), 128.1 (CH), 134.3 (C), 139.5

(C), 169.5 (C), 171.6 (C); IR  $(v_{max}/cm^{-1})$  2933, 2891, 2863, 1756, 1645, 1465, 1348, 1253, 1201, 1133, 1073, 1028, 1016; MS m/z (ESI+) 553 [M + Na]<sup>+</sup>; HRMS found 531.2957 [M + H<sup>+</sup>], C<sub>29</sub>H<sub>47</sub>O<sub>5</sub>Si<sub>2</sub> requires 531.2957.

#### **Compound 24**

To a stirred solution of the  $\gamma$ -butenolide<sup>27</sup> (500 mg, 2.08 mmol, 1 equiv) in anhydrous THF (11 mL) at 0 °C was added a solution of HF-pyridine (76 µL, 70% in pyridine, 4.17 mmol, 2 equiv). The reaction was stirred at room temperature and followed by TLC. After disappearance of the starting material, the reaction was quenched with a saturated aqueous solution of NaHCO<sub>3</sub>. The aqueous phase was extracted with ether and the combined organics layers were dried over anhydrous MgSO<sub>4</sub>, filtered and concentrated in vacuo. The resulting crude product was purified by flash chromatography on silica gel (petroleum ether-ethyl acetate 1:1) to give 24 (200 mg, 76%) as a 9:1 mixture of diastereomers.  $\delta_{\rm H}$  (400 MHz, C<sub>6</sub>D<sub>6</sub>) 4.06 (2H, d, J = 6.8 Hz, CH<sub>2</sub>), 4.72 (1H, t, J = 6.8 Hz, CH), 5.44 (1H, d, J =5.3 Hz, CH), 6.16 (1H, d, J = 5.3 Hz, CH);  $\delta_{\rm C}$  (100 MHz, C<sub>6</sub>D<sub>6</sub>) 57.2 (CH<sub>2</sub>), 114.2 (CH), 120.1 (CH), 143.1 (C), 149.2 (C), 168.8 (C); IR  $(v_{\text{max}}/\text{cm}^{-1})$  3347, 2954, 2922, 2854, 1774, 1747, 1677, 1463, 1118, 1065; HRMS found 127.0389 [M + H]<sup>+</sup>, C<sub>6</sub>H<sub>7</sub>O<sub>3</sub> requires 127.0390.

#### **Compound 25**

To a stirred solution of CH<sub>2</sub>Cl<sub>2</sub> (1.6 mL), imidazole (108 mg, 2.55 mmol, 5 equiv) and  $iPr_2SiCl_2$  (58 µL, 0.32 mmol, 1 equiv) was added dropwise and at room temperature 19 (80 mg, 0.32 mmol, 1 equiv) in CH<sub>2</sub>Cl<sub>2</sub> (0.5 mL). After disappearance of 19 (5 min), lactone 24 (40 mg, 0.32 mmol, 1 equiv) in CH<sub>2</sub>Cl<sub>2</sub> (1.5 mL) was added to the mixture. The reaction was stirred for 15 min, then guenched with a saturated aqueous solution of NH<sub>4</sub>Cl. The aqueous layer was extracted with CH<sub>2</sub>Cl<sub>2</sub>. The combined organic phase were dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated under vacuum. The crude product was purified by flash chromatography (petroleum ether-diethylether 8:2) to give the silicon tethered (109 mg, 70%). In Schlenk tube, the silicon tethered (109 mg) was heated (55 °C) in degassed  $C_6D_6$  (6 mL) for 4 hours. The solution was then concentrated and purified by flash chromatography (petroleum ether-diethylether 85:15) to give 25 (44 mg, 40%).  $\delta_{\rm H}$  (400 MHz, C<sub>6</sub>D<sub>6</sub>) -0.17 (3H, s, CH<sub>3</sub>), 0.01 (3H, s, CH<sub>3</sub>), 0.87 (9H, s, 3  $\times$  CH<sub>3</sub>), 1.08–1.12 (14H, m,  $4 \times CH_3$  and  $2 \times CH$ ), 2.63 (1H, td, J = 10 and 4 Hz, CH), 3.84 (1H, dd, J = 11 and 4 Hz, CH<sub>2</sub>), 4.01–4.07 (1H, m, CH<sub>2</sub>), 4.43 (1H, s, CH), 5.24 (1H, d, J = 10 Hz, CH), 5.33 (1H, d, J = 5.5 Hz, CH), 5.33 (1H, d, J = 5.5 Hz, CH), 7.10-7.24 (3H, m, 3 × CH<sub>Ar</sub>), 7.82 (1H, d, J = 7.5 Hz, CH<sub>Ar</sub>);  $\delta_{\rm C}$ (100 MHz, CDCl<sub>3</sub>) -4.5 (CH<sub>3</sub>), -4.2 (CH<sub>3</sub>), 12.4 (CH), 13.6 (CH), 16.9 (CH<sub>3</sub>), 17.0 (CH<sub>3</sub>), 17.2 (CH<sub>3</sub>), 17.2<sub>4</sub> (CH<sub>3</sub>), 18.3 (C), 25.9 (3 × CH<sub>3</sub>), 44.2 (CH), 64.1 (CH<sub>2</sub>), 72.3 (CH), 73.8 (CH), 89.8 (C), 121.8 (CH), 125.6 (CH), 127.4 (CH), 127.5 (CH), 128.9 (CH), 134.3 (C), 139.1 (C), 156.7 (CH), 171.9 (C); IR  $(v_{\text{max}}/\text{cm}^{-1})$  2953, 2928, 2896, 2860, 1767, 1463, 1254, 1134, 1081, 1027; MS m/z (ESI+) 511 [M + Na]<sup>+</sup>; HRMS found  $506.2751 [M + NH_4^+], C_{26}H_{44}NO_5Si_2$  requires 506.2753.

#### Acknowledgements

The Agence Nationale pour la Recherche (A.N.R.-09-JCJC-0036), the CNRS and Aix-Marseille Université (UMR 7313) are gratefully acknowledged for financial support. The authors wish to thank Michel Giorgi for X-Ray analysis. Dr Gaëlle Chouraqui is also gratefully thanked for her fruitful participation.
