1 Proof of Lemma 8.3

Lemma 1.1 *Suppose assumption (A3) holds and $d \geq 3$. Then, for all $h \in \mathcal{H}_d$, we have*

$$\mathbb{E} \|X_{(1)}^h(X^h) - X^h\|^2 \leq \frac{16R^2}{n^{2/d}} \left(\frac{d}{2} - 1\right)^{4/d}.$$

Proof – Fix $h \in \mathcal{H}_d$ and denote μ_h the distribution of X^h . Since $\dim S(h) \leq d$, one may consider that X^h is \mathbb{R}^d -valued and that μ_h is of support in \mathbb{R}^d . Hence, for all $\varepsilon > 0$, we have

$$\begin{aligned} \mathbb{P} \left(\|X_{(1)}^h(X^h) - X^h\| > \varepsilon \right) &= \mathbb{E} \left[\mathbb{P} \left(\|X_{(1)}^h(X^h) - X^h\| > \varepsilon \mid X \right) \right] \\ &= \mathbb{E} \left[\mathbb{P} \left(\|X_1^h - X^h\| > \varepsilon \mid X \right)^n \right] \\ &= \mathbb{E} \left[\left(1 - \mu_h \left(B_d \left(X^h, \varepsilon \right) \right) \right)^n \right] \\ &= \int_{\|u\|_d \leq R} \left(1 - \mu_h \left(B_d(u, \varepsilon) \right) \right)^n \mu_h(du), \end{aligned}$$

since, under assumption (A3), the variable X^h is $B_d(0, R)$ -valued. Now, for all $\varepsilon > 0$, the ε -covering number $N(\varepsilon)$ of $B_d(0, R)$ satisfies

$$N(\varepsilon) \leq \left(\frac{4R}{\varepsilon} \right)^d$$

(see e.g. Proposition 5 in Cucker and Smale, 2001). Thus, given $\varepsilon > 0$, one may find a finite collection of Euclidian balls $B_1, \dots, B_{N(\varepsilon)}$ of radius at most ε in \mathbb{R}^d

such that

$$B_d(0, R) \subset \bigcup_{i=1}^{N(\varepsilon)} B_i.$$

We can notice that for all $i \in \{1, \dots, N(\varepsilon)\}$, we have $u \in B_i \Rightarrow B_i \subset B_d(u, \varepsilon)$. Then

$$\begin{aligned} \mathbb{P}\left(\|X_{(1)}^h(X^h) - X^h\| > \varepsilon\right) &= \int_{\|u\|_d \leq R} (1 - \mu_h(B_d(u, \varepsilon)))^n \mu_h(du) \\ &\leq \sum_{i=1}^{N(\varepsilon)} \int_{B_i} (1 - \mu_h(B_i))^n \mu_h(du) \\ &= \sum_{i=1}^{N(\varepsilon)} \mu_h(B_i) (1 - \mu_h(B_i))^n. \end{aligned}$$

Then, since for all $t \in [0, 1]$ we have $t(1-t)^n \leq \frac{1}{n}$, it follows that for all $\varepsilon > 0$

$$\mathbb{P}\left(\|X_{(1)}^h(X^h) - X^h\| > \varepsilon\right) \leq \frac{N(\varepsilon)}{n} \leq \frac{1}{n} \left(\frac{4R}{\varepsilon}\right)^d.$$

Now write $C_n := \frac{(4R)^d}{n}$. Using the fact that $d \geq 3$, we have

$$\begin{aligned} \mathbb{E}\|X_{(1)}^h(X^h) - X^h\|^2 &= \int_0^{+\infty} \mathbb{P}\left(\|X_{(1)}^h(X^h) - X^h\| > \sqrt{\varepsilon}\right) d\varepsilon \\ &\leq \int_0^{+\infty} \min\left(1, \frac{C_n}{\varepsilon^{d/2}}\right) d\varepsilon \\ &\leq \inf_{\delta > 0} \left(\int_0^\delta d\varepsilon + C_n \int_\delta^{+\infty} \frac{d\varepsilon}{\varepsilon^{d/2}} \right) \\ &= \inf_{\delta > 0} \left(\delta + C_n \left(\frac{d}{2} - 1\right) \delta^{1-d/2} \right) \\ &= C_n^{2/d} \left(\frac{d}{2} - 1\right)^{4/d} \\ &= \frac{16R^2}{n^{2/d}} \left(\frac{d}{2} - 1\right)^{4/d}, \end{aligned}$$

which concludes the proof. \square

Proof of Lemma 8.3 – Fix $k \in \{1, \dots, n\}$, $\rho > 0$ and $h \in \mathbf{H}_d(\rho)$ such that $\|h - h^*\|_\infty \leq \rho$. To ease notations we set

$$\hat{r}_h := \hat{r}_h[k] \quad \text{and} \quad W_i(h, \cdot) := W_i[k](h, \cdot), \quad i = n+1, \dots, 2n.$$

First we have

$$\begin{aligned} \mathbb{E} \left[(r(X) - \hat{r}_h(h(X)))^2 \right] &\leq 2\mathbb{E} \left[(r(X) - r_h(h(X)))^2 \right] \\ &\quad + 2\mathbb{E} \left[(r_h(h(X)) - \hat{r}_h(h(X)))^2 \right]. \end{aligned}$$

Since $r = r_{h^*} \circ h^*$ and $r_{h^*} \in \mathcal{G}$, we have under assumptions **(A4)** and **(A5)**

$$\begin{aligned} \mathbb{E} \left[(r(X) - r_h(h(X)))^2 \right] &\leq 2\mathbb{E} \left[(r_{h^*}(h^*(X)) - r_{h^*}(h(X)))^2 \right] \\ &\quad + 2\mathbb{E} \left[(r_{h^*}(h(X)) - r_h(h(X)))^2 \right] \\ &\leq 2(L^2 + K^2)\|h - h^*\|_\infty^2 \\ &\leq 2(L^2 + K^2)\rho^2. \end{aligned}$$

Therefore, we deduce that

$$\mathbb{E} \left[(r(X) - \hat{r}_h(h(X)))^2 \right] \leq 4(L^2 + K^2)\rho^2 + 2\mathbb{E} \left[(r_h(h(X)) - \hat{r}_h(h(X)))^2 \right].$$

Next, denoting $\mathcal{S} = \{X_{n+1}, \dots, X_{2n}\}$, we have

$$\begin{aligned} \mathbb{E} \left[(r_h(h(X)) - \hat{r}_h(h(X)))^2 \mid X \right] &= \mathbb{E} \left[\left(r_h(h(X)) - \mathbb{E} \left[\hat{r}_h(h(X)) \mid X, \mathcal{S} \right] \right)^2 \mid X \right] \\ &\quad + \mathbb{E} \left[\left(\hat{r}_h(h(X)) - \mathbb{E} \left[\hat{r}_h(h(X)) \mid X, \mathcal{S} \right] \right)^2 \mid X \right] \\ &=: E_1 + E_2. \end{aligned}$$

Here, we have used the fact that

$$\begin{aligned} &\mathbb{E} \left[\left(r_h(h(X)) - \mathbb{E} \left[\hat{r}_h(h(X)) \mid X, \mathcal{S} \right] \right) \left(\hat{r}_h(h(X)) - \mathbb{E} \left[\hat{r}_h(h(X)) \mid X, \mathcal{S} \right] \right) \mid X \right] \\ &= \mathbb{E} \left[\mathbb{E} \left[\left(r_h(h(X)) - \mathbb{E} \left[\hat{r}_h(h(X)) \mid X, \mathcal{S} \right] \right) \left(\hat{r}_h(h(X)) - \mathbb{E} \left[\hat{r}_h(h(X)) \mid X, \mathcal{S} \right] \right) \mid X, \mathcal{S} \right] \mid X \right] \\ &= \mathbb{E} \left[\left(r_h(h(X)) - \mathbb{E} \left[\hat{r}_h(h(X)) \mid X, \mathcal{S} \right] \right) \mathbb{E} \left[\hat{r}_h(h(X)) - \mathbb{E} \left[\hat{r}_h(h(X)) \mid X, \mathcal{S} \right] \mid X, \mathcal{S} \right] \mid X \right] \\ &= 0. \end{aligned}$$

First, we bound the term E_1 . We have

$$\begin{aligned}
\mathbb{E} \left[\hat{r}_h(h(X)) \middle| X, \mathcal{S} \right] &= \mathbb{E} \left[\sum_{i=n+1}^{2n} W_i(h, h(X)) Y_i \middle| X, \mathcal{S} \right] \\
&= \sum_{i=n+1}^{2n} W_i(h, h(X)) \mathbb{E} [Y_i | X_i] \\
&= \sum_{i=n+1}^{2n} W_i(h, h(X)) r(X_i). \tag{1.1}
\end{aligned}$$

Therefore

$$\begin{aligned}
E_1 &= \mathbb{E} \left[\left(r_h(h(X)) - \mathbb{E} \left[\hat{r}_h(h(X)) \middle| X, \mathcal{S} \right] \right)^2 \middle| X \right] \\
&= \mathbb{E} \left[\left(\sum_{i=n+1}^{2n} W_i(h, h(X)) (r_h(h(X)) - r_{h^*}(h^*(X_i))) \right)^2 \middle| X \right] \\
&\leq 3 \mathbb{E} \left[\left(\sum_{i=n+1}^{2n} W_i(h, h(X)) (r_h(h(X)) - r_{h^*}(h(X))) \right)^2 \middle| X \right] \\
&\quad + 3 \mathbb{E} \left[\left(\sum_{i=n+1}^{2n} W_i(h, h(X)) (r_{h^*}(h(X)) - r_{h^*}(h(X_i))) \right)^2 \middle| X \right] \\
&\quad + 3 \mathbb{E} \left[\left(\sum_{i=n+1}^{2n} W_i(h, h(X)) (r_{h^*}(h(X_i)) - r_{h^*}(h^*(X_i))) \right)^2 \middle| X \right] \\
&=: J_1 + J_2 + J_3.
\end{aligned}$$

Since $r = r_{h^*} \circ h^*$ and $r_{h^*} \in \mathcal{G}$, assumptions **(A4)** and **(A5)** lead to

$$J_1 \leq 3K^2 \rho^2 \quad \text{and} \quad J_3 \leq 3L^2 \rho^2.$$

The fact that r_{h^*} is L -Lipschitz leads to

$$J_2 \leq 3L^2 \mathbb{E} \left[\left(\frac{1}{k} \sum_{i=1}^k \|X^h - X_{(i)}^h(X^h)\| \right)^2 \middle| X \right].$$

Now let $\tilde{n} = \lfloor n/k \rfloor$. We split the sample $\{X_{n+1}^h, \dots, X_{n+k\tilde{n}}^h\}$ into k subsamples of size \tilde{n} :

$$Z_j = \left\{ X_{n+(j-1)\tilde{n}+1}^h, \dots, X_{n+j\tilde{n}}^h \right\}, \quad j = 1, \dots, k,$$

and denote by $Z_j^{(1)}$ the closest element of Z_j from X^h . Then

$$\sum_{j=1}^k \|X_{(j)}^h(X^h) - X^h\| \leq \sum_{j=1}^k \|Z_j^{(1)} - X^h\|.$$

Therefore, by Jensen's inequality and lemma 1.1, we have

$$\begin{aligned} \mathbb{E}[E_1] &\leq \frac{3L^2}{k} \sum_{j=1}^k \mathbb{E} \|Z_j^{(1)} - X^h\|^2 + 3(L^2 + K^2)\rho^2 \\ &\leq \frac{48L^2R^2}{\tilde{n}^{2/d}} \left(\frac{d-2}{2} \right)^{4/d} + 3(L^2 + K^2)\rho^2 \\ &\leq 48L^2R^2 4^{1/d} \left(\frac{d-2}{2} \right)^{4/d} \left(\frac{k}{n} \right)^{2/d} + 3(L^2 + K^2)\rho^2, \end{aligned}$$

where the last inequality holds provided $\frac{k}{n} \lfloor n/k \rfloor \geq \frac{1}{2}$.

Now we turn to bounding the term E_2 . According to (1.1), we have

$$\begin{aligned} E_2 &= \mathbb{E} \left[\left(\sum_{i=n+1}^{2n} W_i(h, h(X)) (Y_i - r(X_i)) \right)^2 \middle| X \right] \\ &= \mathbb{E} \left[\sum_{i=n+1}^{2n} W_i(h, h(X))^2 (Y_i - r(X_i))^2 \middle| X \right], \end{aligned}$$

where we have used the fact that if $i \neq j \in \{n+1, \dots, 2n\}$

$$\mathbb{E} \left[W_i(h, h(X)) (Y_i - r(X_i)) W_j(h, h(X)) (Y_j - r(X_j)) \middle| X \right] = 0.$$

Using the properties $\sum_{i=n+1}^{2n} W_i(h, h(X)) = 1$, $W_i(h, h(X)) \leq \frac{1}{k}$ and $|Y_i - r(X_i)| \leq B+L$, for all $i \in \{n+1, \dots, 2n\}$, we conclude that

$$\mathbb{E}[E_2] \leq \frac{(B+L)^2}{k}.$$

To complete the proof, write

$$\begin{aligned}\mathbb{E}\left[(r(X) - \hat{r}_h(h(X)))^2\right] &\leq 2\mathbb{E}[E_1] + 2\mathbb{E}[E_2] + 4(L^2 + K^2)\rho^2 \\ &\leq \frac{2(B+L)^2}{k} + 96L^2R^24^{1/d} \left(\frac{d-2}{2}\right)^{4/d} \left(\frac{k}{n}\right)^{2/d} + 10(L^2 + K^2)\rho^2 \\ &\leq C \left\{ \frac{1}{k} + \left(\frac{k}{n}\right)^{2/d} \right\} + C\rho^2,\end{aligned}$$

where $C := \max \left\{ 2(B+L)^2; 10(L^2 + K^2); 96L^2R^24^{1/d} \left(\frac{d-2}{2}\right)^{4/d} \right\}$. \square
