HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

**RESOLVENT AND PROPAGATION ESTIMATES
FOR KLEIN-GORDON EQUATIONS
WITH NON-POSITIVE ENERGY**

V. GEORGESCU, C. GÉRARD, AND D. HAEFNER

ABSTRACT. We study in this paper an abstract class of Klein-Gordon equations:

$$\partial_t^2 \phi(t) - 2ik\partial_t \phi(t) + h\phi(t) = 0,$$

where $\phi : \mathbb{R} \rightarrow \mathcal{H}$, \mathcal{H} is a (complex) Hilbert space, and h, k are self-adjoint, resp. symmetric operators on \mathcal{H} .

We consider their generators H (resp. K) in the two natural spaces of Cauchy data, the *energy* (resp. *charge*) spaces. We do not assume that the dynamics generated by H or K has any positive conserved quantity, in particular these operators may have complex spectrum. Assuming conditions on h and k which allow to use the theory of selfadjoint operators on *Krein spaces*, we prove weighted estimates on the boundary values of the resolvents of H, K on the real axis. From these resolvent estimates we obtain corresponding propagation estimates on the behavior of the dynamics for large times.

Examples include wave or Klein-Gordon equations on asymptotically euclidean or asymptotically hyperbolic manifolds, minimally coupled with an external electro-magnetic field decaying at infinity.

1. INTRODUCTION

This paper is devoted to the proof of resolvent and propagation estimates for the generators of a class of abstract Klein-Gordon equations

$$(1.1) \quad \partial_t^2 \phi(t) - 2ik\partial_t \phi(t) + h\phi(t) = 0,$$

where $\phi : \mathbb{R} \rightarrow \mathcal{H}$, \mathcal{H} is a (complex) Hilbert space, and h, k are self-adjoint, resp. symmetric operators on \mathcal{H} .

There are many natural examples of such abstract class of equations: one class is obtained by considering Klein-Gordon equations

$$-\nabla^a \nabla_a \phi + m^2 \phi = 0,$$

on a Lorentzian manifold having a global Killing vector field, corresponding in (1.1) to ∂_t . A related class is obtained by perturbing a static Klein-Gordon equation:

$$\partial_t^2 \phi - \nabla^j \nabla_j \phi + m^2 \phi = 0$$

on $\mathbb{R}_t \times N$ (N is a Riemannian manifold) by minimal coupling this equation to an external electro-magnetic field A_a independent on t . We obtain then the equation

$$(\partial_t - iv(x))^2 \phi - (\nabla^j - iA^j(x))(\nabla_j - iA_j(x))\phi + m^2 \phi = 0,$$

which can be put in the form (1.1).

An example to keep in mind is the Klein-Gordon equation on Minkowski space minimally coupled with an external electric field:

$$(1.2) \quad (\partial_t - iv(x))^2 \phi(t, x) - \Delta_x \phi(t, x) + m^2 \phi(t, x) = 0,$$

Date: March 2013.

Key words and phrases. Klein-Gordon equations, Krein spaces, resolvent estimates, propagation estimates.

for which $\mathcal{H} = L^2(\mathbb{R}^d, dx)$, $h = -\Delta_x + m^2 - v^2(x)$, $k = v(x)$ is a (real) electric potential and $m \geq 0$ is the mass of the Klein-Gordon field. We will use this example to describe the results and methods of the present work.

1.1. Description of the main results. The equation (1.2) has two natural conserved quantities, the *charge*:

$$\int_{\mathbb{R}^d} \left(i\partial_t \bar{\phi}(t, x)\phi(t, x) - i\bar{\phi}(t, x)\partial_t \phi(t, x) - 2v(x)|\phi(t, x)|^2 \right) dx,$$

and the *energy*:

$$\int_{\mathbb{R}^d} \left(|\partial_t \phi(t, x)|^2 + |\nabla_x \phi(t, x)|^2 + (m^2 - v^2(x))|\phi(t, x)|^2 \right) dx,$$

both related to the symplectic nature of (1.2). In order to associate a generator to (1.2), one has to consider a *Cauchy problem*. There are two natural ways to define Cauchy data at time t . One can set

$$(1.3) \quad f(t) = \begin{pmatrix} \phi(t) \\ i^{-1}\partial_t \phi(t) - v\phi(t) \end{pmatrix},$$

so that

$$f(t) = e^{itK} f(0), \quad K = \begin{pmatrix} v & \mathbb{1} \\ -\Delta_x + m^2 & v \end{pmatrix}.$$

This choice is natural when one emphasizes the conservation of the charge, which takes the simple form:

$$q(f, f) = \int_{\mathbb{R}^d} \bar{f}_1(x)f_0(x) + \bar{f}_0(x)f_1(x) dx, \quad f = \begin{pmatrix} f_0 \\ f_1 \end{pmatrix}.$$

Another choice, more common in the PDE literature is:

$$(1.4) \quad f(t) = \begin{pmatrix} \phi(t) \\ i^{-1}\partial_t \phi(t) \end{pmatrix},$$

so that

$$f(t) = e^{itH} f(0), \quad H = \begin{pmatrix} 0 & \mathbb{1} \\ -\Delta_x + m^2 - v^2 & 2v \end{pmatrix}.$$

With this choice the energy takes the simple form:

$$E(f, f) = \int_{\mathbb{R}^d} |f_1|^2(x) + |\nabla f_0|^2(x) + (m^2 - v^2(x))|f_0|^2(x) dx, \quad f = \begin{pmatrix} f_0 \\ f_1 \end{pmatrix}.$$

Note that the two operators K and H are obviously related by similarity, see e.g. Subsect. 4.4.

The main problem one faces when studying Klein-Gordon equations (1.2) is the lack of a *positive* conserved quantity. For example q is clearly never positive definite, while E is not positive definite if the electric potential v becomes too large, so that $-\Delta_x + m^2 - v^2(x)$ acquires some negative spectrum. In other words it is generally not possible to equip the space of Cauchy data with a Hilbert space structure such that K or H are self-adjoint.

There are two manifestations of this problem with some physical significance. The first one, discovered long ago by physicists [SSW], is the fact that if v is too large, K and H acquire complex eigenvalues, appearing in complex conjugate pairs. This phenomenon is sometimes called the *Klein paradox*. It implies the existence of exponentially growing solutions, and causes difficulties with the quantization of (1.2).

The second manifestation is known as *superradiance*. It appears for example for the Klein-Gordon equation (1.2) in 1 dimension, when the electric potential v has two limits v_{\pm} at $\pm\infty$ with $|v_+ - v_-| > m$, see [Ba] for a mathematical analysis. It also appears in more complicated models, like the Klein-Gordon equation on

the *Kerr space-time*, which can be reduced to the abstract form (1.1) after some separation of variables.

Superradiance appears when there exist infinite dimensional subspaces of Cauchy data, asymptotic invariant under H , on which the energy is positive (resp. negative). If this happens a wave coming from $+\infty$ may, after scattering by the potential, return to $+\infty$ with more energy than it initially had.

Another more mathematical issue with (1.2) is that there are many possible topologies to put on the space of Cauchy data. If we use (1.3) it is natural to require that the charge should be bounded for the chosen topology. This of course does not fix the topology, but by considering the simple case $v(x) \equiv 0$ it is easy to see (see Subsect. 4.5) that the natural space of Cauchy data is the *charge space*:

$$\mathcal{F} = H^{\frac{1}{2}}(\mathbb{R}^d) \oplus H^{-\frac{1}{2}}(\mathbb{R}^d),$$

where $H^s(\mathbb{R}^d)$ denotes the usual Sobolev space of order s .

If we use (1.4), then we should require that the energy be bounded, which leads to the essentially unique choice of the *energy space*:

$$\mathcal{E} = H^1(\mathbb{R}^d) \oplus L^2(\mathbb{R}^d).$$

Note that if $m = 0$ the *homogeneous energy space*

$$\dot{\mathcal{E}} = (-\Delta_x - v^2)^{-\frac{1}{2}} L^2(\mathbb{R}^d) \oplus L^2(\mathbb{R}^d)$$

(see Subsect. 2.1 for this notation) could also be considered, and will actually play an important role in our work.

Let us now illustrate the results of our paper on the example (1.2), assuming for simplicity that $v \in C_0^\infty(\mathbb{R}^d)$. Using general results on self-adjoint operators on Krein spaces, one can first show that

$$\begin{aligned} \sigma(H) &= \sigma(K), \\ \sigma_{\text{ess}}(H) &= \sigma_{\text{ess}}(K) =]-\infty, -m] \cup [m, +\infty[\\ \sigma(H) \setminus \mathbb{R} &= \sigma(K) \setminus \mathbb{R} = \cup_{1 \leq j \leq n} \{\lambda_j, \overline{\lambda_j}\}, \end{aligned}$$

where $\lambda_j, \overline{\lambda_j}$ are eigenvalues of finite Riesz index.

The main result of this work are *weighted resolvent estimates*, valid near the essential spectrum of K, H :

$$(1.5) \quad \sup_{\text{Re } z \in I, 0 < \text{Im } z \leq \delta} \|\langle x \rangle_{\text{diag}}^{-\delta} (H - z)^{-1} \langle x \rangle_{\text{diag}}^{-\delta}\|_{B(\mathcal{E})} < \infty, \quad \forall \frac{1}{2} < \delta,$$

Here $\langle x \rangle_{\text{diag}}$ denotes the diagonal operator on the space of Cauchy data $H^1(\mathbb{R}^d) \oplus L^2(\mathbb{R}^d)$ with entries $\langle x \rangle$ (see Subsect. 2.1), $I \subset \mathbb{R}$ is a compact interval disjoint from $\pm m$, containing no real eigenvalues of H , nor so called *critical points* of H (see Sect. 3 for the definition of critical points).

Similar results hold for K , replacing \mathcal{E} by \mathcal{F} . By the usual argument based on Fourier transformation, we deduce from (1.5) *propagation estimates* on the C_0 -groups e^{itH}, e^{itK} :

$$(1.6) \quad \begin{aligned} \int_{\mathbb{R}} \|\langle x \rangle_{\text{diag}}^{-\delta} e^{itH} \chi(H) \langle x \rangle_{\text{diag}}^{-\delta} f\|_{\mathcal{E}}^2 dt &\leq C \|f\|_{\mathcal{E}}^2, \\ \int_{\mathbb{R}} \|\langle x \rangle_{\text{diag}}^{-\delta} e^{itK} \chi(K) \langle x \rangle_{\text{diag}}^{-\delta} f\|_{\mathcal{F}}^2 dt &\leq C \|f\|_{\mathcal{F}}^2, \end{aligned}$$

where $\chi \in C_0^\infty(\mathbb{R})$ is a cutoff function supported away from real eigenvalues and critical points of H and K .

From (1.6) it is easy to construct the short-range scattering theory for the dynamics e^{itH}, e^{itK} . With a little more effort, the long-range scattering theory can

also be constructed. In this way the results of [Ge], dealing with the scattering theory of massive Klein-Gordon equations in energy spaces, can certainly be extended to the massless case (ie to wave equations), both in the energy and charge spaces.

1.2. Methods. In the usual Hilbert space setting, where H is self-adjoint for some Hilbert space scalar product, the most powerful way to prove estimates (1.5), (1.6) relies on the *Mourre method*, i.e. on the construction of another self-adjoint operator A such that

$$(1.7) \quad \mathbb{1}_I(H)[H, iA]\mathbb{1}_I(H) \geq c\mathbb{1}_I(H) + R,$$

where R is compact and $c > 0$. This method can be directly applied to (1.2) if the energy $E(f, f)$ is positive definite, so that it defines a compatible scalar product on \mathcal{E} . Numerous papers rely on this observation, see among many others the papers [E, Lu, N, S, VW], and for more recent results based on the Mourre method [Ha1, Ha2].

If the energy is not positive, one can consider the energy space \mathcal{E} equipped with E as a *Krein space*, i.e. a Hilbertizable vector space equipped with a bounded, non-degenerate hermitian form. Orthogonal and adjoints on a Krein space are defined w.r.t. the Krein scalar product, and conservation of energy is formally equivalent to the fact that the generator H is self-adjoint in the Krein sense.

There exists a class of self-adjoint operators on Krein spaces, the so-called *definitizable operators*, (see Subsect. 3.2) which admit a continuous and Borel functional calculus quite similar to the one of usual self-adjoint operators. A finite set of their real spectrum, called the *critical points*, plays the role of *spectral singularities* for the functional calculus. Spectral projections on intervals whose endpoints are not critical points can be defined, and they have the important property that if they do not contain critical points, then the Krein scalar product is *definite* (positive or negative) on their range.

In [GGH1], we exploited these properties of definitizable operators on Krein spaces to extend the Mourre method to this setting, obtaining weighted resolvent estimates in an abstract setting.

In this work we apply the general results of [GGH1] to one of the main examples of self-adjoint operators on Krein spaces, namely the generators of one of the C_0 -groups associated to the abstract Klein-Gordon equation (1.1).

Note that several papers were devoted to Klein-Gordon or wave equations from the Krein space point of view, see e.g. [J3, LNT1, LNT2]. However resolvent estimates near the real spectrum were never considered in the above papers.

We obtain resolvent and propagation estimates which are generalizations of (1.5), (1.6). Examples of our abstract framework are minimally coupled Klein-Gordon or wave equations on *scattering* or *asymptotically hyperbolic* manifolds.

Note that the typical assumption of the electric potential v is that it should decay to 0 at ∞ . This assumption is necessary to ensure that H is definitizable. Therefore the models considered in this paper, while possibly exhibiting the Klein paradox, do not give rise to superradiance. In a subsequent paper [GGH2] we will prove similar results for a model exhibiting superradiance, namely the Klein-Gordon equation on *Kerr-de Sitter space-times*. Using the results of this paper, it is possible to prove resolvent estimates and to study scattering theory also for such superradiant Klein-Gordon equations.

1.3. Plan of the paper. Sect. 2 contains some preparatory material, the most important dealing with quadratic operator pencils.

In Sect. 3 we recall the theory of *definitizable operators* on Krein spaces. In particular we devote some effort to present a self-contained exposition of their

functional calculus, which is a rather delicate but interesting topic. Among previous contributions to this question, we mention the works of Langer [La] and Jonas [J4].

In [GGH1] we constructed the natural version of the *continuous* functional calculus for a definitizable operator H , associated to an algebra of continuous functions having asymptotic expansions of a specific order at each *critical point* of H . Although we will not need its full generality in the rest of the paper, we found it worthwhile to develop the corresponding *Borel* functional calculus. An interesting feature of this calculus is that the natural algebra is not an algebra of functions on \mathbb{R} anymore, but has to be augmented by adding a copy of \mathbb{C} at each critical point.

In Sect. 4 we discuss in some detail the various setups for abstract Klein-Gordon equations and the possible choices of topologies on the space of initial data.

Sects. 5 and 6 are devoted to basic facts on the generators of Klein-Gordon equations in energy and charge spaces respectively. Related results can be found in [LNT1, LNT2]. In particular *quadratic pencils* play an important role here.

In Sect. 7 we introduce a class of definitizable Klein-Gordon operators. We also construct an approximate diagonalization of these operators which will be needed later.

Sect. 8 is devoted to the proof of a positive (in the Krein sense) commutator estimate for the operators considered in Sect. 7. It relies on abstract conditions on the scalar operators h, k appearing in (1.1).

In Sect. 9 resolvent estimates are proved for the generators H on energy spaces. From them we deduce similar estimates for the quadratic pencils considered in Sect. 5, which in turn imply resolvent estimates for the generators K on charge spaces.

Sect. 11 is devoted to the proof of propagation estimates for the groups e^{itH} and e^{itK} . They follow from resolvent estimates by the standard arguments, usually applied in the Hilbert space setting.

In Sect. 12 we give various examples of our abstract class of Klein-Gordon equations. The first examples are Klein-Gordon equations on *scattering manifolds*, minimally coupled to external electro-magnetic fields. The massive and massless cases are discussed separately, a *Hardy inequality* playing an important role in the massless case. The second examples are Klein-Gordon equations on *asymptotically hyperbolic manifolds*, again with minimal coupling.

Various technical proofs are collected in Appendices A, B.

2. SOME PREPARATIONS

In this section we collect some notation and preparatory material which will be used in later sections.

2.1. Notations. Sets

- if X, Y are sets and $f : X \rightarrow Y$ we write $f : X \xrightarrow{\sim} Y$ if f is bijective. If X, Y are equipped with topologies, we use the same notation if $f : X \rightarrow Y$ is a homeomorphism.

- if $I \subset \mathbb{R}$ and f is a real valued function defined on I then $f(I)$ denotes the image of I under f .

Examples of this notation used in Subsect. 8.3 are \sqrt{I} , I^2 and $|I|$.

- we set $\langle \lambda \rangle := (\lambda^2 + 1)^{\frac{1}{2}}$, $\lambda \in \mathbb{R}$.

Linear operators

- if $E \subset F$ are Banach spaces, we denote by $[E, F]_{\theta}$, $0 \leq \theta \leq 1$ the complex interpolation space of order θ .

- if A is a closed, densely defined operator, we denote by $\rho(A) \subset \mathbb{C}$ its resolvent set and by $\text{Dom}A$ its domain.

- let X, Y, Z be Banach spaces such that $X \subset Y \subset Z$ with continuous and dense embeddings. Then to each continuous operator $\widehat{S} : X \rightarrow Z$ one may associate a densely defined operator S acting in Y defined as the restriction of \widehat{S} to the domain $\text{Dom} S = (\widehat{S})^{-1}(Y)$.

- if $\mathcal{H}_1, \mathcal{H}_2$ are Hilbert spaces, we denote by $B_\infty(\mathcal{H}_1, \mathcal{H}_2)$ the ideal of compact operators from \mathcal{H}_1 to \mathcal{H}_2 and set $B_\infty(\mathcal{H}) = B_\infty(\mathcal{H}, \mathcal{H})$.

- If a, b are linear operators, then we set $\text{ad}_a(b) := [a, b]$. Usually in this paper commutators are defined in the operator sense, i.e. $[a, b]$ has domain $\text{Dom}(ab) \cap \text{Dom}(ba)$.

- if A, B are two positive self-adjoint operators on a Hilbert space \mathcal{H} , we write $A \sim B$ if

$$\text{Dom} A^{\frac{1}{2}} =: \text{Dom} B^{\frac{1}{2}} \text{ and } c^{-1}A \leq B \leq cA \text{ on } \text{Dom} A^{\frac{1}{2}}, \quad c > 0.$$

Dual pairs

-Let \mathcal{G}, \mathcal{H} be reflexive Banach spaces and $\mathcal{E} = \mathcal{G} \oplus \mathcal{H}$. The usual realization $(\mathcal{G} \oplus \mathcal{H})^* = \mathcal{G}^* \oplus \mathcal{H}^*$ of the adjoint space will not be convenient in the sequel, we shall rather set $\mathcal{E}^* := \mathcal{H}^* \oplus \mathcal{G}^*$ so that

$$\langle w|f \rangle = \langle w_0|f_1 \rangle + \langle w_1|f_0 \rangle, \text{ for } f = (f_0, f_1) \in \mathcal{E}, \quad w = (w_0, w_1) \in \mathcal{E}^*.$$

For example, if $\mathcal{H} = \mathcal{G}^*$, so $\mathcal{H}^* = \mathcal{G}$, the adjoint space of $\mathcal{E} = \mathcal{G} \oplus \mathcal{G}^*$ is identified with itself $\mathcal{E}^* = \mathcal{E}$.

Scale of Sobolev spaces

Let \mathcal{H} be a Hilbert space with norm $\|\cdot\|$ and scalar product $(\cdot|\cdot)$. We identify \mathcal{H} with its adjoint space $\mathcal{H}^* = \mathcal{H}$ via the Riesz isomorphism. Let h be a self-adjoint operator on \mathcal{H} .

We can associate to it the *non-homogeneous Sobolev spaces*

$$\langle h \rangle^{-s} \mathcal{H} := \text{Dom} |h|^s, \quad \langle h \rangle^s \mathcal{H} := (\langle h \rangle^{-s} \mathcal{H})^*, \quad s \geq 0.$$

The spaces $\langle h \rangle^{-s} \mathcal{H}$ are equipped with the graph norm $\|\langle h \rangle^s u\|$.

If moreover $\text{Ker} h = \{0\}$, then we can also define the *homogeneous Sobolev spaces* $|h|^s \mathcal{H}$ equal to the completion of $\text{Dom} |h|^{-s}$ for the norm $\||h|^{-s} u\|$.

The notation $\langle h \rangle^s \mathcal{H}$ or $|h|^s \mathcal{H}$ is very convenient but somewhat ambiguous because usually $a\mathcal{H}$ denotes the image of \mathcal{H} under the linear operator a . Let us explain how to reconcile these two meanings:

let \mathcal{H}_c be the space of $u \in \mathcal{H}$ such that $u = \mathbb{1}_I(h)u$, for some compact $I \subset \mathbb{R} \setminus \{0\}$. We equip \mathcal{H}_c with its natural topology by saying that $u_n \rightarrow u$ in \mathcal{H}_c if there exists $I \subset \mathbb{R} \setminus \{0\}$ compact such that $u_n = \mathbb{1}_I(h)u_n$ for all n and $u_n \rightarrow u$ in \mathcal{H} . We set $\mathcal{H}_{\text{loc}} := (\mathcal{H}_c)^*$. Then $|h|^s$ and $\langle h \rangle^s$ preserve \mathcal{H}_c and \mathcal{H}_{loc} , and $\langle h \rangle^s \mathcal{H}$, resp. $|h|^s \mathcal{H}$ are the images in \mathcal{H}_{loc} of \mathcal{H} under $\langle h \rangle^s$, resp. $|h|^s$. It follows that these spaces are subspaces (equipped with finer topologies) of \mathcal{H}_{loc} , in particular they are pairwise compatible. Let us mention some properties of these spaces:

$$\langle h \rangle^{-s} \mathcal{H} \subset \langle h \rangle^{-t} \mathcal{H}, \text{ if } t \leq s, \quad \langle h \rangle^{-s} \mathcal{H} \subset |h|^{-s} \mathcal{H}, |h|^s \mathcal{H} \subset \langle h \rangle^s \mathcal{H} \text{ if } s \geq 0,$$

$$\langle h \rangle^0 \mathcal{H} = |h|^0 \mathcal{H} = \mathcal{H}, \quad \langle h \rangle^s \mathcal{H} = (\langle h \rangle^{-s} \mathcal{H})^*, \quad |h|^s \mathcal{H} = (|h|^{-s} \mathcal{H})^*,$$

$$0 \in \rho(h) \Leftrightarrow \langle h \rangle^s \mathcal{H} = |h|^s \mathcal{H} \text{ for some } s \neq 0 \Leftrightarrow \langle h \rangle^s \mathcal{H} = |h|^s \mathcal{H} \text{ for all } s.$$

Moreover the operator $|h|^s$ is unitary from $|h|^{-t} \mathcal{H}$ to $|h|^{s-t} \mathcal{H}$ for all $s, t \in \mathbb{R}$.

The following fact is a rephrasing of the Kato-Heinz theorem:

- if $a \sim b$ then $a^s \mathcal{H} = b^s \mathcal{H}$ for all $|s| \leq \frac{1}{2}$.

Smoothness of operators

Let $\mathcal{H}_1, \mathcal{H}_2$ be two Banach spaces such that $\mathcal{H}_1 \subset \mathcal{H}_2$ continuously and densely. Let $\{T_t\}_{t \in \mathbb{R}}$ be a C_0 -group on \mathcal{H}_2 , preserving \mathcal{H}_1 . It follows by [ABG, Prop. 3.2.5] that T_t defines a C_0 -group on \mathcal{H}_1 . If a is the generator of T_t on \mathcal{H}_2 , so that $T_t = e^{ita}$

on \mathcal{H}_2 , then the generator of T_t on \mathcal{H}_1 is $a|_{\mathcal{H}_1}$ with domain $\{u \in \mathcal{H}_1 \cap \text{Doma} : au \in \mathcal{H}_1\}$.

We denote by $C^k(a; \mathcal{H}_1, \mathcal{H}_2)$ (resp. $C_{\text{u}}^k(a; \mathcal{H}_1, \mathcal{H}_2)$) for $k \in \mathbb{N}$ the space of operators $b \in B(\mathcal{H}_1, \mathcal{H}_2)$ such that $\mathbb{R} \ni t \mapsto e^{ita}be^{-ita}$ is C^k for the strong (resp. operator) topology of $B(\mathcal{H}_1, \mathcal{H}_2)$.

One defines similarly $C_{(\text{u})}^s(a; \mathcal{H}_1, \mathcal{H}_2)$ first for $0 < s < 1$, then for all non integers $s \in \mathbb{R}^+$ by requiring the Hölder continuity of the above map. Note that by the uniform boundedness principle, the spaces $C^s(a; \mathcal{H}_1, \mathcal{H}_2)$ and $C_{\text{u}}^s(a; \mathcal{H}_1, \mathcal{H}_2)$ coincide for non integer s . It follows also from the same argument that $C^k(a; \mathcal{H}_1, \mathcal{H}_2) \subset C_{\text{u}}^s(a; \mathcal{H}_1, \mathcal{H}_2)$ for $0 < s < k$.

If $b \in C^1(a; \mathcal{H}_1, \mathcal{H}_2)$ then b maps $\text{Doma}|_{\mathcal{H}_1}$ into Doma and $\text{ad}_a b := ab - ba \in B(\mathcal{H}_1, \mathcal{H}_2)$.

If $\mathcal{H}_1 = \mathcal{H}_2 = \mathcal{H}$, the above spaces are simply denoted by $C_{(\text{u})}^s(a; \mathcal{H})$ or even $C_{(\text{u})}^s(a)$ if \mathcal{H} is fixed from the context.

2.2. Quadratic pencils. In this subsection we prove some basic results about a quadratic operator pencil related to the abstract Klein-Gordon operator.

Let \mathcal{H} be a Hilbert space, h be a self-adjoint operator on \mathcal{H} and $\langle h \rangle^{-s}\mathcal{H}$ the Sobolev spaces introduced in Subsect. 2.1. Let $k : \langle h \rangle^{-\frac{1}{2}}\mathcal{H} \rightarrow \mathcal{H}$ be a continuous symmetric operator and denote also k its unique extension to a continuous map $\mathcal{H} \rightarrow \langle h \rangle^{\frac{1}{2}}\mathcal{H}$. Denote

$$h_0 = h + k^2 : \langle h \rangle^{-\frac{1}{2}}\mathcal{H} \rightarrow \langle h \rangle^{\frac{1}{2}}\mathcal{H}$$

and

$$p(z) = h + z(2k - z) = h_0 - (k - z)^2 \in B(\langle h \rangle^{-\frac{1}{2}}\mathcal{H}, \langle h \rangle^{\frac{1}{2}}\mathcal{H}), \quad z \in \mathbb{C}.$$

Definition 2.1. We denote by $\rho(h, k)$ the set of $z \in \mathbb{C}$ such that

$$p(z) : \langle h \rangle^{-\frac{1}{2}}\mathcal{H} \xrightarrow{\sim} \langle h \rangle^{\frac{1}{2}}\mathcal{H}.$$

Observe that the domain in \mathcal{H} of the operator $p(z) : \langle h \rangle^{-\frac{1}{2}}\mathcal{H} \rightarrow \langle h \rangle^{\frac{1}{2}}\mathcal{H}$ is equal to $\langle h \rangle^{-1}\mathcal{H}$, i.e. $\langle h \rangle^{-1}\mathcal{H} = p(z)^{-1}\mathcal{H}$. Indeed, for $f \in \langle h \rangle^{-\frac{1}{2}}\mathcal{H}$ we have $p(z)f = hf + z(2k - z)f$ and the last term belongs to \mathcal{H} , hence $p(z)f \in \mathcal{H}$ if and only if $hf \in \mathcal{H}$. Note also that the relation $p(z)^* = p(\bar{z})$ in $B(\langle h \rangle^{-\frac{1}{2}}\mathcal{H}, \langle h \rangle^{\frac{1}{2}}\mathcal{H})$ is obvious. It follows that the map $p(z) : \langle h \rangle^{-\frac{1}{2}}\mathcal{H} \rightarrow \langle h \rangle^{\frac{1}{2}}\mathcal{H}$ naturally induces operators in $B(\langle h \rangle^{-1}\mathcal{H}, \mathcal{H})$ and $B(\mathcal{H}, \langle h \rangle\mathcal{H})$.

The following two results are proved in [GGH1, Lemmas 8.1, 8.2].

Lemma 2.2. *The operator induced by $p(z)$ in \mathcal{H} is a closed operator and its Hilbert space adjoint is the operator induced by $p(\bar{z})$ in \mathcal{H} . In other terms, the relation $p(z)^* = p(\bar{z})$ also holds in the sense of closed operators in \mathcal{H} . The following conditions are equivalent:*

- (1) $p(z) : \langle h \rangle^{-1}\mathcal{H} \xrightarrow{\sim} \mathcal{H}$, (2) $p(\bar{z}) : \langle h \rangle^{-1}\mathcal{H} \xrightarrow{\sim} \mathcal{H}$,
- (3) $p(z) : \langle h \rangle^{-\frac{1}{2}}\mathcal{H} \xrightarrow{\sim} \langle h \rangle^{\frac{1}{2}}\mathcal{H}$, (4) $p(\bar{z}) : \langle h \rangle^{-\frac{1}{2}}\mathcal{H} \xrightarrow{\sim} \langle h \rangle^{\frac{1}{2}}\mathcal{H}$,
- (5) $p(z) : \mathcal{H} \xrightarrow{\sim} \langle h \rangle\mathcal{H}$, (6) $p(\bar{z}) : \mathcal{H} \xrightarrow{\sim} \langle h \rangle\mathcal{H}$.

In particular, the set

$$(2.1) \quad \rho(h, k) := \{z \in \mathbb{C} \mid p(z) : \langle h \rangle^{-\frac{1}{2}}\mathcal{H} \xrightarrow{\sim} \langle h \rangle^{\frac{1}{2}}\mathcal{H}\} = \{z \in \mathbb{C} \mid p(z) : \langle h \rangle^{-1}\mathcal{H} \xrightarrow{\sim} \mathcal{H}\}$$

is invariant under conjugation.

Proposition 2.3. *Assume that h is bounded below. Then there exists $c_0 > 0$ such that*

$$\{z : |\text{Im}z| > |\text{Re}z| + c_0\} \subset \rho(h, k).$$

3. OPERATORS ON KREIN SPACES

In this section we review some basic facts about Krein spaces and self-adjoint operators on Krein spaces. We refer the reader for more details to the survey paper [La], or to [Ge], [GGH1]. We also describe the natural extension of the continuous functional calculus constructed in [GGH1] to the Borel case.

3.1. Krein spaces. If \mathcal{H} is a topological complex vector space, we denote by $\mathcal{H}^\#$ the space of continuous linear forms on \mathcal{H} and by $\langle w, u \rangle$, for $u \in \mathcal{H}$, $w \in \mathcal{H}^\#$ the duality bracket between \mathcal{H} and $\mathcal{H}^\#$.

Definition 3.1. A Krein space \mathcal{K} is a hilbertizable vector space equipped with a bounded hermitian form $\langle u|v \rangle$ non-degenerate in the sense that if $w \in \mathcal{K}^\#$ there exists a unique $u \in \mathcal{K}$ such that

$$\langle u|v \rangle = \langle w, v \rangle, \quad v \in \mathcal{K}.$$

If \mathcal{K}_1 is a subspace of \mathcal{K} , we denote by \mathcal{K}_1^\perp the orthogonal of \mathcal{K}_1 for $\langle \cdot | \cdot \rangle$.

If we fix a scalar product $(\cdot | \cdot)$ on \mathcal{K} endowing \mathcal{K} with its hilbertizable topology, then by the Riesz theorem there exists a bounded, invertible self-adjoint operator M such that

$$\langle u|v \rangle = (u|Mv), \quad u, v \in \mathcal{K}.$$

Using the polar decomposition of M , $M = J|M|$ where $J = J^*$, $J^2 = \mathbb{1}$, one can equip \mathcal{K} with the equivalent scalar product

$$(3.2) \quad (u|v)_M := (u||M|v),$$

so that

$$(3.3) \quad \langle u|v \rangle = (u|Jv)_M, \quad u, v \in \mathcal{K}.$$

Definition 3.2. A Krein space $(\mathcal{K}, \langle \cdot | \cdot \rangle)$ is a Pontryagin space if either $\mathbb{1}_{\mathbb{R}^-}(J)$ or $\mathbb{1}_{\mathbb{R}^+}(J)$ has finite rank.

Clearly this definition is independent on the choice of the scalar product $(\cdot | \cdot)$.

Replacing $\langle \cdot | \cdot \rangle$ by $-\langle \cdot | \cdot \rangle$ we can assume that $\mathbb{1}_{\mathbb{R}^-}(J)$ has finite rank, which is the usual convention for Pontryagin spaces.

Let $A : \text{Dom}A \rightarrow \mathcal{K}$ be a densely defined linear operator on the Krein space \mathcal{K} . The adjoint A^\dagger of A on $(\mathcal{K}, \langle \cdot | \cdot \rangle)$ is defined as

$$\text{Dom}A^\dagger := \{u \in \mathcal{K} : \exists f =: A^\dagger u \text{ such that } \langle f|v \rangle = \langle u|Av \rangle, \forall v \in \text{Dom}A\}.$$

We will sometimes use the following easy fact: there is a constant $C > 0$ such that

$$(3.4) \quad C^{-1}\|A\| \leq \|A^\dagger\| \leq C\|A\|, \quad A \in B(\mathcal{K}).$$

A densely defined operator H is *self-adjoint* on \mathcal{K} if $H = H^\dagger$. The following fact is often useful.

Lemma 3.3. Let H be closed and densely defined on \mathcal{K} . Assume that for some $z \in \rho(H) \cap \overline{\rho(H)}$ one has $((H - z)^{-1})^\dagger = (H - \bar{z})^{-1}$. Then $H = H^\dagger$.

3.2. Definitizable operators on Krein spaces. Not much of interest can be said about self-adjoint operators on a Krein space, except for the trivial fact that $\rho(H) = \overline{\rho(H)}$. There is however a special class of self-adjoint operators, called *definitizable*, which admit a functional calculus close to the one of usual self-adjoint operators on a Hilbert space.

Definition 3.4. A self-adjoint operator H is *definitizable* if

- (1) $\rho(H) \neq \emptyset$,
 - (2) there exists a real polynomial $p(\lambda)$ such that
- $$(3.5) \quad \langle u|p(H)u \rangle \geq 0, \quad \forall u \in \text{Dom}H^k, \quad k := \deg p.$$

An operator H on a Krein space \mathcal{K} which is definitizable with an even definitizing polynomial will be called even-definitizable.

The following result is well-known, see e.g. [J4, Lemma 1].

Proposition 3.5. *Let H be definitizable. Then:*

- (1) *If $z \in \sigma(H) \setminus \mathbb{R}$ then $p(z) = 0$ for each definitizing polynomial p ,*
- (2) *There is a definitizing polynomial p such that $\sigma(H) \setminus \mathbb{R}$ is exactly the set of non-real zeroes of p ,*
- (3) *Moreover, this p may be chosen such that if $\lambda \notin \mathbb{R}$ is a zero of multiplicity k of p then λ is an eigenvalue of H of Riesz index k ,*
- (4) *The non-real spectrum of H consists of a finite number of eigenvalues of finite Riesz index distributed symmetrically with respect to the real axis.*

The usefulness of the notion of Pontryagin spaces comes from the following theorem (see [La]).

Theorem 3.6. *A self-adjoint operator H on a Pontryagin space is even-definitizable.*

The following result is easy (see Langer [La]). If λ is an isolated point of $\sigma(H)$ the Riesz spectral projection on λ is:

$$E(\lambda, H) := \frac{1}{2i\pi} \oint_C (z - H)^{-1} dz$$

where C is a small curve in $\rho(H)$ surrounding λ .

Proposition 3.7. *Let H be a definitizable self-adjoint operator and*

$$\mathbb{1}_{\text{pp}}^{\mathbb{C}}(H) = \sum_{\lambda \in \sigma(H), \text{Im}\lambda > 0} (E(\lambda, H) + E(\bar{\lambda}, H)), \quad \mathcal{K}_{\text{pp}}^{\mathbb{C}} := \mathbb{1}_{\text{pp}}^{\mathbb{C}}(H)\mathcal{K}.$$

Then $\mathbb{1}_{\text{pp}}^{\mathbb{C}}(H)$ is a projection, $\mathbb{1}_{\text{pp}}^{\mathbb{C}}(H) = (\mathbb{1}_{\text{pp}}^{\mathbb{C}}(H))^{\dagger}$, hence $\mathcal{K}_{\text{pp}}^{\mathbb{C}}$ is a Krein space and

$$\mathcal{K} = \mathcal{K}_{\text{pp}}^{\mathbb{C}} \oplus (\mathcal{K}_{\text{pp}}^{\mathbb{C}})^{\perp}.$$

3.3. C^{α} functional calculus. In this subsection we recall some results of [GGH1], extending earlier results of [J4, La] on the continuous functional calculus for definitizable operators. It turns out that a definitizable operator H admits a functional calculus associated to the algebra of bounded continuous functions on \mathbb{R} having an asymptotic expansion of a specific order at each *critical point* of H (see Def. 3.11).

Let $\hat{\mathbb{R}} = \mathbb{R} \cup \{\infty\}$ be the one point compactification of \mathbb{R} , so that $C(\hat{\mathbb{R}})$ is identified with the set of continuous functions $\mathbb{R} \rightarrow \mathbb{C}$ having a finite limit at ∞ .

We equip $\hat{\mathbb{R}} \times \mathbb{N}$ with the order relation defined by $(\xi, s) \leq (\eta, t)$ iff $\xi = \eta$ and $s \leq t$. If $\omega = (\xi, s) \in \hat{\mathbb{R}} \times \mathbb{N}$ we denote by χ_{ω} the rational function equal to $(x - \xi)^s$ if $\xi \in \mathbb{R}$ and x^{-s} if $\xi = \infty$. We set also $\rho_{\omega} = \chi_{\omega}^{-1}$.

Definition 3.8. *Let $\omega = (\xi, s) \in \hat{\mathbb{R}} \times \mathbb{N}$. We denote by $C^{\omega}(\hat{\mathbb{R}})$ the space of functions $\varphi \in C(\hat{\mathbb{R}})$ such that there is a polynomial P with:*

$$\varphi(x) = \begin{cases} P(x - \xi) + o(|x - \xi|^s), & \text{if } \xi \in \mathbb{R}, \\ P(1/x) + o(|x|^{-s}), & \text{if } \xi = \infty. \end{cases}$$

Clearly $C^{\mu}(\hat{\mathbb{R}}) \subset C^{\omega}(\hat{\mathbb{R}})$ if $\mu \geq \omega$. If $\varphi \in C^{\omega}(\hat{\mathbb{R}})$ then the terms of degree $\leq s$ of P are uniquely determined, hence there is a unique sequence of complex numbers $\{\delta_{\mu}(\varphi)\}_{\mu \leq \omega}$ such that the rational function

$$(3.6) \quad T_{\omega}^{+} \varphi := \sum_{\mu \leq \omega} \delta_{\mu}(\varphi) \chi_{\mu}$$

satisfies

$$(3.7) \quad \varphi(x) = T_\omega^+ \varphi(x) + o(|\chi_\omega(x)|).$$

Set

$$(3.8) \quad T_\omega \varphi := \sum_{\mu < \omega} \delta_\mu(\varphi) \chi_\mu, \quad R_\omega \varphi := \rho_\omega(\varphi - T_\omega \varphi),$$

so that

$$\varphi = T_\omega \varphi + \chi_\omega R_\omega \varphi.$$

Note that if $\omega = (\xi, 0)$ then $R_\omega \varphi = \varphi$. It follows that

$$\|\varphi\|_\omega := \sum_{\mu \leq \omega} \sup |R_\mu \varphi|$$

is a norm on $C^\omega(\hat{\mathbb{R}})$ dominating the sup norm.

An element $\omega \in \hat{\mathbb{R}} \times \mathbb{N}$ may be seen as a function $\hat{\mathbb{R}} \rightarrow \mathbb{N}$ with support containing at most one point. A function $\alpha : \hat{\mathbb{R}} \rightarrow \mathbb{N}$ with finite support is called an *order function*. We write $\omega \preceq \alpha$ if $\omega = (\xi, s) \in \hat{\mathbb{R}} \times \mathbb{N}$ and $s \leq \alpha(\xi)$. Then $\omega \prec \alpha$ means $\omega \preceq \alpha$ and $s < \alpha(\xi)$.

To each definitizable operator one can associate a natural order function:

Definition 3.9. *Let H be a definitizable operator on \mathcal{K} .*

- (1) *To each definitizing polynomial p for H we associate an order function β as follows: if $\xi \in \mathbb{R}$ then $\beta(\xi)$ is the multiplicity of ξ as zero of p and $\beta(\infty) = 0$ if p is of even degree and $\beta(\infty) = 1$ if p is of odd degree.*
- (2) *The order function α_H of H is the infimum over all definitizing polynomials for H of the above functions β .*

If α is an order function, we set

$$C^\alpha(\hat{\mathbb{R}}) := \cap_{\omega \preceq \alpha} C^\omega(\hat{\mathbb{R}}),$$

which, equipped with the norm $\|\varphi\|_\alpha := \sup_{\omega \preceq \alpha} \|\varphi\|_\omega$, is a unital Banach $*$ -algebra for the usual operations.

The following theorem is shown in [GGH1, Thm. 4.9]

Theorem 3.10. *Let H be a self-adjoint definitizable operator on the Krein space \mathcal{H} with $\sigma(H) \subset \mathbb{R}$. Then there is a unique linear continuous map*

$$C^{\alpha_H}(\hat{\mathbb{R}}) \ni \varphi \mapsto \varphi(H) \in B(\mathcal{K})$$

such that if $\varphi(\lambda) = (\lambda - z)^{-1}$ for $z \in \mathbb{C} \setminus \mathbb{R}$ then $\varphi(H) = (H - z)^{-1}$. This map is a morphism of unital $$ -algebras.*

Thm. 3.10 implies an optimal estimate of the resolvent of a definitizable operator. We first introduce some terminology.

Definition 3.11. *We set $\sigma_{\mathbb{C}}(H) := \sigma(H) \setminus \mathbb{R}$, $c(H) := \{\omega \in \hat{\mathbb{R}} : \alpha_H(\xi) \neq 0\}$. The set $c(H)$ is called the set of critical points of H .*

Let H be a definitizable operator. Note that Def. 3.9 extends naturally to give an order function on $\hat{\mathbb{C}} = \mathbb{C} \cup \{\infty\}$, still denoted by α_H . The following result is proved in [GGH1, Prop. 4.15].

Proposition 3.12. *With the preceding notations, there exists $c > 0$ such that*

$$(3.9) \quad c \|(H - z)^{-1}\| \leq \sum_{\xi \in \sigma_{\mathbb{C}}(H)} |z - \xi|^{-\alpha_H(\xi)} + |\operatorname{Im} z|^{-1} \left(1 + \sum_{\xi \in c(H) \cap \mathbb{R}} |z - \xi|^{-\alpha_H(\xi)} + |z|^{\alpha_H(\infty)} \right)$$

for all $z \notin \sigma_{\mathbb{C}}(H) \cup \mathbb{R}$. Note that $\alpha_H(\infty)$ is either 0 or 1.

We will use the following corollary of Prop. 3.12, giving estimates on $(H - z)^{-1}$ in a bounded region or in a conic neighborhood of infinity in $\mathbb{C} \setminus \mathbb{R}$.

Corollary 3.13. *Let for $R, a, \delta > 0$:*

$$\begin{aligned} U_0(R, a) &= \{z \in \mathbb{C} : 0 < |\operatorname{Im}z| < a, |\operatorname{Re}z| \leq R\}, \\ U_\infty(R, \delta) &= \{z \in \mathbb{C} : 0 < |\operatorname{Im}z| \leq \delta|\operatorname{Re}z|, |\operatorname{Re}z| \geq R\}. \end{aligned}$$

where R, a are chosen such that $\sigma_{\mathbb{C}}(H)$ does not intersect $U_0(R, a)$ and $U_\infty(R, \delta)$. Then there exists $C > 0$ such that:

$$\|(H - z)^{-1}\| \leq \begin{cases} C|\operatorname{Im}z|^{-m-1}, & \text{for } z \in U_0(R, a), \\ C\langle z \rangle^{\alpha_H(\infty)}|\operatorname{Im}z|^{-1}, & \text{for } z \in U_\infty(R, \delta), \end{cases}$$

where $m = \sup_{\xi \in \mathbb{R}} \alpha_H(\xi)$.

It is sometimes convenient to have a concrete expression of $\varphi(H)$ if $\varphi \in C_0^\infty(\mathbb{R})$. Let $\tilde{\varphi} \in C_0^\infty(\mathbb{C})$ be an *almost-analytic extension* of φ , satisfying:

$$\tilde{\varphi}|_{\mathbb{R}} = \varphi, \quad \left| \frac{\partial \tilde{\varphi}(z)}{\partial \bar{z}} \right| \leq C_N |\operatorname{Im}z|^N, \quad \forall N \in \mathbb{N}.$$

For $m \in \mathbb{N}$ we set $\|\varphi\|_m := \sum_{0 \leq k \leq m} \|\partial_x^k \varphi\|_\infty$. Then we have:

$$(3.10) \quad \varphi(H) = \frac{i}{2\pi} \int_{\mathbb{C}} \frac{\partial \tilde{\varphi}}{\partial \bar{z}}(z) (z - H)^{-1} dz \wedge d\bar{z},$$

where due to Corollary 3.13 the integral is norm-convergent and one has

$$(3.11) \quad \|\varphi(H)\| \leq C \|\varphi\|_m, \quad \text{for some } m \in \mathbb{N}.$$

3.4. Borel functional calculus. In this subsection we extend the results of Subsect. 3.3 to cover the Borel functional calculus. Similar results were already obtained by Jonas [J4], see also [Wr], although we believe that our approach is simpler and more transparent.

The standard method to obtain a Borel functional calculus from a continuous one relies on the Riesz and monotone class theorems (see Thm. B.1 and the beginning of the Appendix B for details).

In our case we have to follow the same procedure, starting from the algebra $C^\alpha(\hat{\mathbb{R}})$ instead of $C(\hat{\mathbb{R}})$. It turns out that the resulting algebra is *not* an algebra of functions on $\hat{\mathbb{R}}$, because after a bounded limit, the top order term in the asymptotic expansion (3.7) is not uniquely determined. Instead the resulting algebra is a direct sum of a sub-algebra of bounded Borel functions satisfying (3.12) below, and of a finite dimensional space.

We first introduce some definitions. Denote by $B(\hat{\mathbb{R}})$ the space of bounded Borel functions on $\hat{\mathbb{R}}$.

Definition 3.14. *Let $\omega = (\xi, s) \in \hat{\mathbb{R}} \times \mathbb{N}$. We denote by $L^\omega(\hat{\mathbb{R}})$ the space of functions $\varphi \in B(\hat{\mathbb{R}})$ such that there is a polynomial P with:*

$$\varphi(x) = \begin{cases} P(x - \xi) + O(|x - \xi|^s), & \text{if } \xi \in \mathbb{R}, \\ P(1/x) + O(|x|^{-s}), & \text{if } \xi = \infty. \end{cases}$$

Again $L^\mu(\hat{\mathbb{R}}) \subset L^\omega(\hat{\mathbb{R}})$ if $\mu \geq \omega$. If $\varphi \in L^\omega(\hat{\mathbb{R}})$ for $\omega = (\xi, s)$, $s \geq 1$, the terms of degree $< s$ of P are uniquely determined, hence there is a unique sequence $\{\delta_\mu(\varphi)\}_{\mu < \omega}$ such that the rational function $T_\omega \varphi$ defined in (3.8) satisfies

$$(3.12) \quad \varphi(x) = T_\omega \varphi(x) + O(|\chi_\omega(x)|).$$

If $\omega = (\xi, 0)$ we set $\delta_\omega(\varphi) := \varphi(\xi)$. We equip $L^\omega(\hat{\mathbb{R}})$ with the norm $\|\varphi\|_\omega$ as before and if α is an order function, we introduce the space $L^\alpha(\hat{\mathbb{R}}) := \bigcap_{\omega \preceq \alpha} L^\omega(\hat{\mathbb{R}})$ equipped with the norm $\|\varphi\|_\alpha$.

Clearly $L^\alpha(\hat{\mathbb{R}})$ is a unital Banach $*$ -algebra for the usual algebraic operations.

Definition 3.15. Let $\tilde{\alpha} = \{(\xi, \alpha(\xi)) : \xi \in \text{supp}\alpha\} \subset \hat{\mathbb{R}} \times \mathbb{N}$. We set

$$\Lambda^\alpha := L^\alpha(\hat{\mathbb{R}}) \oplus \mathbb{C}^{\tilde{\alpha}},$$

and:

$$\begin{aligned} I : C^\alpha(\hat{\mathbb{R}}) &\rightarrow \Lambda^\alpha \\ \varphi &\mapsto (\varphi, (\delta_\omega(\varphi))_{\omega \in \tilde{\alpha}}). \end{aligned}$$

For $\varphi = (\varphi^0, (a_\omega)_{\omega \in \tilde{\alpha}}) \in \Lambda^\alpha$ and $\omega \preceq \alpha$, we define

$$\delta_\omega(\varphi) := \begin{cases} \delta_\omega(\varphi^0) & \text{if } \omega \notin \tilde{\alpha}, \\ a_\omega & \text{if } \omega \in \tilde{\alpha}, \end{cases}$$

which allows to write φ as $(\varphi^0, (\delta_\omega(\varphi))_{\omega \in \tilde{\alpha}})$. We can then equip Λ^α with a $*$ -algebra structure by setting:

$$\begin{aligned} \varphi\psi &:= (\varphi^0, (\delta_\omega(\varphi))_{\omega \in \tilde{\alpha}}) \cdot (\psi^0, (\delta_\omega(\psi))_{\omega \in \tilde{\alpha}}) \\ &= \left(\varphi^0 \psi^0, \left(\sum_{\mu+\nu=\omega} \delta_\mu(\varphi) \delta_\nu(\psi) \right)_{\omega \in \tilde{\alpha}} \right), \\ (\varphi^0, (\delta_\omega(\varphi))_{\omega \in \tilde{\alpha}})^* &:= (\overline{\varphi^0}, (\overline{\delta_\omega(\varphi)})_{\omega \in \tilde{\alpha}}). \end{aligned}$$

It is easy to see that Λ^α , equipped with the norm

$$(3.13) \quad \|\varphi\|_{\Lambda^\alpha} = \max_{\omega \preceq \alpha} \max \{ \|\varphi^0\|_\omega, \sum_{\mu \leq \omega} |\delta_\mu(\varphi)| \}$$

is a unital Banach $*$ -algebra with $(1, 0)$ as unit. The embedding $I : C^\alpha(\hat{\mathbb{R}}) \rightarrow \Lambda^\alpha$ is isometric hence $C^\alpha(\hat{\mathbb{R}})$ is identified with a closed $*$ -subalgebra of Λ^α .

Definition 3.16. A sequence $(\varphi_n)_{n \in \mathbb{N}}$ in Λ^α is *b-convergent* to φ if $\sup_n \|\varphi_n\|_{\Lambda^\alpha} < \infty$ and $\lim_n \delta_\omega(\varphi_n) = \delta_\omega(\varphi)$ for each $\omega \preceq \alpha$.

Clearly the b-convergence of (φ_n) to φ implies the b-convergence of (φ_n^0) to φ^0 .

The main result of this subsection is the following theorem which is the natural extension of Thm. 3.10 to the Borel case.

Theorem 3.17. Let H be a self-adjoint definitizable operator on a Krein space \mathcal{K} with $\sigma(H) \subset \mathbb{R}$ and order function α_H . Then there is a unique linear weakly b-continuous map

$$\Lambda^{\alpha_H} \ni \varphi \mapsto \varphi(H) \in B(\mathcal{K})$$

such that if $\varphi = Ir_z$, with $r_z(\lambda) = (\lambda - z)^{-1}$ and $z \in \mathbb{C} \setminus \mathbb{R}$, then $\varphi(H) = (H - z)^{-1}$. This map is a norm continuous morphism of unital $*$ -algebras.

The proof will be given in Appendix B.

Corollary 3.18. Let H a self-adjoint definitizable operator as above. Let $J \subset \hat{\mathbb{R}}$ an open set such that $\overline{J} \cap \text{supp}\alpha_H = \emptyset$ and $B_J(\hat{\mathbb{R}}) \subset B(\hat{\mathbb{R}})$ be the $*$ -ideal of functions supported in \overline{J} . Then the map

$$B_J(\hat{\mathbb{R}}) \ni \varphi \mapsto \varphi(H) := (\varphi, 0)(H) \in B(\mathcal{K})$$

is a $*$ -morphism, continuous for the norm topologies of $B_J(\hat{\mathbb{R}})$ and $B(\mathcal{K})$ and weakly b-continuous.

Proof. Let us denote by $C_J(\hat{\mathbb{R}}) \subset C(\hat{\mathbb{R}})$ the $*$ -ideal of functions supported in \overline{J} . Clearly $C_J(\hat{\mathbb{R}}) \subset C^{\alpha_H}(\hat{\mathbb{R}})$ isometrically. Moreover $I\varphi = (\varphi, 0)$ for $\varphi \in C_J(\hat{\mathbb{R}})$, if $I : C^{\alpha_H}(\hat{\mathbb{R}}) \rightarrow \Lambda^{\alpha_H}$ is defined in Def. 3.15. Finally if $\varphi_n \in B_J(\hat{\mathbb{R}})$ and $\text{b-}\lim_n \varphi_n = \varphi$ then $\text{b-}\lim_n (\varphi_n, 0) = (\varphi, 0) \in \Lambda^\alpha$. These facts imply the corollary. \square

3.5. Existence of the dynamics. Let us mention a well-known consequence of Corollary 3.18 about the existence of the dynamics generated by an even-definitizable operator.

Let H be *even-definitizable*, $f_t : x \mapsto e^{itx}$ and $\chi \in C_0^\infty(\mathbb{R})$ such all finite critical points of H are in the support of χ . We write $f_t = \chi f_t + (1 - \chi)f_t$, and extend $(1 - \chi)f_t$ arbitrarily at ∞ . We can define $(\chi f_t)(H)$ by Thm. 3.10 and $((1 - \chi)f_t)(H)$ by Corollary 3.18. We set then

$$f_t(H) := (\chi f_t)(H) + ((1 - \chi)f_t)(H) \in B(\mathcal{K}),$$

which is independent on the choice of χ with the above properties.

The space $\mathcal{K}_{\text{pp}}^{\mathbb{C}} = \mathbb{1}_{\text{pp}}^{\mathbb{C}}(H)\mathcal{K}$ is finite dimensional and invariant under H , hence we can obviously define $(e^{itH})|_{\mathcal{K}_{\text{pp}}^{\mathbb{C}}}$. We then set

$$e^{itH} := f_t(H) + (e^{itH})|_{\mathcal{K}_{\text{pp}}^{\mathbb{C}}}, \quad t \in \mathbb{R}.$$

It is easy to see that $\{e^{itH}\}_{t \in \mathbb{R}}$ is a C_0 -group on \mathcal{K} , with $(e^{itH})^\dagger = e^{-itH}$, i.e. a unitary C_0 -group on $(\mathcal{K}, \langle \cdot | \cdot \rangle)$. Moreover H is the generator of $\{e^{itH}\}_{t \in \mathbb{R}}$ and there exist $C, \lambda > 0, n \in \mathbb{N}$ such that

$$(3.14) \quad \|(e^{itH})|_{\mathcal{K}_{\text{pp}}^{\mathbb{C}}}\| \leq C e^{\lambda|t|}, \quad \|(e^{itH})|_{(\mathcal{K}_{\text{pp}}^{\mathbb{C}})^\perp}\| \leq C \langle t \rangle^n, \quad t \in \mathbb{R}.$$

4. ABSTRACT KLEIN-GORDON EQUATIONS

Let us discuss in more details the Klein-Gordon equation (1.1). The scalar product on \mathcal{H} will be denoted by $(u|v)$ or sometimes by $\bar{u} \cdot v$.

To associate a generator to (1.1) one has to turn this equation into a first order evolution equation. It turns out that there are several ways to do this, leading to different generators, and different topological spaces of Cauchy data.

In order to present the results of this paper, we first discuss these questions in an informal way, without worrying about the problems of existence, uniqueness or even the meaning of solutions to (1.1).

4.1. Symplectic setup. The most natural approach is to consider $\mathcal{Y} = \mathcal{H} \oplus \mathcal{H}$ whose elements are denoted by (φ, π) , and to equip it with the complex *symplectic form* (i.e. sesquilinear, non-degenerate, anti-hermitian):

$$\overline{(\varphi_1, \pi_1)} \omega(\varphi_2, \pi_2) := \overline{\pi_1} \cdot \varphi_2 - \overline{\varphi_1} \cdot \pi_2.$$

The *classical Hamiltonian* is:

$$E(\varphi, \pi) := \overline{(\pi + ik\varphi)} \cdot (\pi + ik\varphi) + \overline{\varphi} \cdot h\varphi.$$

We consider ω, E as maps from \mathcal{Y} to \mathcal{Y}^* , where \mathcal{Y}^* is the space of anti-linear forms on \mathcal{Y} and set:

$$(4.15) \quad A := -i\omega^{-1}E = \begin{pmatrix} k & -i \\ ih_0 & k \end{pmatrix},$$

for $h_0 = h + k^2$. In other words e^{itA} is the symplectic flow obtained from the classical Hamiltonian E .

If we set

$$\begin{pmatrix} \varphi(t) \\ \pi(t) \end{pmatrix} := e^{itA} \begin{pmatrix} \varphi \\ \pi \end{pmatrix}$$

then $\phi(t) := \varphi(t)$ solves the Cauchy problem:

$$\begin{cases} \partial_t^2 \phi(t) - 2ik \partial_t \phi(t) + h\phi(t) = 0, \\ \phi(0) = \varphi, \quad \partial_t \phi(0) = \pi + ik\varphi. \end{cases}$$

4.2. Quadratic pencils and stationary solutions. If we look for a solution of (1.1) of the form $\phi(t) = e^{itz}\phi$ (or equivalently set $i^{-1}\partial_t = z$), we obtain that ϕ should solve

$$p(z)\phi = 0, \text{ for } p(z) = h_0 - (k - z)^2.$$

The map $z \mapsto p(z)$, called a *quadratic pencil*, is further discussed in Subsect. 2.2.

4.3. Charge setup. Since we work on a complex symplectic space, it is more convenient to turn the symplectic form ω into a hermitian form. In fact setting

$$f := \begin{pmatrix} \varphi \\ i^{-1}\pi \end{pmatrix} = \begin{pmatrix} f_0 \\ f_1 \end{pmatrix}$$

the hermitian form $q := i\omega$, called the *charge*, takes the form:

$$\bar{f}qf = (f_1|f_0) + (f_0|f_1),$$

and the energy E becomes:

$$E(f, f) = \|f_1 + kf_0\|^2 + (f_0|hf_0).$$

Note that from (4.15) we obtain

$$(4.16) \quad E(f, f) = \bar{f}qKf.$$

If

$$f(t) := e^{itK}f, \text{ for } K := \begin{pmatrix} k & \mathbb{1} \\ h_0 & k \end{pmatrix},$$

then $\phi(t) = f_0(t)$ solves the Cauchy problem:

$$\begin{cases} \partial_t^2 \phi(t) - 2ik\partial_t \phi(t) + h\phi(t) = 0, \\ \phi(0) = f_0, \quad i^{-1}\partial_t \phi(0) - k\phi(0) = f_1. \end{cases}$$

4.4. PDE setup. Finally let us describe the standard setup used in partial differential equations. We set:

$$f(t) = e^{itH}f, \text{ for } H := \begin{pmatrix} 0 & \mathbb{1} \\ h & 2k \end{pmatrix},$$

and $\phi(t) = f_0(t)$ solves the Cauchy problem:

$$\begin{cases} \partial_t^2 \phi(t) - 2ik\partial_t \phi(t) + h\phi(t) = 0, \\ \phi(0) = f_0, \quad i^{-1}\partial_t \phi(0) = f_1. \end{cases}$$

The charge and energy become:

$$\begin{aligned} \bar{f}qf &= (f_1|f_0) + (f_0|f_1) - 2(f_0|kf_0), \\ E(f, f) &= \|f_1\|^2 + (f_0|hf_0). \end{aligned}$$

Note that if

$$\Phi = \begin{pmatrix} \mathbb{1} & 0 \\ k & \mathbb{1} \end{pmatrix},$$

then $H\Phi = \Phi K$.

4.5. The choice of functional spaces. Let us now discuss the choice of the possible topologies to put on the spaces of Cauchy data. We will use the abstract Sobolev spaces $\langle h \rangle^s \mathcal{H}$ and $|h|^s \mathcal{H}$ associated to the self-adjoint operator h , whose definition and properties are given in Subsect. 2.1.

The first natural choices correspond to topologies for which the symplectic form ω is bounded. Note that our choice of $\mathcal{Y} = \mathcal{H} \oplus \mathcal{H}$ as symplectic space in Subsect. 4.1 was quite arbitrary. In fact we can choose a reflexive Banach space \mathcal{G} and set $\mathcal{Y} = \mathcal{G} \oplus \mathcal{G}^*$ equipped with

$$\bar{g}\omega f := \langle g_1 | f_0 \rangle - \langle g_0 | f_1 \rangle,$$

where $\langle g_0 | f_1 \rangle = f_1(g_0)$ and $\langle g_1 | f_0 \rangle = \overline{\langle f_0 | g_1 \rangle}$. Clearly ω is sesquilinear, anti-hermitian, non degenerate and bounded on \mathcal{Y} .

Examples of such symplectic spaces are the *charge spaces*:

$$\mathcal{K}_\theta = \langle h \rangle^{-\theta} \mathcal{H} \oplus \langle h \rangle^\theta \mathcal{H}, \dot{\mathcal{K}}_\theta = |h|^{-\theta} \mathcal{H} \oplus |h|^\theta \mathcal{H}, \theta \geq 0.$$

In this case it is convenient to use the charge setup. An additional requirement is of course that K should be well defined as a closed operator on \mathcal{K}_θ or $\dot{\mathcal{K}}_\theta$, possibly with non-empty resolvent set, and that K be the generator of a strongly continuous group e^{itK} .

Another possibility often used in partial differential equations is to forget about the symplectic form and consider instead spaces on which the energy E is bounded. It is then more convenient to use the PDE setup, and to work with the generator H . Reasonable choices are then the *energy spaces*:

$$\mathcal{E} = \langle h \rangle^{-\frac{1}{2}} \mathcal{H} \oplus \mathcal{H}, \dot{\mathcal{E}} = |h|^{-\frac{1}{2}} \mathcal{H} \oplus \mathcal{H}.$$

To select convenient spaces among all these, it suffices to consider the 'static' Klein-Gordon equation:

$$(4.17) \quad \partial_t^2 \phi(t) + \epsilon^2 \phi(t) = 0,$$

corresponding to $h = \epsilon^2$, $k = 0$ (we assume of course that $\epsilon \geq 0$ is unbounded). In this case we have

$$H = K = \begin{pmatrix} 0 & \mathbb{1} \\ \epsilon^2 & 0 \end{pmatrix} =: H_0.$$

On any space of Cauchy data, the group e^{itH_0} will be formally given by:

$$e^{itH_0} = \begin{pmatrix} \cos(\epsilon t) & i\epsilon^{-1} \sin(\epsilon t) \\ i\epsilon \sin(\epsilon t) & \cos \epsilon t \end{pmatrix}.$$

We see that among these spaces the only ones on which e^{itH_0} is bounded are $\dot{\mathcal{E}}$, \mathcal{E} , $\dot{\mathcal{K}}_{\frac{1}{4}}$ and $\mathcal{K}_{\frac{1}{4}}$. The first two are the usual homogeneous and non-homogeneous energy spaces. The last two are called the homogeneous and non-homogeneous *charge spaces*. Note that the space $\dot{\mathcal{K}}_{\frac{1}{4}}$ appears naturally as the *one-particle space* in the Fock quantization of (4.17).

In this paper we consider the two operators H acting on \mathcal{E} and K acting on $\mathcal{K}_{\frac{1}{4}}$.

5. KLEIN-GORDON OPERATORS IN ENERGY SPACES

In this section we discuss the properties of the operator H in Subsect. 4.4 considered as acting on the energy spaces \mathcal{E} or $\dot{\mathcal{E}}$.

5.1. Non-homogeneous energy space. Let us fix a self-adjoint operator h on \mathcal{H} and a bounded, symmetric operator $k : \langle h \rangle^{-\frac{1}{2}}\mathcal{H} \rightarrow \mathcal{H}$ as in Subsect. 2.2.

The *energy space* \mathcal{E} and its adjoint space \mathcal{E}^* are defined by

$$(5.1) \quad \mathcal{E} := \langle h \rangle^{-\frac{1}{2}}\mathcal{H} \oplus \mathcal{H} \quad \text{and} \quad \mathcal{E}^* := \mathcal{H} \oplus \langle h \rangle^{\frac{1}{2}}\mathcal{H},$$

where we used the convention explained in Subsect. 2.1. We have a continuous and dense embedding $\mathcal{E} \subset \mathcal{E}^*$.

Lemma 5.1. (1) $h : \langle h \rangle^{-\frac{1}{2}}\mathcal{H} \xrightarrow{\sim} \langle h \rangle^{\frac{1}{2}}\mathcal{H}$ iff $0 \in \rho(h)$ iff $0 \in \rho(h, k)$.

(2) If $0 \in \rho(h)$ then \mathcal{E} equipped with the hermitian sesquilinear form:

$$\langle f|f \rangle_{\mathcal{E}} := (f_0|hf_0) + (f_1|f_1)$$

is a Krein space.

(3) if in addition $\text{Tr}\mathbb{1}_{]-\infty, 0]}(h) < \infty$, then $(\mathcal{E}, \langle \cdot | \cdot \rangle_{\mathcal{E}})$ is Pontryagin.

Proof. (1) follows from Lemma 2.2. (2) and (3) are immediate. \square

5.2. Klein-Gordon operators on energy space. We set

$$(5.2) \quad \widehat{H} := \begin{pmatrix} 0 & \mathbb{1} \\ h & 2k \end{pmatrix} \in B(\mathcal{E}, \mathcal{E}^*).$$

Definition 5.2. The energy Klein-Gordon operator is the operator H induced by \widehat{H} in \mathcal{E} . Its domain is given by

$$(5.3) \quad \text{Dom}H := \mathcal{D} = \langle h \rangle^{-1}\mathcal{H} \oplus \langle h \rangle^{-\frac{1}{2}}\mathcal{H} = (\widehat{H} - z)^{-1}\mathcal{E}, \quad z \in \rho(h, k).$$

We have

$$H = \begin{pmatrix} 0 & \mathbb{1} \\ h & 2k \end{pmatrix}.$$

Proposition 5.3. (1) one has $\rho(H) = \rho(h, k)$.

(2) In particular, if $\rho(h, k) \neq \emptyset$ then H is a closed densely defined operator in \mathcal{E} and its spectrum is invariant under complex conjugation.

(3) If $z \in \rho(h, k)$ then

$$(5.4) \quad (H - z)^{-1} = p(z)^{-1} \begin{pmatrix} z - 2k & 1 \\ h & z \end{pmatrix}.$$

Proof. We will prove (1) and (3). Note that (2) will follow then from Lemma 2.2.

Let $z \in \rho(H)$. If $f_0 \in \langle h \rangle^{-1}\mathcal{H}$ with $p(z)f_0 = 0$, then $f = (f_0, zf_0) \in \text{Ker}(H - z)$ hence $f_0 = 0$. If $g_1 \in \mathcal{H}$ then $g = (0, g_1) \in \mathcal{E}$ and if $f = (H - z)^{-1}g$ then $p(z)f_0 = g_1$, hence $p(z) : \langle h \rangle^{-1}\mathcal{H} \xrightarrow{\sim} \mathcal{H}$ and $z \in \rho(h, k)$. Therefore $\rho(H) \subset \rho(h, k)$.

Conversely let $z \in \rho(h, k)$ so that $p(z) : \langle h \rangle^{-1}\mathcal{H} \xrightarrow{\sim} \mathcal{H}$. We shall show that $z \in \rho(H)$ and

$$(5.5) \quad (H - z)^{-1} = \begin{pmatrix} \ell w & \ell \\ \ell h & z\ell \end{pmatrix}, \quad \ell = p(z)^{-1}, \quad w = z - 2k,$$

completing the proof of (1) and (3). One must interpret carefully the operators appearing in the matrix above because $(H - z)^{-1}$ must send \mathcal{E} into \mathcal{D} . More precisely, since $hf_0 \in \langle h \rangle^{\frac{1}{2}}\mathcal{H}$ if $f_0 \in \langle h \rangle^{-\frac{1}{2}}\mathcal{H}$, the factor ℓ in the product ℓh is not the inverse of $p(z) : \langle h \rangle^{-1}\mathcal{H} \xrightarrow{\sim} \mathcal{H}$ but of its extension $p(z) : \langle h \rangle^{-\frac{1}{2}}\mathcal{H} \xrightarrow{\sim} \langle h \rangle^{\frac{1}{2}}\mathcal{H}$. We can do this thanks to Lemma 2.2. Now a mechanical computation implies

$$\begin{aligned} & \begin{pmatrix} \ell w & \ell \\ \ell h & z\ell \end{pmatrix} \begin{pmatrix} -z & 1 \\ h & 2k - z \end{pmatrix} \begin{pmatrix} f_0 \\ f_1 \end{pmatrix} \\ &= \begin{pmatrix} \ell w & \ell \\ \ell h & z\ell \end{pmatrix} \begin{pmatrix} -zf_0 + f_1 \\ hf_0 - wf_1 \end{pmatrix} = \begin{pmatrix} f_0 \\ f_1 \end{pmatrix}, \end{aligned}$$

for all $f = (f_0, f_1) \in \mathcal{D}$. Similarly for $g = (g_0, g_1) \in \mathcal{E}$ we compute

$$\begin{aligned} & \begin{pmatrix} -z & 1 \\ h & 2k - z \end{pmatrix} \begin{pmatrix} \ell w & \ell \\ \ell h & z\ell \end{pmatrix} \begin{pmatrix} g_0 \\ g_1 \end{pmatrix} \\ &= \begin{pmatrix} -z & 1 \\ h & -w \end{pmatrix} \begin{pmatrix} \ell w g_0 + \ell g_1 \\ \ell h g_0 + z\ell g_1 \end{pmatrix} = \begin{pmatrix} g_0 \\ g_1 \end{pmatrix} \end{aligned}$$

which holds because $h\ell w = w\ell h$ on $\langle h \rangle^{-\frac{1}{2}}\mathcal{H}$, where ℓ is the inverse of $p(z) : \langle h \rangle^{-\frac{1}{2}}\mathcal{H} \rightarrow \langle h \rangle^{\frac{1}{2}}\mathcal{H}$. Thus $z \in \rho(H)$ and $(H - z)^{-1}$ is given by (5.5). \square

Theorem 5.4. *Assume that $0 \in \rho(h)$.*

- (1) *Then H is a self-adjoint operator on the Krein space $(\mathcal{E}, \langle \cdot | \cdot \rangle_{\mathcal{E}})$ with $\rho(H) \neq \emptyset$.*
- (2) *If in addition $\text{Tr}\mathbb{1}_{[-\infty, 0]}(h) < \infty$, then H is even-definitizable.*

Proof. If $0 \in \rho(h)$ then $0 \in \rho(h, k) = \rho(H)$ and from (5.5) we get

$$(5.6) \quad H^{-1} = \begin{pmatrix} -2h^{-1}k & h^{-1} \\ \mathbb{1} & 0 \end{pmatrix}.$$

By Lemma 3.3 it suffices to show that $(H^{-1})^{\dagger} = H^{-1}$, which is a simple computation. This proves (1). Since any self-adjoint operator with non-empty resolvent set on a Pontryagin space is even-definitizable, (2) follows from Lemma 5.1. \square

5.3. Homogeneous energy space. Assume that $\text{Ker } h = \{0\}$. Then we can introduce the *homogeneous energy space*

$$(5.7) \quad \dot{\mathcal{E}} := |h|^{-\frac{1}{2}}\mathcal{H} \oplus \mathcal{H},$$

equipped with his canonical Hilbert space structure. Note that $\mathcal{E} \subset \dot{\mathcal{E}}$ continuously and densely. Of course $\mathcal{E} = \dot{\mathcal{E}}$ iff $0 \in \rho(h)$, so the typical situation considered in the sequel is $0 \in \sigma(h)$.

The following analog of Lemma 5.1 is obvious.

Lemma 5.5. *Assume that $\text{Ker } h = \{0\}$. Then $\dot{\mathcal{E}}$ equipped with $\langle \cdot | \cdot \rangle_{\mathcal{E}}$ is a Krein space. If in addition $\text{Tr}\mathbb{1}_{[-\infty, 0]}(h) < \infty$, then $\dot{\mathcal{E}}$ is Pontryagin.*

5.4. Klein-Gordon operators on homogeneous energy space.

Definition 5.6. *The (homogeneous) energy Klein-Gordon operator is the operator \dot{H} induced by \widehat{H} in $\dot{\mathcal{E}}$. Its domain is given by*

$$(5.8) \quad \dot{\mathcal{D}} = \left(|h|^{-\frac{1}{2}}\mathcal{H} \cap |h|^{-1}\mathcal{H} \right) \oplus \langle h \rangle^{-\frac{1}{2}}\mathcal{H} = \{f \in \dot{\mathcal{E}} : \widehat{H}f \in \dot{\mathcal{E}}\}.$$

which is continuously and densely embedded in $\dot{\mathcal{E}}$. We have

$$(5.9) \quad \dot{H} = \begin{pmatrix} 0 & \mathbb{1} \\ h & 2k \end{pmatrix}.$$

Since $\mathcal{E} \subset \dot{\mathcal{E}}$ and $\mathcal{D} \subset \dot{\mathcal{D}}$ continuously and densely, H may also be considered as an operator acting in $\dot{\mathcal{E}}$. We shall prove below that \dot{H} is its closure in $\dot{\mathcal{E}}$.

Proposition 5.7. (1) $\rho(\dot{H}) = \rho(h, k)$.

- (2) *In particular, if $\rho(h, k) \neq \emptyset$ then \dot{H} is a closed densely defined operator in $\dot{\mathcal{E}}$ and its spectrum is invariant under complex conjugation.*
- (3) *For $z \in \rho(h, k)$, $z \neq 0$ we have:*

$$(5.10) \quad (\dot{H} - z)^{-1} = \begin{pmatrix} z^{-1}p(z)^{-1}h - z^{-1} & p(z)^{-1} \\ p(z)^{-1}h & zp(z)^{-1} \end{pmatrix}.$$

Remark 5.8. It would be tempting to take the expression in (5.4) for $(\dot{H} - z)^{-1}$. The trouble is that kf_0 does not have an obvious meaning under our assumptions on k if $f_0 \in |h|^{-\frac{1}{2}}\mathcal{H}$. We obtain a meaningful formula for $(\dot{H} - z)^{-1}$ by noting that $(2k - z) = z^{-1}(p(z) - h)$ for $z \neq 0$.

Proof. Let us first prove that $\rho(\dot{H}) \subset \rho(h, k)$. Let $z \in \rho(\dot{H})$. Assume first that $z \neq 0$. Then for $g_1 \in \mathcal{H}$ and $g = (0, g_1) \in \dot{\mathcal{E}}$ there exists a unique $f = (f_0, f_1) \in \dot{\mathcal{D}}$ such that $(\dot{H} - z)f = g$ i.e. $f_1 = zf_0$ and $p(z)f_0 = g_1$. Since $f_1 = zf_0 \in \mathcal{H}$ and $z \neq 0$ it follows that $f_0 \in \langle h \rangle^{-1}\mathcal{H}$ hence $p(z) : \langle h \rangle^{-1}\mathcal{H} \rightarrow \mathcal{H}$ and $z \in \rho(h, k)$.

If $0 \in \rho(\dot{H})$, then for all $(g_0, g_1) \in \dot{\mathcal{E}}$ there exists a unique $(f_0, f_1) \in |h|^{-1}\mathcal{H} \cap |h|^{-\frac{1}{2}}\mathcal{H} \oplus \langle h \rangle^{-\frac{1}{2}}\mathcal{H}$ with $f_1 = g_0$ and $hf_0 + 2kf_1 = g_1$. This implies that $|h|^{-\frac{1}{2}}\mathcal{H} = \langle h \rangle^{-\frac{1}{2}}\mathcal{H}$, hence $0 \in \rho(h)$, hence $0 \in \rho(h, k)$.

We now prove that $\rho(h, k) \subset \rho(\dot{H})$ and that (5.10) holds for $z \in \rho(h, k)$, $z \neq 0$.

First, let $z \in \rho(h, k)$ with $z \neq 0$, $g = (g_0, g_1) \in \dot{\mathcal{E}}$, and (f_0, f_1) given by the r.h.s. of (5.10) applied to g . We begin by proving that $f \in \dot{\mathcal{D}}$.

Note that $p(z)^{-1}g_1 \in \langle h \rangle^{-1}\mathcal{H} \subset |h|^{-1}\mathcal{H} \cap |h|^{-\frac{1}{2}}\mathcal{H}$, and $hg_0 \in |h|^{\frac{1}{2}}\mathcal{H} \subset \langle h \rangle^{\frac{1}{2}}\mathcal{H}$ hence $p(z)^{-1}hg_0 \in \langle h \rangle^{-\frac{1}{2}}\mathcal{H}$. It follows that $f_1 = p(z)^{-1}hg_0 + zp(z)^{-1}g_1 \in \langle h \rangle^{-\frac{1}{2}}\mathcal{H}$. The same argument shows that $f_0 = z^{-1}p(z)^{-1}hg_0 - z^{-1}g_0 + p(z)^{-1}g_1 \in |h|^{-\frac{1}{2}}\mathcal{H}$. It remains to prove that $f_0 \in |h|^{-1}\mathcal{H}$ i.e. that $hf_0 \in \mathcal{H}$. Since $p(z)^{-1}g_1 \in \langle h \rangle^{-1}\mathcal{H}$ it suffices to prove that $z^{-1}h(p(z)^{-1}h - \mathbb{1})g_0 \in \mathcal{H}$. Note that

$$z^{-1}h(p(z)^{-1}h - \mathbb{1})g_0 = z^{-1}(hp(z)^{-1} - \mathbb{1})hg_0 = (z - 2k)p(z)^{-1}hg_0.$$

Since $g_0 \in |h|^{-\frac{1}{2}}\mathcal{H}$, $hg_0 \in \langle h \rangle^{\frac{1}{2}}\mathcal{H} \subset \langle h \rangle^{\frac{1}{2}}\mathcal{H}$, we obtain that $p(z)^{-1}hg_0 \in \langle h \rangle^{-\frac{1}{2}}\mathcal{H}$ hence $(z - 2k)p(z)^{-1}hg_0 \in \mathcal{H}$. This completes the proof of the fact that $f \in \dot{\mathcal{D}}$.

It remains to prove that $(\dot{H} - z)f = g$, which is a standard computation.

Finally assume that $0 \in \rho(h, k)$. Then $0 \in \rho(h)$ which implies that $\dot{\mathcal{E}} = \mathcal{E}$ and $\dot{H} = H$. Then by Prop. 5.3, $0 \in \rho(H)$. This completes the proof of (1), (3) and of the first statement of (2). \square

Theorem 5.9. *Assume that there exists $z \in \rho(h, k)$ with $z \neq 0$.*

- (1) *Then \dot{H} is self-adjoint on $(\dot{\mathcal{E}}, \langle \cdot | \cdot \rangle_{\dot{\mathcal{E}}})$ and $\rho(H) \neq \emptyset$.*
- (2) *If in addition $\text{Tr} \mathbb{1}_{]-\infty, 0]}(h) < \infty$, then \dot{H} is even-definitizable.*

Proof. An easy computation using (5.10) shows that $((\dot{H} - z)^{-1})^\dagger = (\dot{H} - \bar{z})^{-1}$. Then (1) follows from Lemma 3.3. (2) follows as before from Lemma 5.5. \square

We now describe the relationship between the two operators H and \dot{H} .

Proposition 5.10. (1) *\dot{H} is the closure of H in $\dot{\mathcal{E}}$;*

- (2) *for $z \in \rho(h, k)$, $z \neq 0$, $(\dot{H} - z)^{-1}$ maps \mathcal{E} into \mathcal{D} and $(H - z)^{-1} = (\dot{H} - z)^{-1}|_{\mathcal{E}}$;*
- (3) *there exists $C > 0$ such that for all $z \in \rho(h, k)$, $z \neq 0$ one has:*

$$\|(H - z)^{-1}g\|_{\mathcal{E}} \leq C((1 + |z|^{-1})\|(\dot{H} - z)^{-1}g\|_{\dot{\mathcal{E}}} + |z|^{-1}\|g\|_{\mathcal{E}}), \quad g \in \mathcal{E}.$$

Proof. If $f = (f_0, f_1) \in \dot{\mathcal{D}}$, we pick a sequence $f_0^n \in \langle h \rangle^{-1}\mathcal{H}$ with $f_0^n \rightarrow f_0$ in $|h|^{-1}\mathcal{H} \cap |h|^{-\frac{1}{2}}\mathcal{H}$. Then $f^n = (f_0^n, f_1) \in \mathcal{D}$ and $f^n \rightarrow f$ in $\dot{\mathcal{D}}$, $Hf^n \rightarrow \dot{H}f$ in $\dot{\mathcal{E}}$, which proves (1). To prove (2) it suffices to note that $(2k - z) = z^{-1}(p(z) - h)$ on $\langle h \rangle^{-\frac{1}{2}}\mathcal{H}$, which proves that on \mathcal{E} the r.h.s. of (5.4) and (5.10) coincide. To prove (3) we use that $\|f\|_{\mathcal{E}} \sim \|f\|_{\dot{\mathcal{E}}} + \|f_0\|_{\mathcal{H}}$. If $f = (H - z)^{-1}g$ then $f_0 = z^{-1}(f_1 - g_0)$, hence

$$\|f_0\|_{\mathcal{H}} \leq |z|^{-1}(\|f_1\|_{\mathcal{H}} + \|g_0\|_{\mathcal{H}}) \leq |z|^{-1}(\|(H - z)^{-1}g\|_{\dot{\mathcal{E}}} + \|g\|_{\mathcal{E}}),$$

which proves (3). \square

Proposition 5.10 has some direct consequences for the estimates on the quadratic pencil that we collect below.

Corollary 5.11. *Assume that there exists $z \in \rho(h, k)$, $z \neq 0$ and that $\text{Tr}\mathbb{1}_{]-\infty, 0]}(h) < \infty$. Then we have the following estimates on the quadratic pencil:*

$$\begin{aligned} \|\langle h \rangle^{\frac{1}{2}} p(z)^{-1}\|_{B(\mathcal{H})} &\leq \begin{cases} C((1 + |z|^{-1})|\text{Im}z|^{-m-1} + |z|^{-1}), & z \in U_0(R, a), \\ C((1 + |z|^{-1})\langle z \rangle^k |\text{Im}z|^{-1} + |z|^{-1}), & z \in U_\infty(R, a). \end{cases} , \\ \|p(z)^{-1}\|_{B(\mathcal{H})} &\leq \begin{cases} \frac{C}{|z|}((1 + |z|^{-1})|\text{Im}z|^{-m-1} + |z|^{-1}), & z \in U_0(R, a), \\ \frac{C}{|z|}((1 + |z|^{-1})\langle z \rangle^k |\text{Im}z|^{-1} + |z|^{-1}), & z \in U_\infty(R, a). \end{cases} \end{aligned}$$

Proof. By Corollary 3.13 and Proposition 5.10 we obtain:

$$\|(H - z)^{-1}\|_{B(\mathcal{E})} \leq \begin{cases} C((1 + |z|^{-1})|\text{Im}z|^{-m-1} + |z|^{-1}), & z \in U_0(R, a), \\ C((1 + |z|^{-1})\langle z \rangle^k |\text{Im}z|^{-1} + |z|^{-1}), & z \in U_\infty(R, a). \end{cases}$$

Using (5.4) we see that we have

$$\|(H - z)^{-1}(0, f)\|_{\mathcal{E}}^2 = \|\langle h \rangle^{\frac{1}{2}} p(z)^{-1} f\|_{\mathcal{H}}^2 + |z|^2 \|p(z)^{-1} f\|_{\mathcal{H}}^2,$$

which gives the result. \square

6. KLEIN-GORDON OPERATORS IN CHARGE SPACES

In this section we discuss in a way parallel to Sect. 5 the properties of the operator K in Subsect. 4.3 considered as acting on the non-homogeneous charge space $\mathcal{K}_{\frac{1}{4}}$ introduced in Subsect. 4.5.

Note that K acting on the homogeneous charge space $\dot{\mathcal{K}}_{\frac{1}{4}}$ could also be considered, at the price of some technical complications.

6.1. Non-homogeneous charge spaces. In this subsection, we consider a pair of operators (h, k) satisfying the conditions in Subsect. 2.2. Note that by duality and interpolation we see that

$$(6.1) \quad k \in B(\langle h \rangle^{-\theta} \mathcal{H}, \langle h \rangle^{\frac{1}{2}-\theta} \mathcal{H}), \quad 0 \leq \theta \leq \frac{1}{2}.$$

We define the (*non-homogeneous*) charge spaces of order θ :

$$(6.2) \quad \mathcal{K}_\theta := \langle h \rangle^{-\theta} \mathcal{H} \oplus \langle h \rangle^\theta \mathcal{H}, \quad 0 \leq \theta \leq \frac{1}{2}.$$

and observe that $\mathcal{E} \subset \mathcal{K}_\theta \subset \mathcal{E}^*$ continuously and densely. Note also that if

$$(6.3) \quad q(f, g) := (f_0|g_1)_{\mathcal{H}} + (f_1|g_0)_{\mathcal{H}}$$

then (\mathcal{K}_θ, q) are Krein spaces.

As we saw in Subsect. 4.5, the middle space

$$(6.4) \quad \mathcal{F} := \mathcal{K}_{\frac{1}{4}},$$

which equals the complex interpolation space $[\mathcal{E}, \mathcal{E}^*]_{\frac{1}{2}}$ is natural even in the case of free Klein-Gordon equations. We will forget the order $\frac{1}{4}$ and call it the *non-homogeneous charge space*.

6.2. Klein-Gordon operators on non-homogeneous charge space. We set

$$\hat{K} := \begin{pmatrix} k & \mathbb{1} \\ h_0 & k \end{pmatrix} \in B(\mathcal{E}, \mathcal{E}^*).$$

Note that there is a simple relation between \hat{K} and \hat{H} defined in (5.2): indeed, if

$$(6.5) \quad \Phi = \Phi(k) = \begin{pmatrix} \mathbb{1} & 0 \\ k & \mathbb{1} \end{pmatrix} \quad \text{hence} \quad \Phi \begin{pmatrix} f_0 \\ f_1 \end{pmatrix} = \begin{pmatrix} f_0 \\ kf_0 + f_1 \end{pmatrix}$$

then a straightforward computation using (6.1) gives

Lemma 6.1. *The map $\Phi = \Phi(k) : \mathcal{E}^* \rightarrow \mathcal{E}^*$ is an isomorphism with inverse $\Phi^{-1} = \Phi(-k)$. The subspaces \mathcal{E} and \mathcal{F} are stable under Φ and the restrictions of Φ to these subspaces are bijective. We have $\hat{H}\Phi = \Phi\hat{K}$.*

Definition 6.2. *The charge Klein-Gordon operator is the operator K induced by \hat{K} in \mathcal{F} . Its domain is given by*

$$(6.6) \quad \text{Dom } K := \{ f \in \mathcal{F} : \hat{K}f \in \mathcal{F} \}.$$

We have

$$K = \begin{pmatrix} k & \mathbb{1} \\ h_0 & \mathbb{1} \end{pmatrix}.$$

Proposition 6.3. (1) *One has $\rho(K) = \rho(h, k)$.*

(2) *In particular, if $\rho(h, k) \neq \emptyset$ then K is a closed, densely defined operator in \mathcal{F} and its spectrum is invariant under complex conjugation.*

(3) *If $z \in \rho(h, k)$ then*

$$(6.7) \quad (K - z)^{-1} = \begin{pmatrix} -p(z)^{-1}(k - z) & p(z)^{-1} \\ \mathbb{1} + (k - z)p(z)^{-1}(k - z) & -(k - z)p(z)^{-1} \end{pmatrix}.$$

Proof. It suffices to prove (1) and (3). We will set $l = p(z)^{-1}$, $u = k - z$ to simplify notation.

Let $z \in \rho(K)$. If $f_0 \in \langle h \rangle^{-\frac{1}{2}}\mathcal{H}$ and $f_1 = -uf_0 \in \mathcal{H}$ then $h_0f_0 + uf_1 = (h_0 - u^2)f_0 = p(z)f_0$ hence $(K_\theta - z)(f_0, f_1)^t = (0, p(z)f_0)^t$. Thus if $p(z)f_0 = 0$ then $(K - z)(f_0, f_1)^t = 0$, in particular $(f_0, f_1)^t \in \text{Dom}K$, and so $f_0 = 0$. Hence $p(z) : \langle h \rangle^{-\frac{1}{2}}\mathcal{H} \rightarrow \langle h \rangle^{\frac{1}{2}}\mathcal{H}$ is injective. Now let $b \in \mathcal{H}$. Since $(K - z)\text{Dom}K = \mathcal{F}$ and $(0, b)^t \in \mathcal{F}$, there are $f_0 \in \langle h \rangle^{-\frac{1}{2}}\mathcal{H}$ and $f_1 \in \mathcal{H}$ such that $K_\theta(f_0, f_1)^t = (0, b)^t$, hence $uf_0 + f_1 = 0$ and $h_0f_0 + uf_1 = b$, or $p(z)f_0 = b$. But $p(z) = h - z^2 + 2zk$ hence $hf_0 = b + z^2f_0 - 2zkf_0 \in \mathcal{H}$ so $f_0 \in \langle h \rangle^{-1}\mathcal{H}$. This proves that $p(z)\langle h \rangle^{-1}\mathcal{H} = \mathcal{H}$ and so $p(z) : \langle h \rangle^{-1}\mathcal{H} \xrightarrow{\sim} \mathcal{H}$ and $z \in \rho(h, k)$.

Conversely let $z \in \rho(h, k)$, so that $p(z) : \langle h \rangle^{-\frac{1}{2}}\mathcal{H} \xrightarrow{\sim} \langle h \rangle^{\frac{1}{2}}\mathcal{H}$. Let

$$G = \begin{pmatrix} -lu & l \\ \mathbb{1} + ulu & -ul \end{pmatrix}$$

be the r.h.s. of (6.7). Clearly $G \in B(\mathcal{E}, \mathcal{E}^*)$ and a simple computation gives $(\hat{K} - z)G = \mathbb{1}$ on \mathcal{E}^* and $G(\hat{K} - z) = \mathbb{1}$ on \mathcal{E} . So G is the inverse of $\hat{K} - z : \mathcal{E} \rightarrow \mathcal{E}^*$. If $a \in \langle h \rangle^{-\frac{1}{2}}\mathcal{H}$, $b \in \langle h \rangle^{\frac{1}{2}}\mathcal{H}$ and $(f_0, f_1)^t := G(a, b)^t$ then $uf_0 + f_1 = a$ and $h_0f_0 + uf_1 = b$ hence $(f_0, f_1)^t \in \text{Dom}K$. Thus $G\mathcal{F} \subset \text{Dom}K$. Reciprocally, if $(f_0, f_1)^t \in \text{Dom}K$ then $(a, b)^t := (K - z)(f_0, f_1)^t$ belongs to \mathcal{F} by (6.6) and $G(a, b)^t = (f_0, f_1)^t$ by the preceding computation. Thus $\text{Dom}K \subset G\mathcal{F}$. So $G\mathcal{F} = \text{Dom}K$ and $K - z : \text{Dom}K \xrightarrow{\sim} \mathcal{F}$ with inverse given by the restriction of G to \mathcal{F} . \square

We deduce from Prop. 6.3 the following analog of Thm. 5.4.

Theorem 6.4. *Assume that $\rho(h, k) \neq \emptyset$. Then K is a self-adjoint operator on the Krein space (\mathcal{F}, q) with $\rho(K) \neq \emptyset$.*

Since we saw that $\hat{H} = \Phi \hat{K} \Phi^{-1}$ and Φ preserves \mathcal{F} , it is instructive to describe the operator $\Phi K \Phi^{-1}$. Note that if we compute the image of the canonical Krein structure q on \mathcal{F} under Φ we get:

$$(6.8) \quad q'(f, g) := q(\Phi^{-1}f, \Phi^{-1}g) = q(f, g) - 2(f_0 | k g_0)_{\mathcal{H}}.$$

Lemma 6.5. (1) $\Phi K \Phi^{-1}$ is equal to the operator induced by \hat{H} on \mathcal{F} ;
 (2) $\Phi K \Phi^{-1}$ is equal to the restriction of \hat{H} to the domain

$$\Phi \text{Dom} K = \langle h \rangle^{-3/4} \mathcal{H} \oplus \langle h \rangle^{-1/4} \mathcal{H} = [\text{Dom} H, \mathcal{E}]_{\frac{1}{2}}.$$

Proof. (1) is obvious, (2) is a routine computation. \square

7. DEFINITIZABLE KLEIN-GORDON OPERATORS ON ENERGY SPACES

In this section, we describe some basic properties of a class of definitizable Klein-Gordon operators on the energy spaces $\mathcal{E}, \dot{\mathcal{E}}$. We also describe an approximate diagonalization of \dot{H} , which will be useful later on.

We will assume

$$(E1) \quad \text{Ker } h = \{0\}$$

$$(E2) \quad \text{Tr} \mathbb{1}_{]-\infty, 0]}(h) < \infty,$$

$$(E3) \quad k|h|^{-\frac{1}{2}} \in B(\mathcal{H}).$$

Condition (E3) implies

$$(E3') \quad k \langle h \rangle^{-\frac{1}{2}} \in B(\mathcal{H}),$$

hence the results of Sect. 5 hold. Moreover (E2) implies that h is bounded below, hence $\rho(h, k) \neq \emptyset$ by Prop. 2.3.

We set

$$m^2 := \inf \sigma(h) \cap \mathbb{R}^+, \quad m \geq 0.$$

The constant m is called the *mass*, Klein-Gordon equations will be called *massive* resp. *massless* if $m > 0$ resp. $m = 0$. A more common name for a massless Klein-Gordon equation is of course a *wave equation*.

Note that (E1) and (E2) imply that $\sigma_{\text{ess}}(h) \subset \mathbb{R}^+$. Moreover if (E1), (E2) hold and $m > 0$ then $0 \notin \sigma(h)$ hence $|h| \sim \langle h \rangle$ hence $\dot{\mathcal{E}} = \mathcal{E}$ and $\dot{H} = H$. By Thm. 5.9, we obtain that if (E) holds then $\dot{\mathcal{E}}$ equipped with $\langle \cdot | \cdot \rangle_{\mathcal{E}}$ if a Pontryagin space and \dot{H} defined in Def. 5.6 is even-definitizable.

Proposition 7.1. *Assume (E) and let U be a compact set with $U \subset \rho(\dot{H})$ if $m > 0$ and $U \subset \rho(\dot{H}) \setminus \{0\}$ if $m = 0$. Then there exists $C > 0$ such that:*

$$(7.1) \quad \|(\dot{H} - z)^{-1}\|_{B(\dot{\mathcal{E}}^*, \dot{\mathcal{E}})} \leq C + C \|(\dot{H} - z)^{-1}\|_{B(\dot{\mathcal{E}})}, \quad z \in U.$$

Proof. If $m = 0$ and $z \in \rho(\dot{H})$, $z \neq 0$, then $(\dot{H} - z)^{-1}$ is given by the r.h.s. of (5.4), using that $k \in B(|h|^{-\frac{1}{2}} \mathcal{H}, \mathcal{H})$. This also implies that $p(z)^{-1}h = \mathbb{1} + zp(z)^{-1}(z - 2k)$. Then an easy computation shows that $(\dot{H} - z)^{-1} \in B(\dot{\mathcal{E}}^*, \dot{\mathcal{E}})$. If $m > 0$ and $z \in \rho(\dot{H})$ then the same result holds using that $H = \dot{H}$, $\dot{\mathcal{E}} = \mathcal{E}$.

Let us prove the bound (7.1). We assume $m = 0$, the proof for $m > 0$ being simpler. We have:

$$(7.2) \quad \begin{aligned} \|(\dot{H} - z)^{-1}\|_{B(\dot{\mathcal{E}}^*, \dot{\mathcal{E}})} &\leq C \left(\| |h|^{\frac{1}{2}} p(z)^{-1} (z - 2k) \|_{B(\mathcal{H})} + \| |h|^{\frac{1}{2}} p(z)^{-1} \epsilon \|_{B(\mathcal{H})} \right. \\ &\quad \left. + \| zp(z)^{-1} (z - 2k) \|_{B(\mathcal{H})} + \| p(z)^{-1} |h|^{\frac{1}{2}} \|_{B(\mathcal{K})} \right) \\ &\leq C \| \langle h \rangle^{\frac{1}{2}} p(z)^{-1} \langle h \rangle^{\frac{1}{2}} \|_{B(\mathcal{K})}, \quad z \in U. \end{aligned}$$

Next from the expression (5.10) of $(\dot{H} - z)^{-1}$ we obtain that

$$(7.3) \quad \|\langle h \rangle^{\frac{1}{2}} p(z)^{-1}\|_{B(\mathcal{H})} + \|p(z)^{-1}\|_{B(\mathcal{H})} \leq C \|(\dot{H} - z)^{-1}\|_{B(\dot{\mathcal{E}})},$$

hence

$$\|\langle h \rangle^{\frac{1}{2}} p(z)^{-1}\|_{B(\mathcal{H})} \leq C \|(\dot{H} - z)^{-1}\|_{B(\dot{\mathcal{E}})}.$$

Taking adjoints and using that $p(z)^* = p(\bar{z})$, we also get

$$\|p(z)^{-1} \langle h \rangle^{\frac{1}{2}}\|_{B(\mathcal{H})} \leq C \|(\dot{H} - \bar{z})^{-1}\|_{B(\dot{\mathcal{E}})} \leq C' \|(\dot{H} - z)^{-1}\|_{B(\dot{\mathcal{E}})},$$

using (3.4). Since $p(z)^{-1}h = \mathbb{1} + p(z)^{-1}(z - 2k)$, we obtain for $z \in U$:

$$\|p(z)^{-1}h\|_{B(\mathcal{H})} \leq C + C \|p(z)^{-1} \langle h \rangle^{\frac{1}{2}}\|_{B(\mathcal{H})} \leq C + C \|(\dot{H} - z)^{-1}\|_{B(\dot{\mathcal{E}})}.$$

By (7.3) we have the same bound for $\|p(z)^{-1} \langle h \rangle\|_{B(\mathcal{H})}$ and for $\|\langle h \rangle p(z)^{-1}\|_{B(\mathcal{H})}$ by taking adjoints. By interpolation we obtain for $z \in U$

$$\|\langle h \rangle^{\frac{1}{2}} p(z)^{-1} \langle h \rangle^{\frac{1}{2}}\|_{B(\mathcal{H})} \leq C + C \|(\dot{H} - z)^{-1}\|_{B(\dot{\mathcal{E}})}$$

which using (7.2) completes the proof of (7.1). \square

7.1. Functional calculus. We saw that under conditions (E1), (E2), (E3'), the operator \dot{H} is even-definitizable, hence admits a C^α and a Λ^α functional calculus, see Subsects. 3.3, 3.4.

In this subsection, we discuss the functional calculus for H , in the case $m = 0$, which is not completely straightforward, since in this case $(\mathcal{E}, \langle \cdot | \cdot \rangle_{\mathcal{E}})$ is not a Krein space. We set

$$\alpha_H := \alpha_{\dot{H}} + \mathbb{1}_{\{0\}},$$

where $\alpha_{\dot{H}}$ is the order function of \dot{H} , (see Def. 3.9).

Proposition 7.2. *Assume (E1), (E2), (E3')*

(1) *there exists a unique continuous $*$ -morphism*

$$C^{\alpha_H}(\hat{\mathbb{R}}) \ni \varphi \mapsto \varphi(H) \in B(\mathcal{E}),$$

such that if $\varphi(\lambda) = (\lambda - z)^{-1}$ for $z \in \rho(H) \setminus \mathbb{R}$ then $\varphi(H) = (H - z)^{-1}$.

(2) *there exists a unique extension of the above map to a weakly b -continuous map*

$$\Lambda^{\alpha_H}(\hat{\mathbb{R}}) \ni \varphi \mapsto \varphi(H) \in B(\mathcal{E}),$$

which is a norm continuous $$ -morphism.*

Proof. By Prop. 5.10 $(H - z)^{-1} = (\dot{H} - z)^{-1}_{|\mathcal{E}}$ for $z \in \rho(\dot{H})$, $z \neq 0$. This implies (see Prop. 3.7) that $\mathbb{1}_{\text{pp}}^{\text{C}}(\dot{H})$ maps \mathcal{E} into itself and defines a bounded projection on \mathcal{E} , naturally denoted by $\mathbb{1}_{\text{pp}}^{\text{C}}(H)$, which commutes with H . Let us set $\mathcal{E}_1 := (\mathbb{1} - \mathbb{1}_{\text{pp}}^{\text{C}}(H))\mathcal{E}$, which is a closed subspace of \mathcal{E} , invariant under $(H - z)^{-1}$ for $z \in \rho(\dot{H})$. Replacing H by $H|_{\mathcal{E}_1}$, we see that without loss of generality we can assume that $\mathcal{E}_1 = \mathcal{E}$.

Let us set $\alpha = \alpha_{\dot{H}}$, $\beta = \alpha_H = \alpha + \mathbb{1}_{\{0\}}$. For $\varphi \in C^\beta(\hat{\mathbb{R}})$ with $\varphi(0) = 0$ we set $\tilde{\varphi}(x) = x^{-1}\varphi(x)$. Clearly $\tilde{\varphi} \in C^\alpha(\hat{\mathbb{R}})$ and there exists $C > 0$ such that

$$(7.4) \quad \|\tilde{\varphi}\|_\alpha \leq C \|\varphi\|_\beta, \quad \forall \varphi \in C^\beta(\hat{\mathbb{R}}) \text{ with } \varphi(0) = 0.$$

We claim that $\varphi(\dot{H})$ is bounded from \mathcal{E} into itself. In fact if $g \in \mathcal{E}$ we have:

$$\begin{aligned} \|\varphi(\dot{H})g\|_{\mathcal{E}} &\leq \|\varphi(\dot{H})g\|_{\dot{\mathcal{E}}} + \|(\varphi(\dot{H})g)_0\|_{\mathcal{H}} = \|\varphi(\dot{H})g\|_{\dot{\mathcal{E}}} + \|(\dot{H}\tilde{\varphi}(\dot{H})g)_1\|_{\mathcal{H}} \\ &= \|\varphi(\dot{H})g\|_{\dot{\mathcal{E}}} + \|(\tilde{\varphi}(\dot{H})g)_1\|_{\mathcal{H}} \leq \|\varphi(\dot{H})g\|_{\dot{\mathcal{E}}} + \|\tilde{\varphi}(\dot{H})g\|_{\dot{\mathcal{E}}}. \end{aligned}$$

Moreover from the above inequality, Thm. 3.10 applied to \dot{H} and (7.4) we obtain that

$$\|\varphi(\dot{H})\|_{B(\mathcal{E})} \leq C(\|\varphi\|_\alpha + \|\tilde{\varphi}\|_\alpha) \leq C\|\varphi\|_\beta.$$

Now for $\varphi \in C^\beta(\hat{\mathbb{R}})$ arbitrary we set $\psi(x) = \varphi(x) - \varphi(0)$ and:

$$\varphi(H) := \varphi(0)\mathbb{1}_{\mathcal{E}} + \psi(\dot{H})|_{\mathcal{E}}.$$

From the fact that $(H - z)^{-1} = (H - z)|_{\mathcal{E}}^{-1}$, we see that $\varphi(H) = (H - z)^{-1}$ if $\varphi(x) = (x - z)^{-1}$. This yields the existence of the $*$ -morphism in (1). The uniqueness follows from the density of the space of bounded rational functions in $C^\beta(\hat{\mathbb{R}})$, see [GGH1, Lemma 4.7]. We deduce (2) from (1) by the argument explained in Appendix B. \square

Remark 7.3. It is easy to construct a similar functional calculus for the operator K considered in Subsect. 6.2. In fact if φ belongs to one of the algebras in Prop. 7.2, then $\varphi(H)$ is bounded on \mathcal{E} and thus on \mathcal{E}^* by duality. Recalling that $\mathcal{F} = [\mathcal{E}, \mathcal{E}^*]_{1/2}$ we see by complex interpolation that $\varphi(H)$ defines a bounded operator on \mathcal{F} with similar estimates. We then define

$$\varphi(K) = \Phi^{-1}\varphi(H)\Phi,$$

which is well defined because Φ and Φ^{-1} are bounded on \mathcal{F} .

7.2. Essential spectrum of Klein-Gordon operators. We now investigate the essential spectrum of the operators H and \dot{H} . We set

$$H_0 = \begin{pmatrix} 0 & \mathbb{1} \\ h & 0 \end{pmatrix},$$

defined as in Def. 5.2 for $k = 0$, so that $\text{Dom}H_0 = \langle h \rangle^{-1}\mathcal{H} \oplus \langle h \rangle^{-\frac{1}{2}}\mathcal{H}$.

Similarly we set

$$\dot{H}_0 = \begin{pmatrix} 0 & \mathbb{1} \\ h & 0 \end{pmatrix},$$

defined as in Def. 5.6, with domain $\dot{D}_0 = |h|^{-1}\mathcal{H} \cap |h|^{-\frac{1}{2}}\mathcal{H} \oplus \langle h \rangle^{-\frac{1}{2}}\mathcal{H}$. Clearly

$$\sigma_{\text{ess}}(H_0) = \sigma_{\text{ess}}(\dot{H}_0) = \sqrt{\sigma_{\text{ess}}(h)} \cup -\sqrt{\sigma_{\text{ess}}(h)}.$$

(Recall that from (E) we saw that $\sigma_{\text{ess}}(h) \subset \mathbb{R}^+$.)

We introduce the condition:

$$(A4) \quad k\langle h \rangle^{-\frac{1}{2}} \in B_\infty(\mathcal{H}).$$

Proposition 7.4. *Assume (E), (A4). Then:*

- (1) $(H - z)^{-1} - (H_0 - z)^{-1} \in B_\infty(\mathcal{E}^*, \mathcal{E})$, $z \in \rho(H) \cap \rho(H_0)$,
- (2) $\sigma_{\text{ess}}(H) = \sigma_{\text{ess}}(\dot{H}) = \sqrt{\sigma_{\text{ess}}(h)} \cup -\sqrt{\sigma_{\text{ess}}(h)}$.

Proof. By (A4) we obtain that $H - H_0 \in B_\infty(\mathcal{E}, \mathcal{E}^*)$ which by the resolvent formula implies that $(H - z)^{-1} - (H_0 - z)^{-1} \in B_\infty(\mathcal{E}^*, \mathcal{E}) \subset B_\infty(\mathcal{E})$. This implies that $\sigma_{\text{ess}}(H) = \sigma_{\text{ess}}(H_0)$. Since by (E2) $h\mathbb{1}_{\mathbb{R}^-}(h) \in B_\infty(\mathcal{H})$ we see by the same argument that $\sigma_{\text{ess}}(H_0) = \sigma_{\text{ess}}(H_1)$ for $H_1 = \begin{pmatrix} 0 & \mathbb{1} \\ h\mathbb{1}_{\mathbb{R}^+}(h) & 0 \end{pmatrix}$. Using the arguments at the beginning of Subsect.7.3, we obtain that $\sigma_{\text{ess}}(H_1) = \sqrt{\sigma_{\text{ess}}(h)} \cup -\sqrt{\sigma_{\text{ess}}(h)}$, which proves (2) for H .

To prove (2) for \dot{H} we use again the second resolvent formula, hypothesis (A4) and the fact that $(\dot{H}_0 - z)^{-1}$ maps $\dot{\mathcal{E}}$ into $\text{Dom}\dot{H}_0$. We obtain that $\sigma_{\text{ess}}(\dot{H}) = \sigma_{\text{ess}}(\dot{H}_0)$. We conclude as in the case of H . \square

For completeness we state the following proposition.

Proposition 7.5. *Assume (E). Then:*

- (1) $\sigma(H) = \sigma(\dot{H})$,
- (2) $\sigma_p(H) = \sigma_p(\dot{H})$.

Proof. By Prop. 5.3 (1) and Prop. 5.7, we see that $\rho(H) = \rho(\dot{H}) = \rho(h, k)$, which proves (1). To prove (2) note that since $H \subset \dot{H}$ we have $\sigma_p(H) \subset \sigma_p(\dot{H})$. Moreover we easily see that $0 \in \sigma_p(H) \Leftrightarrow 0 \in \sigma_p(h) \Leftrightarrow 0 \in \sigma_p(\dot{H})$. Since by (E1) $\text{Ker } h = \{0\}$ we obtain that $0 \notin \sigma_p(H) \cup \sigma_p(\dot{H})$. Finally if $f \in \text{Ker}(\dot{H} - z)$, $z \neq 0$, we see that $f \in \mathcal{E}$, hence $\dot{H}f = \dot{H}f \in \mathcal{E}$ and $f \in \text{Ker}(H - z)$. Hence $\sigma_p(\dot{H}) \subset \sigma_p(H)$, which completes the proof of (2). \square

7.3. Approximate diagonalization. It will be convenient later to diagonalize as much as possible the operator \dot{H} . This can be done by extracting a convenient positive part from h .

We assume that

- (A1) $h = b^2 - r$ with $b \geq 0$, self-adjoint on \mathcal{H} , $b^2 \sim |h|$,
- (A2) r symmetric on $\langle h \rangle^{-\frac{1}{2}}\mathcal{H}$, $b^{-1}rb^{-1} \in B(\mathcal{H})$.

From (A1), (E1) and the Kato-Heinz inequality (see page 6) we see that:

$$(7.5) \quad \text{Ker } b = \{0\}, \quad \langle b \rangle^s \mathcal{H} = \langle h \rangle^{s/2} \mathcal{H}, \quad b^s \mathcal{H} = |h|^{s/2} \mathcal{H}, \quad |s| \leq 1.$$

Set

$$U := \frac{1}{\sqrt{2}} \begin{pmatrix} b & \mathbb{1} \\ b & -\mathbb{1} \end{pmatrix}, \quad U^{-1} = \frac{1}{\sqrt{2}} \begin{pmatrix} b^{-1} & b^{-1} \\ \mathbb{1} & -\mathbb{1} \end{pmatrix}.$$

We see using (7.5) that

$$(7.6) \quad U : \dot{\mathcal{E}} \rightarrow \mathcal{H} \oplus \mathcal{H} =: \mathcal{K}, \quad U : \dot{\mathcal{E}}^* \rightarrow b\mathcal{H} \oplus b\mathcal{H} = |L_0|\mathcal{K},$$

for

$$L_0 := \begin{pmatrix} b & 0 \\ 0 & -b \end{pmatrix} = U \begin{pmatrix} 0 & \mathbb{1} \\ b^2 & 0 \end{pmatrix} U^{-1}.$$

We will also use the space:

$$\langle L_0 \rangle \mathcal{K} = \langle b \rangle \mathcal{H} \oplus \langle b \rangle \mathcal{H} = \langle h \rangle^{\frac{1}{2}} \mathcal{H} \oplus \langle h \rangle^{\frac{1}{2}} \mathcal{H}.$$

Note that $\langle L_0 \rangle \mathcal{K} = U\mathcal{E}^*$ iff $m > 0$.

We have

$$(7.7) \quad \begin{aligned} L &:= U\dot{H}U^{-1} = L_0 + V_1 + V_2, \\ V_1 &:= k \begin{pmatrix} \mathbb{1} & -\mathbb{1} \\ -\mathbb{1} & \mathbb{1} \end{pmatrix}, \quad V_2 := \frac{1}{2}rb^{-1} \begin{pmatrix} -\mathbb{1} & -\mathbb{1} \\ \mathbb{1} & \mathbb{1} \end{pmatrix}. \end{aligned}$$

The canonical Hilbertian scalar product on $\mathcal{K} = \mathcal{H} \oplus \mathcal{H}$ will be denoted by $\langle \cdot | \cdot \rangle_0$. Then the Krein structure $\langle \cdot | \cdot \rangle_{\mathcal{E}}$ is mapped by U on

$$(7.8) \quad \langle u | u \rangle = \langle u | (\mathbb{1} + K)u \rangle_0, \quad K := -\frac{1}{2}b^{-1}rb^{-1} \begin{pmatrix} \mathbb{1} & \mathbb{1} \\ \mathbb{1} & \mathbb{1} \end{pmatrix}.$$

Clearly if (E), (A1), (A2) hold then L is even-definitizable on the Krein space $(\mathcal{K}, \langle \cdot | \cdot \rangle)$.

Lemma 7.6. *Assume (E), (A1), (A2). Then:*

- (1) $L - z : \mathcal{K} \rightarrow \langle L_0 \rangle \mathcal{K}$, for $z \in \rho(L) = \rho(\dot{H})$.
- (2) Let U be a compact set with $U \subset \rho(\dot{H})$ if $m > 0$ and $U \subset \rho(\dot{H}) \setminus \{0\}$ if $m = 0$. Then there exists $C > 0$ such that:

$$\|(L - z)^{-1}\|_{B(\langle L_0 \rangle \mathcal{K}, \mathcal{K})} \leq C1 + C\|(L - z)^{-1}\|_{B(\mathcal{K})} \quad \forall z \in U.$$

Note that Lemma 7.6 would be immediate if $\text{Dom}L = \text{Dom}L_0$.

Proof. If $m > 0$ we know that $\langle h \rangle \sim |h|$ hence $b^2 \sim \langle b \rangle^2$ by (A1). This implies that $\langle L_0 \rangle \mathcal{K} = |L_0| \mathcal{K}$ and the lemma follows from Prop. 7.1 and (7.6). Assume that $m = 0$. Then from (A2) we see that $L - z \in B(\mathcal{K}, \langle L_0 \rangle \mathcal{K})$. We note then that

$$(7.9) \quad \|u\|_{\langle b \rangle \mathcal{H}} \sim \|\mathbb{1}_{[0,1]}(b)u\|_{\mathcal{H}} + \|\mathbb{1}_{1,+\infty}(b)u\|_{b\mathcal{H}}, \quad u \in \langle b \rangle \mathcal{H}.$$

Prop. 7.1 gives $(\dot{H} - z)^{-1} : \dot{\mathcal{E}}^* \rightarrow \dot{\mathcal{E}}$, hence $(L - z)^{-1} : |L_0| \mathcal{K} \rightarrow \mathcal{K}$ by using again (7.6). Since $(L - z)^{-1} : \mathcal{K} \rightarrow \mathcal{K}$, we get from (7.9) $(L - z)^{-1} \in B(\langle L_0 \rangle \mathcal{K}, \mathcal{K})$ and

$$\|(L - z)^{-1}\|_{B(\langle L_0 \rangle \mathcal{K}, \mathcal{K})} \leq C\|(L - z)^{-1}\|_{B(|L_0| \mathcal{K}, \mathcal{K})} + C\|(L - z)^{-1}\|_{B(\mathcal{K})}.$$

Then we apply Prop. 7.1. \square

We now introduce the following condition:

$$(A3) \quad k\langle b \rangle^{-1}, b^{-1}rb^{-1} \in B_\infty(\mathcal{H}).$$

Proposition 7.7. *Assume (E), (A1), (A2), (A3). Then:*

- (1) $(L - z)^{-1} - (L_0 - z)^{-1} \in B_\infty(\langle L_0 \rangle \mathcal{K}, \mathcal{K})$, $z \in \rho(L) \cap \rho(L_0)$,
- (2) $\sigma_{\text{ess}}(L) = \sqrt{\sigma_{\text{ess}}(h)} \cup -\sqrt{\sigma_{\text{ess}}(h)}$.

Remark 7.8. Note that Prop. 7.7 still holds if we replace $b^{-1}rb^{-1} \in B_\infty(\mathcal{H})$ by the weaker condition $\langle b \rangle^{-1}rb^{-1} \in B_\infty(\mathcal{H})$. If $b^{-1}rb^{-1} \in B_\infty(\mathcal{H})$ then K defined in (7.8) belongs to $B_\infty(\mathcal{K})$, which will be useful in Sect. 8.

Proof. To prove (1) we use that $(L - z)^{-1}, (L_0 - z)^{-1} \in B(\langle L_0 \rangle \mathcal{K}, \mathcal{K})$ by Lemma 7.6, that V_1, V_2 defined in (7.7) belong to $B_\infty(\mathcal{K}, \langle L_0 \rangle \mathcal{K})$ and the second resolvent formula. The relation (2) follows from the analogous statement for \dot{H} in Prop. 7.4, noting that (A3) implies (A4). \square

We will need later the following lemma.

Lemma 7.9. *Assume (E), (A1), (A2), (A3),. Let $\chi \in C_0^\infty(\mathbb{R})$ with $0 \notin \text{supp}\chi$ if $m = 0$. Then*

- (1) $\chi(L) \in B(\langle L_0 \rangle \mathcal{K}, \mathcal{K})$,
- (2) $\chi(L) - \chi(L_0) \in B_\infty(\mathcal{K})$.

Proof. We use the functional calculus formula:

$$\chi(L) = \frac{i}{2\pi} \int_{\mathbb{C}} \frac{\partial \tilde{\chi}}{\partial \bar{z}}(z)(z - L)^{-1} dz \wedge d\bar{z}.$$

Then (1) follows from Lemma 7.6 and the bound in Corollary 3.13. Statement (2) follows from Prop. 7.7 (1) and the fact that the integrals defining $\chi(L)$ and $\chi(L_0)$ are norm convergent. \square

We conclude this subsection by discussing the situation when $h_0 = h + k^2$ is positive and by formulating conditions on k which imply conditions (A).

Lemma 7.10. *Assume that $h_0 \geq 0$, $\text{Ker } h_0 = \{0\}$ and:*

- $h_0 \sim |h|$,
- $k = k_1 + k_2$ where k_i are symmetric on $\langle h \rangle^{-\frac{1}{2}} \mathcal{H}$ and $\|k_1|h_0|^{-\frac{1}{2}}\|_{B(\mathcal{H})} < 1$, $k_1\langle h_0 \rangle^{-\frac{1}{2}}, k_2|h_0|^{-\frac{1}{2}} \in B_\infty(\mathcal{H})$.

Then conditions (A) are satisfied for

$$b = (h_0 - k_1^2)^{\frac{1}{2}}, \quad r = k^2 - k_1^2 = k_2^2 + k_1k_2 + k_2k_1.$$

Proof. Since $\|k_1|h_0|^{-\frac{1}{2}}\| < 1$ we have $b^2 \sim h_0 \sim |h|$, hence (A1) holds. We know $k_i \in B(b^{-1}\mathcal{H}, \mathcal{H})$ hence $k_i \in B(\mathcal{H}, b\mathcal{H})$ by duality. This implies $r \in B(b^{-1}\mathcal{H}, b\mathcal{H})$, which is (A2). Similarly we obtain that $k\langle b \rangle^{-1}$ and $b^{-1}rb^{-1}$ belong to $B_\infty(\mathcal{H})$. \square

8. MOURRE ESTIMATE FOR KLEIN-GORDON OPERATORS ON ENERGY SPACES

This section is devoted to the proof of a Mourre estimate for Klein-Gordon operators on energy spaces. We will use the approximate diagonalization in Subsect. 7.3, and consider the operator L .

8.1. Scalar conjugate operators. We start with some preparations with scalar operators, i.e. operators acting on \mathcal{H} .

Let us fix as in Subsect. 7.3 two operators b, r such that (A1), (A2) hold. Let a be a self-adjoint operator on \mathcal{H} such that:

$$(M1) \quad b^2 \in C^2(a).$$

Then $\chi(b^2) : \text{Dom } a \rightarrow \text{Dom } a$ for $\chi \in C_0^\infty(\mathbb{R})$ and (see e.g. [Ha1, Subsect. 2.2.2])

$$(8.1) \quad a_\chi := \chi(b^2)a\chi(b^2)$$

is essentially self-adjoint on $\text{Dom } a$. We still denote by a_χ its closure. Then $b^2 \in C^2(a_\chi)$ and $\text{ad}_{a_\chi}^\alpha(b^2) \in B(\mathcal{H})$ for $0 \leq \alpha \leq 2$.

Lemma 8.1. *Assume (M1). Then:*

- (1) $e^{ita_\chi} : \langle b \rangle^s \mathcal{H} \rightarrow \langle b \rangle^s \mathcal{H}$ and defines a C_0 -group on $\langle b \rangle^s \mathcal{H}$ for $|s| \leq 2$,
- (2) if $m > 0$ or $m = 0$ and $0 \notin \text{supp } \chi$ then

$$\text{ad}_{a_\chi}^\alpha(b) \in B(\mathcal{H}) \text{ if } 0 \leq \alpha \leq 2 \text{ and } b, \langle b \rangle \in C^2(a_\chi; \langle b \rangle^{-1} \mathcal{H}, \mathcal{H}) \cap C^2(a_\chi; \mathcal{H}, \langle b \rangle \mathcal{H}).$$

Proof. Since $[b^2, a_\chi] \in B(\mathcal{H})$, it follows from [GG, Appendix] that e^{ita_χ} preserves $\text{Dom } b^2 = \langle b \rangle^{-2} \mathcal{H}$, hence also $\langle b \rangle^s \mathcal{H}$ for $|s| \leq 2$ by duality and interpolation. By [ABG, Prop. 3.2.5], e^{ita_χ} defines a C_0 -group on all these spaces. This proves (1). If $m > 0$ or $m = 0$ and $0 \notin \text{supp } \chi$ we have

$$(8.2) \quad \text{ad}_{a_\chi}(b) = \text{ad}_{a_\chi}(f(b^2)),$$

for some $f \in C_0^\infty(\mathbb{R})$. Since $b^2 \in C^1(a)$ we get $\text{ad}_{a_\chi}(f(b^2)) \in B(\mathcal{H})$. The same argument shows that

$$(8.3) \quad \text{ad}_{a_\chi}^\alpha(b) = \chi(b^2)M_\alpha\chi(b^2), \quad M_\alpha \in B(\mathcal{H}), \quad 0 \leq \alpha \leq 2.$$

The same hold for $\langle b \rangle$, which implies (2). \square

Lemma 8.2. *Assume (M1) and let a_χ be defined by (8.1) with $0 \notin \text{supp } \chi$. Then*

$$\langle a_\chi \rangle^{-\delta} (\langle b \rangle - b) \langle a_\chi \rangle^\delta \in B(\mathcal{H}), \quad 0 \leq \delta \leq 1.$$

Proof. The proof is given in Subsect. A.3. \square

We now introduce assumptions on k and r .

$$(M2) \quad k \langle b \rangle^{-1}, \langle b \rangle^{-1} r b^{-1} \in C^2(a_\chi; \mathcal{H}), b^{-1} r b^{-1} \in C^1(a_\chi; \mathcal{H}).$$

Note that if (E), (A1), (A2) hold, then $k \langle b \rangle^{-1}$, $\langle b \rangle^{-1} r b^{-1}$ and $b^{-1} r b^{-1}$ belong to $B(\mathcal{H})$, so assumption (M2) makes sense.

Lemma 8.3. *Assume (E), (A1), (A2), (M1), (M2). Then*

$$k, r b^{-1} \in C^2(a_\chi; \mathcal{H}, \langle b \rangle \mathcal{H}).$$

Proof. Since $\langle b \rangle \in C^2(a_\chi; \mathcal{H}, \langle b \rangle \mathcal{H})$ it suffices to show that $\langle b \rangle^{-1} k$, $\langle b \rangle^{-1} r b^{-1}$ belong to $C^2(a_\chi; \mathcal{H})$, which follows from (M2) and [ABG, Prop. 5.1.7]. \square

We now discuss conditions on k which imply (M2), if $h_0 := h + k^2 \geq 0$ and $|h| \sim h_0$, similar to Lemma 7.10.

Lemma 8.4. *Assume the hypotheses of Lemma 7.10 and choose $b = (h_0 - k_1^2)^{\frac{1}{2}}$ so that $r = k_2^2 + k_1k_2 + k_2k_1$. Assume moreover that $[k_1, k_2] = 0$, as an identity in $B(\langle h \rangle^{-\frac{1}{2}}\mathcal{H}, \langle h \rangle^{\frac{1}{2}}\mathcal{H})$. Then if*

$$(M2') \quad k_1\langle b \rangle^{-1}, k_2b^{-1} \in C^2(a_\chi; \mathcal{H}), \quad b^{-1}k_1k_2b^{-1} \in C^1(a_\chi; \mathcal{H})$$

condition (M2) is satisfied.

Proof. Arguing as in the proof of (8.2) we obtain that $b\langle b \rangle^{-1} \in C^2(a_\chi; \mathcal{H})$. Since $k_2b^{-1} \in C^2(a_\chi; \mathcal{H})$, we obtain that $k_2\langle b \rangle^{-1} \in C^2(a_\chi; \mathcal{H})$, by [ABG, Props. 5.1.7, 5.2.3], hence $k\langle b \rangle^{-1} \in C^2(a_\chi; \mathcal{H})$. Using that $r = k_2^2 + 2k_1k_2$ and the same argument, we also obtain the remaining conditions in (M2). \square

8.2. Conjugate operators for Klein-Gordon operators. We first introduce some notation. If c is a closed densely defined operator on \mathcal{H} , we set

$$c_{\text{diag}} := \begin{pmatrix} c & 0 \\ 0 & c \end{pmatrix}, \quad \text{acting on } \mathcal{K} = \mathcal{H} \oplus \mathcal{H}.$$

We will use the approximate diagonalization introduced in Subsect. 7.3. Recall that $U\dot{\mathcal{E}} = \mathcal{K}$ and $U\dot{\mathcal{E}}^* = |L_0|\mathcal{K}$.

Let now $A = (a_\chi)_{\text{diag}}$ which is the generator of $(e^{ita_\chi})_{\text{diag}}$ on \mathcal{K} .

Proposition 8.5. *Assume (E), (A1), (A2), (M1), (M2). Then:*

- (1) e^{itA} is a C_0 -group on $\langle L_0 \rangle \mathcal{K}$,
- (2) the Krein structure $\langle \cdot | \cdot \rangle$ is of class $C^1(A)$,
- (3) L, L_0 belong to $C^2(A; \mathcal{K}, \langle L_0 \rangle \mathcal{K})$ hence to $C^2(A)$.

We refer to [GGH1, Subsect. 5.5] for the terminology in (2) above.

Proof. (1) follows from Lemma 8.1 (1), (2) from (M2) and identity (7.8), and (3) from (M2) and identity (7.7). \square

Proposition 8.6. *Assume (E), (A1), (A2), (A3), (M1), (M2). Let $\chi \in C_0^\infty(\mathbb{R})$ with $0 \notin \text{supp} \chi$ if $m = 0$. Then*

$$\chi(L)[L, iA]\chi(L) - \chi(L_0)[L_0, iA]\chi(L_0) \in B_\infty(\mathcal{K}).$$

Proof. From (E), (A1), (A2), (A3), we see that $L - L_0 \in B_\infty(\mathcal{K}, \langle L_0 \rangle \mathcal{K})$. From Prop. 8.5 we know that $L - L_0 \in C^2(A; \mathcal{K}, \langle L_0 \rangle \mathcal{K}) \subset C_u^1(A; \mathcal{K}, \langle L_0 \rangle \mathcal{K})$. Therefore

$$(8.4) \quad [L - L_0, iA] \in B_\infty(\mathcal{K}, \langle L_0 \rangle \mathcal{K}).$$

We write now:

$$\begin{aligned} & \chi(L)[L, iA]\chi(L) - \chi(L_0)[L_0, iA]\chi(L_0) \\ &= \chi(L)[L - L_0, iA]\chi(L) + \chi(L)[L_0, iA](\chi(L) - \chi(L_0)) \\ & \quad + (\chi(L) - \chi(L_0))[L_0, iA]\chi(L_0). \end{aligned}$$

By (8.4), the fact that $[L_0, iA] \in B(\mathcal{K})$, and Lemma 7.9 (2), this is compact. \square

8.3. Mourre estimate. We denote by $\tau(b^2, a)$ the set of *thresholds* for (b^2, a) . If a is fixed from the context, we will often simply write $\tau(b^2)$ for $\tau(b^2, a)$. So if $\lambda \notin \tau(b^2, a)$ there exists an interval $I \subset \mathbb{R}$, with $\lambda \in I$, a constant $c_0 > 0$ and $R \in B_\infty(\mathcal{H})$ such that

$$\mathbb{1}_I(b^2)[b^2, ia]\mathbb{1}_I(b^2) \geq c_0\mathbb{1}_I(b^2) + R.$$

We set

$$\tau(b) := \sqrt{\tau(b^2)}.$$

In the theorem below we use the notation $c(L)$ for the set of critical points of L .

Recall that $\langle \cdot | \cdot \rangle_0$ denotes the Hilbertian scalar product on \mathcal{K} . If $A \in B(\mathcal{H})$ then

$$A \geq_0 0, \text{ resp. } A \geq 0,$$

means that A is self-adjoint positive for $\langle \cdot | \cdot \rangle_0$, resp. $\langle \cdot | \cdot \rangle$.

Theorem 8.7. *Assume (E), (A1), (A2), (A3), (M1), (M2). Let $I \subset \mathbb{R}^\pm$ a compact interval such that:*

$$i) I \cap \pm\tau(b) = \emptyset, \text{ ii) } I \cap c(L) = \emptyset, \text{ iii) } 0 \notin I.$$

Let $\chi \in C_0^\infty(\mathbb{R})$ such that $\chi \equiv 1$ on I^2 and $0 \notin \text{supp}\chi$ if $m = 0$, and $A = (a_\chi)_{\text{diag}}$, where a_χ is defined in (8.1). Then:

(1) for $f \in C_0^\infty(\overset{\circ}{I})$ there exists $c_1 > 0$ and $R \in B_\infty(\mathcal{K})$ such that

$$\pm \text{Re}(f(L)[L, iA]f(L)) \geq c_1 f^2(L) + R,$$

(2) if $\lambda \in I \setminus \sigma_p(L)$ there exists $\delta > 0, c_2 > 0$ such that

$$\pm \text{Re}(\mathbb{1}_{[\lambda-\delta, \lambda+\delta]}(L)[L, iA]\mathbb{1}_{[\lambda-\delta, \lambda+\delta]}(L)) \geq c_2 \mathbb{1}_{[\lambda-\delta, \lambda+\delta]}(L).$$

In (1) and (2) we choose the sign \pm if $I \subset \mathbb{R}^\pm$.

Remark 8.8. We assume for simplicity that $0 \notin I$, even if $m > 0$. This is not a restriction since by Prop. 7.7 we know that $0 \notin \sigma_{\text{ess}}(L)$ if $m > 0$.

Proof. Since by i) $I^2 \cap \tau(b^2) = \emptyset$, there exists $c_0 > 0, R \in B_\infty(\mathcal{H})$ such that

$$\mathbb{1}_{I^2}(b^2)[b^2, ia]\mathbb{1}_{I^2}(b^2) \geq c_0 \mathbb{1}_{I^2}(b^2) + R.$$

By [Ha1, Thm. 2.2.4] this implies if $\chi \in C_0^\infty(\mathbb{R})$ is such that $\chi \equiv 1$ on I^2 , there exists $c_1 > 0, R_1 \in B_\infty(\mathcal{H})$ such that

$$(8.5) \quad \mathbb{1}_{|I|}(b)[b, ia_\chi]\mathbb{1}_{|I|}(b) \geq c_1 \mathbb{1}_{|I|}(b) + R_1.$$

This implies that if $I \subset \mathbb{R}^\pm$ one has

$$\pm \mathbb{1}_I(L_0)[L_0, iA]\mathbb{1}_I(L_0) \geq_0 c_1 \mathbb{1}_I(L_0) + R_2, \quad R_2 \in B_\infty(\mathcal{K}),$$

which implies that for $f \in C_0^\infty(\overset{\circ}{I})$ one has:

$$(8.6) \quad \pm f(L_0)[L_0, iA]f(L_0) \geq_0 c_1 f^2(L_0) + R_3, \quad R_3 \in B_\infty(\mathcal{K}).$$

Let us now set

$$B = f(L)[L, iA]f(L), \quad C = f^2(L),$$

$$B_0 = f(L_0)[L_0, iA]f(L_0), \quad C_0 = f^2(L_0),$$

and let K be defined in (7.8). By (A3), we know that $K \in B_\infty(\mathcal{K})$. By Lemma 7.9, Prop. 8.6 and hypothesis (A2), we know that

$$(8.7) \quad B - B_0, \quad C - C_0, \quad K \in B_\infty(\mathcal{K}).$$

We have for $u \in \mathcal{K}$:

$$\begin{aligned} \pm \text{Re}\langle u | Bu \rangle &= \pm \text{Re}\langle u | B_0 u \rangle + \text{Re}\langle u | Ru \rangle \\ &= \pm \text{Re}\langle u | (\mathbb{1} + K)B_0 u \rangle_0 + \text{Re}\langle u | Ru \rangle \\ &= \pm \text{Re}\langle u | B_0 u \rangle_0 + \text{Re}\langle u | Ru \rangle \\ &\geq c_1 \langle u | C_0 u \rangle_0 + \text{Re}\langle u | Ru \rangle_0 + \text{Re}\langle u | Ru \rangle \\ &= c_1 \langle u | C u \rangle + \text{Re}\langle u | Ru \rangle, \end{aligned}$$

where R denotes an element of $B_\infty(\mathcal{K})$ and we used (8.7), (7.8). This proves (1).

Assume now that $\lambda \in I \setminus \sigma_p(L)$. Since I does not contain critical points of L , we know that $\mathbb{1}_I(L) \geq 0$ and that the restriction of $\langle \cdot | \cdot \rangle$ to $\mathbb{1}_I(L)\mathcal{K}$ is a Hilbertian scalar product, equivalent to $\langle \cdot | \cdot \rangle_0$, and the restriction of L to $\mathbb{1}_I(L)\mathcal{K}$ is self-adjoint

in the usual sense for this scalar product. Then (2) follows from (1) by the usual argument. \square

9. LIMITING ABSORPTION PRINCIPLE

In this section we apply the abstract results from [GGH1] to deduce weighted resolvent estimates from the positive commutator estimate proved in the previous section. The following theorem follows directly from [GGH1, Thm. 7.9], whose hypotheses follow from Thm. 8.7 and Prop. 8.5.

Theorem 9.1. *Assume (E), (A1), (A2), (A3), (M1), (M2).*

Let $I \subset \mathbb{R}$ a compact interval such that

$$i) I \cap \pm\tau(b) = \emptyset, \quad ii) I \cap c(L) = \emptyset, \quad iii) 0 \notin I, \quad iv) I \cap \sigma_p(L) = \emptyset.$$

Let $\chi \in C_0^\infty(\mathbb{R})$ such that $\chi \equiv 1$ on I^2 and $0 \notin \text{supp}\chi$ if $m = 0$, and $A = (a_\chi)_{\text{diag}}$, where a_χ is defined in (8.1).

Then there exists $\epsilon_0 > 0$ such that for $\delta > \frac{1}{2}$ one has:

$$\sup_{\text{Re}z \in I, 0 < |\text{Im}z| \leq \epsilon_0} \|\langle A \rangle^{-\delta} (L - z)^{-1} \langle A \rangle^{-\delta}\|_{B(\mathcal{K})} < \infty.$$

9.1. Limiting absorption principle in energy space. After conjugation by the operator U defined in Subsect. 7.3, we immediately deduce from Thm. 9.1 a corresponding result on $(\dot{H} - z)^{-1}$ acting on the homogeneous Hilbert space $\dot{\mathcal{E}}$.

Clearly we have $c(L) = c(\dot{H})$ since \dot{H}, L are unitarily equivalent. Although H is not necessarily definitizable on $(\mathcal{E}, \langle \cdot | \cdot \rangle_{\mathcal{E}})$ if $m = 0$, we will still set

$$c(H) := c(\dot{H}).$$

The weights appearing on both sides of $(\dot{H} - z)^{-1}$ are not convenient for applications, at least in the massless case, because they contain the relatively singular operators b and b^{-1} (see (9.1) below). In this subsection we consider the resolvent $(H - z)^{-1}$ on \mathcal{E} and prove more useful resolvent estimates, with non singular weights.

It is convenient to formulate these estimates in terms of an additional operator on \mathcal{H} which dominates the conjugate operator a_χ . Let us introduce the corresponding abstract hypothesis:

We fix a self-adjoint operator $\langle x \rangle \geq \mathbb{1}$ on \mathcal{H} , called a *reference weight*, such that:

$$(M3) \begin{cases} (i) & \langle a_\chi \rangle \langle x \rangle^{-1} \in B(\mathcal{H}), \quad \forall \chi \in C_0^\infty(\mathbb{R}), \\ (ii) & [\langle b \rangle, \langle x \rangle^{-\delta}] \langle x \rangle^\delta \in B(\mathcal{H}), \quad 0 \leq \delta \leq 1. \end{cases}$$

In concrete cases (see Sect. 12) it is very easy to find a reference weight $\langle x \rangle$.

Theorem 9.2. *Assume (E), (A1), (A2), (A3), (M1), (M2), (M3). Let $I \subset \mathbb{R}$ be an interval as in Thm. 9.1. Then there exists $\epsilon_0 > 0$ such that for $\frac{1}{2} < \delta \leq 1$:*

$$\sup_{\text{Re}z \in I, 0 < |\text{Im}z| \leq \epsilon_0} \|(\langle x \rangle^{-\delta})_{\text{diag}} (H - z)^{-1} (\langle x \rangle^{-\delta})_{\text{diag}}\|_{B(\mathcal{E})} < \infty.$$

Proof. Set $J = \{z \in \mathbb{C} : \text{Re}z \in I, 0 < |\text{Im}z| \leq \epsilon_0\}$. Since

$$(9.1) \quad U^{-1} \langle A \rangle^{-\delta} U = \begin{pmatrix} b^{-1} \langle a_\chi \rangle^{-\delta} b & 0 \\ 0 & \langle a_\chi \rangle^{-\delta} \end{pmatrix},$$

we obtain that if $g \in \dot{\mathcal{E}}$ and $f = (\dot{H} - z)^{-1}g$ one has:

$$(9.2) \quad \|\langle a_\chi \rangle^{-\delta} b f_0\|_{\mathcal{H}} + \|\langle a_\chi \rangle^{-\delta} f_1\|_{\mathcal{H}} \leq c (\|\langle a_\chi \rangle^\delta b g_0\|_{\mathcal{H}} + \|\langle a_\chi \rangle^\delta g_1\|_{\mathcal{H}}), \quad z \in J.$$

If $g \in \mathcal{E}$, then by Prop. 5.10 we know that $f \in \mathcal{E}$ and $f = (H - z)^{-1}g$. Moreover since $f_0 = z^{-1}(f_1 - g_0)$ and $0 \notin I$ we also obtain that:

$$(9.3) \quad \|\langle a_\chi \rangle^{-\delta} f_0\|_{\mathcal{H}} \leq c \left(\|\langle a_\chi \rangle^\delta b g_0\|_{\mathcal{H}} + \|\langle a_\chi \rangle^{-\delta} g_0\|_{\mathcal{H}} + \|\langle a_\chi \rangle^\delta g_1\|_{\mathcal{H}} \right), \quad z \in J.$$

Writing $\langle b \rangle = b + (\langle b \rangle - b)$ and using Lemma 8.2, we obtain that:

$$(9.4) \quad \begin{aligned} \|\langle a_\chi \rangle^{-\delta} \langle b \rangle f_0\|_{\mathcal{H}} &\leq c \left(\|\langle a_\chi \rangle^{-\delta} b f_0\|_{\mathcal{H}} + \|\langle a_\chi \rangle^{-\delta} f_0\|_{\mathcal{H}} \right), \\ \|\langle a_\chi \rangle^\delta b g_0\|_{\mathcal{H}} &\leq c \left(\|\langle a_\chi \rangle^\delta \langle b \rangle g_0\|_{\mathcal{H}} + \|\langle a_\chi \rangle^\delta g_0\|_{\mathcal{H}} \right). \end{aligned}$$

From condition (M3) (i) we obtain by interpolation that $\langle a_\chi \rangle^\delta \langle x \rangle^{-\delta}$ is bounded, hence:

$$\begin{aligned} \|\langle x \rangle^{-\delta} \langle b \rangle f_0\|_{\mathcal{H}} &\leq c \left(\|\langle a_\chi \rangle^{-\delta} b f_0\|_{\mathcal{H}} + \|\langle x \rangle^{-\delta} f_0\|_{\mathcal{H}} \right), \\ \|\langle a_\chi \rangle^\delta b g_0\|_{\mathcal{H}} &\leq c \left(\|\langle x \rangle^\delta \langle b \rangle g_0\|_{\mathcal{H}} + \|\langle x \rangle^\delta g_0\|_{\mathcal{H}} \right), \\ \|\langle x \rangle^{-\delta} f_i\|_{\mathcal{H}} &\leq c \|\langle a_\chi \rangle^{-\delta} f_i\|_{\mathcal{H}}, \quad i = 0, 1, \\ \|\langle a_\chi \rangle^\delta g_i\|_{\mathcal{H}} &\leq c \|\langle x \rangle^\delta g_i\|_{\mathcal{H}}, \quad i = 0, 1. \end{aligned}$$

Therefore we deduce from (9.2), (9.3) that

$$(9.5) \quad \begin{aligned} &\|\langle x \rangle^{-\delta} \langle b \rangle f_0\|_{\mathcal{H}} + \|\langle x \rangle^{-\delta} f_0\|_{\mathcal{H}} + \|\langle x \rangle^{-\delta} f_1\|_{\mathcal{H}} \\ &\leq c \left(\|\langle x \rangle^\delta \langle b \rangle g_0\|_{\mathcal{H}} + \|\langle x \rangle^\delta g_0\|_{\mathcal{H}} + \|\langle x \rangle^\delta g_1\|_{\mathcal{H}} \right), \quad z \in J. \end{aligned}$$

We use now (M3) (ii) which implies that:

$$\begin{aligned} \|\langle b \rangle \langle x \rangle^{-\delta} f_0\|_{\mathcal{H}} &\leq \|\langle x \rangle^{-\delta} \langle b \rangle f_0\|_{\mathcal{H}} + \|\langle x \rangle^{-\delta} f_0\|_{\mathcal{H}}, \\ \|\langle x \rangle^\delta \langle b \rangle g_0\|_{\mathcal{H}} &\leq \|\langle b \rangle \langle x \rangle^\delta g_0\|_{\mathcal{H}}. \end{aligned}$$

Therefore (9.5) yields:

$$(9.6) \quad \|\langle b \rangle \langle x \rangle^{-\delta} f_0\|_{\mathcal{H}} + \|\langle x \rangle^{-\delta} f_1\|_{\mathcal{H}} \leq c \left(\|\langle b \rangle \langle x \rangle^\delta g_0\|_{\mathcal{H}} + \|\langle x \rangle^\delta g_1\|_{\mathcal{H}} \right), \quad z \in J.$$

Since $\langle b \rangle^2 \simeq \langle \epsilon \rangle^2$, this completes the proof of the theorem. \square

9.2. Weighted estimates for quadratic pencils. In this subsection we consider weighted estimates for $p(z)^{-1}$. It is natural to introduce the following assumption on k and the reference weight $\langle x \rangle$:

$$(M4) \quad \langle x \rangle^\delta k \langle x \rangle^{-\delta} \langle h \rangle^{-\frac{1}{2}} \in B(\mathcal{H}), \quad \text{for } |\delta| \leq 1.$$

Note that (M4) follows from (E2) if k and $\langle x \rangle$ commute, which will be the case in the applications in Sect. 12.

Proposition 9.3. *Assume (E), (M4) and let $I \subset \mathbb{R}$ a compact interval with $0 \notin I$, and $0 < \delta \leq 1$. Then the following are equivalent:*

- (1) $\sup_{\operatorname{Re} z \in I, 0 < |\operatorname{Im} z| \leq \epsilon_0} \|(\langle x \rangle^{-\delta})_{\operatorname{diag}} (H - z)^{-1} (\langle x \rangle^{-\delta})_{\operatorname{diag}}\|_{B(\mathcal{E})} < \infty,$
- (2) $\sup_{\operatorname{Re} z \in I, 0 < |\operatorname{Im} z| \leq \epsilon_0} \|\langle h \rangle^{\frac{1}{2}} \langle x \rangle^{-\delta} p(z)^{-1} \langle x \rangle^{-\delta}\|_{B(\mathcal{H})} < \infty.$

Proof. The proof is an easy computation, using formula (5.4), the identity $p(z)^{-1} h = \mathbb{1} + p(z)^{-1} z(z - 2k)$ and the fact that $\langle x \rangle^\delta (z - 2k) \langle x \rangle^{-\delta} \langle h \rangle^{-\frac{1}{2}}$ is bounded, by (M4). The details are left to the reader. \square

9.3. Limiting absorption principle in charge space. From Prop. 9.3 we easily get from Thm. 9.2 similar resolvent estimates for $(K - z)^{-1}$ on the charge space \mathcal{F} .

Theorem 9.4. *Assume (E), (A1), (A2), (A3), (M). Let $I \subset \mathbb{R}$ an interval as in Thm. 9.1. Then there exists $\epsilon_0 > 0$ such that for $\frac{1}{2} < \delta \leq 1$ one has:*

$$\sup_{\operatorname{Re} z \in I, 0 < |\operatorname{Im} z| \leq \epsilon_0} \|(\langle x \rangle^{-\delta})_{\operatorname{diag}}(K - z)^{-1}(\langle x \rangle^{-\delta})_{\operatorname{diag}}\|_{B(\mathcal{F})} < \infty.$$

Proof. We use formula (6.7) to express $(K - z)^{-1}$. We see that the estimate in the theorem holds iff

$$\sup_{\operatorname{Re} z \in I, 0 < |\operatorname{Im} z| \leq \epsilon_0} \|M_i(z)\|_{B(\mathcal{H})} < \infty, \quad i = 1, \dots, 4,$$

for

$$\begin{aligned} M_1(z) &= \langle h \rangle^{\frac{1}{4}} \langle x \rangle^{-\delta} p(z)^{-1} (k - z) \langle x \rangle^{-\delta} \langle h \rangle^{-\frac{1}{4}}, \\ M_2(z) &= \langle h \rangle^{\frac{1}{4}} \langle x \rangle^{-\delta} p(z)^{-1} \langle x \rangle^{-\delta} \langle h \rangle^{\frac{1}{4}}, \\ M_3(z) &= \langle h \rangle^{-\frac{1}{4}} \langle x \rangle^{-\delta} (\mathbb{1} + (k - z)p(z)^{-1}(k - z)) \langle x \rangle^{-\delta} \langle h \rangle^{-\frac{1}{4}}, \\ M_4(z) &= \langle h \rangle^{-\frac{1}{4}} \langle x \rangle^{-\delta} (k - z)p(z)^{-1} \langle x \rangle^{-\delta} \langle h \rangle^{-\frac{1}{4}}. \end{aligned}$$

Using (M4), duality and interpolation, we see that $\langle h \rangle^{-\frac{1}{4}} \langle x \rangle^{-\delta} (k - z) \langle x \rangle^{\delta} \langle h \rangle^{-\frac{1}{4}}$ is bounded. Therefore the estimate for $M_2(z)$ implies the others. By Thm. 9.2 and Prop. 9.3 we know that

$$\sup_{\operatorname{Re} z \in I, 0 < |\operatorname{Im} z| \leq \epsilon_0} \|\langle h \rangle^{\frac{1}{2}} \langle x \rangle^{-\delta} p(z)^{-1} \langle x \rangle^{-\delta}\|_{B(\mathcal{H})} < \infty.$$

Using duality, the fact that $p(z)^* = p(\bar{z})$ and interpolation, this implies the estimate for $M_2(z)$. This completes the proof of the theorem. \square

10. EXISTENCE OF THE DYNAMICS

In this section we discuss the existence of the dynamics generated by the operators H, K considered in Sects. 5, 6, 7. Note that this not a completely trivial point, since we do not know a priori if these operators are generators of C_0 -groups.

We will assume in this section conditions (E).

10.1. Existence of the dynamics for H . If $m > 0$ then $H = \dot{H}$ which is even-definitizable, hence we can define the C_0 -group e^{itH} , by Subsect. 3.5.

If $m = 0$ we use now Prop. 7.2 instead of Thm. 3.17. Using the bounded projection $\mathbb{1}_{\mathcal{E}_{\text{pp}}^{\mathbb{C}}}(H)$ (see the proof of Prop. 7.2), we split \mathcal{E} into the direct sum

$$\mathcal{E} = \mathcal{E}_{\text{pp}}^{\mathbb{C}}(H) \oplus \mathcal{E}_1(H),$$

both spaces being closed and H -invariant, the first one finite-dimensional. We argue as in Subsect. 3.5 to construct $e^{itH}|_{\mathcal{E}_1(H)}$. Thus there exist $C, \lambda > 0, n \in \mathbb{N}$ such that

$$(10.1) \quad \|(e^{itH})|_{\mathcal{E}_{\text{pp}}^{\mathbb{C}}(H)}\| \leq Ce^{\lambda|t|}, \quad \|(e^{itH})|_{\mathcal{E}_1(H)}\| \leq C|t|^n, \quad t \in \mathbb{R}.$$

10.2. Existence of the dynamics for K . We start with a useful observation which is further developed in [GGH1]. Note that the sesquilinear form q defined in (6.3) is defined on $\mathcal{E} \times \mathcal{E}^*$ and turns $(\mathcal{E}, \mathcal{E}^*)$ into a dual pair. Since Φ defined in (6.5) preserves \mathcal{E} and \mathcal{E}^* by Lemma 6.3, the same is true of the sesquilinear form q' defined in (6.8), (which is equal to q transported by Φ).

We check immediately that e^{itH} is unitary for q' on \mathcal{E} . Therefore by duality e^{itH} extends as a C_0 -group on \mathcal{E}^* , satisfying (10.1). Since $\mathcal{F} = [\mathcal{E}, \mathcal{E}^*]_{\frac{1}{2}}$, we obtain by interpolation that e^{itH} and hence $\Phi^{-1}e^{itH}\Phi$ extends as C_0 -groups on \mathcal{F} . Using also

Lemma 6.1 we see that the generator of the later group is K , i.e. $\Phi^{-1}e^{itH}\Phi = e^{itK}$. Therefore e^{itK} is a C_0 -group on \mathcal{F} , satisfying (10.1).

11. PROPAGATION ESTIMATES

In this section we will establish propagation estimates for $e^{it\dot{H}}$, e^{itH} and e^{itK} . We will need the following assumption:

(M5) $D(\langle x \rangle) \cap D(b^2)$ is dense in $D(b^2)$, $e^{is\langle x \rangle}$ sends $D(b^2)$ into itself, and $[\langle x \rangle, b^2]$ extends to a bounded operator from $D(b^2)$ to \mathcal{H} which we denote $[\langle x \rangle, b^2]_0$.

Note that (M5) implies (see [ABG, Prop. 3.2.5]):

$$(11.2) \quad \sup_{0 \leq s \leq 1} \|b^2 e^{is\langle x \rangle} u\| < \infty$$

for all $u \in D(b^2)$.

We assume (E), (A), (M1), (M2), (M3), (M5) in the following. We also suppose that $[k_i, \langle x \rangle] = 0$ for $i = 1, 2$ which implies in particular (M4).

Lemma 11.1. *If $z \in \rho(h, k)$ and $0 \leq \delta \leq 1$ then $p^{-1}(z)$ sends $D(\langle x \rangle^\delta)$ into itself.*

Proof. We first show $p^{-1}(z)$ sends $D(\langle x \rangle)$ into itself. Let $u \in D(\langle x \rangle)$. We have to show that

$$\sup_{|t| \leq 1} \left\| \frac{e^{it\langle x \rangle} - 1}{t} p^{-1}(z) u \right\| < \infty.$$

We write

$$\frac{e^{it\langle x \rangle} - 1}{t} p^{-1}(z) u = p^{-1}(z) \frac{e^{it\langle x \rangle} - 1}{t} u + e^{it\langle x \rangle} \frac{p^{-1}(z) - e^{-it\langle x \rangle} p^{-1}(z)}{t} e^{it\langle x \rangle} u.$$

Clearly

$$\sup_{|t| \leq 1} \left\| p^{-1}(z) \frac{e^{it\langle x \rangle} - 1}{t} u \right\| < \infty.$$

Let us now consider the second term. We have

$$\frac{p^{-1}(z) - e^{-it\langle x \rangle} p^{-1}(z)}{t} e^{it\langle x \rangle} u = e^{-it\langle x \rangle} p^{-1}(z) e^{it\langle x \rangle} \frac{e^{-it\langle x \rangle} b^2 e^{it\langle x \rangle} - b^2}{t} p^{-1}(z) u,$$

where we have used that $e^{is\langle x \rangle}$ sends $D(b^2)$ into itself. Now note that

$$\frac{e^{-it\langle x \rangle} b^2 e^{it\langle x \rangle} - b^2}{t} = \frac{1}{t} \int_0^t e^{-i\theta\langle x \rangle} [\langle x \rangle, b^2]_0 e^{i\theta\langle x \rangle} d\theta.$$

It follows using (11.2) that:

$$\sup_{|t| \leq 1} \left\| e^{-it\langle x \rangle} p^{-1}(z) e^{it\langle x \rangle} \frac{e^{-it\langle x \rangle} b^2 e^{it\langle x \rangle} - b^2}{t} p^{-1}(z) u \right\| < \infty$$

and thus the lemma for $\delta = 1$. The lemma for $\delta = 0$ is obvious, the general case follows by interpolation. \square

Corollary 11.2. *For all $0 \leq \delta \leq 1$ and $\chi \in C_0^\infty(\mathbb{R})$ the operators $\langle x \rangle^\delta \chi(H) \langle x \rangle^{-\delta}$ and $\langle x \rangle^\delta \chi(K) \langle x \rangle^{-\delta}$ are bounded.*

Proof. By an interpolation argument it is sufficient to consider the case $\delta = 1$. Using (5.4) and the fact that $[\langle x \rangle, k] = 0$ we see that for $z \in \rho(h, k)$ we have

$$\langle x \rangle (H - z)^{-1} \langle x \rangle^{-1} = \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix} + \langle x \rangle p^{-1}(z) \langle x \rangle^{-1} \begin{pmatrix} z - 2k & 1 \\ -z(2k - z) & z \end{pmatrix}.$$

By the definition of the smooth functional calculus for H it is sufficient to show that $\langle x \rangle p^{-1}(z) \langle x \rangle^{-1}$, which is bounded on \mathcal{H} by Lemma 11.1, fulfills suitable resolvent estimates. Using Lemma 11.1 we can write the commutator

$$[\langle x \rangle, p^{-1}(z)] = p^{-1}(z) \langle h \rangle^{\frac{1}{2}} \langle h \rangle^{-\frac{1}{2}} [b^2, \langle x \rangle]_0 p^{-1}(z).$$

It is now sufficient to apply Corollary 5.11 to obtain the required estimates. By duality $\langle x \rangle^\delta \chi(H) \langle x \rangle^{-\delta}$ is bounded on \mathcal{E}^* and thus on \mathcal{F} by complex interpolation. To obtain the result for K we use that

$$\chi(K) = \Phi^{-1} \chi(H) \Phi,$$

that Φ commutes with $\langle x \rangle$ and that Φ, Φ^{-1} are continuous on \mathcal{F} . \square

Proposition 11.3. *Let $I \subset \mathbb{R}$ an interval as in Thm. 9.1 and $\chi \in C_0^\infty, \text{supp} \chi \subset I$. Let $\frac{1}{2} < \delta \leq 1$. Then there exists $C > 0$ such that:*

$$(11.3) \quad \int_{\mathbb{R}} \|\langle x \rangle^{-\delta} e^{itH} \chi(H) \langle x \rangle^{-\delta} f\|_{\mathcal{E}}^2 dt \leq C \|f\|_{\mathcal{E}}^2,$$

$$(11.4) \quad \int_{\mathbb{R}} \|\langle x \rangle^{-\delta} e^{itK} \chi(K) \langle x \rangle^{-\delta} f\|_{\mathcal{F}}^2 dt \leq C \|f\|_{\mathcal{F}}^2$$

Proof. We first prove (11.3). Note that by Theorem 9.2 there exists $\epsilon_0 > 0$ such that one has:

$$\sup_{0 < |\text{Im} z| \leq \epsilon_0} \|(\langle x \rangle^{-\delta})_{\text{diag}} (H - z)^{-1} \chi(z) (\langle x \rangle^{-\delta})_{\text{diag}}\|_{B(\mathcal{E})} < \infty.$$

We now have to show that we can replace $\chi(z)$ by $\chi(H)$. We choose $\tilde{\chi} \in C_0^\infty(I)$ with $\tilde{\chi}\chi = \chi$. We write :

$$(11.5) \quad \begin{aligned} \|\langle x \rangle^{-\delta} (H - z)^{-1} \chi(H) \langle x \rangle^{-\delta} f\|_{B(\mathcal{E})}^2 &\leq C \|\langle x \rangle^{-\delta} (H - z)^{-1} \tilde{\chi}(z) \chi(H) \langle x \rangle^{-\delta} f\|_{B(\mathcal{E})}^2 \\ &+ C \|\langle x \rangle^{-\delta} (H - z)^{-1} (1 - \tilde{\chi}(z)) \chi(H) \langle x \rangle^{-\delta} f\|_{B(\mathcal{E})}^2. \end{aligned}$$

The estimate for the first term follows from the estimate with $\chi(z)$ and Corollary 11.2. Let us treat the second term. We claim

$$\|\langle x \rangle^{-\delta} (H - (\lambda + i\epsilon))^{-1} (1 - \tilde{\chi}(\lambda)) \chi(H) \langle x \rangle^{-\delta} f\|_{B(\mathcal{E})}^2 \leq C \langle \lambda \rangle^{-2},$$

uniformly in ϵ . Let

$$f_\lambda^\epsilon(x) = \langle \lambda \rangle \frac{1}{x - (\lambda + i\epsilon)} (1 - \tilde{\chi}(\lambda)) \chi(x).$$

It is sufficient to show that all the semi-norms $\|f_\lambda^\epsilon\|_m$ are uniformly bounded with respect to λ, ϵ . Note that $g_\lambda(x) = (1 - \tilde{\chi}(\lambda)) \chi(x)$ vanishes to all orders at $x = \lambda$. If $\text{supp} \chi \subset [-C, C]$ this is enough to assure that $\|f_\lambda^\epsilon\|_m$ is uniformly bounded in $\lambda \in [-2C, 2C]$ and $\epsilon > 0$. For $|\lambda| \geq 2C$ we observe that

$$\left| \langle \lambda \rangle \frac{1}{x - (\lambda + i\epsilon)} \right| \leq C$$

with analogous estimates for the derivatives. Thus the second term in (11.5) is also uniformly bounded in $0 < |\text{Im} z| \leq \epsilon_0$.

We now write :

$$((H - (\lambda + i\epsilon))^{-1} - (H - (\lambda - i\epsilon))^{-1}) \chi(H) f = i \int_{-\infty}^{\infty} e^{-\epsilon|t|} e^{i\lambda t} e^{-iHt} \chi(H) f dt,$$

the integral being norm convergent by (10.1). By Plancherel's formula this yields:

$$\begin{aligned} &\int_{-\infty}^{\infty} \|\langle x \rangle^{-\delta} ((H - (\lambda + i\epsilon))^{-1} - (H - (\lambda - i\epsilon))^{-1}) \chi(H) \langle x \rangle^{-\delta} f\|_{\mathcal{E}}^2 d\lambda \\ &= \int_{-\infty}^{\infty} e^{-2\epsilon|t|} \|\langle x \rangle^{-\delta} e^{-itH} \chi(H) \langle x \rangle^{-\delta} f\|_{\mathcal{E}}^2 dt. \end{aligned}$$

The lhs of this equation is uniformly bounded in ϵ with ϵ small enough, which implies (11.3).

Let us now prove (11.4). First note that by duality we can replace $B(\mathcal{E})$ by $B(\mathcal{E}^*)$ in (11.3). This gives (11.4) with K replaced by H by complex interpolation. We then use that

$$e^{itK}\chi(K) = \Phi^{-1}e^{itH}\chi(H)\Phi,$$

that $\langle x \rangle^{-\delta}$ commutes with Φ and that Φ, Φ^{-1} are bounded operators on \mathcal{F} . \square

12. EXAMPLES

In this section we describe examples of Klein-Gordon equations to which the abstract results of Sects. 7, 8 and 9 can be applied.

Let us first discuss how to check the abstract hypotheses (E). If $\inf \sigma_{\text{ess}}(h) > 0$ the only delicate condition is (E1). In fact in this case (E1) implies (E2) and also that $0 \notin \sigma(h)$. Therefore $|h| \sim \langle h \rangle$. It follows that if $\epsilon \geq 0$ is a self-adjoint operator such that $\text{Dom } h = \text{Dom } \epsilon^2$ we have $|h| \sim \langle h \rangle \sim \langle \epsilon \rangle^2$ and hence in condition (E3) we can replace $|h|^{-\frac{1}{2}}$ by $\langle \epsilon \rangle^{-1}$.

Similarly if b is an operator such that (A1) holds, we have $b^2 \sim \langle \epsilon \rangle^2$ and in conditions (A2), (A3), (A4) we can replace b^{-1} and $\langle b \rangle^{-1}$ by $\langle \epsilon \rangle^{-1}$.

If $\inf \sigma_{\text{ess}}(h) = 0$ then both (E1) and (E2) are important. Moreover it is again important to find a self-adjoint operator $\epsilon \geq 0$ such that $|h| \sim \epsilon^2$. An abstract result allowing to do this is given in the following proposition.

Proposition 12.1. *Let $\epsilon \geq 0$ be a self-adjoint operator on \mathcal{H} and r_1, r_2 two symmetric operators on $\text{Dom } \epsilon$ such that*

$$\text{Ker } \epsilon = \{0\}, \quad \|r_1\epsilon^{-1}\| < 1, \quad r_2\epsilon^{-1} \in B_\infty(\mathcal{H}).$$

If $h = \epsilon^2 - r_1^2 - r_2^2$ as an identity in $B(\langle \epsilon \rangle^{-1}\mathcal{H}, \langle \epsilon \rangle\mathcal{H})$ and $\text{Ker } h = \{0\}$, then

$$(12.1) \quad \begin{cases} (1) & \text{Tr} \mathbb{1}_{]-\infty, 0]}(h) < \infty, \\ (2) & |h| \sim \epsilon^2. \end{cases}$$

The proof will be given in Subsect. A.2.

12.1. Charged Klein-Gordon equations on scattering manifolds. Let \mathcal{N} be a smooth, $d-1$ dimensional compact manifold whose elements are denoted by ω . We consider a d dimensional manifold:

$$\mathcal{M} \simeq \mathcal{M}_0 \cup]1, +\infty[\times \mathcal{N},$$

where $\mathcal{M}_0 \Subset \mathcal{M}$ is relatively compact. For $m \in \mathbb{R}$ we denote by $S^m(\mathcal{M})$ the space of real valued functions $f \in C^\infty(\mathcal{M})$ such that

$$\forall k \in \mathbb{N}, \alpha \in \mathbb{N}^{d-1}, \quad |\partial_s^k \partial_\omega^\alpha f(s, \omega)| \leq C_{k, \alpha} s^{m-k} \quad \text{for } (s, \omega) \in]1, \infty[\times \mathcal{N}.$$

Definition 12.2. *A Riemannian metric g^0 on \mathcal{M} is called conic if there exists $R > 0$ and a Riemannian metric h on \mathcal{N} such that*

$$g^0 = ds^2 + s^2 h_{jk}(\omega) d\omega^j d\omega^k, \quad (s, \omega) \in [R, \infty[\times \mathcal{N}.$$

A Riemannian metric g on \mathcal{M} is called a scattering metric if $g = g^0 + \tilde{g}$, where g^0 is a conic metric and \tilde{g} is of the form

$$\tilde{g} = m^0(s, \omega) ds^2 + sm_j^1(s, \omega)(ds d\omega^j + d\omega^j ds) + s^2 m_{jk}^2(s, \omega) d\omega^j d\omega^k$$

with $m^l \in S^{-\mu_l}(\mathcal{M})$ for $l = 0, 1, 2$, $\mu_l > 0$.

We will assume in the sequel that g is a scattering metric on \mathcal{M} in the sense of the above definition. We consider a charged Klein-Gordon field ϕ on \mathcal{M} minimally coupled to an external electromagnetic field described by the electric potential $v(s, \omega)$ and the magnetic potential $A_k(s, \omega)dx^k$. It fulfills the Klein-Gordon equation:

$$(12.2) \quad (\partial_t - iv)^2 \phi - (\nabla^k - iA^k)(\nabla_k - iA_k)\phi + m^2 \phi = 0.$$

Here ∇ is the Levi-Civita connection associated to the metric g . The function $m(s, \omega)$ on \mathcal{M} corresponds to a variable mass term. The above equation writes in local coordinates:

$$(\partial_t - iv)^2 \phi - |g|^{-1/2}(\partial_j - iA_j)|g|^{1/2}g^{jk}(\partial_k - iA_k)\phi + m^2(s, \omega)\phi = 0,$$

where $g^{jk} = (g_{jk})^{-1}$, $|g| = \det(g_{jk})$. We denote by $dv = |g|^{1/2}dsd\omega$ the Riemannian volume element on (\mathcal{M}, g) . Putting $\psi = |g|^{1/4}\phi$ we see that ψ solves

$$(\partial_t - iv)^2 \psi - |g|^{-1/4}(\partial_j - iA_j)|g|^{1/2}g^{jk}(\partial_k - iA_k)|g|^{-1/4}\psi + m^2(s, \omega)\psi = 0,$$

which is the equation we will consider.

Remark 12.3. The equation (12.2) can be seen as a Klein-Gordon equation on the lorentzian manifold $\mathbb{R} \times \mathcal{M}$ with metric $dt^2 - g$. Our results easily generalize to the metric $c(s, \omega)dt^2 - g$ where $0 < c_1 \leq c(s, \omega) \leq c_1^{-1}$ is a smooth function tending to 1 at infinity. The generalization reduces to a simple change of unknown function, see [GHPS, Sect. 2.1] for details.

We set

$$(12.3) \quad h_0 := -g^{-1/4}(\partial_j - iA_j)g^{1/2}g^{jk}(\partial_k - iA_k)g^{-1/4} + m^2(s, \omega)$$

acting on $\mathcal{H} = L^2(\mathcal{M}; dsd\omega)$, equipped with its canonical scalar product. Let also

$$p = -g^{-1/4}\partial_j g^{1/2}g^{jk}\partial_k g^{-1/4}.$$

We assume that:

$$(12.4) \quad \begin{cases} A_j(s, \omega), m(s, \omega) - m_\infty \in S^{-\mu_0}(\mathcal{M}) \\ \text{for some } \mu_0 > 0, m_\infty := \lim_{s \rightarrow \infty} m(s, \omega) \geq 0. \end{cases}$$

The operator k is assumed to be a multiplication operator $k = v(s, \omega)$ with:

$$(12.5) \quad \begin{cases} v(s, \omega) = v_1(s, \omega) + v_s(s, \omega), v_1(s, \omega) \in S^{-\mu_0}(\mathcal{M}), \\ v_s(s, \omega)\langle p \rangle^{-1/2} \in B_\infty(\mathcal{H}), \langle s \rangle^2 v_s(s, \omega)\langle p \rangle^{-1/2} \in B(\mathcal{H}). \end{cases}$$

It follows that $h = h_0 - k^2$ is self-adjoint and bounded below with $\langle h \rangle \sim \langle h_0 \rangle$ and $\sigma_{\text{ess}}(h) = [m_\infty^2, +\infty[$.

As scalar conjugate operator we choose as usual the generator of dilations:

$$a = \frac{1}{2}(\eta(s)sD_s + D_s s\eta(s)),$$

where $\eta \in C^\infty(\mathbb{R}, \mathbb{R}^+)$ with $\eta(s) = 1$ for $s \geq 2$ and $\eta(s) = 0$ for $s \leq 1$. As reference weight we choose:

$$\langle x \rangle = (s^2 + 1)^{\frac{1}{2}}.$$

12.1.1. *Massive case.* In this subsection we consider massive Klein-Gordon equations i.e. $m = \inf \sigma(h) \cap \mathbb{R}^+ > 0$. This implies that $m_\infty > 0$.

Proposition 12.4. *Assume (12.4), (12.5), $m_\infty > 0$ and $\text{Ker}h = \{0\}$. Then*

- (1) *conditions (E), (A), (M) are satisfied;*
- (2) *one has $\tau(b) = \{m_\infty\}$.*

Proof. To check (E) we use Prop. 12.1 with $\epsilon = h_0^{\frac{1}{2}}$, $r_1 = \mathbb{1}_{\{|x| \geq R\}}v$, $r_2 = \mathbb{1}_{\{|x| \leq R\}}v$. Clearly $r_2\epsilon^{-1} \in B_\infty(\mathcal{H})$, and since $s\text{-}\lim_{R \rightarrow \infty} \mathbb{1}_{\{|x| \geq R\}} = 0$, we deduce from (12.5) that $\|r_1\epsilon^{-1}\| < 1$ for R large enough. Moreover $|h| \sim h_0 \sim D_s^2 - \frac{1}{s^2}\Delta_{\mathcal{N}} + \mathbb{1}$.

To check (A) we use Lemma 7.10. We fix smooth cutoff functions $F_0, F_\infty \in C^\infty(\mathbb{R})$ with

$$(12.6) \quad \text{supp}F_0 \subset [-2, 2], \quad F_0 \equiv 1 \text{ in } [-1, 1], \quad F_0 + F_\infty = 1.$$

We split k as $k_1 + k_2$ with

$$k_1 = F_\infty(R^{-1}s)v_1, \quad k_2 = v_s + F_0(R^{-1}s)v_1.$$

Since $F_0(R^{-1}|x|)v_1$ satisfies the same conditions as v_s we can assume that $k_2 = v_s$ in the sequel. As before for $R \gg 1$ we have $\|k_1\epsilon^{-1}\| < 1$, $k_1\langle \epsilon \rangle^{-1}, k_2\epsilon^{-1} \in B_\infty(\mathcal{H})$. By Lemma 7.10 conditions (A) are satisfied for $b = (\epsilon^2 - k_1^2)^{\frac{1}{2}}$ and $r = k_2^2 + 2k_1k_2$. (M1) is clearly satisfied. To check (M2) we apply Lemma 8.4 and check (M2') instead. It is a standard fact that $\text{ad}_{a_\chi}^\alpha(k_1\langle b \rangle^{-1}) \in B(\mathcal{H})$ (one may for example use pseudo-differential calculus on scattering manifolds, see e.g. [Me, Chapter 6.3] for an overview of this calculus). Therefore $k_1\langle b \rangle^{-1} \in C^2(a_\chi; \mathcal{H})$. Since $0 \notin \sigma(b)$ we also see that $k_1b^{-1} \in C^2(a_\chi; \mathcal{H})$.

The same type of argument shows that

$$(12.7) \quad a_\chi\langle s \rangle^{-1}\langle p \rangle^{-1/2}, \quad a_\chi^2\langle s \rangle^{-2}\langle p \rangle^{-1/2} \in B(\mathcal{H}).$$

This implies that $\text{ad}_{a_\chi}^\alpha(k_2b^{-1}) \in B(\mathcal{H})$ using (12.5), by undoing the commutators with k_2 , and using that $0 \notin \sigma(b)$. Therefore $k_2b^{-1} \in C^2(a_\chi; \mathcal{H})$. Since we saw that $k_1b^{-1} \in C^2(a_\chi; \mathcal{H})$ this also implies by [ABG, Prop. 5.2.3] that $b^{-1}k_1k_2b^{-1} \in C^2(a_\chi; \mathcal{H})$. Hence (M2') is satisfied.

The fact that condition (M3) is satisfied is also a standard result (one can either use pseudo-differential calculus or express $\langle b \rangle$ via almost-analytic extensions). (M4) follows from (A2) since k and $\langle s \rangle$ commute. (M5) follows from the pseudo-differential calculus on scattering manifolds.

The fact that $\tau(b^2) = m_\infty^2$ follows from [It, Theorem 1]. This proves (2). \square

From Prop. 12.4 and Prop. 7.4 we see that

$$\sigma_{\text{ess}}(H) = \sigma_{\text{ess}}(\dot{H}) =]-\infty, -m_\infty] \cup [m_\infty, +\infty[.$$

12.1.2. *Massless case.* We consider h_0 as in (12.3) satisfying (12.4) but assume now that $\inf \sigma(h_0) = 0$. This is of course equivalent to $m_\infty = 0$.

We assume $d \geq 3$, because the Hardy inequality on (\mathcal{M}, g) will play an important role. Instead of (12.5) we assume for $k = v$ that

$$(12.8) \quad \begin{cases} v(s, \omega) = v_l(s, \omega) + v_s(s, \omega), \\ \exists R_0 > 1, \quad 0 \leq \delta < 1 \text{ such that } |v_l(s, \omega)| \leq \delta \frac{d-2}{2} \langle s \rangle^{-1}, \text{ for } s \geq R_0, \\ sv_s\langle p \rangle^{-1/2} \in B_\infty(\mathcal{H}), \quad s^3v_s\langle p \rangle^{-1/2} \in B(\mathcal{H}). \end{cases}$$

Note that compared to (12.5) we require an extra power of s in the assumptions on v_2 , which is needed to control the $|h|^{-\frac{1}{2}}$ or b^{-1} term arising in (A) and (M), thanks to the Hardy inequality. As before $h = h_0 - k^2$ is self-adjoint with domain $H^2(M)$, bounded below, $\langle h \rangle \sim \langle h_0 \rangle$ and $\sigma_{\text{ess}}(h) = [0, +\infty[$. The operators a and $\langle x \rangle$ are as in the previous subsection.

We have the following analog of Prop. 12.4, whose proof however is more involved and relies on estimates proved in Subsect. A.1.

Proposition 12.5. *Assume (12.3), (12.4) with $m_\infty = 0$, (12.8), $\text{Ker } h = \{0\}$ and $d \geq 3$. Then:*

- (1) *conditions (E), (A), (M) are satisfied;*

(2) one has $\tau(b) = \{0\}$.

Proof. To check (E) we use again Prop. 12.1, with ϵ , r_1 , r_2 as in the proof of Prop. 12.4. We first claim that $v_s \epsilon^{-1}$ is compact. We use

$$(12.9) \quad \epsilon^{-1} = \langle \epsilon \rangle^{-1} + \langle \epsilon \rangle^{-1} \epsilon^{-1} (\langle \epsilon \rangle - \epsilon).$$

The term $v_s (\epsilon + 1)^{-1}$ is compact by (12.8), so it suffices to prove that $v_s \langle \epsilon \rangle^{-1} \epsilon^{-1}$ is compact. We have

$$v_s \langle \epsilon \rangle^{-1} \epsilon^{-1} = (v_s \langle s \rangle \langle \epsilon \rangle^{-1}) \times (\langle \epsilon \rangle \langle s \rangle^{-1} \langle \epsilon \rangle^{-1} \langle s \rangle) \times (\langle s \rangle \epsilon^{-1}).$$

The first factor is compact by (12.8). The second is seen to be bounded by commuting $\langle s \rangle^{-1}$ through $\langle \epsilon \rangle$. The third term is bounded by Prop. A.2 (1). Therefore $v_s \epsilon^{-1}$ is compact. Since $\mathbb{1}_{s \leq R} v_1$ satisfies the same estimates as v_s we see that $r_2 \epsilon^{-1} \in B_\infty(\mathcal{H})$. This also implies that $\|\mathbb{1}_{s \geq R} v_s \epsilon^{-1}\| \rightarrow 0$ when $R \rightarrow \infty$. By Prop. A.2 (2) we obtain that $\|\mathbb{1}_{|x| \geq R} v_1 \epsilon^{-1}\| < 1$ for $R \gg 1$. Therefore $\|r_1 \epsilon^{-1}\| < 1$ for $R \gg 1$. Applying Prop. 12.1 we obtain (E1), (E2). We also get that $|h| \sim \epsilon^2 \sim D_s^2 - \frac{1}{s^2} \Delta_{\mathcal{N}}$. By what we saw above, $k \epsilon^{-1}$ is bounded, hence (E3) also holds.

To check (A) we use again Lemma 7.10, with the same splitting of k as in the proof of Prop. 12.4. We already checked that the hypotheses of Lemma 7.10 hold, which proves (A)

(A3) is immediate since $k_1 \langle \epsilon \rangle^{-1} \in B_\infty(\mathcal{H})$.

(M1) and the fact that $k_1 \langle b \rangle^{-1} \in C^2(a_\chi, \mathcal{H})$ are proved as in Prop. 12.4. To prove (M2) we check the hypotheses of Lemma 8.4. To prove that $k_2 b^{-1} \in C^2(a_\chi; \mathcal{H})$ we have to check that $\text{ad}_{a_\chi}^\alpha(k_2 b^{-1})$ are bounded for $\alpha = 1, 2$. We use that:

$$\begin{aligned} & a_\chi \langle s \rangle^{-1} \langle p \rangle^{-1/2}, \langle s \rangle^{-1} \langle p \rangle^{-1/2} b^{-1} a_\chi, \langle s \rangle^{-1} b^{-1}, \\ & a_\chi a_\chi \langle s \rangle^{-2} \langle p \rangle^{-1/2}, \langle p \rangle^{-1/2} \langle s \rangle^{-2} b^{-1} a_\chi a_\chi \in B(\mathcal{H}). \end{aligned}$$

The bounds with a_χ are as in (12.7), using that $b^{-1} a_\chi = \tilde{\chi}(b^2) a_\chi(b^2)$ for $\tilde{\chi} \in C_0^\infty(\mathbb{R})$, since $0 \notin \text{supp } \chi$. The fact that $\langle x \rangle^{-1} b^{-1}$ is bounded follows from Prop. A.2 (1), using that $b^2 \simeq \epsilon^2$. Undoing the commutators and using (12.8) we obtain that $\text{ad}_{a_\chi}^\alpha(k_2 b^{-1})$ are bounded for $\alpha = 1, 2$. The same argument using that $k_1 \in O(\langle s \rangle^{-1})$ shows that $\text{ad}_{a_\chi}(b^{-1} k_1 k_2 b^{-1})$ is bounded. This completes the proof of (M2').

As in the massive case we prove that (M3), (M4) hold and that $\tau(b^2) = \{0\}$ using [It, Theorem 1]. (M5) follows from the pseudo-differential calculus on scattering manifolds. \square

As in Subsection 12.1.1 one has:

$$\sigma_{\text{ess}}(H) = \sigma_{\text{ess}}(\dot{H}) = \mathbb{R}.$$

12.1.3. Some additional remarks in the euclidean case. If $\mathcal{M} = \mathbb{R}^d$ and the metric g is asymptotically flat, then using polar coordinates we see that (\mathcal{M}, g) is a scattering manifold. In this case, using results of [KT], it is possible to exclude eigenvalues and critical points embedded in the essential spectrum.

Proposition 12.6. *Assume that $\mathcal{M} = \mathbb{R}^d$ and g is asymptotically flat. Assume moreover that $v = v_1 + v_2$ where*

$$\begin{cases} \partial_x^\alpha v_1 \in O(\langle x \rangle^{-\mu-|\alpha|}), \quad \mu > 0, \quad |\alpha| \leq 2, \\ v_2 \text{ has compact support, } v_2 \in L^d(\mathbb{R}^d). \end{cases}$$

Then $\sigma_p(H) \cup c(H) \subset [-m_\infty, m_\infty]$. If $m_\infty = 0$ and $\text{Ker } h = \{0\}$, then $\sigma_p(H) \cup c(H) = \emptyset$.

Proof. Since $\dot{\mathcal{E}}$ is a Pontryagin space, we know that critical points of H are eigenvalues. From [Ge, Prop. 3.1] we know that $\sigma_p(H) \subset [-m_\infty, m_\infty]$. Moreover $\text{Ker } h = \{0\}$ implies that $\text{Ker } H = \{0\}$. \square

12.2. Models with hyperbolic ends. We fix a smooth compact manifold \mathcal{N} , whose elements will be denoted by ω and a smooth positive density on \mathcal{N} denoted by $d\omega$. We set $\mathcal{M} := \mathbb{R} \times \mathcal{N}$, whose elements are denoted by (s, ω) and equip \mathcal{M} with the density $dsd\omega$.

In this subsection we will describe some examples of Klein-Gordon equations

$$(12.10) \quad (\partial_t - ik)^2 \phi(t) + h_0 \phi(t) = 0,$$

on the Hilbert space $\mathcal{H} = L^2(\mathcal{M}, dsd\omega)$, to which the results of Sects. 7, 8 can be applied.

Remark 12.7. All the results of this subsection extend easily to the case where the smooth manifold \mathcal{M} is equal to $\mathcal{M}_0 \cup [1, +\infty[\times \mathcal{N}$, where \mathcal{M}_0 is compact. One has to assume that the restriction of h_0 to $[1, +\infty[\times \mathcal{N}$ satisfies similar assumptions as below, and the restriction of h_0 to \mathcal{M}_0 is a second order, elliptic differential operator with smooth coefficients.

We introduce the spaces of exponentially decreasing functions:

$$(12.11) \quad T^p(\mathcal{M}) := \{f \in C^\infty(\mathcal{M}) : \partial_s^\alpha \partial_\omega^\beta f \in O(e^{p|s|})\}, \quad p \in \mathbb{R}.$$

Similarly to Subsect. 12.1.1, we set

$$S^p(\mathcal{M}) := \{f \in C^\infty(\mathcal{M}) : \partial_s^\alpha \partial_\omega^\beta f \in O(\langle s \rangle^{p-|\alpha|})\}, \quad p \in \mathbb{R}.$$

As usual a function f in $T^p(\mathcal{M})$ resp. in $S^p(\mathcal{M})$ is called *elliptic* if $f^{-1} \in T^{-p}(\mathcal{M})$ resp. $f^{-1} \in S^{-p}(\mathcal{M})$.

We fix a second order differential operator $P = P(\omega, \partial_\omega)$ on \mathcal{N} , assumed to be self-adjoint, positive on $L^2(\mathcal{N}, d\omega)$ with domain $H^2(\mathcal{N})$.

We consider an operator h_0 acting on $C_0^\infty(\mathcal{M})$ as

$$(12.12) \quad h_0 = -c_0(s, \omega) \partial_s g_0(s, \omega) \partial_s c_0(s, \omega) - c_{-\frac{1}{2}}(s, \omega) P(\omega, \partial_\omega) c_{-\frac{1}{2}}(s, \omega) + d_0(s, \omega),$$

where the coefficients $c_0, g_0, c_{-\frac{1}{2}}$ and d_0 satisfy:

$$(12.13) \quad \begin{cases} c_0, g_0 \text{ elliptic in } S^0(\mathcal{M}), \quad c_0 - 1, g_0 - 1 \in S^{-2}(\mathcal{M}), \\ c_{-\frac{1}{2}} \text{ elliptic in } T^{-\frac{1}{2}}(\mathcal{M}), \quad \langle s \rangle^{-2} (c_{-\frac{1}{2}}(s, \omega) - \tilde{c}_{-\frac{1}{2}}(s)) \in T^{-1/2}(\mathcal{M}) \\ \text{for some } \tilde{c}_{-\frac{1}{2}}(s) \text{ elliptic in } T^{-\frac{1}{2}}(\mathcal{M}), \\ d_0(s, \omega) \in S^0(\mathcal{M}), \quad d_0(s, \omega) - m_\infty^2 \in S^{-2}(\mathcal{M}), \quad m_\infty \geq 0. \end{cases}$$

We assume moreover that on $C_0^\infty(\mathbb{R})$ one has:

$$(12.14) \quad h_0 \geq m^2(s, \omega) \text{ for some } m \in S^0(\mathcal{M}), \quad m(s, \omega) > 0, \quad \forall (s, \omega) \in \mathcal{M}.$$

It is easy to see that h_0 belongs to the general class studied in [FH], [Ha1, Sect. 3.3]. Therefore h_0 is self-adjoint, bounded below with domain

$$\text{Dom } h_0 = \{u \in L^2(\mathcal{M}) : h_0 u \in L^2(\mathcal{M})\} = \text{Dom } h_{\text{sep}},$$

where

$$h_{\text{sep}} = -\partial_s^2 - \tilde{c}_{-\frac{1}{2}}(s) P(\omega, \partial_\omega) \tilde{c}_{-\frac{1}{2}}(s),$$

is separable. Moreover the inequality (12.14) still holds on $\text{Dom } h_0$. One also knows that $\sigma_{\text{ess}}(h_0) = [m_\infty^2, +\infty[$ where m_∞ is defined in (12.13).

Concerning the operator k we assume that $k = k(s, \omega)$ is a multiplication operator with:

$$(12.15) \quad k(s, \omega) \in S^{-2}(\mathcal{M}), \quad k(s, \omega) m(s, \omega)^{-1} \rightarrow 0 \text{ when } s \rightarrow \infty.$$

From [FH] we get that h_0 is self-adjoint on $\text{Dom } h_{\text{sep}}$. Since (12.14) implies $\text{Ker } h_0 = \{0\}$, we see that we are dealing with a massive Klein-Gordon equation iff $m_\infty > 0$.

We now describe the conjugate operator a , following [FH] and [Ha1]. Let us fix functions $F, \chi \in C^\infty(\mathbb{R})$, with $F', \chi' \geq 0$, $F(\lambda) = 0$ for $\lambda \leq -1$, $F(\lambda) = 1$ for $\lambda \geq -\frac{1}{2}$, $\chi(s) = 0$ for $s \leq 1$, $\chi(s) = 1$ for $s \geq 2$. We set $F_S(\lambda) = F(S^{-1}\lambda)$, $\chi_R(s) = \chi(R^{-1}s)$ for $S, R \geq 1$ and

$$\begin{aligned} X_{S,R}(s, P) &= \chi_R^2(s) F_S^2(\sigma s - \ln(P+1))(\sigma s - \ln(P+1) + 2S) \\ &\quad + \chi_R^2(-s) F_S^2(-\sigma s - \ln(P+1))(\sigma s + \ln(P+1) - 2S), \\ a_{S,R} &:= \frac{1}{2} (X_{S,R}(s, P) D_s + D_s X_{S,R}(s, P)). \end{aligned}$$

Let us summarize some properties of $h, a_{S,R}$, which can be proved as in [FH], [Ha1]:

Proposition 12.8. *Assume (12.13), (12.14) and (12.15). Then:*

- (1) $a_{S,R}$ is essentially self-adjoint on $\text{Dom}(h_{\text{sep}} + \langle s \rangle^2)$,
- (2) $\langle s \rangle^{-p} a_{S,R} \langle s \rangle^{p-1} \in B(\mathcal{H})$ for $p \in \mathbb{R}$,
- (3) $h_0 + f \in C^2(a_{S,R})$ for any $f \in S^{-2}(\mathcal{M})$,
- (4) Let $\tau(h_0 + f) := \bigcap_{S,R \geq 1} \tau(h_0 + f, a_{S,R})$ (see the beginning of Subsect. 8.3 for notation). Then $\tau(h_0 + f) = \{m_\infty^2\}$.

Remark 12.9. Note that (4) means that if $\lambda \neq m_\infty^2$, then there exist an interval I with $\lambda \in I$, parameters $S, R \geq 1$, a constant $c_0 > 0$ and $K \in B_\infty(\mathcal{H})$ such that

$$\mathbb{1}_I(h_0 + f)[h_0 + f, ia_{S,R}] \mathbb{1}_I(h_0 + f) \geq c_0 \mathbb{1}_I(h_0 + f) + K.$$

In the sequel we will forget the fact that the scalar conjugate operator $a_{S,R}$ depends on parameters S, R , and denote it simply by a .

It remains to fix the reference weight appearing in hypothesis (M3). We choose

$$\langle x \rangle := (s^2 + 1)^{\frac{1}{2}}.$$

To prove Prop. 12.11 below, we will need the following lemma, whose proof may be found in Subsect. A.4.

Lemma 12.10. *Let $f \in S^{-2}(\mathcal{M})$ such that $\epsilon^2 - f^2 =: b^2 \geq 0$. Then*

$$[\langle b \rangle, \langle s \rangle^\delta] \in B(\mathcal{H}), \quad \text{for } 0 \leq \delta \leq 1.$$

Proposition 12.11. *Assume (12.13)-(12.15) and $\text{Ker } h = \{0\}$. Then:*

- (1) conditions (E), (A), (M) are satisfied;
- (2) one has $\tau(b) = \{m_\infty\}$.

Proof. Set $\epsilon = h_0^{\frac{1}{2}}$. We first claim that

$$(12.16) \quad \begin{cases} (1) & \|\mathbb{1}_{\{|s| \geq R\}} k \epsilon^{-1}\| \rightarrow 0 \text{ when } R \rightarrow +\infty, \\ (2) & \mathbb{1}_{\{|s| \leq R\}} k \epsilon^{-1} \in B_\infty(\mathcal{H}). \end{cases}$$

In fact (1) follows from the fact that $h_0 \geq m^2(s, \omega)$ and $k(s, \omega) m(s, \omega)^{-1} \rightarrow 0$ when $s \rightarrow \infty$, using also Kato-Heinz inequality. To complete the proof of (12.16) it suffices to prove that $g(s) \epsilon^{-1} \in B_\infty(\mathcal{H})$ for $g \in C_0^\infty(\mathbb{R})$. Note that $g(s) \epsilon^{-1}$ is bounded by (12.14).

As in the proof of Prop. 12.5 it suffices using (12.9) to check that $g(s) \langle \epsilon \rangle^{-1}$ and $g(s) \langle \epsilon \rangle^{-1} \epsilon^{-1}$ are compact. The term $g(s) \langle \epsilon \rangle^{-1}$ is compact, by [FH, Lemma 1.2]. We write the second term as $\langle \epsilon \rangle^{-1} g(s) \epsilon^{-1} - [\langle \epsilon \rangle^{-1}, g(s)] \epsilon^{-1}$. The first term is again compact since $g(s) \epsilon^{-1}$ is bounded. We write the second term as

$$[\langle \epsilon \rangle^{-1}, g(s)] \epsilon^{-1} = \frac{i}{2\pi} \int_{\mathbb{C}} \frac{\partial \tilde{f}_{-\frac{1}{2}}}{\partial \bar{z}}(z) (z - \epsilon^2)^{-1} [\epsilon^2, g] \epsilon^{-1} (z - \epsilon^2)^{-1} dz \wedge d\bar{z},$$

where $\tilde{f}_{-\frac{1}{2}}$ is an almost analytic extension of $f_{-\frac{1}{2}}(\lambda) = (\lambda^2 + 1)^{-1/4}$, satisfying

$$(12.17) \quad \begin{cases} \text{supp} \tilde{f}_{-\frac{1}{2}} \subset \{z \in \mathbb{C} : |\text{Im}z| \leq C\langle \text{Re}z \rangle\}, \\ \left| \frac{\partial \tilde{f}_{-\frac{1}{2}}}{\partial \bar{z}}(z) \right| \leq C_N \langle z \rangle^{-3/2-N} |\text{Im}z|^N, \quad N \in \mathbb{N}. \end{cases}$$

Since ϵ^2 is a second order differential operator, we obtain $[\epsilon^2, g] = (\epsilon^2 + 1)B\tilde{g}(s)$ with B is compact and $\tilde{g} \in C_0^\infty(\mathbb{R})$. Therefore $(\epsilon^2 + 1)^{-1}[\epsilon^2, g]\epsilon^{-1}$ is compact. We use now the bounds

$$\|(\epsilon^2 - z)^{-1}\| \in O(|\text{Im}z|^{-1}), \quad \|(\epsilon^2 - z)^{-1}(\epsilon^2 + 1)\| \in O(\langle z \rangle |\text{Im}z|^{-1}),$$

and (12.17) to obtain that $[(\epsilon)^{-1}, g(s)]\epsilon^{-1}$ is compact. This completes the proof of (12.16). We apply then Prop. 12.1 with $r_1 = \mathbb{1}_{\{|s| \geq R\}}k$, $r_2 = \mathbb{1}_{\{|s| \leq R\}}k$. The hypotheses of Prop. 12.1 hold by (12.16), which implies (E1), (E2). Moreover $|h| \sim h_0$ and we can replace $|h|^{-\frac{1}{2}}$ by ϵ^{-1} in conditions (E3) and (A). Since by (12.16) we know that $k\epsilon^{-1} \in B(\mathcal{H})$, condition (E3) holds. To check (A) we use Lemma 7.10 and split k as $k_1 + k_2$ with

$$k_1 = F_\infty(R^{-1}|s|)v_1, \quad k_2 = v_s + F_0(R^{-1}|s|)v_1$$

for some F_0, F_∞ as in (12.6). By (12.16) $\|k_1\epsilon^{-1}\| < 1$ for $R \gg 1$, $k_2\epsilon^{-1}$ is compact. The fact that $k\langle \epsilon \rangle^{-1}$ is compact follows once again from [FH, Lemma 1.2].

Let us now check (M1), (M2'). Note first that $b^2 = \epsilon^2 - k_1^2$ is of the form $\epsilon^2 + f$ for $f \in S^{-2}(\mathcal{M})$. Moreover if $R \gg 1$ we have

$$(12.18) \quad b^2 \geq \frac{1}{2}m^2(s, \omega),$$

by (12.14). Then (M1) follows from Prop. 12.8 (3). Using Prop. 12.8 (2) and the fact that $k_1 \in S^{-2}(\mathcal{M})$, we obtain that $k_1 \in C^2(a_\chi; \mathcal{H})$ by undoing the commutators. Since $\langle b \rangle^{-1} \in C^2(a_\chi; \mathcal{H})$, this proves the first condition of (M2').

To prove the rest of (M2') we claim that $g(s)b^{-1} \in C^2(a_\chi; \mathcal{H})$ for $g \in C_0^\infty(\mathbb{R})$. Note that this implies the last two conditions of (M2'), since $k_2, k_1k_2 \in C_0^\infty(\mathbb{R})$.

If $m_\infty > 0$ this is proved by the same argument as before. If $m_\infty = 0$, i.e. we are considering the massless case, then we argue as in the proof of Lemma 12.5: we use that

$$\begin{aligned} a_\chi \langle s \rangle^{-1}, \quad \langle s \rangle b^{-1} a_\chi, \quad \langle s \rangle^n g(s) b^{-1}, \\ a_\chi a_\chi \langle s \rangle^{-2}, \quad \langle s \rangle^{-2} b^{-1} a_\chi a_\chi \in B(\mathcal{H}). \end{aligned}$$

The bounds with a_χ rely on Prop. 12.8 (2) and the fact that $b^{-1}a_\chi = \tilde{\chi}(b^2)a_\chi(b^2)$ for $\tilde{\chi} \in C_0^\infty(\mathbb{R})$ since $0 \notin \text{supp}\chi$. As before we complete the proof by undoing the commutators with $g(s)b^{-1}$.

We now prove (M3). The first condition of (M3) follows from Prop. 12.8 (2). To prove the second it suffices to prove that

$$(12.19) \quad [\langle b \rangle, \langle s \rangle^\delta] \in B(\mathcal{H}), \quad 0 \leq \delta \leq 1,$$

which has been shown in Lemma 12.10. Finally (M4) is true since k and $\langle x \rangle$ commute, and the fact that $\tau(b) = \{m_\infty\}$ follows from Prop. 12.8 (4). \square

APPENDIX A

A.1. Diamagnetic and Hardy inequalities. We start by recalling some well-known facts related to the diamagnetic inequality. We are working on the scattering manifolds introduced in Subsect. 12.1 and set

$$p = - \sum_{j,k=1}^d g^{-1/4} \partial_j g^{1/2} g^{jk} \partial_k g^{-1/4}, \quad p_A := - \sum_{j,k=1}^d g^{-1/4} (\partial_j - iA_j) g^{1/2} g^{jk} (\partial_k - iA_k) g^{-1/4}$$

where $A(s, \omega)$ satisfies (12.4). We use the notations of Subsect. 12.1.

Lemma A.1. *Let $V \in C^0(\mathbb{R}^d, \mathbb{R})$ be a bounded potential. Then:*

$$p + V \geq 0 \Rightarrow p_A + V \geq 0,$$

Proof. Let us first recall the diamagnetic inequality :

$$(A.1) \quad |e^{-t(p_A+V)}u| \leq e^{-t(p+V)}|u|, \quad u \in \mathcal{H}, \quad t \geq 0.$$

This inequality is well known on \mathbb{R}^d and also holds on scattering manifolds. Indeed it is equivalent to a certain estimate on the quadratic forms associated to the operators, which clearly also holds on scattering manifolds, see [Si] for details. Now recall that

$$(A.2) \quad a^{-\alpha} = C_\alpha \int_0^{+\infty} t^{\alpha-1} e^{-ta} dt, \quad a > 0, \alpha > 0,$$

where C_α is a positive constant. Using (A.2) for $\alpha = 1$ we obtain

$$(u|p_A + V + \delta)^{-1}u \leq (|u|(p + V + \delta)^{-1}|u|) \leq \delta^{-1}\|u\|^2,$$

which by Kato-Heinz inequality implies that $p_A + V + \delta \geq \delta$, which proves the lemma. \square

We now prove some estimates related to Hardy's inequality on the scattering manifold (\mathcal{M}, g) considered in Subsect. 12.1.

Let g^0 be a conic metric as in Def. 12.2, restricted to $\mathcal{M}_\infty =]1, +\infty[\times \mathcal{N}$. The corresponding Laplace-Beltrami operator is

$$-\Delta_{g^0} = -s^{(1-d)}\partial_s s^{d-1}\partial_s - \Delta_h,$$

which is self-adjoint on $L^2(\mathcal{M}_\infty, s^{d-1}|h|^{\frac{1}{2}}dsd\omega)$. The usual proof on \mathbb{R}^d , which relies on the identity $s^{-2} = -\frac{1}{2}s\partial_s(s^{-2})$ for $s = |x|$, yields for $u \in C_0^\infty(\mathcal{M}_\infty)$:

$$(A.3) \quad \left(\frac{d-2}{2}\right)^2 \int_{\mathcal{M}_\infty} s^{-2}|u|^2 s^{d-1}|h|^{\frac{1}{2}}dsd\omega \leq - \int_{\mathcal{M}_\infty} \bar{u}\Delta_{g^0}us^{d-1}|h|^{\frac{1}{2}}dsd\omega,$$

where $-\Delta_h$ is the Laplace-Beltrami operator on (\mathcal{N}, h) . Using the unitary map:

$$T : L^2(\mathcal{M}, |g|^{\frac{1}{2}}dsd\omega) \ni u \mapsto |g|^{1/4}u \in L^2(\mathcal{M}, dsd\omega),$$

this immediately implies that ([VaWu, Prop. 3.4]) :

$$(A.4) \quad s^{-2} \leq Cp, \quad C > 0, \quad \text{on } \mathcal{H} = L^2(\mathcal{M}, dsd\omega).$$

Proposition A.2. *Assume (12.4) and $d \geq 3$. Then:*

- (1) $p_A \geq C\langle s \rangle^{-2}$,
- (2) *if in addition $v_l(x)$ satisfies (12.8) then*

$$(1 + \alpha)^{-1}p_A \geq F_\infty^2(R^{-1}|s|)v_l^2(s), \quad \text{for some } 0 < \alpha < 1, \quad R \gg 1,$$

and F_∞ as in (12.6).

Proof. Statement (1) follows from (A.4) and Lemma A.1. Let us now prove (2). Since g is a long-range perturbation of g^0 , we deduce from (A.3) that

$$\mathbb{1}_{|s| \geq R} \leq \left(\frac{2}{d-2}\right)^2(1 + O(R^{-\mu}))p,$$

hence by Lemma A.1:

$$\mathbb{1}_{\{s \geq R\}}(s)\langle s \rangle^{-2} \leq \left(\frac{2}{d-2}\right)^2(1 + O(R^{-\mu}))p_A,$$

which implies (2), using the estimate (12.8) on $v_l(s, \omega)$. \square

A.2. Proof of Prop. 12.1. Let $\epsilon_1^2 = \epsilon^2 - r_1^2$. Since $\|r_1\epsilon^{-1}\| < 1$, we have $\epsilon_1^2 \sim \epsilon^2$. Therefore $\text{Ker } \epsilon_1 = \{0\}$, and $r_2\epsilon_1^{-1} \in B_\infty(\mathcal{H})$. We have

$$h = \epsilon^2 - r^2 = \epsilon_1^2 - r_2^2.$$

Therefore denoting ϵ_1 again by ϵ we can assume that $r_1 = 0$ and denote r_2 by r , so that $r\epsilon^{-1} \in B_\infty(\mathcal{H})$, $h = \epsilon^2 - r^2$. Note that $\sigma_{\text{ess}}(h) = \sigma_{\text{ess}}(\epsilon^2)$. If $m > 0$ then $\sigma_{\text{ess}}(h) \subset [m_\infty^2, +\infty[$ for some $m_\infty > 0$ hence $\text{Tr}\mathbb{1}_{]-\infty, 0]}(h) < \infty$. Moreover $0 \notin \sigma(h)$ and $0 \notin \sigma(\epsilon^2)$, thus $|h| \sim \langle h \rangle \sim \langle \epsilon \rangle^2 \sim \epsilon^2$. Hence (2) in (12.1) also holds.

Let us now assume that $m = 0$. We first prove (1) from (12.1). Noting that $r\langle \epsilon \rangle^{-1}$ is bounded, we obtain by the Birman-Schwinger principle that

$$\text{Tr}\mathbb{1}_{]-\infty, -\alpha]}(h) = \text{Tr}\mathbb{1}_{]1, +\infty[}(K_\alpha),$$

for $K_\alpha = r(\epsilon^2 + \alpha)^{-1}r \in B_\infty(\mathcal{H})$, $\alpha > 0$. Since $r\epsilon^{-1} \in B_\infty(\mathcal{H})$ we have $K_\alpha \nearrow K_0 = r\epsilon^{-2}r \in B_\infty(\mathcal{H})$, hence

$$\text{Tr}\mathbb{1}_{]-\infty, 0]}(h) = \text{Tr}\mathbb{1}_{]1, +\infty[}(K_0) < \infty.$$

Since $\text{Ker } h = \{0\}$, this implies that $\text{Tr}\mathbb{1}_{]-\infty, 0]}(h) < \infty$, which proves (1) in (12.1).

We now prove (2) from (12.1). Set $P_\pm := \mathbb{1}_{\mathbb{R}^\pm}(h)$. If $hu = (\epsilon^2 - r^2)u = -\lambda u$, $\lambda > 0$ we have $\epsilon^{-1}u = (-\lambda)^{-1}(\mathbb{1} - \epsilon^{-1}r^2\epsilon^{-1})\epsilon u \in \mathcal{H}$. This implies that

$$|u\rangle\langle u| \leq C\epsilon^2, \quad C > 0.$$

Since $\text{Tr}P_- < \infty$ this implies that $P_- \leq C\epsilon^2$, for some $C > 0$. Now

$$|h| = h - 2hP_- \leq h + 2|\inf \sigma(h)|P_- \leq \epsilon^2 + 2C|\inf \sigma(h)|\epsilon^2,$$

which shows that $|h| \leq C\epsilon^2$ for some $C > 0$.

To prove the lower bound, we adapt some arguments in [S]. Let

$$h_\delta = h - \delta r^2 = \epsilon^2 - (1 + \delta)r^2.$$

Again by the Birman-Schwinger principle, we have $\text{Tr}\mathbb{1}_{]-\infty, 0]}(h_\delta) = \text{Tr}\mathbb{1}_{]-\infty, 0]}(h)$, for δ small enough. Therefore there exists $c_0, \delta_0 > 0$ such that

$$(A.5) \quad \mathbb{1}_{]-c_0, 0]}(h_\delta) = 0, \quad \forall 0 \leq \delta \leq \delta_0.$$

We fix cutoff functions χ_\pm with $\chi_- \in C_0^\infty(]-\infty, -c_0/2])$, $\chi_+ \in C^\infty(]-c_0, +\infty[)$ and $\chi_-^2(h) + \chi_+^2(h) = \mathbb{1}$. From (A.5) it follows that $\chi_+(h_\delta)h_\delta\chi_+(h_\delta) \geq 0$. Therefore:

$$(A.6) \quad \begin{aligned} P_+h_\delta P_+ &= P_+(\chi_-(h_\delta)h_\delta\chi_-(h_\delta) + \chi_+(h_\delta)h_\delta\chi_+(h_\delta))P_+ \\ &\geq P_+(\chi_-(h_\delta)h_\delta\chi_-(h_\delta))P_+ = P_+Rh_\delta RP_+, \end{aligned}$$

for $R = \chi_-(h_\delta) - \chi_-(h)$, using that $P_+\chi_-(h) = 0$. We claim that

$$(A.7) \quad Rh_\delta R \geq -C\delta^2\epsilon^2, \quad C > 0 \quad \text{uniformly for } 0 \leq \delta \leq \delta_0,$$

which follows from

$$(A.8) \quad \|\epsilon^{-1}R\langle h_\delta \rangle^{\frac{1}{2}}\| \leq C\delta, \quad \text{uniformly for } 0 \leq \delta \leq \delta_0.$$

To prove (A.8) it suffices to check that

$$(A.9) \quad \|(\epsilon + \alpha)^{-1}R\langle h_\delta \rangle^{\frac{1}{2}}\| \leq C\delta, \quad \text{uniformly for } 0 \leq \delta \leq \delta_0, \alpha > 0.$$

We have

$$(A.10) \quad \begin{aligned} &(\epsilon + \alpha)^{-1}R\langle h_\delta \rangle^{\frac{1}{2}} \\ &= \delta \frac{i}{2\pi} \int_{\mathbb{C}} \frac{\partial}{\partial \bar{z}} \tilde{\chi}_-(z) (\epsilon + \alpha)^{-1} (z - h)^{-1} r^2 (z - h_\delta)^{-1} \langle h_\delta \rangle^{\frac{1}{2}} dz \wedge d\bar{z}, \end{aligned}$$

where $\tilde{\chi}_-(z) \in C_0^\infty(\mathbb{R})$ is an almost analytic extension of χ_- . We write:

$$\begin{aligned}
& (\epsilon + \alpha)^{-1}(z - h)^{-1}r^2(z - h_\delta)^{-1}\langle h_\delta \rangle^{\frac{1}{2}} \\
&= (z - h)^{-1}(\epsilon + \alpha)^{-1}r^2(z - h_\delta)^{-1}\langle h_\delta \rangle^{\frac{1}{2}} \\
&+ (z - h)^{-1}[h, (\epsilon + \alpha)^{-1}](z - h)^{-1}r^2(z - h_\delta)^{-1}\langle h_\delta \rangle^{\frac{1}{2}} \\
&= (z - h)^{-1}(\epsilon + \alpha)^{-1}r^2(z - h_\delta)^{-1}\langle h_\delta \rangle^{\frac{1}{2}} \\
&+ (z - h)^{-1}(\epsilon + \alpha)^{-1}r^2(z - h)^{-1}r^2(z - h_\delta)^{-1}\langle h_\delta \rangle^{\frac{1}{2}} \\
&- (z - h)^{-1}r^2(\epsilon + \alpha)^{-1}(z - h)^{-1}r^2(z - h_\delta)^{-1}\langle h_\delta \rangle^{\frac{1}{2}} \\
&=: I_1(z) + I_2(z) - I_3(z).
\end{aligned}$$

We write:

$$\begin{aligned}
(A.11) \quad I_1(z) &= (z - h)^{-1} \times (\epsilon + \alpha)^{-1}r^2\langle h_\delta \rangle^{-\frac{1}{2}} \times (z - h_\delta)^{-1}\langle h_\delta \rangle \\
&= O(|\text{Im}z|^{-2}), \text{ uniformly in } \alpha, \delta \text{ and } z \in \text{supp}\tilde{\chi}_-,
\end{aligned}$$

using that $r\epsilon^{-1}$ is bounded, and $r\langle h_\delta \rangle^{-\frac{1}{2}}$ is bounded uniformly in $0 \leq \delta \leq \delta_0$. Similarly we have:

$$\begin{aligned}
(A.12) \quad I_2(z) &= (z - h)^{-1} \times (\epsilon + \alpha)^{-1}r^2\langle h \rangle^{-\frac{1}{2}} \times \langle h \rangle(z - h)^{-1} \\
&\quad \times \langle h \rangle^{-\frac{1}{2}}r^2\langle h_\delta \rangle^{-\frac{1}{2}} \times (z - h_\delta)^{-1}\langle h_\delta \rangle \\
&= O(|\text{Im}z|^{-3}), \text{ uniformly in } \alpha, \delta \text{ and } z \in \text{supp}\tilde{\chi}_-.
\end{aligned}$$

A similar argument shows that $I_3(z)$ satisfies the same bound as $I_2(z)$. Therefore using (A.10) we obtain (A.9), hence (A.7).

We have now

$$\begin{aligned}
P_+hP_+ &= (1 + \delta)^{-1}p_+h_\delta P_+ + \delta(1 + \delta)^{-1}P_+\epsilon^2P_+ \\
&\geq (\delta - C\delta^2)(1 + \delta)^{-1}P_+\epsilon^2P_+,
\end{aligned}$$

by (A.6) and (A.7). Choosing δ small enough we obtain that

$$(A.13) \quad P_+\epsilon^2P_+ \leq CP_+hP_+, \quad C > 0.$$

On the other hand since $\text{Ran}P_-$ is finite dimensional and included in $\text{Dom}\epsilon$, we have $P_-\epsilon^2P_- \leq CP_-^2$ for some $C > 0$. Using that

$$P_+\epsilon^2P_- + P_-\epsilon^2P_+ \leq P_+\epsilon^2P_+ + P_-\epsilon^2P_-$$

we finally obtain

$$\begin{aligned}
\epsilon^2 &= (P_+ + P_-)\epsilon^2(P_+ + P_-) \\
&\leq 2P_+\epsilon^2P_+ + 2P_-\epsilon^2P_- \\
&\leq 2CP_+hP_+ + 2CP_-^2 \leq C'|h|,
\end{aligned}$$

where in the last inequality we used (A.5) for $\delta = 0$. This proves (2) in (12.1). \square

A.3. Proof of Lemma 8.2. Let $\tilde{f}_{-\delta}$ be an almost analytic extension of the function $\langle \cdot \rangle^{-\delta}$ satisfying:

$$\begin{aligned}
& \text{supp}\tilde{f}_{-\delta} \subset \{z \in \mathbb{C} : |\text{Im}z| \leq c\langle \text{Re}z \rangle\}, \\
& \left| \frac{\partial \tilde{f}_{-\delta}}{\partial \bar{z}}(z) \right| \leq C_N \langle z \rangle^{-\delta-1-N} |\text{Im}z|^N, \quad N \in \mathbb{N},
\end{aligned}$$

see [DG, Appendix C.2]. We have

$$(A.14) \quad [\langle a_\chi \rangle^{-\delta}, \langle b \rangle - b] \langle a_\chi \rangle^\delta =$$

$$\frac{i}{2\pi} \int_{\mathbb{C}} \frac{\partial \tilde{f}_{-\delta}}{\partial \bar{z}}(z) (z - a_\chi)^{-1} [a_\chi, \langle b \rangle - b] (z - a_\chi)^{-1} \langle a_\chi \rangle^\delta dz \wedge d\bar{z}.$$

Since $0 \notin \text{supp} \chi$, there exist $g \in C_0^\infty(\mathbb{R})$ such that

$$[a_\chi, \langle b \rangle - b] = \chi(b^2) [a, g(b^2)] \chi(b^2) \in B(\mathcal{H}),$$

by (M1). Now we use the bound $\|(z - a_\chi)^{-1} \langle a_\chi \rangle^\delta\| \in O(\langle z \rangle^\delta |\text{Im} z|^{-1})$ and the estimates satisfied by $\tilde{f}_{-\delta}$ to obtain that the integral in (A.14) is norm convergent. This completes the proof of the lemma. \square

A.4. Proof of Lemma 12.10. Note that b^2 is of the form (12.12). We claim first that

$$(A.15) \quad [b^2, \langle s \rangle^\delta] \langle b \rangle^{-1}, \langle b \rangle^{-1} [b^2, [b^2, \langle s \rangle^\delta]] \langle b \rangle^{-1} \in B(\mathcal{H}), \quad 0 \leq \delta \leq 1.$$

In fact this follows by an easy computation using (12.13) and the fact that

$$\partial_s \langle b \rangle^{-1}, c_{-\frac{1}{2}}(s, \omega) \partial_\omega \langle b \rangle^{-1} \in B(\mathcal{H}),$$

see [Ha1, Lemma 4.3.1].

We write now

$$\langle b \rangle = (b^2 + 1) \langle b \rangle^{-1}, \quad [\langle b \rangle, \langle s \rangle^{-\delta}] = [b^2, \langle s \rangle^{-\delta}] \langle b \rangle^{-1} + (b^2 + 1) [\langle b \rangle^{-1}, \langle s \rangle^{-\delta}].$$

The first term is bounded by (A.15). To estimate the second term, we introduce the function $f_{-\frac{1}{2}}(\lambda) = (\lambda + 1)^{-\frac{1}{2}}$ and write with $\tilde{f}_{-\frac{1}{2}}$ as in (12.17):

$$\begin{aligned} & (b^2 + 1) [\langle b \rangle^{-1}, \langle s \rangle^{-\delta}] \\ &= \frac{i}{2\pi} \int_{\mathbb{C}} \frac{\partial \tilde{f}_{-\frac{1}{2}}}{\partial \bar{z}}(z) (b^2 + 1) (z - b^2)^{-1} [b^2, \langle s \rangle^\delta] (z - b^2)^{-1} dz \wedge d\bar{z} \\ &= (b^2 + 1) f'_{-\frac{1}{2}}(b^2) [b^2, \langle s \rangle^\delta] \\ &+ \frac{i}{2\pi} \int_{\mathbb{C}} \frac{\partial \tilde{f}_{-\frac{1}{2}}}{\partial \bar{z}}(z) (b^2 + 1) (z - b^2)^{-2} [b^2, [b^2, \langle s \rangle^\delta]] (z - b^2)^{-1} dz \wedge d\bar{z}. \end{aligned}$$

The first term is again bounded using (A.15) and the fact that $f'_{-\frac{1}{2}}(\lambda) \in O(\langle \lambda \rangle^{-3/2})$.

The integral in the second term is norm convergent, using (A.15), the estimates on $\tilde{f}_{-\frac{1}{2}}$ and the bounds $\langle b \rangle^\alpha (z - b^2)^{-1} \in O(\langle z \rangle^{\alpha/2} |\text{Im} z|^{-1})$ for $0 \leq \alpha \leq 2$. This completes the proof of the fact that $[\langle b \rangle, \langle s \rangle^\delta]$ is bounded. \square

APPENDIX B

In this appendix we prove Thm. 3.17. We first recall some standard results.

Let X be a locally compact space, $C(X)$ the space of bounded continuous functions and $B(X)$ the space of bounded Borel functions. We recall that a sequence $(\varphi_n)_{n \in \mathbb{N}}$ in $B(X)$ is *b-convergent* to φ , written as $\text{b-lim}_n \varphi_n = \varphi$ if $\sup_n \|\varphi_n\|_\infty < \infty$ and $\varphi_n \rightarrow \varphi$ pointwise on X .

The *monotone class theorem* implies that $B(X)$ is the smallest space of functions on X containing $C(X)$ and stable under bounded convergence of sequences. The *Riesz theorem* says that any continuous linear form on $C(X)$ uniquely extends to a linear form on $B(X)$ continuous for the b-convergence of sequences.

Recall also that a Banach space \mathcal{H} is *weakly sequentially complete*, if for each sequence $(u_n)_{n \in \mathbb{N}}$ in \mathcal{H} such that $\lim_n \langle f, u_n \rangle$ exists for each $f \in \mathcal{H}^\#$, there exists $u \in \mathcal{H}$ with $\lim_n \langle f, u_n \rangle = \langle f, u \rangle$ for each $f \in \mathcal{H}^\#$. Reflexive Banach spaces, hence Hilbertizable spaces, are weakly sequentially complete.

This property implies that if $(T_n)_{n \in \mathbb{N}}$ is a sequence in $B(\mathcal{H})$ such that $\lim_n \langle f, T_n u \rangle$ exists for each $u \in \mathcal{H}, f \in \mathcal{H}^\#$, then there is a unique $T \in B(\mathcal{H})$ such that $w\text{-}\lim_{T_n} = T$.

From these facts, it is straightforward to prove the following result, see eg [Wr, Cor. 9.1.10].

Theorem B.1. *Let X a locally compact space, \mathcal{H} a weakly sequentially complete Banach space. Then if $F_0 : C(X) \rightarrow B(\mathcal{H})$ is a continuous algebra morphism, there is a unique algebra morphism $F : B(X) \rightarrow B(\mathcal{H})$ such that $b\text{-}\lim_n \varphi_n = \varphi$ implies $w\text{-}\lim F(\varphi_n) = F(\varphi)$.*

Proof of Thm. 3.17.

We will deduce Thm. 3.17 from Thm. B.1 for a convenient choice of the locally compact space X . We use the notations in Subsects. 3.3, 3.4.

Let χ be a smooth function which has a zero of order $\alpha(\xi)$ at each $\xi \in \text{supp}\alpha$ and has no other zeros. This means $\chi = c_\omega \chi_\omega + o(\chi_\omega)$ if $\omega \in \tilde{\alpha}$ with c_ω non zero numbers and $\chi(x) \neq 0$ outside $\text{supp}\alpha$.

Let 2ε be the minimal distance between two points of $\text{supp}\alpha$ and let θ_0 be a smooth function with $\theta_0(x) = 1$ if $|x| < \varepsilon/3$ and $\theta_0(x) = 0$ if $|x| > \varepsilon/2$. Then let θ_1 be a smooth function equal to 1 on a neighborhood of ∞ and equal to 0 at points at distance $< \varepsilon$ from $\text{supp}\alpha \cap \mathbb{R}$. Finally, if $\omega = (\xi, s) \in \tilde{\alpha}$ and $\xi \in \mathbb{R}$ then we set $\theta_\omega(x) = \theta_0(x - \xi)$, and if $\xi = \infty$ we set $\theta_\omega = \theta_1$. Thus the functions in the family $\{\theta_\omega\}_{\omega \in \tilde{\alpha}}$ have disjoint supports and each of them is equal to one on a neighborhood of a unique point from $\text{supp}\alpha$.

Recall that for $\varphi \in \Lambda^\alpha$ we have $\delta_\omega(\varphi) = \delta_\omega(\varphi^\circ)$ if $\omega \prec \alpha$ and so $T_\omega \varphi = T_\omega \varphi^\circ$ if $\alpha \preceq \alpha$. We associate to such a φ a function $\tilde{\varphi} \in B(\hat{\mathbb{R}})$ defined by

$$\tilde{\varphi} = \chi^{-1}(\varphi^\circ - \sum_{\omega \in \tilde{\alpha}} \theta_\omega T_\omega \varphi)$$

outside $\text{supp}\alpha$, while at points $\xi \in \text{supp}\alpha$ we set $\tilde{\varphi}(\xi) = c_\omega^{-1} \delta_\omega(\varphi)$ with $\omega = (\xi, \alpha(\xi))$. The definition of $\tilde{\varphi}$ on the support of α is such that $\tilde{\varphi} \in C(\hat{\mathbb{R}})$ if $\varphi \in C^\alpha(\hat{\mathbb{R}}) \subset \Lambda^\alpha$. Observe that

$$\sum_{\omega \in \tilde{\alpha}} \theta_\omega T_\omega \varphi = \sum_{\mu < \omega \in \tilde{\alpha}} \theta_\omega \delta_\mu(\varphi) \chi_\mu = \sum_{\mu < \omega \in \alpha} \theta_\mu \delta_\mu(\varphi) \chi_\mu = \sum_{\omega \prec \alpha} \theta_\omega \delta_\omega(\varphi) \chi_\omega$$

because for $\mu < \omega$ we have $\theta_\mu = \theta_\omega$. Thus we have

$$(B.1) \quad \varphi^\circ = \chi \tilde{\varphi} + \sum_{\omega \in \tilde{\alpha}} \theta_\omega T_\omega \varphi = \chi \tilde{\varphi} + \sum_{\omega \prec \alpha} \theta_\omega \delta_\omega(\varphi) \chi_\omega$$

Now let us denote $\hat{\alpha} = \{\omega \mid \omega \prec \alpha\}$ and let us consider the map

$$A : \Lambda^\alpha = L^\alpha(\hat{\mathbb{R}}) \oplus \mathbb{C}^{\hat{\alpha}} \rightarrow B(\hat{\mathbb{R}}) \oplus \mathbb{C}^{\hat{\alpha}} \quad \text{defined by } A\varphi = (\tilde{\varphi}, (\delta_\omega(\varphi))_{\omega \prec \alpha}).$$

Then clearly A is linear continuous and injective and we have $AC^\alpha(\hat{\mathbb{R}}) \subset C(\hat{\mathbb{R}}) \oplus \mathbb{C}^{\hat{\alpha}}$. On the other hand, from (B.1) it follows that A is bijective with continuous inverse given by

$$A^{-1}(\psi, (a_\omega)_{\omega \prec \alpha}) = (\chi\psi + \sum_{\omega \prec \alpha} \theta_\omega a_\omega \chi_\omega, (c_\omega \psi(\omega))_{\omega \in \tilde{\alpha}})$$

where we used the notation $\psi(\omega) = \psi(\xi)$ for $\omega = (\xi, \alpha(\xi)) \in \tilde{\alpha}$. It is also easy to check that A^{-1} sends $C(\hat{\mathbb{R}}) \oplus \mathbb{C}^{\hat{\alpha}}$ into $C^\alpha(\hat{\mathbb{R}})$, hence $A : C^\alpha(\hat{\mathbb{R}}) \rightarrow C(\hat{\mathbb{R}}) \oplus \mathbb{C}^{\hat{\alpha}}$ is an isomorphism.

Summarizing we have:

- i) $A : C^\alpha(\hat{\mathbb{R}}) \sim C(\hat{\mathbb{R}}) \oplus \mathbb{C}^{\hat{\alpha}},$
- ii) $A : \Lambda^\alpha \sim B(\hat{\mathbb{R}}) \oplus \mathbb{C}^{\hat{\alpha}}.$

Let $\hat{\mathbb{R}} \sqcup \hat{\alpha}$ be the topological disjoint union of $\hat{\mathbb{R}}$ with the discrete space $\hat{\alpha}$. We have obvious identifications $C(\hat{\mathbb{R}}) \oplus \mathbb{C}^{\hat{\alpha}} \sim C(\hat{\mathbb{R}} \sqcup \hat{\alpha})$ and $B(\hat{\mathbb{R}}) \oplus \mathbb{C}^{\hat{\alpha}} \sim B(\hat{\mathbb{R}} \sqcup \hat{\alpha})$, which in particular induce the natural notion of b -convergence for sequences on the space

$B(\hat{\mathbb{R}}) \oplus C^{\hat{\alpha}}$. Then it is clear that A and A^{-1} are continuous for the b-convergence. It suffices now to apply Thm. B.1 to $X = \hat{\mathbb{R}} \cup \hat{\alpha}$, using also Thm. 3.10. \square
