Received 26 March 2010; accepted 20 April 2010

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{La–Ru}) = 0.001$ Å;
disorder in main residue; R factor = 0.036; wR factor = 0.062; data-to-parameter
ratio = 22.7.

$\text{La}_{21}\text{Ru}_{9+x}\text{In}_{5-x}$ (Pearson symbol $tI140$) is isotropic to the filled
 Y_3Rh_2 -type structure, from which it can be derived through an
ordered substitution at two sites. One of the square-prismatic
sites (site symmetry $.m$) is occupied by a mixture of Ru and In
atoms and one of the square-antiprismatic sites ($4/m..$) is fully
occupied by In atoms.

Comment

New rare-earth metal-rich indium compounds $\text{RE}_3\text{T}_{2-x}\text{In}_x$ ($\text{RE} = \text{Gd}, \text{Tb}, \text{Dy}, \text{Ho}, \text{Er}, \text{Tm}; \text{T} = \text{Rh}, \text{Pd}, \text{Ir}$) have been recently synthesized (Zaremba et al., 2007). They can be regarded as extensions of the parent binaries RE_3T_2 with either the Y_3Rh_2 - ($\text{T} = \text{Rh}, \text{Ir}$) or U_3Si_2 -type ($\text{T} = \text{Pd}$) structures into the ternary $\text{RE}-\text{T}-\text{In}$ systems. In contrast, $\text{La}_{21}\text{Ru}_{9+x}\text{In}_{5-x}$, presented here, is strictly a ternary compound with no corresponding La-Ru binary of the same stoichiometry.

In the Y_3Rh_2 -type structure, six crystallographically independent transition metal sites are available with trigonal prismatic, square prismatic, and square antiprismatic coordination environments (Moreau et al., 1976). The structure of $\text{La}_{21}\text{Ru}_{9+x}\text{In}_{5-x}$ is derived through an ordered substitution at two sites, with the square prismatic site (16l) occupied by a mixture of Ru and In atoms and one of the square antiprismatic sites (4c) occupied fully by In atoms (Fig. 1). This suggests the existence of a solid solution, as confirmed by EDX measurements which revealed a homogeneity range of ca. 3 at.% in $\text{La}_{21}\text{Ru}_{9+x}\text{In}_{5-x}$.

Experimental

The title compound was prepared by arc-melting of the constituent elements (La, 99.8%; Ru, 99.9%, In, 99.999%) under a high purity argon atmosphere on a water-cooled cooper hearth. The arc-melted button, with nominal composition $\text{La}_{59.26}\text{Ru}_{29.63}\text{In}_{11.11}$, was turned over and remelted to ensure its homogeneity. The weight loss was less than 1%. The sample was annealed in an evacuated quartz ampoule at 870 K for 600 h and quenched in cold water. The single crystal was selected from the crushed sample.

EDX analysis of the majority phase in a number of samples revealed that the composition of the new compound ranges from $\text{La}_{58.8}\text{Ru}_{26.2}\text{In}_{15.0}$ to $\text{La}_{61.1}\text{Ru}_{28.3}\text{In}_{10.7}$ with an uncertainty of about 1 at.% for each element. Thus the homogeneity range of the title compound is approximately 3 at.% at 870 K.

Refinement

The atomic parameters were standardized with the program STRUCTURE TIDY (Gelato & Parthé, 1987). The highest peak and the deepest hole in the final difference map are located 0.69 Å from La2 and 0.82 Å, respectively, from Ru1.

53 parameters	$\Delta\rho_{\min} = -2.74 \text{ e \AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
