#### Abstract

We study a problem describing the motion of an incompressible, nonisothermal and non-Newtonian fluid, taking into account the heat convection term. The novelty here is that fluid viscosity depends on the temperature, the velocity of the fluid, and also of the deformation tensor, but not explicitly. The boundary conditions take into account the slip phenomenon on a part of the boundary of the domain. By using the notion of pseudo-monotone operators and fixed point Theorem we prove an existence result of its weak solution.

Keywords: Heat convection; Non-Newtonian fluid; Non-isothermal fluid; Tresca fluid-solid conditions; Pseudo-monotone operators; Schauder point fixed Theorem.

## 1 Introduction

Let $\omega$ be fixed bounded domain of $\mathbb{R}^{2}$, with Lipschitz continuous boundary. We suppose that $\omega$ is the bottom of the fluid domain $\Omega$, the upper surface $\Gamma_{1}$ is defined by the equation $x_{3}=h\left(x^{\prime}\right)$ where $x^{\prime}=\left(x_{1}, x_{2}\right)$ and $h$ is a positive smooth and bounded function. Then

$$
\Omega=\left\{\left(x^{\prime}, x_{3}\right) \in \mathbb{R}^{3} ; \quad x^{\prime} \in \omega \quad \text { and } \quad 0<x_{3}<h\left(x^{\prime}\right)\right\} .
$$

The boundary $\partial \Omega$ is composed of three parts; $\partial \Omega=\bar{\omega} \cup \bar{\Gamma}_{1} \cup \bar{\Gamma}_{L}$, where $\Gamma_{L}$ is the lateral boundary. We consider a stationary problem, in the bounded domain $\Omega$, describing the

[^0]motion of an incompressible non-isothermal and non-Newtonian fluid. This problem is deduced (see [5]) from the three conservation laws of, mass, momentum and energy, (see for example $[15,19]$ ), where the density is assumed to be constant and equal to 1 , so the mass conservation law becomes the incompressibility condition of the fluid
\[

$$
\begin{equation*}
\operatorname{div}(v)=0 \quad \text { in } \quad \Omega, \tag{1.1}
\end{equation*}
$$

\]

where $v$ is the velocity of the fluid. Many fluid flows (molten polymers in solution, oils, sludge ...) do not verify Newton's law $\sigma(v)=-\pi I+2 \mu D(v)$, with $\mu=$ const., but a more complex in which the viscosity $\mu$ varies with the strain tensor $D(v)$, the temperature $\theta$, or also the second invariant $D_{11}=\frac{1}{2} D(v): D(v)$. We consider here that the heat conduction phenomenon is described by Fourier's law, relating the heat flux to the temperature $\theta$, so the energy law leads to

$$
\begin{equation*}
v \cdot \nabla \theta=2 \mu(\theta, v,|D(v)|) D(v): D(v)+\operatorname{div}(K \nabla \theta)+r(\theta) \quad \text { in } \quad \Omega, \tag{1.2}
\end{equation*}
$$

where $K$ is a positive function defined on $\Omega$ and $r$ is real function.
The motion of the fluid is assumed to be slow, then the momentum law leads to

$$
\begin{equation*}
-2 \operatorname{div}(\mu(\theta, v,|D(v)|) D(v))+\nabla \pi=f \quad \text { in } \quad \Omega, \tag{1.3}
\end{equation*}
$$

where $\pi$ is the pressure of the fluid, $f$ is a given vector and will be specified later.
Compared to the works [2]- [9], and to the earlier works, to our knowledge, the novelty in this study is firstly that we take into account the effects of the heat convection expressed by the presence of the left term in (1.2), secondly we consider the viscosity $\mu$ of the fluid as a function depending on its temperature, its velocity and its strain tensor. This general choice of the viscosity allows us to include the cases, of power law [13, 16], Carreau law $[4,20]$ or Bingham law [15].

This choice also allows to choose the appropriate viscosity that meets industrial applications such that, for example, the manufacture of flak vest, containing a fluid that has the ability to focus on the impact of the projectile upon contact with the flak vest.

See an other situation in [12] where the paper concerns longtime and large-data existence results for a generalization of the Navier-Stokes fluid whose viscosity depends on the shear rate and the pressure in the form $\nu=\nu\left(p,|D(v)|^{2}\right)$. We can see also [11] in which the authors considered flows of fluids in unbounded domains with viscosity having the same form as in [12].

In order to close the system, it remains to describe the boundary conditions for the temperature $\theta$ and the velocity $v$. We consider the following Neumann boundary condition

$$
\begin{equation*}
K \frac{\partial \theta}{\partial n}=\theta_{\omega}, \quad \text { on } \quad \omega, \tag{1.4}
\end{equation*}
$$

where $n=\left(n_{1}, n_{2}, n_{3}\right)$ is the outward unit normal to $\partial \Omega$, and $\theta_{\omega}$ is a given fixed temperature flux on $\omega$, and the following Dirichlet condition

$$
\begin{equation*}
\theta=0, \quad \text { on } \quad \Gamma_{1} \cup \Gamma_{L} \tag{1.5}
\end{equation*}
$$

For the boundary conditions for the velocity $v$, let $g=\left(g_{1}, g_{2}, g_{3}\right)$ be a function such that

$$
\int_{\partial \Omega} g . n d s=0, \quad g_{3}=0 \quad \text { on } \quad \Gamma_{L}, \quad g=0 \quad \text { on } \quad \Gamma_{1}, \quad g . n=0, \quad \text { on } \quad \omega,
$$

the velocity on $\Gamma_{L}$ is known and parallel to the plane $\left(x_{1}, x_{2}\right)$ so,

$$
\begin{equation*}
v=g \quad \text { on } \quad \Gamma_{L} \tag{1.6}
\end{equation*}
$$

the upper surface $\Gamma_{1}$ being assumed to be fixed so

$$
\begin{equation*}
v=0 \quad \text { on } \quad \Gamma_{1} \tag{1.7}
\end{equation*}
$$

we assume that there is no flux through $\omega$, so the normal component of the velocity vanishes,

$$
\begin{equation*}
v . n=0 \quad \text { on } \quad \omega \tag{1.8}
\end{equation*}
$$

but the tangential component $v_{t}$ of the velocity is unknown and satisfies the Tresca law [2], [15] Chap.3,

$$
\left\{\begin{array}{l}
\left|\sigma_{t}\right|=k \Rightarrow \exists \lambda \geq 0 ; v_{t}=s-\lambda \sigma_{t}  \tag{1.9}\\
\left|\sigma_{t}\right|<k \Rightarrow v_{t}=s
\end{array}\right.
$$

Where $k$ is the upper limit for the stress, $s$ is the velocity of the surface $\omega$ and $\sigma_{t}$ is the tangential component of $\sigma n$, where $\sigma=\left(\sigma_{i j}\right)_{1 \leq i, j \leq 3}$ is the stress tensor defined by

$$
\begin{equation*}
\sigma_{i j}=2 \mu(\theta, v,|D(v)|) d_{i j}(v)-\pi \delta_{i j} \tag{1.10}
\end{equation*}
$$

with $\delta_{i j}$ is the Kronecker symbol and $D(v)$ is the deformation tensor given by

$$
\begin{equation*}
D(v)=\left(d_{i j}(v)\right)_{1 \leq i, j \leq 3}, \quad d_{i j}(v)=\frac{1}{2}\left(\partial_{j} v_{i}+\partial_{i} v_{j}\right) \tag{1.11}
\end{equation*}
$$

Here and below, we write $\partial_{i}$ to design $\frac{\partial}{\partial x_{i}}$ and use the convention of implicit summation over repeated indices.

The term $|D(v)|$ denotes the euclidian norm of $D(v)$, that is $|D(v)|^{2}=d_{i j}(v) d_{i j}(v)$, induced by the product $D(u): D(v)=d_{i j}(u) d_{i j}(v)$.

The plan of this paper is as follows. In Section 2 we establish the variational formulation of the considered problem (1.1)-(1.9). Note that the terms $\mu(\theta, v,|D(v)|) D(v)$ :
$D(v)$ and $v . \nabla \theta$ in (1.2) and $\operatorname{div}(\mu(\theta, v,|D(v)|) D(v))$ in (1.3) lead us to consider particular sets of the Sobolev spaces $\left(W^{1, p}(\Omega)\right)^{3}$ and $\left(W^{1, q}(\Omega)\right)^{3}$ where $p>3$ and $q$ its exponent conjugate, for details see the proof of Proposition 2.1. In the same section we give some lemmas needed for the next one to prove the boundedness and the coerciveness of the operator $A$ defined by

$$
\langle A(v), \varphi\rangle=\int_{\Omega} 2 \mu(\theta, v,|D(v)|) d_{i j}(v) \partial_{j} \varphi_{i} d x .
$$

In fact its coerciveness also follows from the assertion

$$
\lim _{\|v\|_{1,2} \rightarrow+\infty} \frac{\|v\|_{1,2}}{\|v\|_{1, p}} \neq 0,
$$

which we prove in the present paper, for notations, see the next section. Also note the fact that the function $\mu$ does not depend explicitly on its arguments leads us to assume it monotone in $|D(v)|$. This enable us to establish the monotonicity of the operator $A$.

In Section 3 we study the existence results of the problem 2.1, in the following three subsections.

In Subsection 3.1, for given temperature $\theta \in W_{\Gamma_{1} \cup \Gamma_{L}}^{1, q}(\Omega)$ and $f \in\left(W^{1, p}(\Omega)\right)^{3}$, $0 \leq k \in L^{p}(\omega)$, we prove in Theorem 3.1, using Korn inequalities and classical results of monotone operators, that there exists at least one $v_{\theta} \in W_{d i v}^{1, p}(\Omega)$ solution of the intermediate problem 3.1. We prove also in Lemma 3.2 that $v_{\theta}$ remains bounded in $W_{d i v}^{1, p}(\Omega)$, independently of the temperature $\theta$. This is needed in Theorem 3.2 where we derive the existence of the pressure $\pi \in L_{0}^{p}(\Omega)$ satisfying the varitional inequality (2.1).

In Subsection 3.2, We consider a second intermediate problem that, for given velocity $v \in V_{d i v}^{p}$ find the temperature solution of Problem 3.2. We remark here that from the weak formulation, the temperature $\theta$ must be obtained in the space $W^{1, q}(\Omega)$. But this weak formulation led us, after linearization of the corresponding equation, to a bilinear form $B(\theta, \psi)$ defined on the space $W^{1, q}(\Omega) \times W^{1, p}(\Omega)$. And in order to apply Lax-Milgram Theorem, we have considered the Hilbert space $H^{1}(\Omega) \times H^{1}(\Omega)$, and we establish in Theorem 3.3 the existence and uniqueness of $\theta$ in $H^{1}(\Omega)$, solution of the linearized problem 3.3, hence $\theta \in W^{1, q}(\Omega)$, because $1<q<2$, see other reasons for this choice of the space $H^{1}(\Omega)$ in the proof of Theorem 3.3.

Using Schauder Fixed Point Theorem, we establish first in Theorem 3.4, the existence of $\theta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$ solution of the second intermediate problem (3.2), then we prove its uniqueness in Theorem 3.5 by a monotony method.

In Subsection 3.3, We recapitulate the necessary assumptions used to prove the existence of at least one solution of the variational global problem 2.1, and establish it in Theorem 3.6.

## 2 Weak formulation

Let $p$ be a real number such that $p>1$, and $q$ its conjugate exponent, that is $\frac{1}{p}+\frac{1}{q}=1$. We know from Lemma 2.2 in [17] that for $g \in\left(W^{1-\frac{1}{p}, p}(\partial \Omega)\right)^{3}$, there exists a function $G$ in $\left(W^{1, p}(\Omega)\right)^{3}$ such that,

$$
\operatorname{div}(G)=0 \quad \text { in } \quad \Omega, \quad G=g \quad \text { on } \quad \Gamma_{L} \cup \Gamma_{1}, \quad G . n=0 \quad \text { on } \quad \omega .
$$

To establish a weak formulation of the problem, we introduce the following sets,
$V^{p}=\left\{\varphi \in\left(W^{1, p}(\Omega)\right)^{3} ; \quad \varphi=G \quad\right.$ on $\quad \Gamma_{L}, \quad \varphi=0 \quad$ on $\quad \Gamma_{1} \quad$ and $\quad \varphi \cdot n=0 \quad$ on $\left.\quad \omega\right\}$,

$$
V_{d i v}^{p}=\left\{\varphi \in V^{p} ; \quad \operatorname{div}(\varphi)=0 \quad \text { in } \quad \Omega\right\}
$$

$V^{p}$ and $V_{d i v}^{p}$ are convex closed subsets of $\left(W^{1, p}(\Omega)\right)^{3}$. We also define the spaces,

$$
\begin{gathered}
V_{0}^{p}=\left\{\varphi \in\left(W^{1, p}(\Omega)\right)^{3} ; \quad \varphi=0, \quad \text { on } \quad \Gamma_{L} \cup \Gamma_{1} \quad \text { and } \quad \varphi \cdot n=0 \quad \text { on } \omega\right\} \\
V_{0, d i v}^{p}=\left\{\varphi \in V_{0}^{p} ; \quad \operatorname{div}(\varphi)=0 \quad \text { in } \quad \Omega\right\} \\
L_{0}^{p}(\Omega)=\left\{u \in L^{p}(\Omega) ; \int_{\Omega} u(x) d x=0\right\}
\end{gathered}
$$

and we denote,

$$
\begin{gathered}
V_{\Gamma}^{p}=\left\{\varphi \in\left(W^{1, p}(\Omega)\right)^{3} ; \quad \varphi=0 \quad \text { on } \quad \Gamma\right\} \\
W_{\Gamma}^{1, p}(\Omega)=\left\{\varphi \in W^{1, p}(\Omega) ; \quad \varphi=0 \quad \text { on } \quad \Gamma\right\}
\end{gathered}
$$

where $\Gamma$ is a subset of $\partial \Omega$ with $|\Gamma|:=\operatorname{meas}(\Gamma) \neq 0$.
Remark that $V_{\Gamma}^{p}=\left(W_{\Gamma}^{1, p}(\Omega)\right)^{3}$ and $V^{p}, V_{0}^{p} \subset V_{\Gamma_{1}}^{p}$. We denote, as usual the norm of the Lebesgue space $L^{p}(\Omega)$ by $\|v\|_{p}=\left(\int_{\Omega}|v|^{p} d x\right)^{\frac{1}{p}}$, and the norms of the Banach spaces $V_{\Gamma}^{p}$ and $W_{\Gamma}^{1, p}(\Omega)$ are designed equally by $\|v\|_{1, p}=\left(\int_{\Omega}|\nabla v|^{p} d x\right)^{\frac{1}{p}}$.

In the following proposition, we deduce rigorously the variational formulation of Problem (1.1)-(1.9). Also note that we only give the necessary assumptions on the data of each part of the paper. We summarize, the necessary hypotheses needed for the final result in Subsection 3.3.

Proposition 2.1. Let $p>3$ and $q$ its conjugate exponent. For $f \in\left(W^{1, p}(\Omega)\right)^{3}, 0 \leq$ $k \in L^{p}(\omega), \mu \in L^{\infty}\left(\mathbb{R} \times \mathbb{R}^{3} \times \mathbb{R}_{+}\right), K \in L^{\infty}(\Omega)$ and $r \in L^{\infty}(\mathbb{R})$, the weak formulation of the strong problem (1.1)-(1.9) leads to the following variational problem,
Problem 2.1. Find $v \in V_{d i v}^{p}, \pi \in L_{0}^{p}(\Omega)$ and $\theta \in W_{\Gamma_{1} \cup \Gamma_{L}}^{1, q}(\Omega)$ such that

$$
\begin{gather*}
a(\theta, v, \varphi-v)-(\pi, \operatorname{div}(\varphi))+j(\varphi)-j(v) \geq(f, \varphi-v) \quad \forall \varphi \in V^{q}  \tag{2.1}\\
B(\theta, \psi)=L(\theta, \psi) \quad \forall \psi \in W_{\Gamma_{1} \cup \Gamma_{L}}^{1, p}(\Omega) \tag{2.2}
\end{gather*}
$$

where

$$
\begin{gather*}
a(\theta, v, \varphi-v)=\int_{\Omega} 2 \mu(\theta, v,|D(v)|) d_{i j}(v) \partial_{j}\left(\varphi_{i}-v_{i}\right) d x \\
L(\theta, \psi)=2 \int_{\Omega} \mu(\theta, v,|D(v)|)|D(v)|^{2} \psi d x+\int_{\Omega} r(\theta) \psi d x+\int_{\omega} \theta_{\omega} \psi d x^{\prime} \tag{2.3}
\end{gather*}
$$

and

$$
\begin{equation*}
B(\theta, \psi)=\int_{\Omega} K(x) \nabla \theta \cdot \nabla \psi d x+\int_{\Omega} \psi v_{i} \partial_{i} \theta d x, \quad j(\varphi)=\int_{\omega} k|\varphi-s| d x^{\prime} \tag{2.4}
\end{equation*}
$$

Proof. Observe first that since $p>3$ and $\Omega$ is bounded, if $v=\left(v_{1}, v_{2}, v_{3}\right) \in V^{p}$ then $v_{i} \in L^{\infty}(\Omega)$. Hence for $\psi \in W_{\Gamma_{1} \cup \Gamma_{L}}^{1, p}(\Omega)$ and $\theta \in W_{\Gamma_{1} \cup \Gamma_{L}}^{1, q}(\Omega)$ the second integral in $B(\theta, \psi)$ makes sense. For the first integral in $L(\theta, \psi)$ we have $|D(v)|^{2} \in L^{\frac{p}{2}}(\Omega)$ then $\mu(\theta, v,|D(v)|)|D(v)|^{2} \psi \in L^{1}(\Omega)$ until $\mu$ is bounded. Also $a(\theta, v, \varphi-v)$ is well defined since $d_{i j}(v) \in L^{p}(\Omega)$ and $\partial_{j}\left(\varphi_{i}-v_{i}\right) \in L^{q}(\Omega)-L^{p}(\Omega) \subset L^{q}(\Omega)$, because $1<q<p$.
To obtain the variational inequality (2.1), we have from (1.3) and (1.10)

$$
\begin{equation*}
-\partial_{j} \sigma_{i j}=f_{i}, \quad i=1,2,3 \tag{2.5}
\end{equation*}
$$

Multiplying (2.5) by $\varphi_{i}-v_{i}$ where $\varphi=\left(\varphi_{1}, \varphi_{2}, \varphi_{3}\right) \in V^{q}$ and integrating over $\Omega$, we obtain

$$
\begin{equation*}
\int_{\Omega} \sigma_{i j} \partial_{j}\left(\varphi_{i}-v_{i}\right) d x-\int_{\partial \Omega} \sigma_{i j}\left(\varphi_{i}-v_{i}\right) n_{j} d s=\int_{\Omega} f_{i}\left(\varphi_{i}-v_{i}\right) d x \tag{2.6}
\end{equation*}
$$

Since $\varphi_{i}-v_{i}=0$ on $\Gamma_{1} \cup \Gamma_{L}$,

$$
\int_{\partial \Omega} \sigma_{i j}\left(\varphi_{i}-v_{i}\right) n_{j} d s=\int_{\omega} \sigma_{i j}\left(\varphi_{i}-v_{i}\right) n_{j} d x^{\prime}
$$

Remark that $\sigma_{i j} n_{j}$ is the i-th component of the vector $\sigma n$, which can be written on the form $\sigma n=\sigma_{t}+\sigma_{n} n$, with $\sigma_{t}=\left(\sigma_{t_{1}}, \sigma_{t_{2}}, \sigma_{t_{3}}\right)$ and $\sigma_{n}=\sigma n . n$, from which we have $\sigma_{i j} n_{j}=\sigma_{t_{i}}+\sigma_{n} n_{i}$. Using this equality, we get

$$
\int_{\omega} \sigma_{i j}\left(\varphi_{i}-v_{i}\right) n_{j} d x^{\prime}=\int_{\omega} \sigma_{t_{i}}\left(\varphi_{i}-v_{i}\right) d x^{\prime}+\int_{\omega} \sigma_{n} n_{i}\left(\varphi_{i}-v_{i}\right) d x^{\prime}
$$

Knowing that from (1.8), $n_{i}\left(\varphi_{i}-v_{i}\right)=0$ on $\omega$, then

$$
\int_{\omega} \sigma_{i j}\left(\varphi_{i}-v_{i}\right) n_{j} d x^{\prime}=\int_{\omega} \sigma_{t_{i}}\left(\varphi_{i}-v_{i}\right) d x^{\prime}
$$

and (2.6) becomes

$$
\begin{equation*}
\int_{\Omega} \sigma_{i j} \partial_{j}\left(\varphi_{i}-v_{i}\right) d x=\int_{\omega} \sigma_{t_{i}}\left(\varphi_{i}-v_{i}\right) d x^{\prime}+\int_{\Omega} f_{i}\left(\varphi_{i}-v_{i}\right) d x \tag{2.7}
\end{equation*}
$$

Let us involve the Tresca condition. For this end, we add to both sides of (2.7) the term $\int_{\omega} k(|\varphi-s|-|v-s|) d x^{\prime}$, then

$$
\begin{equation*}
\int_{\Omega} \sigma_{i j} \partial_{j}\left(\varphi_{i}-v_{i}\right) d x+\int_{\omega} k(|\varphi-s|-|v-s|) d x^{\prime}=\int_{\Omega} f_{i}\left(\varphi_{i}-v_{i}\right) d x+A, \tag{2.8}
\end{equation*}
$$

with

$$
A=\int_{\omega}\left[\sigma_{t_{i}}\left(\varphi_{i}-v_{i}\right)+k(|\varphi-s|-|v-s|)\right] d x^{\prime}
$$

Let us prove that $A$ is positive. First, Following [15] Chap. 3 page 140, we prove that the condition (1.9) is equivalent to

$$
\begin{equation*}
\left(v_{t}-s\right) \cdot \sigma_{t}+k\left|v_{t}-s\right|=0, \tag{2.9}
\end{equation*}
$$

indeed if (1.9) holds and $\left|\sigma_{t}\right|=k$, then $v_{t}=s-\lambda \sigma_{t}$ for some $\lambda \geq 0$, so

$$
\left(v_{t}-s\right) \cdot \sigma_{t}+k\left|v_{t}-s\right|=-\sigma_{t} \cdot \sigma_{t}+k \lambda\left|\sigma_{t}\right|=-\lambda \sigma_{t}^{2}+\lambda \sigma_{t}^{2}=0 .
$$

Now if $\left|\sigma_{t}\right|<k$, by (1.9) $v_{t}=s$ and (2.9) holds.
Conversely if $\left|\sigma_{t}\right|=k$, then by $(2.9)\left(v_{t}-s\right) \cdot \sigma_{t}=-\left|\sigma_{t}\right|\left|v_{t}-s\right|$, so there exists $\lambda \geq 0$ such that $v_{t}-s=-\lambda \sigma_{t}$, that is $v_{t}=s-\lambda \sigma_{t}$. The first part of (1.9) is shown. If $\left|\sigma_{t}\right|<k$, then by (2.9) we have $\left(v_{t}-s\right) \cdot \sigma_{t}+k\left|v_{t}-s\right|=0 \geq\left|v_{t}-s\right|\left(k-\left|\sigma_{t}\right|\right)$, thus $v_{t}-s=0$ because $\left|\sigma_{t}\right|<k$. The second part of (1.9) holds, and the assertion is proved.
Now by (1.8) we deduce that $v=v_{t}$ on $\omega$, hence

$$
A=\int_{\omega}\left(\sigma_{t} \cdot(\varphi-s)+k|\varphi-s|\right) d x^{\prime}
$$

But $\sigma_{t} .(\varphi-s) \geq-\left|\sigma_{t}\right||\varphi-s|$, and since $\left|\sigma_{t}\right| \leq k$ on $\omega$, it follows that

$$
\sigma_{t} \cdot(\varphi-s)+k|\varphi-s| \geq 0 \quad \text { on } \quad \omega,
$$

this shows that $A$ is positive. And (2.8) becomes

$$
\int_{\Omega} \sigma_{i j} \partial_{j}\left(\varphi_{i}-v_{i}\right) d x+\int_{\omega} k(|\varphi-s|-|v-s|) d x^{\prime} \geq \int_{\Omega} f_{i}\left(\varphi_{i}-v_{i}\right) d x
$$

Replacing $\sigma_{i j}$ by its expression (1.10) and using (1.1), we obtain the variationnal inequality for the velocity field $v$. For all $\varphi \in V^{q}$

$$
\begin{array}{r}
\int_{\Omega} 2 \mu(\theta, v,|D(v)|) d_{i j}(v) \partial_{j}\left(\varphi_{i}-v_{i}\right) d x-\int_{\Omega} \pi d i v(\varphi) d x \\
\quad+\int_{\omega} k(|\varphi-s|-|v-s|) d x^{\prime} \geq \int_{\Omega} f_{i}\left(\varphi_{i}-v_{i}\right) d x
\end{array}
$$

Similarly, by multiplying (1.2) by $\psi \in W_{\Gamma_{1} \cup \Gamma_{L}}^{1, p}(\Omega)$ we obtain (2.2).
Subsequently, we will use the following well known results,

$$
\begin{gather*}
\int_{\Omega}|D(u)|^{2} d x \leq \int_{\Omega}|\nabla u|^{2} d x, \quad \forall u \in\left(W^{1, p}(\Omega)\right)^{3},  \tag{2.10}\\
\int_{\Omega}|D(u)|^{2} d x \geq \frac{1}{2} \int_{\Omega}|\nabla u|^{2} d x, \quad \forall u \in V_{0}^{p} \tag{2.11}
\end{gather*}
$$

## 3 Existence results

We assume that the function $\mu$ defined on $\mathbb{R} \times \mathbb{R}^{3} \times \mathbb{R}_{+}$is such that

$$
\begin{gather*}
\exists \mu_{0}, \mu_{1} \in \mathbb{R} ; \quad 0<\mu_{0} \leq \mu(t, u, s) \leq \mu_{1}, \quad \forall(t, u, s) \in \mathbb{R} \times \mathbb{R}^{3} \times \mathbb{R}_{+},  \tag{3.1}\\
\text {the } \text { function } s \mapsto \mu(., ., s) \quad \text { is monotone on } \mathbb{R}_{+} \tag{3.2}
\end{gather*}
$$

### 3.1 First intermediate problem

From the variational inequality (2.1), we obtain the following intermediate problem
Problem 3.1. For given $\theta \in W_{\Gamma_{1} \cup \Gamma_{L}}^{1, q}(\Omega)$ and $f \in\left(W^{1, p}(\Omega)\right)^{3}$, we look for $v \in V_{d i v}^{p}$ satisfying the following variational inequality

$$
\begin{equation*}
a(\theta, v, \varphi-v)+j(\varphi)-j(v) \geq(f, \varphi-v), \quad \forall \varphi \in V_{d i v}^{q} \tag{3.3}
\end{equation*}
$$

To solve this problem we will use the Nonlinear Operators Theory [18]. We define the operator

$$
\begin{equation*}
A: V_{\Gamma_{1}}^{p} \rightarrow\left(V_{\Gamma_{1}}^{p}\right)^{\prime} \quad \text { by } \quad\langle A(v), \varphi\rangle=a(\theta, v, \varphi) \tag{3.4}
\end{equation*}
$$

where $\langle.,$.$\rangle is the duality brackets between \left(V_{\Gamma_{1}}^{p}\right)^{\prime}$ and $V_{\Gamma_{1}}^{p}$, and we denote by $\Lambda_{V_{d i v}}$ the characteristic function of $V_{d i v}^{p}$,

$$
\Lambda_{V_{d i v}}(u)=0 \quad \text { if } \quad u \in V_{d i v}^{p}, \quad \text { and } \quad \Lambda_{V_{d i v}}(u)=+\infty \quad \text { if } \quad u \notin V_{d i v}^{p}
$$

Then the variational inequality (3.3) becomes,

$$
\begin{equation*}
\langle A(v), \varphi-v\rangle+j(\varphi)+\Lambda_{V_{d i v}}(\varphi)-j(v)-\Lambda_{V_{d i v}}(v) \geq(f, \varphi-v), \forall \varphi \in V_{\Gamma_{1}}^{q} \tag{3.5}
\end{equation*}
$$

Lemma 3.1. The operator $A$ defined by (3.4) is bounded, hemicontinuous and monotone on $V_{\Gamma_{1}}^{p}$.
Proof. For any $v \in V_{\Gamma_{1}}^{p}$ and $\varphi \in V_{\Gamma_{1}}^{q}$, we have

$$
|\langle A(v), \varphi\rangle|=\left|\int_{\Omega} 2 \mu(\theta, v,|D(v)|) d_{i j}(v) \partial_{j} \varphi_{i} d x\right| \leq 2 \mu_{1}\left|\int_{\Omega} d_{i j}(v) d_{i j}(\varphi) d x\right|
$$

using Hölder's and Minkowski's inequalities, and (3.1), we get

$$
\begin{aligned}
|\langle A(v), \varphi\rangle| & \leq 2 \mu_{1} \int_{\Omega}\left(\sum_{i, j=1}^{3}\left|d_{i j}(v)\right|^{p}\right)^{\frac{1}{p}}\left(\sum_{i, j=1}^{3}\left|d_{i j}(\varphi)\right|^{q}\right)^{\frac{1}{q}} d x \\
& \leq 2 \mu_{1} \int_{\Omega}\left(\sum_{i, j=1}^{3}\left|\partial_{j} v_{i}\right|^{p}\right)^{\frac{1}{p}}\left(\sum_{i, j=1}^{3}\left|\partial_{j} \varphi_{i}\right|^{q}\right)^{\frac{1}{q}} d x
\end{aligned}
$$

so
$|\langle A(v), \varphi\rangle| \leq 2 \mu_{1}\left(\int_{\Omega}|\nabla v|^{p} d x\right)^{\frac{1}{p}}\left(\int_{\Omega}|\nabla \varphi|^{q} d x\right)^{\frac{1}{q}} \leq 2 \mu_{1}\|v\|_{1, p}\|\varphi\|_{1, q} \quad \forall(v, \varphi) \in V_{\Gamma_{1}}^{p} \times V_{\Gamma_{1}}^{q}$,
then $A$ is bounded.
We show that $A$ is hemicontinuous. For this, we prove that for any $u, v, w \in V_{\Gamma_{1}}^{p}$, the function

$$
\alpha: \mathbb{R} \rightarrow \mathbb{R}, \quad \alpha(t)=\langle A(u+t v), w\rangle
$$

is continuous. We have

$$
\alpha(t)=\int_{\Omega} 2 \mu(\theta, u+t v,|D(u+t v)|) D(u+t v): D(w) d x
$$

The function

$$
t \mapsto s(t)=2 \mu(\theta, u+t v,|D(u+t v)|) D(u+t v): D(w)
$$

is obviously continuous on $\mathbb{R}$. Let $\left(t_{n}\right)$ be a sequence converging to $t$ in $\mathbb{R}$. Then $s_{n}:=s\left(t_{n}\right) \in L^{1}(\Omega)$ and $\left(s_{n}\right)$ converges to $s(t)$ when $n$ goes to $+\infty$.
The sequence $\left(t_{n}\right)$ is bounded, so there exists $M>0$ such that $\left|t_{n}\right|<M, \forall n \geq 0$.
Then we have

$$
\left|s_{n}\right| \leq g:=2 \mu_{1}(|D(u)||D(w)|+M|D(v)||D(w)|)
$$

Since $g \in L^{1}(\Omega)$ and is positive, by Dominated Convergence Theorem, we deduce that $s(t) \in L^{1}(\Omega)$ and

$$
\lim _{n \longrightarrow+\infty} \int_{\Omega} s_{n} d x=\int_{\Omega} s(t) d x
$$

that is

$$
\lim _{n \longrightarrow+\infty} \alpha\left(t_{n}\right)=\alpha(t)
$$

This shows that $A$ is hemicontinuous. For the monotonicity of $A$, we establish that,

$$
\langle A(u)-A(v), u-v\rangle \geq 0, \quad \forall u, v \in V_{\Gamma_{1}}^{p}
$$

We have,

$$
\langle A(u)-A(v), u-v\rangle=2 \int_{\Omega}\left[\mu(\theta, u,|D(u)|) d_{i j}(u)-\mu(\theta, v,|D(v)|) d_{i j}(v)\right] \partial_{j}\left(u_{i}-v_{i}\right) d x
$$

we have also

$$
\begin{aligned}
\langle A(u)-A(v), u-v\rangle & =\int_{\Omega} 2 \mu(\theta, u,|D(u)|) d_{i j}(u) \partial_{j} u_{i} d x+\int_{\Omega} 2 \mu(\theta, v,|D(v)|) d_{i j}(v) \partial_{j} v_{i} d x \\
& -\int_{\Omega} 2 \mu(\theta, u,|D(u)|) d_{i j}(u) \partial_{j} v_{i} d x-\int_{\Omega} 2 \mu(\theta, v,|D(v)|) d_{i j}(v) \partial_{j} u_{i} d x
\end{aligned}
$$

By the fact that

$$
d_{i j}(u) \partial_{j} v_{i}=d_{i j}(u) d_{i j}(v)=D(u): D(v) \leq|D(u)||D(v)|
$$

we obtain

$$
\begin{aligned}
\langle A(u)-A(v), u-v\rangle & \geq \int_{\Omega} 2 \mu(\theta, u,|D(u)|)|D(u)|^{2} d x+\int_{\Omega} 2 \mu(\theta, v,|D(v)|)|D(v)|^{2} d x \\
& -2 \int_{\Omega}(\mu(\theta, u,|D(u)|)+\mu(\theta, v,|D(v)|))|D(u)||D(v)| d x
\end{aligned}
$$

Now since, $2|D(u)||D(v)| \leq|D(u)|^{2}+|D(v)|^{2}$ we get
$\langle A(u)-A(v), u-v\rangle \geq \int_{\Omega}(\mu(\theta, u,|D(u)|)-\mu(\theta, v,|D(v)|))\left(|D(u)|^{2}-|D(v)|^{2}\right) d x$.
Using (3.2), we deduce that

$$
\langle A(u)-A(v), u-v\rangle \geq 0 \quad \forall u, v \in u, v \in V_{\Gamma_{1}}^{p}
$$

That is $A$ is monotone.
Now we are in position to give the existence Theorem for Problem 3.1.
Theorem 3.1. Assume that (3.1) and (3.2) are satisfied, $f \in\left(W^{1, p}(\Omega)\right)^{3}$ and $0 \leq k \in$ $L^{p}(\omega)$, then for fixed $\theta$ in $W_{\Gamma_{1} \cup \Gamma_{L}}^{1, q}(\Omega)$ there exists $v_{\theta} \in V_{d i v}^{p}$ solution of (3.3).

Proof. From Lemma 3.1, we conclude that the operator $A$ is pseudo-monotone. The function $v \mapsto j(v)+\Lambda_{V_{\text {div }}}(v)$ is convex, proper and lower semi-continuous. Let us check the coercivity condition, that is

$$
\exists v^{*} \in V_{\Gamma_{1}}^{p} \quad \text { such } \quad \text { that } \quad j\left(v^{*}\right)+\Lambda_{V_{d i v}}\left(v^{*}\right)<+\infty
$$

and

$$
\lim _{\|v\|_{1, p} \rightarrow+\infty} \frac{\left\langle A(v), v-v^{*}\right\rangle+j(v)+\Lambda_{V_{d i v}}(v)}{\|v\|_{1, p}}=+\infty .
$$

We choose $v^{*}=G$, and observe, from their explicit expressions, that

$$
\begin{equation*}
\text { if } \lim _{\|v\|_{1, p} \rightarrow \infty} \frac{\langle A(v-G), v-G\rangle}{\|v\|_{1, p}}=+\infty \quad \text { then } \quad \lim _{\|v\|_{1, p} \rightarrow \infty} \frac{\langle A(v), v-G\rangle}{\|v\|_{1, p}}=+\infty \tag{3.6}
\end{equation*}
$$

Indeed

$$
\begin{aligned}
\langle A(v-G), v-G\rangle & =2 \int_{\Omega} \mu(\theta, v-G,|D(v-G)|)\left(|D(v)|^{2}-2 D(v): D(G)\right) d x \\
& +2 \int_{\Omega} \mu(\theta, v-G,|D(v-G)|)|D(G)|^{2} d x
\end{aligned}
$$

and

$$
\langle A(v), v-G\rangle=2 \int_{\Omega} \mu(\theta, v,|D(v)|)\left(|D(v)|^{2}-D(v): D(G)\right) d x
$$

Now since the function $\mu$ is positive and bounded on $\mathbb{R} \times \mathbb{R}^{3} \times \mathbb{R}_{+}$and $\|G\|_{1,2}^{2}\|v\|_{1, p}^{-1} \rightarrow 0$ when $\|v\|_{1, p} \rightarrow \infty$, (3.6) follows. Then we can use here $\langle A(v-G), v-G\rangle$ instead of $\langle A(v), v-G\rangle$. For $v \in V_{\Gamma_{1}}^{p}$, by positivity of the function $j+\Lambda_{V_{d i v}}$ and (3.1) we obtain

$$
\langle A(v-G), v-G\rangle+j(v)+\Lambda_{V_{d i v}}(v) \geq 2 \mu_{0} \int_{\Omega}|D(v-G)|^{2} d x
$$

We have $v-G \in V_{0}^{p}$ then by (2.11), we get

$$
\langle A(v-G), v-G\rangle+j(v)+\Lambda_{V_{d i v}}(v) \geq \mu_{0}\|v-G\|_{1,2}^{2}
$$

and by Cauchy-Schwarz inequality

$$
\mu_{0}\|v-G\|_{1,2}^{2} \geq \mu_{0}\|v\|_{1,2}^{2}-2 \mu_{0}\|v\|_{1,2}\|G\|_{1,2}+\mu_{0}\|G\|_{1,2}^{2}
$$

so, we obtain

$$
\begin{equation*}
\frac{\langle A(v-G), v-G\rangle+j(v)+\Lambda_{V_{d i v}}(v)}{\|v\|_{1, p}} \geq \mu_{0}\left(\|v\|_{1,2} \frac{\|v\|_{1,2}}{\|v\|_{1, p}}-2\|G\|_{1,2} \frac{\|v\|_{1,2}}{\|v\|_{1, p}}+\frac{\|G\|_{1,2}^{2}}{\|v\|_{1, p}}\right) \tag{3.7}
\end{equation*}
$$

By the continuity of the embedding $V_{\Gamma_{1}}^{p} \subset V_{\Gamma_{1}}^{2}$, we deduce that there exists a constant $c>0$ depending only on $\Omega$ and $p$ such that $\|v\|_{1,2} \leq c\|v\|_{1, p}$. Letting $\|v\|_{1,2} \rightarrow \infty$, then $\|v\|_{1, p} \rightarrow \infty$ and we have

$$
\begin{equation*}
\lim _{\|v\|_{1,2} \rightarrow+\infty} \frac{\|v\|_{1,2}}{\|v\|_{1, p}} \neq 0 \tag{3.8}
\end{equation*}
$$

indeed, for $v \in V_{\Gamma_{1}}^{p}$ and $v \neq 0$, set $w=v\|v\|_{1, p}^{-1}$ then

$$
\begin{equation*}
\|w\|_{1, p}=1 \tag{3.9}
\end{equation*}
$$

But

$$
\lim _{\|v\|_{1,2} \rightarrow+\infty} \frac{\|v\|_{1,2}}{\|v\|_{1, p}}=0 \Longrightarrow \lim _{\|v\|_{1,2} \rightarrow+\infty}\|w\|_{1,2}=0
$$

This is a contradition with (3.9), so (3.8) holds. Now by letting $\|v\|_{1,2} \rightarrow \infty$, we get $\|v\|_{1, p} \rightarrow \infty$ and we can deduce, by (3.8), that the right side hand of (3.7) tends to $+\infty$. consequently

$$
\frac{\langle A(v-G), v-G\rangle+j(v)+\Lambda_{V_{d i v}}(v)}{\|v\|_{1, p}} \rightarrow+\infty
$$

So by (3.6),

$$
\frac{\langle A(v), v-G\rangle+j(v)+\Lambda_{V_{d i v}}(v)}{\|v\|_{1, p}} \rightarrow+\infty
$$

This shows that the coercivity condition is satisfied. Applying Theorem 8.5 chap. 2 in [18], we conclude that (3.5) and hence (3.3) admits a solution $v_{\theta}$ in the space $V_{d i v}^{p}$.

Before stating the existence Theorem of the pressure we need to prove the following lemma.

Lemma 3.2. The solution $v_{\theta}$ of Problem 3.1 is bounded in $V_{d i v}^{p}$ independently of the temperature $\theta$.
Proof. As $v_{\theta}$ satisties the following variational inequality

$$
a\left(\theta, v_{\theta}, \varphi-v_{\theta}\right)+j(\varphi)-j\left(v_{\theta}\right) \geq\left(f, \varphi-v_{\theta}\right), \quad \forall \varphi \in V_{d i v}^{q}
$$

by taking $\varphi=G \in V_{d i v}^{p} \subset V_{d i v}^{q}$, we get

$$
\begin{equation*}
\left\langle A\left(v_{\theta}\right), v_{\theta}-G\right\rangle \leq\left(f, v_{\theta}\right)-(f, G)+j(G) \tag{3.10}
\end{equation*}
$$

because $j$ is positive. Remark that we can write

$$
\begin{aligned}
\left\langle A\left(v_{\theta}\right), v_{\theta}-G\right\rangle & =2 \int_{\Omega} \mu\left(\theta, v_{\theta},\left|D\left(v_{\theta}\right)\right|\right) d_{i j}\left(v_{\theta}-G\right) \partial_{j}\left(v_{\theta}^{i}-G_{i}\right) d x \\
& +2 \int_{\Omega} \mu\left(\theta, v_{\theta},\left|D\left(v_{\theta}\right)\right|\right) d_{i j}(G) \partial_{j}\left(v_{\theta}^{i}-G_{i}\right) d x
\end{aligned}
$$

where $v_{\theta}^{i}$ is the i-th component of $v_{\theta}$. Then

$$
\begin{align*}
\left\langle A\left(v_{\theta}\right), v_{\theta}-G\right\rangle & =2 \int_{\Omega} \mu\left(\theta, v_{\theta},\left|D\left(v_{\theta}\right)\right|\right)\left(\left|D\left(v_{\theta}-G\right)\right|^{2}+D(G): D\left(v_{\theta}\right)\right) d x \\
& -2 \int_{\Omega} \mu\left(\theta, v_{\theta},\left|D\left(v_{\theta}\right)\right|\right)|D(G)|^{2} d x \tag{3.11}
\end{align*}
$$

Now from (3.1), (3.10), (3.11), (2.11), (2.10) and Hölder's inequality we get

$$
\begin{aligned}
\mu_{0}\left\|v_{\theta}-G\right\|_{1,2}^{2} & \leq 2 \mu_{1}\left\|v_{\theta}\right\|_{1,2}\|G\|_{1,2}+\|f\|_{W^{1, p}}\left\|v_{\theta}\right\|_{1, q} \\
& +2 \mu_{1}\|G\|_{1,2}^{2}+\|f\|_{W^{1, p}}\|G\|_{1, q}+j(G),
\end{aligned}
$$

hence

$$
\begin{align*}
\mu_{0}\left\|v_{\theta}\right\|_{1,2}^{2} \leq 2\left(\mu_{0}+\mu_{1}\right)\left\|v_{\theta}\right\|_{1,2}\|G\|_{1,2} & +\|f\|_{W^{1, p}}\left\|v_{\theta}\right\|_{1, q}+2 \mu_{1}\|G\|_{1,2}^{2} \\
& +\|f\|_{W^{1, p}}\|G\|_{1, q}+j(G) . \tag{3.12}
\end{align*}
$$

From the continuous embedding $V_{\Gamma_{1}}^{2} \subset V_{\Gamma_{1}}^{q}$, there exists a positive constant $\beta$ such that,

$$
\left\|v_{\theta}\right\|_{1, q} \leq \beta\left\|v_{\theta}\right\|_{1,2} .
$$

Then (3.12) becomes

$$
\begin{align*}
\mu_{0}\left\|v_{\theta}\right\|_{1,2}^{2} \leq 2\left(\mu_{0}+\mu_{1}\right)\left\|v_{\theta}\right\|_{1,2}\|G\|_{1,2} & +\beta\|f\|_{W^{1, p}}\left\|v_{\theta}\right\|_{1,2}+2 \mu_{1}\|G\|_{1,2}^{2} \\
& +\|f\|_{W^{1, p}}\|G\|_{1, q}+j(G) . \tag{3.13}
\end{align*}
$$

By (3.13) we deduce that there exists a positive constant $C$ independent of $\theta$ such that

$$
\begin{equation*}
\left\|v_{\theta}\right\|_{1,2} \leq C . \tag{3.14}
\end{equation*}
$$

Indeed, on the contrary, by dividing the two sides of (3.13) by $\left\|v_{\theta}\right\|_{1,2}^{2}$ and letting $\left\|v_{\theta}\right\|_{1,2} \rightarrow+\infty$ we obtain $\mu_{0} \leq 0$. This is a contradiction because $\mu_{0}>0$, then (3.14) holds.

By (3.8), $\left\|v_{\theta}\right\|_{1,2}^{-1}\left\|v_{\theta}\right\|_{1, p}$ is bounded for $\left\|v_{\theta}\right\|_{1,2}$ large enough, so it follows from (3.14), the existence of a positive constant $C^{\prime}$ independent of $\theta$ such that

$$
\begin{equation*}
\left\|v_{\theta}\right\|_{1, p} \leq C^{\prime} . \tag{3.15}
\end{equation*}
$$

The lemma is proved.
Theorem 3.2. Under the assumptions of Theorem 3.1, there exists a unique $\pi \in L_{0}^{p}(\Omega)$ satisfying equation (2.1).

Proof. Let $v_{\theta}$ be the solution of (3.3). By taking $\varphi=v_{\theta} \pm \phi$, for all $\phi \in V_{0, d i v}^{q}$, we obtain from (3.3) the following variational equation,

$$
\begin{equation*}
a\left(\theta, v_{\theta}, \phi\right)=(f, \phi), \quad \forall \phi \in V_{0, d i v}^{q} \tag{3.16}
\end{equation*}
$$

Consider the linear form $F$ defined on $V_{0}^{q}$ by

$$
F(\phi)=a\left(\theta, v_{\theta}, \phi\right)-(f, \phi)
$$

We prove that $F$ is continuous on $V_{0}^{q}$. For all $\phi$ in $V_{0}^{q}$ we have

$$
|F(\phi)| \leq 2|\Omega|^{\frac{p-2}{p}} \mu_{1}\left\|v_{\theta}\right\|_{1, p}\|\phi\|_{1, p}+|\Omega|^{\frac{p-2}{p}}\|f\|_{1, p}\|\phi\|_{1, q},
$$

by Lemma 3.2 we have (3.15) so

$$
|F(\phi)| \leq|\Omega|^{\frac{p-2}{p}}\left(2 \mu_{1} C^{\prime}+\|f\|_{1, p}\right)\|\phi\|_{1, q}
$$

This shows the continuity of $F$, and that $F \in W^{-1, p}(\Omega)$. And since

$$
F(\phi)=0, \quad \forall \phi \in V_{0, d i v}^{q}
$$

by De Rham's Theorem in [1] page 116, we deduce the existence of a unique $\pi \in L_{0}^{p}(\Omega)$, such that

$$
F(\phi)=\langle\nabla \pi, \phi\rangle \quad \forall \phi \in V_{0}^{q},
$$

using Green's formula we deduce that

$$
2 \operatorname{div}\left(\mu\left(\theta, v_{\theta},\left|D\left(v_{\theta}\right)\right|\right) D\left(v_{\theta}\right)+f=\nabla \pi\right.
$$

By multiplying this equality by $\varphi \in V^{q}$ and using Green's formula again, we deduce that $\left(v_{\theta}, \pi\right) \in V_{d i v}^{p} \times L_{0}^{p}(\Omega)$ satisfies (2.1).

### 3.2 Second intermediate problem

Recall that the temperature satisfies the variational equation (2.2) with (2.3) and (2.4). We assume that the function $K$ is also such that

$$
\begin{equation*}
\exists k_{0}, k_{1} \in \mathbb{R} ; \quad 0<k_{0} \leq K(x) \leq k_{1}, \quad \forall x \in \Omega \tag{3.17}
\end{equation*}
$$

In fact we must take $p \geq 4$ and seek the solution $\theta$ in the subspace $H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$ of $W_{\Gamma_{1} \cup \Gamma_{L}}^{1, q}(\Omega)$, this choice will be justified below in the proof of Theorem 3.4. Let us consider the second intermediate problem.

Problem 3.2. For given $v \in V_{d i v}^{p}$, find $\theta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$ solution of the equation,

$$
\begin{equation*}
B(\theta, \psi)=L(\theta, \psi), \quad \forall \psi \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega) \tag{3.18}
\end{equation*}
$$

Remark that, from (2.3), $L$ depends on $v$. To study this nonlinear problem we consider first the following corresponding linearized problem.
Problem 3.3. For given $v \in V_{d i v}^{p}$ and $\eta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$, find $\theta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$ solution of the equation,

$$
\begin{equation*}
B(\theta, \psi)=L(\eta, \psi), \quad \forall \psi \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega) . \tag{3.19}
\end{equation*}
$$

Theorem 3.3. Assume that $p \geq 4$, (3.17) and the assumptions of Theorem 3.1 hold. Then for $\eta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega), v \in V_{d i v}^{p}, \theta_{\omega} \in L^{2}(\omega)$ and $r \in L^{\infty}(\mathbb{R})$, there exists a unique $\theta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$ solution for (3.19).
Proof. The bilinear form $B$ is continuous on $H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega) \times H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$. Indeed, by (3.17) and since $v \in V_{d i v}^{p} \subset\left(L^{\infty}(\Omega)\right)^{3}$, there exists $M>0$ such that

$$
|B(\theta, \psi)| \leq k_{1}\|\theta\|_{1,2}\|\psi\|_{1,2}+M\|\theta\|_{1,2}\|\psi\|_{2} .
$$

Using the Poincaré's inequality we get, for some positive constant $C$,

$$
|B(\theta, \psi)| \leq\left(k_{1}+M C\right)\|\theta\|_{1,2}\|\psi\|_{1,2} .
$$

This shows the continuity of the form $B$. Let us prove that $B$ is coercive. We have, for any $\theta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$,

$$
B(\theta, \theta)=\int_{\Omega} K(x)|\nabla \theta|^{2} d x+\int_{\Omega} \theta v_{i} \partial_{i} \theta d x \geq k_{0} \int_{\Omega}|\nabla \theta|^{2} d x+\int_{\Omega} \frac{1}{2} v_{i} \partial_{i}\left(\theta^{2}\right) d x
$$

By Green's formula, we obtain

$$
\begin{equation*}
\vartheta:=\int_{\Omega} v_{i} \partial_{i}\left(\theta^{2}\right) d x=\int_{\partial \Omega} \theta^{2} v_{i} n_{i} d s-\int_{\Omega} \theta^{2} \partial_{i} v_{i} d x \tag{3.20}
\end{equation*}
$$

Since $\theta=0$ on $\Gamma_{1} \cup \Gamma_{L}$, n.v $=0$ on $\omega$ and $\operatorname{div}(v)=0$ in $\Omega$ we deduce that $\vartheta=0$, and then

$$
B(\theta, \theta) \geq k_{0}\|\theta\|_{1,2}^{2}, \quad \forall \theta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega) .
$$

The coercivity of $B$ follows. We prove that the linear form $L(\eta,$.$) is continuous on$ $H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$. Let $\psi \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$, by the continuous embedding $H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega) \subset L^{2}(\omega)$ we obtain

$$
|L(\eta, \psi)| \leq 2 \mu_{1} \int_{\Omega}|D(v)|^{2}|\psi| d x+C \int_{\Omega}|\psi| d x+\int_{\omega}\left|\theta_{\omega}\right||\psi| d x^{\prime}
$$

and by Poincaré's and Hölder's inequalities, we obtain

$$
|L(\eta, \psi)| \leq\left[2 \mu_{1} C_{1}|\Omega|^{\frac{p-4}{2 p}}\|D(v)\|_{p}^{2}+C_{2}|\Omega|^{\frac{1}{2}}+C_{3}\left\|\theta_{\omega}\right\|_{L^{2}(\omega)}\right]\|\psi\|_{1,2} .
$$

As $p \geq 4$, this proves the continuity of $L(\eta,$.$) , and by Lax-Milgram Theorem, we deduce$ that there exists a unique $\theta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$ solution of the linearized problem 3.3.

In the following theorem we prove only the existence of at least one solution to the intermediate Problem 3.2.

Theorem 3.4. Let $\theta_{\omega} \in L^{2}(\omega)$ and $r \in L^{\infty}(\mathbb{R})$. Assume that functions $r$ and $t \mapsto$ $\mu(t, .,$.$) are Lipschitzian. Then with the same assumptions as Theorem 3.3, there exists$ at least one $\theta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$ solution to the intermediate Problem 3.2.

Proof. For $\eta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$, Theorem 3.3 ensures the existence and the uniqueness of $\theta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$ solution of the linearized problem (3.19). Then we can define the operator

$$
\begin{align*}
T: H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega) & \rightarrow H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega) \\
\eta & \mapsto T(\eta)=\theta \tag{3.21}
\end{align*}
$$

where $\theta$ is the unique solution of the linear problem 3.3.
We establish that $T$ is completely continuous. For given $\eta_{1}\left(\right.$ resp. $\eta_{2}$ ) in $H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$, we associate $T\left(\eta_{1}\right)$ (resp. $T\left(\eta_{2}\right)$ ), the solution of the equation (3.19). By substraction we obtain,

$$
\begin{equation*}
B\left(T\left(\eta_{1}\right)-T\left(\eta_{2}\right), \psi\right)=L\left(\eta_{1}, \psi\right)-L\left(\eta_{2}, \psi\right), \quad \forall \psi \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega) \tag{3.22}
\end{equation*}
$$

By taking $\psi=T\left(\eta_{1}\right)-T\left(\eta_{2}\right)$ in (3.22) we get

$$
\begin{equation*}
\int_{\Omega} K(x)\left|\nabla\left(T\left(\eta_{1}\right)-T\left(\eta_{2}\right)\right)\right|^{2} d x+P=Q+R \tag{3.23}
\end{equation*}
$$

where

$$
\begin{aligned}
P & =\int_{\Omega}\left(T\left(\eta_{1}\right)-T\left(\eta_{2}\right)\right) v_{i} \partial_{i}\left(T\left(\eta_{1}\right)-T\left(\eta_{2}\right)\right) d x \\
Q & =2 \int_{\Omega}\left[\mu\left(\eta_{1}, v,|D(v)|\right)-\mu\left(\eta_{2}, v,|D(v)|\right)\right]\left[T\left(\eta_{1}\right)-T\left(\eta_{2}\right)\right]|D(v)|^{2} d x
\end{aligned}
$$

and

$$
R=\int_{\Omega}\left[r\left(\eta_{1}\right)-r\left(\eta_{2}\right)\right]\left[T\left(\eta_{1}\right)-T\left(\eta_{2}\right)\right] d x
$$

Let us evaluate the terms $P, Q$ and $R$. By using the same arguments as in (3.20) we get

$$
\begin{equation*}
P=\frac{1}{2} \int_{\Omega} v_{i} \partial_{i}\left[\left(T\left(\eta_{1}\right)-T\left(\eta_{2}\right)\right)^{2}\right] d x=\frac{1}{2} \int_{\Omega} v_{i} \partial_{i}\left[\left(\theta_{1}-\theta_{2}\right)^{2}\right] d x=0 \tag{3.24}
\end{equation*}
$$

For the trem $Q$ we write,

$$
\begin{equation*}
|Q| \leq 2 C_{\mu} \int_{\Omega}\left|\eta_{1}-\eta_{2}\right|\left|T\left(\eta_{1}\right)-T\left(\eta_{2}\right)\right||D(v)|^{2} d x \tag{3.25}
\end{equation*}
$$

where $C_{\mu}$ is the Lipschitz constant of the function $t \mapsto \mu(t, \ldots)$.
Note here that if we took $\theta$ and $\eta$ in $W_{\Gamma_{1} \cup \Gamma_{L}}^{1, q}(\Omega)$, the integrand in (3.25) would not be necessairily in $L^{1}(\Omega)$, this forced us to take $H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$ instead of $W_{\Gamma_{1} \cup \Gamma_{L}}^{1, q}(\Omega)$.

Now we know from Rellich-Kondrachov Theorem that $H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$ is compactly embedded in $L^{4}(\Omega)$. Then by taking $\eta_{i}$ and $T\left(\eta_{i}\right)$ in $L^{4}(\Omega)$ we get

$$
|Q| \leq 2|\Omega|^{\frac{p-4}{2 p}} C_{\mu}\left\|\eta_{1}-\eta_{2}\right\|_{4}\left\|T\left(\eta_{1}\right)-T\left(\eta_{2}\right)\right\|_{4}\|D(v)\|_{p}^{2}
$$

Again by the compact embedding $H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega) \subset L^{4}(\Omega)$, there exists a positive constant $C^{\prime}$ depending only on $\Omega$ such that

$$
\begin{equation*}
|Q| \leq 2|\Omega|^{\frac{p-4}{2 p}} C_{\mu} C^{\prime}\left\|\eta_{1}-\eta_{2}\right\|_{1,2}\left\|T\left(\eta_{1}\right)-T\left(\eta_{2}\right)\right\|_{1,2}\|D(v)\|_{p}^{2} \tag{3.26}
\end{equation*}
$$

Finally by Hölder's and Poincaré's inequalities we have

$$
\begin{equation*}
|R| \leq C_{r}\left\|\eta_{1}-\eta_{2}\right\|_{2}\left\|T\left(\eta_{1}\right)-T\left(\eta_{2}\right)\right\|_{2} \leq C_{P} C_{r}\left\|\eta_{1}-\eta_{2}\right\|_{1,2}\left\|T\left(\eta_{1}\right)-T\left(\eta_{2}\right)\right\|_{1,2}, \tag{3.27}
\end{equation*}
$$

where $C_{P}$ and $C_{r}$ are respectively Poincarés constant and Lipschitz's constant of the function $r$. Now by (3.17), (3.23), (3.24), (3.26) and (3.27) we obtain
$k_{0}\left\|T\left(\eta_{1}\right)-T\left(\eta_{2}\right)\right\|_{1,2}^{2} \leq\left(2|\Omega|^{\frac{p-4}{2 p}} C_{\mu} C^{\prime}\|D(v)\|_{p}^{2}+C_{P} C_{r}\right)\left\|\eta_{1}-\eta_{2}\right\|_{1,2}\left\|T\left(\eta_{1}\right)-T\left(\eta_{2}\right)\right\|_{1,2}$, and then

$$
k_{0}\left\|T\left(\eta_{1}\right)-T\left(\eta_{2}\right)\right\|_{1,2} \leq\left(2|\Omega|^{\frac{p-4}{2 p}} C_{\mu} C^{\prime}\|D(v)\|_{p}^{2}+C_{P} C_{r}\right)\left\|\eta_{1}-\eta_{2}\right\|_{1,2}
$$

This proves that the operator $T$ is Lipschitzian. Let us now show that $T$ is bounded in $H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$. We know that for $\eta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega), T(\eta)$ is solution of (3.19), that is

$$
B(T(\eta), \psi)=L(\eta, \psi), \quad \forall \psi \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega) .
$$

By taking $\psi=T(\eta)$, and using (3.2) and (3.17) we obtain

$$
k_{0} \int_{\Omega}|\nabla T(\eta)|^{2} d x \leq 2 \mu_{1} \int_{\Omega}|D(v)|^{2}|T(\eta)| d x+r_{1} \int_{\Omega}|T(\eta)| d x+\int_{\omega}\left|\theta_{\omega}\right||T(\eta)| d x
$$

where $r_{1}=\operatorname{ess} \sup \{r(t), t \in \mathbb{R}\}$. From the continuous embedding $H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega) \subset L^{2}(\omega)$, there exists a positive constant $C^{\prime \prime}$ independent of $\eta$ such that

$$
\|T(\eta)\|_{L^{2}(\omega)} \leq C^{\prime \prime}\|T(\eta)\|_{1,2},
$$

and by Hölder's and Poincaré's inequalities, we get

$$
\begin{align*}
k_{0}\|T(\eta)\|_{1,2}^{2} & \leq 2|\Omega|^{\frac{p-4}{2 p}} \mu_{1} C_{p}\|D(v)\|_{p}^{2}\|T(\eta)\|_{1,2} \\
& +r_{1} C_{p}\|T(\eta)\|_{1,2}+C^{\prime \prime}\left\|\theta_{\omega}\right\|_{L^{2}(\omega)}\|T(\eta)\|_{1,2} \tag{3.28}
\end{align*}
$$

The boundedness of $T$ follows from (3.28), $\|T(\eta)\|_{1,2} \leq C^{*}$, where

$$
C^{*}=k_{0}^{-1}\left(2|\Omega|^{\frac{p-4}{2 p}} \mu_{1} C_{p}\|D(v)\|_{p}^{2}+C^{\prime \prime}\left\|\theta_{\omega}\right\|_{L^{2}(\omega)}+C_{p} r_{1}\right) .
$$

Now according to Schauder Fixed Point Theorem we deduce that the operator $T$ has at least one fixed point $\theta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$, solution of the variational problem (3.2).

In the following theorem, we prove the uniqueness of the solution to the intermediate Problem 3.2.

Theorem 3.5. Let $\theta_{\omega} \in L^{2}(\omega)$ and $r \in L^{\infty}(\mathbb{R})$. Assume that functions $r$ and $t \mapsto$ $\mu(t, .,$.$) are Lipschitzian and nonincreasing. So with the same assumptions as in Theo-$ rem 3.3, the solution of the intermediate Problem 3.2 is unique.

Proof. Indeed, suppose in contrary that there exist two solutions $\theta_{1}$ and $\theta_{2}$ for (3.2). By substracting, we obtain for all $\psi \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$,

$$
\begin{align*}
\int_{\Omega} K(x) \nabla \Theta \cdot \nabla \psi d x+\int_{\Omega} \psi v_{i} \partial_{i} \Theta d x & =2 \int_{\Omega}\left[\mu\left(\theta_{1}, v,|D(v)|\right)-\mu\left(\theta_{2}, v,|D(v)|\right)\right]|D(v)|^{2} \psi d x \\
& +\int_{\Omega}\left(r\left(\theta_{1}\right)-r\left(\theta_{2}\right)\right) \psi d x \tag{3.29}
\end{align*}
$$

where $\Theta=\theta_{1}-\theta_{2}$. Now we use the real function $f_{\delta}$ (see eg $[10,14]$ ) defined for $\delta>0$ by

$$
f_{\delta}(t)=\left\{\begin{array}{cc}
\left(1-\frac{\delta}{t}\right)^{+} & \text {if } \quad t>0 \\
0 & \text { if } \quad t \leq 0
\end{array}\right.
$$

with $A^{+}=\max (A, 0)$. As $\Theta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$ then $f_{\delta}(\Theta) \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$ and

$$
\nabla f_{\delta}(\Theta)=\frac{\delta}{\Theta^{2}} \chi_{[\Theta>\delta]} \nabla \Theta
$$

here $\chi_{[\Theta>\delta]}$ is the indicator function of the set $[\Theta>\delta]=\{x \in \Omega, \quad \Theta(x)>\delta\}$, that is

$$
\chi_{[\Theta>\delta]}(x)=1 \quad \text { if } \quad \Theta(x)>\delta, \quad \chi_{[\Theta>\delta]}(x)=0 \quad \text { if } \quad \Theta(x) \leq \delta .
$$

As $\psi=0$ on $\Gamma_{1} \cup \Gamma_{L}$, v.n $=0$ on $\omega$ and $\operatorname{div}(v)=0$ in $\Omega$, we have

$$
\begin{equation*}
\int_{\Omega} \psi v_{i} \partial_{i} \Theta d x=-\int_{\Omega} \Theta v \cdot \nabla \psi d x . \tag{3.30}
\end{equation*}
$$

Taking $\psi=f_{\delta}(\Theta)$ in (3.29) and using (3.30) we get

$$
\begin{align*}
\delta \int_{\Omega \cap[\Theta>\delta]} K(x)\left|\frac{\nabla \Theta}{\Theta}\right|^{2} d x & =2 \int_{\Omega \cap[\Theta>\delta]} \frac{\mu\left(\theta_{1}, v,|D(v)|\right)-\mu\left(\theta_{2}, v,|D(v)|\right)}{\theta_{1}-\theta_{2}}|D(v)|^{2}(\Theta-\delta) d x \\
& +\int_{\Omega \cap[\Theta>\delta]} \frac{r\left(\theta_{1}\right)-r\left(\theta_{2}\right)}{\theta_{1}-\theta_{2}}(\Theta-\delta) d x+\delta \int_{\Omega \cap[\Theta>\delta]} v \frac{\nabla \Theta}{\Theta} d x . \tag{3.31}
\end{align*}
$$

Since the functions $r$ and $t \mapsto \mu(t, .,$.$) are nonincreasing then$

$$
\begin{equation*}
\frac{\mu\left(\theta_{1}, v,|D(v)|\right)-\mu\left(\theta_{2}, v,|D(v)|\right)}{\theta_{1}-\theta_{2}} \leq 0, \quad \text { and } \quad \frac{r\left(\theta_{1}\right)-r\left(\theta_{2}\right)}{\theta_{1}-\theta_{2}} \leq 0 \tag{3.32}
\end{equation*}
$$

Recall that $v \in V_{d i v}^{p} \subset\left(L^{\infty}(\Omega)\right)^{3}$, so there exists a positive constant $M$ independent of $\delta$ such that

$$
\int_{\Omega \cap[\Theta>\delta]} v \frac{\nabla \Theta}{\Theta} d x \leq M \int_{\Omega \cap[\Theta>\delta]}\left|\frac{\nabla \Theta}{\Theta}\right| d x
$$

Now by (3.17), (3.32) and Cauchy-Schwarz inequality, (3.31) becomes

$$
k_{0} \int_{\Omega \cap[\Theta>\delta]}\left|\frac{\nabla \Theta}{\Theta}\right|^{2} d x \leq M \int_{\Omega \cap[\Theta>\delta]}\left|\frac{\nabla \Theta}{\Theta}\right| d x \leq M|\Omega|^{\frac{1}{2}}\left(\int_{\Omega \cap[\Theta>\delta]}\left|\frac{\nabla \Theta}{\Theta}\right|^{2} d x\right)^{\frac{1}{2}}
$$

Then

$$
\begin{align*}
\left(\int_{\Omega}\left|\nabla \ln \left(1+\frac{(\Theta-\delta)^{+}}{\delta}\right)\right|^{2} d x\right)^{\frac{1}{2}} & =\left(\int_{\Omega \cap[\Theta>\delta]}\left|\frac{\nabla \Theta}{\Theta}\right|^{2} d x\right)^{\frac{1}{2}} \\
& \leq M k_{0}^{-1}|\Omega|^{\frac{1}{2}} \tag{3.33}
\end{align*}
$$

The right hand side of (3.33) is independent of $\delta$, then for $\delta \rightarrow 0$ we must obtain, $\Theta=\theta_{1}-\theta_{2} \leq 0$ a.e. in $\Omega$, and by permuting the roles of $\theta_{1}$ and $\theta_{2}$ we get $\theta_{2}-\theta_{1} \leq 0$ then $\theta_{1}=\theta_{2}$. This ends the proof of uniqueness of the temperature.

### 3.3 Existence result for the coupled problem 2.1

We recall here the necessary assumptions to ensure the existence of at least one solution to the coupled problem 2.1.

We assume that, the real number $p \geq 4$, the function $\mu$ satisfies (3.1) and (3.2), the function $K$ satisfies (3.17), the exterior force vector $f \in\left(W^{1, p}(\Omega)\right)^{3}$, the upper limit for the stress $0 \leq k \in L^{p}(\omega)$, the given fixed flux $\theta_{\omega}$ on $\omega$ is in $L^{2}(\omega)$, the real function $r \in L^{\infty}(\mathbb{R})$, we also suppose that functions $r$ and $t \mapsto \mu(t, .,$.$) are Lipschitzian and$ nonincreasing.

Theorem 3.6. Under the above assumptions, there exists a unique $\theta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$ solution to Problem 3.2 and there exists at least one $\left(v_{\theta}, \pi_{\theta}\right) \in V_{\text {div }}^{p} \times L_{0}^{p}(\Omega)$ satisfying the variational inequality (2.1).

Proof. For all $\eta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega) \subset W_{\Gamma_{1} \cup \Gamma_{L}}^{1, q}(\Omega)$, because $1<q<2$, by Theorem 3.1, there exists $v=v_{\eta}$ in $V_{d i v}^{p}$ and by Theorem 3.2 there exists $\pi=\pi_{\eta}$ in $L_{0}^{p}(\Omega)$ solution to the variational inequality

$$
\begin{equation*}
a\left(\eta, v_{\eta}, \varphi-v_{\eta}\right)-\left(\pi_{\eta}, \operatorname{div}(\varphi)\right)+j(\varphi)-j\left(v_{\eta}\right) \geq\left(f, \varphi-v_{\eta}\right) \quad \forall \varphi \in V^{q}, \tag{3.34}
\end{equation*}
$$

also by Theorems 3.4-3.5, there exists a unique $\theta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega)$, solution to the Problem 3.2. So we can use the oprerator $T$ defined by (3.21). By Theorem 3.4 we know that $T$ has at least one fixed point $\theta \in H_{\Gamma_{1} \cup \Gamma_{L}}^{1}(\Omega), \theta=T(\theta)$, which is solution to the Problem 3.2. Then $\left(\theta, v_{\theta}, \pi_{\theta}\right)$ is solution to the Problem 2.1.

Remark 3.1. To our knowledge, the uniqueness of the problem 2.1 remains an open question.
