HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Advocating for a systemic view of innovation in company ecosystems

Bernard Yannou

Professor of Design & Industrial Engineering

Laboratoire Genie Industriel

Ecole Centrale Paris

Grande Voie des Vignes - 92290 Chatenay-Malabry, France

One may and one must study design creativity and innovation from theoretical perspectives and carefully study cognitive aspects of it within the ideation process which is the heart of innovation process. But one must not forget realities of companies because they are the first beneficiaries of the practical perspectives: getting effective methods in companies to develop ever more innovative products and services.

But studying design creativity and innovation from practical perspectives for companies is not much developed today since many barriers make it uneasy. Indeed, in a company, there are many more influencing factors than in a controlled lab experiment, experiments are not repeatable, company executives do not tolerate non profitable experiments, designers are most of the time working on different projects at a time, and it is hard and time consuming to properly measure the effects of a creativity method or innovation theory (see a recent survey in [1]).

To do so, it requires a good understanding of the company ecosystem and its inner processes contributing to delivered innovations [2]. Second, it requires a rigorous design research methodology so as to provide effective design models, methods, platforms that are truly effective in the context of company [3].

Working in an Industrial Engineering laboratory, I advocate a more systemic vision of design creativity and innovation in company ecosystems [4]. I presently work with my team and colleagues to develop and make professional an innovation engineering to professionalize as much as possible, an innovation supply chain in companies (see also [5; 6]), i.e. to ensure a continuous production of innovations without "killing innovation" by framing too tight, organizing too much. But one must make possible to deliver a stream of innovations in accordance with the concerned disciplines in companies as well as with the layers of business processes that contribute to it. We are also at the crossing of several scientific disciplines that have their language, their methods of observation, production and model validation like design engineering, industrial engineering, strategic management of innovation projects, management of technologies, strategic marketing, business information systems, process modeling, accounting and market economy.

I hope this journal can be also the place to publish this type of research works.
