#### Abstract

Let  $\Omega$  be a bounded domain of  $\mathbb{R}^N$ , and  $Q = \Omega \times (0,T)$ . We first study the problem

$$\begin{cases} u_t - \Delta_p u = \mu & \text{in } Q, \\ u = 0 & \text{on } \partial\Omega \times (0, T), \\ u(0) = u_0 & \text{in } \Omega, \end{cases}$$

where p > 1,  $\mu \in \mathcal{M}_b(\Omega)$  and  $u_0 \in L^1(\Omega)$ . Our main result is a *stability theorem* extending the results of Dal Maso, Murat, Orsina, Prignet, for the elliptic case.

As an application, we consider the perturbed problem

$$\begin{cases} u_t - \Delta_p u + \mathcal{G}(u) = \mu & \text{in } Q, \\ u = 0 & \text{on } \partial\Omega \times (0, T), \\ u(0) = u_0 & \text{in } \Omega, \end{cases}$$

where  $\mathcal{G}(u)$  may be an absorption or a source term. In the model case  $\mathcal{G}(u) = \pm |u|^{q-1} u$  (q > p-1), or  $\mathcal{G}$  has an exponential type. We give existence results when q is subcritical, or when the measure  $\mu$  is good in time and satisfies suitable capacity conditions.

## 1 Introduction

Let  $\Omega$  be a bounded domain of  $\mathbb{R}^N$ , and  $Q = \Omega \times (0,T)$ , T > 0. We denote by  $\mathcal{M}_b(\Omega)$  and  $\mathcal{M}_b(Q)$  the sets of bounded Radon measures on  $\Omega$  and Q respectively. We are concerned with the problem

$$\begin{cases} u_t - \Delta_p u = \mu & \text{in } Q, \\ u = 0 & \text{on } \partial\Omega \times (0, T), \\ u(0) = u_0 & \text{in } \Omega, \end{cases}$$
 (1.1)

where  $\Delta_p$  is the p-Laplacian (p > 1),  $\mu \in \mathcal{M}_b(\Omega)$  and  $u_0 \in L^1(\Omega)$ ; and problems with a nonlinear term of order 0:

$$\begin{cases} u_t - \Delta_p u + \mathcal{G}(u) = \mu & \text{in } Q, \\ u = 0 & \text{on } \partial\Omega \times (0, T), \\ u(0) = u_0 & \text{in } \Omega, \end{cases}$$
 (1.2)

where  $\mathcal{G}(u)$  may be an absorption or a source term, and possibly depend on  $(x,t) \in Q$ . The model problem is the case where  $\mathcal{G}$  has a power-type  $\mathcal{G}(u) = \pm |u|^{q-1} u$  (q > p-1), or an exponential type.

First make a brief survey of the elliptic problem associated to problem (1.1):

$$\begin{cases}
-\Delta_p u = \mu & \text{in } \Omega, \\
u = 0 & \text{on } \partial\Omega,
\end{cases}$$

with  $\mu \in \mathcal{M}_b(\Omega)$ . When p=2, existence and uniqueness are proved for general elliptic operators by duality methods in [58]. For p>2-1/N, the existence of solutions in the sense of distributions is obtained in [23] and [24]. The condition on p ensures that the gradient  $\nabla u$  is well defined in  $L^1(\Omega)$ . For general p>1, new classes of solutions are introduced, first when  $\mu \in L^1(\Omega)$ , such as entropy solutions, and renormalized solutions, see [13], and also [57], and existence and uniqueness is obtained. For any  $\mu \in \mathcal{M}_b(\Omega)$  the main work is done in [32, Theorems 3.1, 3.2], where not only existence is proved, but also a stability result, fundamental for applications. Uniqueness is still an open problem.

Next recall the mains results about problem (1.1).

The first results concern the case  $\mu \in L^{p'}(Q)$  and  $u_0 \in L^2(\Omega)$ , where existence and uniqueness is obtained by variational methods, see [45]. In the general case  $\mu \in \mathcal{M}_b(Q)$  and  $u_0 \in \mathcal{M}_b(\Omega)$ , the pionner studies come from [23], proving the existence of solutions in the sense of distributions for

$$p > p_1 = 2 - \frac{1}{N+1},\tag{1.3}$$

see also [55], [56], and [26]. The approximated solutions of (1.1) lie in Marcinkiewicz spaces  $u \in L^{p_c,\infty}(Q)$  and  $|\nabla u| \in L^{m_c,\infty}(Q)$ , where

$$p_c = p - 1 + \frac{p}{N}, \qquad m_c = p - \frac{N}{N+1}.$$
 (1.4)

This condition (1.3) ensures that u and  $|\nabla u|$  belong to  $L^1(Q)$ , since  $m_c > 1$  means  $p > p_1$  and  $p_c > 1$  means p > 2N/(N+1). Uniqueness follows in the case p = 2, by duality methods, see [48].

For  $\mu \in L^1(Q)$ , uniqueness is obtained in new classes of solutions: *entropy solutions*, and renormalized solutions, see [19], [54], see also [3] for a semi-group approach.

Then a class of regular measures is studied in [33]: they introduce a notion of parabolic capacity  $c_p^Q$ , defined for any Borel set  $E \subset Q$ , by

$$c_p^Q(E) = \inf(\inf_{E \subset U \text{ open} \subset Q} \{||u||_W : u \in W, u \ge \chi_U \quad a.e. \text{ in } Q\}),$$

where

$$X = L^{p}(0, T; W_{0}^{1,p}(\Omega) \cap L^{2}(\Omega)),$$

$$W = \{z : z \in X, \quad z_{t} \in X'\}, \text{ embedded with the norm } ||u||_{W} = ||u||_{X} + ||u_{t}||_{X'}.$$

Let  $\mathcal{M}_0(Q)$  be the set of Radon measures  $\mu$  on Q that do not charge the sets of zero  $c_p^Q$ -capacity:

$$\forall E \text{ Borel set } \subset Q, \quad c_n^Q(E) = 0 \Longrightarrow |\mu(E)| = 0.$$

Then existence and uniqueness of renormalized solutions holds for any measure  $\mu \in \mathcal{M}_b(\Omega) \cap \mathcal{M}_0(Q)$ , called regular (or diffuse) and  $u_0 \in L^1(\Omega)$ , and p > 1. The equivalence with the notion of entropy solutions is shown in [34]; see also [20] for more general equations.

Next consider any measure  $\mu \in \mathcal{M}_b(Q)$ . Let  $\mathcal{M}_s(Q)$  be the set of all bounded Radon measures on Q with support on a set of zero  $c_p^Q$  capacity, also called *singular*. Let  $\mathcal{M}_b^+(Q)$ ,  $\mathcal{M}_0^+(Q)$ ,  $\mathcal{M}_s^+(Q)$  be the positive cones of  $\mathcal{M}_b(Q)$ ,  $\mathcal{M}_0(Q)$ ,  $\mathcal{M}_s(Q)$ . From [33],  $\mu$  can be written (in a unique way) under the form

$$\mu = \mu_0 + \mu_s, \qquad \mu_0 \in \mathcal{M}_0(Q), \quad \mu_s = \mu_s^+ - \mu_s^-, \qquad \mu_s^+, \mu_s^- \in \mathcal{M}_s^+(Q),$$
 (1.5)

and  $\mu_0 \in \mathcal{M}_0(Q)$  admits (at least) a decomposition under the form

$$\mu_0 = f - \operatorname{div} g + h_t, \qquad f \in L^1(Q), \quad g \in (L^{p'}(Q))^N, \quad h \in X,$$
 (1.6)

and we write  $\mu_0 = (f, g, h)$ . The solutions of (1.1) are searched in a renormalized sense linked to this decomposition, introduced in [19],[49]. In the range (1.3) the existence of a renormalized solution relative to the decomposition (1.6) is proved in [49], using suitable approximations of  $\mu_0$  and  $\mu_s$ . Uniqueness is still open, as well as in the elliptic case.

Next consider the problem (1.2). First we consider the case of an absorption term:  $\mathcal{G}(u)u \geq 0$ .

Let us recall the case p=2 and  $\mathcal{G}(u)=|u|^{q-1}u$  (q>1). The first results concern the case  $\mu=0$  and  $u_0$  is a Dirac mass in  $\Omega$ , see [28]: existence holds if and only if q<(N+2)/N. Then optimal results are given in [7], for any  $\mu \in \mathcal{M}_b(Q)$  and  $u_0 \in \mathcal{M}_b(\Omega)$ . Here two capacities are involved: the elliptic Bessel capacity  $C_{\alpha,k}$ ,  $(\alpha, k > 1)$  defined, for any Borel set  $E \subset \mathbb{R}^N$ , by

$$C_{\alpha,k}(E) = \inf\{||\varphi||_{L^k(\mathbb{R}^N)} : \varphi \in L^k(\mathbb{R}^N), \quad G_\alpha * \varphi \ge \chi_E\},$$

where  $G_{\alpha}$  is the Bessel kernel of order  $\alpha$ ; and a capacity  $c_{\mathbf{G},k}$  (k > 1) adapted to the operator of the heat equation of kernel  $\mathbf{G}(x,t) = \chi_{(0,\infty)} (4\pi t)^{-N/2} e^{-|x|^2/4t}$ : for any Borel set  $E \subset \mathbb{R}^{N+1}$ ,

$$c_{\mathbf{G},k}(E) = \inf\{||\varphi||_{L^k(\mathbb{R}^{N+1})} : \varphi \in L^k(\mathbb{R}^{N+1}), \quad \mathbf{G} * \varphi \ge \chi_E\}.$$

From [7], there exists a solution if and only if  $\mu$  does not charge the sets of  $c_{\mathbf{G},q'}(E)$  capacity zero and  $u_0$  does not charge the sets of  $C_{2/q,q'}$  capacity zero. Observe that one can reduce to a zero initial data, by considering the measure  $\mu + u_0 \otimes \delta_0^t$  in  $\Omega \times (-T,T)$ , where  $\otimes$  is the tensorial product and  $\delta_0^t$  is the Dirac mass in time at 0.

For  $p \neq 2$  such a linear parabolic capacity cannot be used. Most of the contributions are relative to the case  $\mu = 0$  with  $\Omega$  bounded, or  $\Omega = \mathbb{R}^N$ . The case where  $u_0$  is a Dirac mass in  $\Omega$  is studied in [36], [40] when p > 2, and [29] when p < 2. Existence and uniqueness hold in the subcritical case  $q < p_c$ . If  $q \geq p_c$  and q > 1, there is no solution with an isolated singularity at t = 0. For  $q < p_c$ , and  $u_0 \in \mathcal{M}_b^+(\Omega)$ , the existence is obtained in the sense of distributions in [60], and for any  $u_0 \in \mathcal{M}_b(\Omega)$  in [16]. The case  $\mu \in L^1(Q)$ ,  $u_0 = 0$  is treated in [30], and  $\mu \in L^1(Q)$ ,  $u_0 = L^1(\Omega)$  in [4] where  $\mathcal{G}$  can be multivalued. The case  $\mu \in \mathcal{M}_0(Q)$  is studied in [50], with a new formulation of the solutions, and existence and uniqueness is obtained for any function  $\mathcal{G} \in C(\mathbb{R})$  such that  $\mathcal{G}(u)u \geq 0$ . Up to our knowledge, up to now no existence results have been obtained for a general measure  $\mu \in \mathcal{M}_b(Q)$ .

The case of a source term  $\mathcal{G}(u) = -u^q$  with  $u \ge 0$  has been treated in [6] for p = 2, where optimal conditions are given for existence. As in the absorption case the arguments of proofs cannot be extended to general p.

## 2 Main results

In all the sequel we suppose that p satisfies (1.3). Then

$$X = L^p(0,T;W_0^{1,p}(\Omega)), \qquad X' = L^{p'}(0,T;W^{-1,p'}(\Omega)).$$

We first study problem (1.1). In Section 3 we give some approximations of  $\mu \in \mathcal{M}_b(Q)$ , useful for the applications. In Section 4 we recall the definition of renormalized solutions, that we call R-solutions of (1.1), relative to the decomposition (1.6) of  $\mu_0$ , and study some of their properties.

Our main result is a *stability theorem* for problem (1.1), proved in Section 5, extending to the parabolic case the stability result of [32, Theorem 3.4], and improving the result of [49]:

Theorem 2.1 Let  $u_0 \in L^1(\Omega)$ ,

$$\mu = f - \operatorname{div} g + h_t + \mu_s^+ - \mu_s^- \in \mathcal{M}_b(Q),$$

with  $f \in L^1(Q), g \in (L^{p'}(Q))^N$ ,  $h \in X$  and  $\mu_s^+, \mu_s^- \in \mathcal{M}_s^+(Q)$ . Let  $u_{0,n} \in L^1(\Omega)$ ,

$$\mu_n = f_n - \operatorname{div} g_n + (h_n)_t + \rho_n - \eta_n \in \mathcal{M}_b(Q),$$

with  $f_n \in L^1(Q), g_n \in (L^{p'}(Q))^N, h_n \in X$ , and  $\rho_n, \eta_n \in \mathcal{M}_h^+(Q)$ , such that

$$\rho_n = \rho_n^1 - \text{div } \rho_n^2 + \rho_{n,s}, \qquad \eta_n = \eta_n^1 - \text{div } \eta_n^2 + \eta_{n,s},$$

with  $\rho_n^1, \eta_n^1 \in L^1(Q), \rho_n^2, \eta_n^2 \in (L^{p'}(Q))^N$  and  $\rho_{n,s}, \eta_{n,s} \in \mathcal{M}_s^+(Q)$ . Assume that

$$\sup_{n} |\mu_n| (Q) < \infty,$$

and  $\{u_{0,n}\}$  converges to  $u_0$  strongly in  $L^1(\Omega)$ ,  $\{f_n\}$  converges to f weakly in  $L^1(Q)$ ,  $\{g_n\}$  converges to g strongly in  $(L^{p'}(Q))^N$ ,  $\{h_n\}$  converges to h strongly in X,  $\{\rho_n\}$  converges to  $\mu_s^+$  and  $\{\eta_n\}$  converges to  $\mu_s^-$  in the narrow topology of measures; and  $\{\rho_n^1\}$ ,  $\{\eta_n^1\}$  are bounded in  $L^1(Q)$ , and  $\{\rho_n^2\}$ ,  $\{\eta_n^2\}$  bounded in  $(L^{p'}(Q))^N$ . Let  $\{u_n\}$  be a sequence of R-solutions of

$$\begin{cases} u_{n,t} - \Delta_p u_n = \mu_n & \text{in } Q, \\ u_n = 0 & \text{on } \partial\Omega \times (0, T), \\ u_n(0) = u_{0,n} & \text{in } \Omega. \end{cases}$$
 (2.1)

relative to the decomposition  $(f_n + \rho_n^1 - \eta_n^1, g_n + \rho_n^2 - \eta_n^2, h_n)$  of  $\mu_{n,0}$ . Let  $v_n = u_n - h_n$ . Then up to a subsequence,  $\{u_n\}$  converges a.e. in Q to a R-solution u of (1.1), and  $\{v_n\}$  converges a.e. in Q to v = u - h. Moreover,  $\{\nabla u_n\}$ ,  $\{\nabla v_n\}$  converge respectively to  $\nabla u$ ,  $\nabla v$  a.e. in Q, and  $\{T_k(u_n)\}$ ,  $\{T_k(v_n)\}$  converge to  $T_k(u)$ ,  $T_k(v)$  strongly in X for any k > 0.

In Section 6 we give applications to problems of type (1.2).

We first give an existence result of subcritical type, valid for any measure  $\mu \in \mathcal{M}_b(Q)$ :

**Theorem 2.2** Let  $(x, t, r) \mapsto \mathcal{G}(x, t, r)$  be a Caratheodory function on  $Q \times \mathbb{R}$  and  $G \in C(\mathbb{R}^+)$  be a nondecreasing function with values in  $\mathbb{R}^+$ , such that

$$|\mathcal{G}(x,t,r)| \le G(|r|)$$
 for a.e.  $(x,t) \in Q$  and any  $r \in \mathbb{R}$ , (2.2)

$$\int_{1}^{\infty} G(s)s^{-1-p_c}ds < \infty. \tag{2.3}$$

(i) Suppose that  $\mathcal{G}(x,t,r)r \geq 0$ , for a.e. (x,t) in Q and any  $r \in \mathbb{R}$ . Then, for any  $\mu \in \mathcal{M}_b(Q)$  and  $u_0 \in L^1(\Omega)$ , there exists a R-solution u of problem

$$\begin{cases} u_t - \Delta_p u + \mathcal{G}(u) = \mu & \text{in } Q, \\ u = 0 & \text{in } \partial\Omega \times (0, T), \\ u(0) = u_0 & \text{in } \Omega. \end{cases}$$
 (2.4)

(ii) (without assumption on the sign of  $\mathcal{G}$ ). There exists  $\varepsilon > 0$  such that for any  $\lambda > 0$ , any  $\mu \in \mathcal{M}_b(Q)$  and  $u_0 \in L^1(\Omega)$  with  $\lambda + |\mu|(Q) + ||u_0||_{L^1(\Omega)} \leq \varepsilon$ , problem

$$\begin{cases}
 u_t - \Delta_p u + \lambda \mathcal{G}(u) = \mu & \text{in } Q, \\
 u = 0 & \text{in } \partial \Omega \times (0, T), \\
 u(0) = u_0 & \text{in } \Omega,
\end{cases}$$
(2.5)

admits a R-solution. Besides, if  $\mathcal{G}(x,t,r)r \leq 0$ , for a.e.  $(x,t) \in Q$  and any  $r \in \mathbb{R}$ , and  $u_0 \geq 0$ ,  $\mu \geq 0$ , then there exists a nonnegative R-solution.

In particular if  $\mathcal{G}(u) = \pm |u|^{q-1} u$ , existence holds for any  $0 < q < p_c$ , for any measure  $\mu \in \mathcal{M}_b(Q)$ , small enough if  $\mathcal{G}(u) = -|u|^{q-1} u$ . In the supercritical case  $q \geq p_c$ , the class of "admissible" measures, for which there exist solutions, is not known.

Next we give new results relative to measures that have a good behaviour in t, based on recent results of [17] relative to the elliptic case. We recall the notions of (truncated) Wölf potential for any nonnegative measure  $\omega \in \mathcal{M}^+(\mathbb{R}^N)$  any R > 0,  $x_0 \in \mathbb{R}^N$ ,

$$\mathbf{W}_{1,p}^{R}[\omega](x_{0}) = \int_{0}^{R} \left(t^{p-N}\omega(B(x_{0},t))\right)^{\frac{1}{p-1}} \frac{dt}{t}.$$

Any measure  $\omega \in \mathcal{M}_b(\Omega)$  is identified with its extension by 0 to  $\mathbb{R}^N$ . In case of absorption, we obtain the following:

**Theorem 2.3** Let p < N, q > p - 1,  $\mu \in \mathcal{M}_b(Q)$ ,  $f \in L^1(Q)$  and  $u_0 \in L^1(\Omega)$ . Assume that

$$|\mu| \leq \omega \otimes F$$
, with  $\omega \in \mathcal{M}_{b}^{+}(\Omega), F \in L^{1}((0,T)), F \geq 0$ ,

and  $\omega$  does not charge the sets of  $C_{p,\frac{q}{q+1-p}}$ -capacity zero. Then there exists a R- solution u of problem

$$\begin{cases} u_t - \Delta_p u + |u|^{q-1} u = f + \mu & \text{in } Q, \\ u = 0 & \text{on } \partial\Omega \times (0, T), \\ u(0) = u_0 & \text{in } \Omega. \end{cases}$$
 (2.6)

We show that some of these measures may not lie in  $\mathcal{M}_0(Q)$ , which improves the existence results of [50], see Proposition 3.3 and Remark 6.7. Otherwise our result can be extended to a more general function  $\mathcal{G}$ , see Remark 6.9. We also consider a source term:

**Theorem 2.4** Let p < N, q > p - 1. Let  $\mu \in \mathcal{M}_h^+(Q)$ , and  $u_0 \in L^{\infty}(\Omega)$ ,  $u_0 \ge 0$ . Assume that

$$\mu \leq \omega \otimes \chi_{(0,T)}, \quad \text{with } \omega \in \mathcal{M}_b^+(\Omega).$$

Then there exist  $\lambda_0 = \lambda_0(N, p, q, diam\Omega)$  and  $b_0 = b_0(N, p, q, diam\Omega)$  such that, if

$$\omega(E) \leq \lambda_0 C_{p,\frac{q}{q-p+1}}(E), \quad \forall E \ compact \subset \mathbb{R}^N, \qquad ||u_0||_{\infty,\Omega} \leq b_0,$$

there exists a nonnegative R-solution u of problem

$$\begin{cases} u_t - \Delta_p u = u^q + \mu & \text{in } Q, \\ u = 0 & \text{on } \partial\Omega \times (0, T), \\ u(0) = u_0 & \text{in } \Omega, \end{cases}$$
 (2.7)

which satisfies, a.e. in Q,

$$u(x,t) \le C_{N,p} \mathbf{W}_{1,p}^{2\text{diam}_{\Omega}}[\omega](x) + 2||u_0||_{L^{\infty}},$$
 (2.8)

where  $C_{N,p}$  is a constant depending on N, p.

Corresponding results in case where  $\mathcal{G}$  has exponential type are given at Theorems 6.10 and 6.15.

Notice that all our results are still available when  $\Delta_p$  is replaced by a more general operator  $u \mapsto A(u) = -\operatorname{div}(a(x,t,\nabla u))$ , where a is a Caratheodory function on  $Q \times \mathbb{R}^N$ , satisfying the following assumptions, where  $C_1, C_2 > 0$  and  $b \in L^{p'}(Q)$ : for a.e.  $(x,t) \in Q$ , and any  $\xi, \zeta \in \mathbb{R}^N$ ,

$$a(x,t,\xi).\xi \ge C_1 |\xi|^p$$
,  $|a(x,t,\xi)| \le b(x,t) + C_2 |\xi|^{p-1}$ ,  
 $(a(x,t,\xi) - a(x,t,\zeta)).(\xi - \zeta) > 0 \text{ if } \xi \ne \zeta.$ 

## 3 Approximations of measures

For any open set  $\varpi$  of  $\mathbb{R}^m$  and  $F \in (L^k(\varpi))^{\nu}$ ,  $k \in [1, \infty]$ ,  $m, \nu \in \mathbb{N}^*$ , we set  $\|F\|_{k, \varpi} = \|F\|_{(L^k(\varpi))^{\nu}}$ .

First we give approximations of nonnegative measures in  $\mathcal{M}_0(Q)$ . We recall that any measure  $\mu \in \mathcal{M}_0(Q) \cap \mathcal{M}_b(Q)$  admits a decomposition under the form  $\mu = (f, g, h)$  given by (1.6). Conversely, any measure of this form, such that  $h \in L^{\infty}(Q)$ , lies in  $\mathcal{M}_0(Q)$ , see [50, Proposition 3.1].

**Lemma 3.1** Let  $\mu \in \mathcal{M}_0(Q) \cap \mathcal{M}_b^+(Q)$  and  $\varepsilon > 0$ .

(i) Then, we can find a decomposition  $\mu = (f, g, h)$  with  $f \in L^1(Q), g \in (L^{p'}(Q))^N, h \in X$  such that

$$||f||_{1,Q} + ||g||_{p',Q} + ||h||_X \le (1+\varepsilon)\mu(Q), \qquad ||g||_{p',Q} + ||h||_X \le \varepsilon.$$
 (3.1)

(ii) Furthermore, there exists a sequence of measures  $\mu_n = (f_n, g_n, h_n)$ , such that  $f_n, g_n, h_n \in C_c^{\infty}(Q)$  and strongly converge to f, g, h in  $L^1(Q), (L^{p'}(Q))^N$  and X respectively, and  $\mu_n$  converges to  $\mu$  in the narrow topology, and satisfying

$$||f_n||_{1,Q} + ||g_n||_{p',Q} + ||h_n||_X \le (1 + 2\varepsilon)\mu(Q), \qquad ||g_n||_{p',Q} + ||h_n||_X \le 2\varepsilon.$$
 (3.2)

**Proof.** (i) Step 1. Case where  $\mu$  has a compact support in Q. By [33], we can find a decomposition  $\mu = (f, g, h)$  with f, g, h have a compact support in Q. Let  $\{\varphi_n\}$  be sequence of mollifiers in  $\mathbb{R}^{N+1}$ . Then  $\mu_n = \varphi_n * \mu \in C_c^{\infty}(Q)$  for n large enough. We see that  $\mu_n(Q) = \mu(Q)$  and  $\mu_n$  admits the decomposition  $\mu_n = (f_n, g_n, h_n) = (\varphi_n * f, \varphi_n * g, \varphi_n * h)$ . Since  $\{f_n\}, \{g_n\}, \{h_n\}$  strongly converge to f, g, h in  $L^1(Q), (L^{p'}(Q))^N$  and X respectively, we have for  $n_0$  large enough,

$$||f - f_{n_0}||_{1,Q} + ||g - g_{n_0}||_{p',Q} + ||h - h_{n_0}||_X \le \varepsilon \min\{\mu(Q), 1\}.$$

Then we obtain a decomposition  $\mu = (\hat{f}, \hat{g}, \hat{h}) = (\mu_{n_0} + f - f_{n_0}, g - g_{n_0}, h - h_{n_0})$ , such that

$$||\hat{f}||_{1,Q} + ||\hat{g}||_{p',Q} + ||\hat{h}||_X \le (1+\varepsilon)\mu(Q), \qquad ||\hat{g}||_{p',Q} + ||\hat{h}||_X \le \varepsilon. \tag{3.3}$$

Step 2. General case. Let  $\{\theta_n\}$  be a nonnegative, nondecreasing sequence in  $C_c^{\infty}(Q)$  which converges to 1, a.e. in Q. Set  $\tilde{\mu}_0 = \theta_0 \mu$ , and  $\tilde{\mu}_n = (\theta_n - \theta_{n-1})\mu$ , for any  $n \geq 1$ . Since  $\tilde{\mu}_n \in$ 

 $\mathcal{M}_0(Q) \cap \mathcal{M}_b^+(Q)$  has compact support, by Step 1, we can find a decomposition  $\tilde{\mu}_n = (\tilde{f}_n, \tilde{g}_n, \tilde{h}_n)$  such that

$$||\tilde{f}_n||_{1,Q} + ||\tilde{g}_n||_{p',Q} + ||\tilde{h}_n||_X \le (1+\varepsilon)\mu_n(Q), \qquad ||\tilde{g}_n||_{p',Q} + ||\tilde{h}_n||_X \le 2^{-n-1}\varepsilon.$$

Let  $\overline{f}_n = \sum_{k=0}^n \tilde{f}_k$ ,  $\overline{g}_n = \sum_{k=0}^n \tilde{g}_k$  and  $\overline{h}_n = \sum_{k=0}^n \tilde{h}_k$ . Clearly,  $\theta_n \mu = (\overline{f}_n, \overline{g}_n, \overline{h}_n)$ , and  $\{\overline{f}_n\}, \{\overline{g}_n\}, \{\overline{h}_n\}$  converge strongly to some f, g, h, respectively in  $L^1(Q), (L^{p'}(Q))^N, X$ , with

$$||\overline{f}_n||_{1,Q} + ||\overline{g}_n||_{p',Q} + ||\overline{h}_n||_X \le (1+\varepsilon)\mu(Q), \qquad ||\overline{g}_n||_{p',Q} + ||\overline{h}_n||_X \le \varepsilon.$$

Therefore,  $\mu = (f, g, h)$  and (3.1) holds.

(ii) We take a sequence  $\{m_n\}$  in  $\mathbb{N}$  such that  $f_n = \varphi_{m_n} * \overline{f}_n, g_n = \varphi_{m_n} * \overline{g}_n, h_n = \varphi_{m_n} * \overline{h}_n \in C_c^{\infty}(Q)$  and

$$||f_n - \overline{f}_n||_{1,Q} + ||g_n - \overline{g}_n||_{p',Q} + ||h_n - \overline{h}_n||_X \le \frac{\varepsilon}{n+1} \min\{\mu(Q), 1\}.$$

Let  $\mu_n = \varphi_{m_n} * (\theta_n \mu) = (f_n, g_n, h_n)$ . Therefore,  $\{f_n\}, \{g_n\}, \{h_n\}$  strongly converge to f, g, h in  $L^1(Q), (L^{p'}(Q))^N$  and X respectively. And (3.2) holds. Furthermore,  $\{\mu_n\}$  converges weak-\* to  $\mu$ , and  $\mu_n(Q) = \int_Q \theta_n d\mu$  converges to  $\mu(Q)$ , thus  $\{\mu_n\}$  converges in the narrow topology.

As a consequence, we get an approximation property for any measure  $\mu \in \mathcal{M}_{b}^{+}(Q)$ :

**Proposition 3.2** Let  $\mu \in \mathcal{M}_b^+(Q)$  and  $\varepsilon > 0$ . Let  $\{\mu_n\}$  be a nondecreasing sequence in  $\mathcal{M}_b^+(Q)$  converging to  $\mu$  in  $\mathcal{M}_b(Q)$ . Then, there exist  $f_n, f \in L^1(Q)$ ,  $g_n, g \in (L^{p'}(Q))^N$  and  $h_n, h \in X$ ,  $\mu_{n,s}, \mu_s \in \mathcal{M}_s^+(Q)$  such that

$$\mu = f - \text{div } g + h_t + \mu_s, \qquad \mu_n = f_n - \text{div } g_n + (h_n)_t + \mu_{n,s},$$

and  $\{f_n\}$ ,  $\{g_n\}$ ,  $\{h_n\}$  strongly converge to f, g, h in  $L^1(Q)$ ,  $(L^{p'}(Q))^N$  and X respectively, and  $\{\mu_{n,s}\}$  converges to  $\mu_s$  (strongly) in  $\mathcal{M}_b(Q)$  and

$$||f_n||_{1,Q} + ||g_n||_{p',Q} + ||h_n||_X + \mu_{n,s}(\Omega) \le (1+\varepsilon)\mu(Q), \quad and \quad ||g_n||_{p',Q} + ||h_n||_X \le \varepsilon.$$
 (3.4)

**Proof.** Since  $\{\mu_n\}$  is nondecreasing, then  $\{\mu_{n,0}\}$ ,  $\{\mu_{n,s}\}$  are too. Clearly,  $\|\mu - \mu_n\|_{\mathcal{M}_b(Q)} = \|\mu_0 - \mu_{n,0}\|_{\mathcal{M}_b(Q)} + \|\mu_s - \mu_{n,s}\|_{\mathcal{M}_b(Q)}$ . Hence,  $\{\mu_{n,s}\}$  converge to  $\mu_s$  and  $\{\mu_{n,0}\}$  converge to  $\mu_0$  (strongly) in  $\mathcal{M}_b(Q)$ . Set  $\tilde{\mu}_{0,0} = \mu_{0,0}$ , and  $\tilde{\mu}_{n,0} = \mu_{n,0} - \mu_{n-1,0}$  for any  $n \geq 1$ . By Lemma 3.1, (i), we can find  $\tilde{f}_n \in L^1(Q)$ ,  $\tilde{g}_n \in (L^{p'}(Q))^N$  and  $\tilde{h}_n \in X$  such that  $\tilde{\mu}_{n,0} = (\tilde{f}_n, \tilde{g}_n, \tilde{h}_n)$  and

$$||\tilde{f}_n||_{1,Q} + ||\tilde{g}_n||_{p',Q} + ||\tilde{h}_n||_X \le (1+\varepsilon)\tilde{\mu}_{n,0}(Q), \qquad ||\tilde{g}_n||_{p',Q} + ||\tilde{h}_n||_X \le 2^{-n-1}\varepsilon.$$

Let  $f_n = \sum_{k=0}^n \tilde{f}_k$ ,  $G_n = \sum_{k=0}^n \tilde{g}_k$  and  $h_n = \sum_{k=0}^n \tilde{h}_k$ . Clearly,  $\mu_{n,0} = (f_n, g_n, h_n)$  and the convergence properties hold with (3.4), since

$$||f_n||_{1,Q} + ||g_n||_{p',Q} + ||h_n||_X \le (1+\varepsilon)\mu_0(Q).$$

In Section 6 we consider some measures  $\mu \in \mathcal{M}_b(Q)$  which satisfy  $|\mu| \leq \omega \otimes F$ , with  $\omega \in \mathcal{M}_b(\Omega)$  and  $F \in L^1((0,T))$ . It is interesting to compare the properties of  $\omega \otimes F$  and  $\omega$ :

Let  $c_p^{\Omega}$  be the elliptic capacity in  $\Omega$  defined by

$$c_p^{\Omega}(K) = \inf\{\int_{\Omega} |\nabla \varphi|^p : \varphi \ge \chi_K, \varphi \in C_c^{\infty}(\Omega)\},$$

for any compact set  $K \subset \Omega$ .

Let  $\mathcal{M}_{0,e}(\Omega)$  be the set of Radon measures  $\omega$  on that do not charge the sets of zero  $c_p^{\Omega}$ -capacity. Recall that  $\mathcal{M}_b(\Omega) \cap \mathcal{M}_{0,e}(\Omega)$  is characterised as the set of measures  $\omega \in \mathcal{M}_b(\Omega)$  which can be written under the form  $\tilde{f} - \operatorname{div} g$  with  $\tilde{f} \in L^1(\Omega)$  and  $\tilde{g} \in (L^{p'}(\Omega))^N$ , see [25].

**Proposition 3.3** For any  $F \in L^1((0,T))$ ,  $F \not\equiv 0$ , and  $\omega \in \mathcal{M}_b(\Omega)$ ,

$$\omega \in \mathcal{M}_{0,e}(\Omega) \Longleftrightarrow \omega \otimes F \in \mathcal{M}_0(Q).$$

**Proof.** Recall that  $\mathcal{M}_b(\Omega) \cap \mathcal{M}_{0,e}(\Omega)$  is the set of measures  $\omega \in \mathcal{M}_b(\Omega)$  which can be written under the form  $\tilde{f}$  – div g with  $\tilde{f} \in L^1(\Omega)$  and  $\tilde{g} \in \left(L^{p'}(\Omega)\right)^N$ , see [25]. Assume that  $\omega \otimes F \in \mathcal{M}_0(Q)$ . Then, there exist  $f \in L^1(Q)$ ,  $g \in \left(L^{p'}(Q)\right)^N$  and  $h \in X$ , such that

$$\int_{Q} \varphi(x,t)F(t)d\omega(x)dt = \int_{Q} \varphi(x,t)f(x,t)dxdt + \int_{Q} g(x,t)\cdot\nabla\varphi(x,t)dxdt - \int_{Q} h(x,t)\varphi_{t}(t,x)dxdt,$$
(3.5)

for all  $\varphi \in C_c^{\infty}(\Omega \times [0,T])$ , see [50, Lemma 2.24 and Theorem 2.27]. By choosing  $\varphi(x,t) = \varphi(x) \in C_c^{\infty}(\Omega)$  and using Fubini's Theorem, (3.5) is rewritten as

$$\int_{\Omega} \varphi(x) d\omega(x) = \int_{\Omega} \varphi(x) \tilde{f}(x) dx + \int_{\Omega} \tilde{g}(x) \cdot \nabla \varphi(x) dx,$$

where  $\tilde{f}(x) = ||F||_{L^1((0,T))}^{-1} \int_0^T f(x,t)dt \in L^1(\Omega)$  and  $\tilde{g}(x) = ||F||_{L^1((0,T))}^{-1} \int_0^T g(x,t)dt \in \left(L^{p'}(\Omega)\right)^N$ ; hence  $\omega \in \mathcal{M}_{0,e}(\Omega)$ .

Conversely, assume that  $\omega = \tilde{f} - \operatorname{div} \tilde{g} \in \mathcal{M}_{0,e}(\Omega)$ , with  $\tilde{f} \in L^1(\Omega)$  and  $\tilde{g} \in \left(L^{p'}(\Omega)\right)^N$ . So  $\omega \otimes T_n(F) = f_n - \operatorname{div} g_n$ , with  $f_n = \tilde{f}T_n(F) \in L^1(Q)$  and  $g_n = \tilde{g}T_n(F) \in \left(L^{p'}(Q)\right)^N$ . Then  $\omega \otimes T_n(F)$  admits the decomposition  $(f_n, g_n, h)$ , with  $h = 0 \in L^{\infty}(Q)$ , thus  $\omega \otimes T_n(F) \in \mathcal{M}_0(Q)$ . And  $\{\omega \otimes T_n(F)\}$  converges to  $\omega \otimes F$  strongly in  $\mathcal{M}_b(Q)$ , since  $\|\omega \otimes (F - T_n(F))\|_{\mathcal{M}_b(Q)} \leq \|\omega\|_{\mathcal{M}_b(\Omega)} \|F - T_n(F)\|_{L^1((0,T))}$ . Then  $\omega \otimes F \in \mathcal{M}_0(Q)$ , since  $\mathcal{M}_0(Q) \cap \mathcal{M}_b(Q)$  is strongly closed in  $\mathcal{M}_b(Q)$ .

## 4 Renormalized solutions of problem (1.1)

#### 4.1 Notations and Definition

For any function  $f \in L^1(Q)$ , we write  $\int_Q f$  instead of  $\int_Q f dx dt$ , and for any measurable set  $E \subset Q$ ,  $\int_E f$  instead of  $\int_E f dx dt$ .

We set  $T_k(r) = \max\{\min\{r, k\}, -k\}$ , for any k > 0 and  $r \in \mathbb{R}$ . We recall that if u is a measurable function defined and finite a.e. in Q, such that  $T_k(u) \in X$  for any k > 0, there exists a measurable function w from Q into  $\mathbb{R}^N$  such that  $\nabla T_k(u) = \chi_{|u| \le k} w$ , a.e. in Q, and for any k > 0. We define the gradient  $\nabla u$  of u by  $w = \nabla u$ .

Let  $\mu = \mu_0 + \mu_s \in \mathcal{M}_b(Q)$ , and (f, g, h) be a decomposition of  $\mu_0$  given by (1.6), and  $\widehat{\mu_0} = \mu_0 - h_t = f - \text{div } g$ . In the general case  $\widehat{\mu_0} \notin \mathcal{M}(Q)$ , but we write, for convenience,

$$\int_{Q} w d\widehat{\mu_0} := \int_{Q} (fw + g.\nabla w), \qquad \forall w \in X \cap L^{\infty}(Q).$$

**Definition 4.1** Let  $u_0 \in L^1(\Omega)$ ,  $\mu = \mu_0 + \mu_s \in \mathcal{M}_b(Q)$ . A measurable function u is a **renormalized solution**, called **R-solution** of (1.1) if there exists a decomposition (f, g, h) of  $\mu_0$  such that

$$v = u - h \in L^{\sigma}(0, T; W_0^{1, \sigma}(\Omega) \cap L^{\infty}(0, T; L^1(\Omega)), \quad \forall \sigma \in [1, m_c); \qquad T_k(v) \in X, \quad \forall k > 0, \quad (4.1)$$

and:

(i) for any  $S \in W^{2,\infty}(\mathbb{R})$  such that S' has compact support on  $\mathbb{R}$ , and S(0) = 0,

$$-\int_{\Omega} S(u_0)\varphi(0)dx - \int_{Q} \varphi_t S(v) + \int_{Q} S'(v)|\nabla u|^{p-2}\nabla u \cdot \nabla \varphi + \int_{Q} S''(v)\varphi|\nabla u|^{p-2}\nabla u \cdot \nabla v = \int_{Q} S'(v)\varphi d\widehat{\mu_0},$$
(4.2)

for any  $\varphi \in X \cap L^{\infty}(Q)$  such that  $\varphi_t \in X' + L^1(Q)$  and  $\varphi(T, .) = 0$ ;

(ii) for any  $\phi \in C(\overline{Q})$ ,

$$\lim_{m \to \infty} \frac{1}{m} \int_{\{m \le v < 2m\}} \phi |\nabla u|^{p-2} \nabla u \cdot \nabla v = \int_{Q} \phi d\mu_s^+, \tag{4.3}$$

$$\lim_{m \to \infty} \frac{1}{m} \int_{\{m \ge v > -2m\}} \phi |\nabla u|^{p-2} \nabla u \cdot \nabla v = \int_{Q} \phi d\mu_s^{-}. \tag{4.4}$$

**Remark 4.2** As a consequence,  $S(v) \in C([0,T];L^1(\Omega))$  and  $S(v)(0,.) = S(u_0)$  in  $\Omega$ ; and u satisfies the equation

$$(S(v))_{t} - \operatorname{div}(S'(v)|\nabla u|^{p-2}\nabla u) + S''(v)|\nabla u|^{p} = fS'(v) - \operatorname{div}(gS'(v)) + S''(v)g.\nabla v, \tag{4.5}$$

in the sense of distributions in Q, see [49, Remark 3]. Moreover

$$\begin{split} \|S(v)_t\|_{X'+L^1(Q)} & \leq \left\| \operatorname{div}(S'(v)|\nabla u|^{p-2}\nabla u) \right\|_{X'} + \left\| S''(v)|\nabla u|^{p-2}\nabla u.\nabla v \right\|_{1,Q} \\ & + \left\| S'(v)f \right\|_{1,Q} + \left\| g.S''(v)\nabla v \right\|_{1,Q} + \left\| \operatorname{div}(S'(v)g) \right\|_{X'}. \end{split}$$

Thus, if  $[-M, M] \supset supp S'$ ,

$$||S(v)_{t}||_{X'+L^{1}(Q)} \leq ||S||_{W^{2,\infty}(\mathbb{R})} (||\nabla u|^{p} \chi_{|v| \leq M}||_{1,Q}^{p-1} + ||\nabla u|^{p-1} |\nabla T_{M}(v)||_{1,Q} + ||f||_{1,Q} + ||g||_{p',Q} ||\nabla u|^{p} \chi_{|v| \leq M}||_{1,Q}^{p-1} + ||g||_{p',Q})$$

$$(4.6)$$

We also deduce that, for any  $\varphi \in X \cap L^{\infty}(Q)$ , such that  $\varphi_t \in X' + L^1(Q)$ ,

$$\int_{\Omega} S(v(T))\varphi(T)dx - \int_{\Omega} S(u_0)\varphi(0)dx - \int_{Q} \varphi_t S(v) + \int_{Q} S'(v)|\nabla u|^{p-2}\nabla u \cdot \nabla \varphi + \int_{Q} S''(v)|\nabla u|^{p-2}\nabla u \cdot \nabla v \varphi = \int_{Q} S'(v)\varphi d\widehat{\mu_0}.$$
(4.7)

The conditions (4.3),(4.4) can be formulated in another way:

**Proposition 4.3** Let u be a function satisfying definition (4.1). Then for any  $\phi \in C(\overline{Q})$ 

$$\lim_{m \to \infty} \frac{1}{m} \int_{\{m \le v < 2m\}} \phi |\nabla u|^p = \int_Q \phi d\mu_s^+, \qquad \lim_{m \to \infty} \frac{1}{m} \int_{\{m \le v < 2m\}} \phi |\nabla v|^p = \int_Q \phi d\mu_s^+, \tag{4.8}$$

$$\lim_{m \to \infty} \frac{1}{m} \int_{\{m \ge v > -2m\}} \phi |\nabla u|^p = \int_Q \phi d\mu_s^-, \qquad \lim_{m \to \infty} \frac{1}{m} \int_{\{m \ge v > -2m\}} \phi |\nabla v|^p = \int_Q \phi d\mu_s^-. \tag{4.9}$$

Moreover, for any  $\varphi \in L^{p'}(Q)$  there holds

$$\lim_{m \to \infty} \frac{1}{m} \int_{m \le |v| < 2m} |\nabla u| \varphi = 0, \qquad \lim_{m \to \infty} \frac{1}{m} \int_{m \le |v| < 2m} |\nabla v| \varphi = 0. \tag{4.10}$$

**Proof.** For proving (4.8),(4.9) we can assume that  $\phi \ge 0$ . For any  $\varepsilon > 0$  there is  $C_{\varepsilon,i} > 0$  for i = 1, 2, 3, 4 such that

$$(1 - 2\varepsilon)|\nabla v|^p - C_{\varepsilon,1}|\nabla h|^p \leq (1 - \varepsilon)|\nabla u|^p - C_{\varepsilon,2}|\nabla h|^p \leq |\nabla u|^{p-2}\nabla u \cdot \nabla v$$
  
$$\leq (1 + \varepsilon)|\nabla u|^p + C_{\varepsilon,3}|\nabla h|^p \leq (1 + 2\varepsilon)|\nabla v|^p + C_{\varepsilon,4}|\nabla h|^p.$$

Thus,

$$\frac{\overline{\lim}}{m \to \infty} \frac{1}{m} \int_{\{m \le v < 2m\}} \phi\left((1 - 2\varepsilon)|\nabla v|^p - C_{\varepsilon,1}|\nabla h|^p\right) \le \overline{\lim}_{m \to \infty} \frac{1}{m} \int_{\{m \le v < 2m\}} \phi\left((1 - \varepsilon)|\nabla u|^p - C_{\varepsilon,2}|\nabla h|^p\right)$$

$$\le \lim_{m \to \infty} \frac{1}{m} \int_{\{m \le v < 2m\}} \phi|\nabla u|^{p-2} \nabla u \cdot \nabla v$$

$$\le \lim_{m \to \infty} \frac{1}{m} \int_{\{m \le v < 2m\}} \phi\left((1 + \varepsilon)|\nabla u|^p + C_{\varepsilon,3}|\nabla h|^p\right)$$

$$\le \lim_{m \to \infty} \frac{1}{m} \int_{\{m \le v < 2m\}} \phi\left((1 + 2\varepsilon)|\nabla v|^p + C_{\varepsilon,4}|\nabla h|^p\right).$$

Since  $\lim_{m\to\infty} \frac{1}{m} \int_{m\leq v<2m} |\nabla h|^p \phi = 0$  and using (4.3), then letting  $\varepsilon\to 0$  we deduce (4.8), and similarly (4.9).

Finally, for any  $\varepsilon > 0$ ,  $|\nabla u| |\varphi| \le \varepsilon |\nabla u|^p + (p-1)p^{-p'}\varepsilon^{-1/(p-1)} |\varphi|^{p'}$ , hence we deduce (4.10) as  $m \to \infty$ , and then  $\varepsilon \to 0$ .

**Remark 4.4** (i) Any function  $U \in X$  such that  $U_t \in X' + L^1(Q)$  admits a unique  $c_p^Q$ -quasi continuous representative, defined  $c_p^Q$ -quasi a.e. in Q, still denoted U. Furthermore, if  $U \in L^{\infty}(Q)$ , then for any  $\mu_0 \in \mathcal{M}_0(Q)$ , there holds  $U \in L^{\infty}(Q, d\mu_0)$ , see [49, Theorem 3 and Corollary 1].

(ii) Let u be any R- solution of problem (1.1). Then, v = u - h admits a  $c_p^Q$ -quasi continuous functions representative which is finite  $c_p^Q$ -quasi a.e. in Q, and u satisfies definition 4.1 for every decomposition  $(\tilde{f}, \tilde{g}, \tilde{h})$  such that  $h - \tilde{h} \in L^{\infty}(Q)$ , see [49, Proposition 3 and Theorem 4].

#### 4.2 Steklov and Landes approximations

A main difficulty for proving Theorem 2.1 is the choice of admissible test functions  $(S, \varphi)$  in (4.2), valid for any R-solution. Because of a lack of regularity of these solutions, we use two ways of approximation adapted to parabolic equations:

**Definition 4.5** Let  $\varepsilon \in (0,T)$  and  $z \in L^1_{loc}(Q)$ . For any  $l \in (0,\varepsilon)$  we define the **Steklov time-averages**  $[z]_l, [z]_{-l}$  of z by

$$[z]_l(x,t) = \frac{1}{l} \int_t^{t+l} z(x,s)ds$$
 for a.e.  $(x,t) \in \Omega \times (0,T-\varepsilon),$ 

$$[z]_{-l}(x,t) = \frac{1}{l} \int_{t-l}^{t} z(x,s)ds$$
 for a.e.  $(x,t) \in \Omega \times (\varepsilon,T)$ .

The idea to use this approximation for R-solutions can be found in [22]. Recall some properties, see [50]. Let  $\varepsilon \in (0,T)$ , and

$$\varphi_1 \in C_c^{\infty}(\overline{\Omega} \times [0,T)), \ \varphi_2 \in C_c^{\infty}(\overline{\Omega} \times (0,T]), \ \text{with } \operatorname{Supp}\varphi_1 \subset \overline{\Omega} \times [0,T-\varepsilon], \ \operatorname{Supp}\varphi_2 \subset \overline{\Omega} \times [\varepsilon,T].$$

- (i) If  $z \in X$ , then  $\varphi_1[z]_l$  and  $\varphi_2[z]_{-l} \in W$ .
- (ii) If  $z \in X$  and  $z_t \in X' + L^1(Q)$ , then, as  $l \to 0$ ,  $(\varphi_1[z]_l)$  and  $(\varphi_2[z]_{-l})$  converge respectively to  $\varphi_1 z$  and  $\varphi_2 z$  in X, and a.e. in Q; and  $(\varphi_1[z]_l)_t$ ,  $(\varphi_2[z]_{-l})_t$  converge to  $(\varphi_1 z)_t$ ,  $(\varphi_2 z)_t$  in  $X' + L^1(Q)$ .
- (iii) If moreover  $z \in L^{\infty}(Q)$ , then from any sequence  $\{l_n\} \to 0$ , there exists a subsequence  $\{l_{\nu}\}$  such that  $\{[z]_{l_{\nu}}\}, \{[z]_{-l_{\nu}}\}$  converge to  $z, c_p^Q$ -quasi everywhere in Q.

Next we recall the approximation introduced in [42], used in [30], [26], [21]:

**Definition 4.6** Let  $\mu \in \mathcal{M}_b(Q)$  and  $u_0 \in L^1(\Omega)$ . Let u be a R-solution of (1.1), and v = u - h given at (4.1), and k > 0. For any  $\nu \in \mathbb{N}$ , the **Landes-time approximation**  $\langle T_k(v) \rangle_{\nu}$  of the truncate function  $T_k(v)$  is defined in the following way:

Let  $\{z_{\nu}\}$  be a sequence of functions in  $W_0^{1,p}(\Omega) \cap L^{\infty}(\Omega)$ , such that  $||z_{\nu}||_{\infty,\Omega} \leq k$ ,  $\{z_{\nu}\}$  converges to  $T_k(u_0)$  a.e. in  $\Omega$ , and  $\nu^{-1}||z_{\nu}||_{W_0^{1,p}(\Omega)}^p$  converges to 0. Then,  $\langle T_k(v)\rangle_{\nu}$  is the unique solution of the problem

$$(\langle T_k(v)\rangle_{\nu})_t = \nu (T_k(v) - \langle T_k(v)\rangle_{\nu})$$
 in the sense of distributions,  $\langle T_k(v)\rangle_{\nu}(0) = z_{\nu}$ , in  $\Omega$ .

Therefore,  $\langle T_k(v)\rangle_{\nu} \in X \cap L^{\infty}(Q)$  and  $(T_k(v)\rangle_{\nu})_t \in X$ , see [42]. Furthermore, up to subsequences,  $\{\langle T_k(v)\rangle_{\nu}\}$  converges to  $T_k(v)$  strongly in X and a.e. in Q, and  $||(T_k(v))_{\nu}||_{L^{\infty}(Q)} \leq k$ .

### 4.3 First properties

In the sequel we use the following notations: for any function  $J \in W^{1,\infty}(\mathbb{R})$ , nondecreasing with J(0) = 0, we set

$$\overline{J}(r) = \int_0^r J(\tau)d\tau, \qquad \mathcal{J}(r) = \int_0^r J'(\tau)\tau d\tau. \tag{4.11}$$

It is easy to verify that  $\mathcal{J}(r) \geq 0$ ,

$$\mathcal{J}(r) + \overline{J}(r) = J(r)r$$
, and  $\mathcal{J}(r) - \mathcal{J}(s) \ge s (J(r) - J(s))$   $\forall r, s \in \mathbb{R}$ . (4.12)

In particular we define, for any k > 0, and any  $r \in \mathbb{R}$ ,

$$\overline{T_k}(r) = \int_0^r T_k(\tau)d\tau, \qquad \mathcal{T}_k(r) = \int_0^r T_k'(\tau)\tau d\tau, \tag{4.13}$$

and we use several times a truncature used in [32]:

$$H_m(r) = \chi_{[-m,m]}(r) + \frac{2m - |s|}{m} \chi_{m < |s| \le 2m}(r), \qquad \overline{H_m}(r) = \int_0^r H_m(\tau) d\tau. \tag{4.14}$$

The next Lemma allows to extend the range of the test functions in (4.2). Its proof, given in the Appendix, is obtained by Steklov approximation of the solutions.

**Lemma 4.7** Let u be a R-solution of problem (1.1). Let  $J \in W^{1,\infty}(\mathbb{R})$  be nondecreasing with J(0) = 0, and  $\overline{J}$  defined by (4.11). Then,

$$\int_{Q} S'(v) |\nabla u|^{p-2} \nabla u \cdot \nabla \left( \xi J(S(v)) \right) + \int_{Q} S''(v) |\nabla u|^{p-2} \nabla u \cdot \nabla v \xi J(S(v)) 
- \int_{\Omega} \xi(0) J(S(u_0)) S(u_0) - \int_{Q} \xi_t \overline{J}(S(v)) 
\leq \int_{Q} S'(v) \xi J(S(v)) d\widehat{\mu_0},$$
(4.15)

for any  $S \in W^{2,\infty}(\mathbb{R})$  such that S' has compact support on  $\mathbb{R}$  and S(0) = 0, and for any  $\xi \in C^1(Q) \cap W^{1,\infty}(Q), \xi \geq 0$ .

Next we give estimates of the gradient, following the first estimates of [26], see also [33], [49, Proposition 2], [43].

**Proposition 4.8** If u is a R-solution of problem (1.1), then there exists C(p) > 0, only depending on p, such that, for any  $k \ge 1$  and  $\ell \ge 0$ ,

$$\int_{\ell \le |v| \le \ell + k} |\nabla u|^p + \int_{\ell \le |v| \le \ell + k} |\nabla v|^p \le C(p)kM, \tag{4.16}$$

and

$$||v||_{L^{\infty}((0,T);L^{1}(\Omega))} \le C(p)(M+|\Omega|),$$
 (4.17)

where

$$M = \|u_0\|_{1,\Omega} + |\mu_s|(Q) + \|f\|_{1,Q} + \|g\|_{p',Q}^{p'} + \|h\|_X^p.$$

As a consequence, for any  $k \ge 1$ ,

meas 
$$\{|v| > k\} \le C_1 M_1 k^{-p_c}$$
, meas  $\{|\nabla v| > k\} \le C_2 M_2 k^{-m_c}$ , (4.18)

meas 
$$\{|u| > k\} \le C_3 M_2 k^{-p_c}$$
, meas  $\{|\nabla u| > k\} \le C_4 M_2 k^{-m_c}$ , (4.19)

where  $C_i = C_i(N, p)$ , i = 1-4, and  $M_1 = (M+|\Omega|)^{\frac{p}{N}}M$  and  $M_2 = M_1 + M$ .

**Proof.** Set for any  $r \in \mathbb{R}$ , and  $m, k, \ell > 0$ ,

$$T_{k,\ell}(r) = \max\{\min\{r-\ell,k\},0\} + \min\{\max\{r+\ell,-k\},0\}.$$

For  $m > k + \ell$ , we can choose  $(J, S, \xi) = (T_{k,\ell}, \overline{H_m}, \xi)$  as test functions in (4.15), where  $\overline{H_m}$  is defined at (4.14) and  $\xi \in C^1([0,T])$  with values in [0,1], independent on x. Since  $T_{k,\ell}(\overline{H_m}(r)) = T_{k,\ell}(r)$  for all  $r \in \mathbb{R}$ , we obtain

$$-\int_{\Omega} \xi(0) T_{k,\ell}(u_0) \overline{H_m}(u_0) - \int_{Q} \xi_t \overline{T_{k,\ell}} (\overline{H_m}(v))$$

$$+ \int\limits_{\{\ell \leq |v| < \ell + k\}} \xi |\nabla u|^{p-2} \nabla u \cdot \nabla v - \frac{k}{m} \int\limits_{\{m \leq |v| < 2m\}} \xi |\nabla u|^{p-2} \nabla u \cdot \nabla v \leq \int_Q H_m(v) \xi T_{k,\ell}(v) d\widehat{\mu_0}.$$

And

$$\int_Q H_m(v)\xi T_{k,\ell}(v)d\widehat{\mu_0} = \int_Q H_m(v)\xi T_{k,\ell}(v)f + \int\limits_{\{\ell \leqq |v|<\ell+k\}} \xi \nabla v.g - \frac{k}{m} \int\limits_{\{m \leqq |v|<2m\}} \xi \nabla v.g.$$

Let  $m \to \infty$ ; then, for any  $k \ge 1$ , since  $v \in L^1(Q)$  and from (4.3), (4.4), and (4.10), we find

$$-\int_{Q} \xi_{t} \overline{T_{k,\ell}}(v) + \int_{\{\ell \leq |v| < \ell + k\}} \xi |\nabla u|^{p-2} \nabla u \cdot \nabla v \leq \int_{\{\ell \leq |v| < \ell + k\}} \xi \nabla v \cdot g + k(\|u_{0}\|_{1,\Omega} + |\mu_{s}|(Q) + \|f\|_{1,Q}).$$

$$(4.20)$$

Next, we take  $\xi \equiv 1$ . We verify that there exists c = c(p) such that

$$|\nabla u|^{p-2}\nabla u.\nabla v - \nabla v.g \ge \frac{1}{4}(|\nabla u|^p + |\nabla v|^p) - c(|g|^{p'} + |\nabla h|^p);$$

hence (4.16) follows. Thus, from (4.20) and the Hölder inequality, we get, with another constant c = c(p), for any  $\xi \in C^1([0,T])$  with values in [0,1],

$$-\int_{O} \xi_{t} \overline{T_{k,\ell}}(v) \leq ckM.$$

Thus  $\int_{\Omega} \overline{T_{k,\ell}}(v)(t) \leq ckM$ , for a.e.  $t \in (0,T)$ . We deduce (4.17) by taking  $k=1,\ell=0$ , since  $\overline{T_{1,0}}(r) = \overline{T_1}(r) \geq |r|-1$ , for any  $r \in \mathbb{R}$ .

Next, from the Gagliardo-Nirenberg embedding Theorem, we have

$$\int_{Q} |T_{k}(v)|^{\frac{p(N+1)}{N}} \leq C \|v\|_{L^{\infty}((0,T);L^{1}(\Omega))}^{\frac{p}{N}} \int_{Q} |\nabla T_{k}(v)|^{p},$$

where C = C(N, p). Then, from (4.16) and (4.17), we get, for any  $k \ge 1$ ,

$$\operatorname{meas} \{|v| > k\} \leq k^{-\frac{p(N+1)}{N}} \int_{Q} |T_{k}(v)|^{\frac{p(N+1)}{N}} \leq C \|v\|_{L^{\infty}((0,T);L^{1}(\Omega))}^{\frac{p}{N}} k^{-\frac{p(N+1)}{N}} \int_{Q} |\nabla T_{k}(v)|^{p} \leq C_{1} M_{1} k^{-p_{c}},$$

with  $C_1 = C_1(N, p)$ . We obtain

$$\begin{split} \max \left\{ |\nabla v| > k \right\} & \leq \frac{1}{k^p} \int_0^{k^p} \max \left( \left\{ |\nabla v|^p > s \right\} \right) ds \\ & \leq \max \left\{ |v| > k^{\frac{N}{N+1}} \right\} + \frac{1}{k^p} \int_0^{k^p} \max \left( \left\{ |\nabla v|^p > s, |v| \leq k^{\frac{N}{N+1}} \right\} \right) ds \\ & \leq C_1 M_1 k^{-m_c} + \frac{1}{k^p} \int_{|v| \leq k^{\frac{N}{N+1}}} |\nabla v|^p \leq C_2 M_2 k^{-m_c}, \end{split}$$

with  $C_2 = C_2(N, p)$ . Furthermore, for any  $k \ge 1$ ,

$$\max\{|h| > k\} + \max\{|\nabla h| > k\} \le Ck^{-p} ||h||_X^p,$$

where C = C(N, p). Therefore, we easily get (4.19).

**Remark 4.9** If data  $\mu \in L^1(Q)$ , then (4.16) holds for all k > 0 and the term  $|\Omega|$  in inequality (4.17) can be removed where  $M = ||u_0||_{1,\Omega} + |\mu|(Q)$ . Furthermore, (4.19) is stated as follows:

$$\text{meas } \{|u| > k\} \le C_3 M^{\frac{p+N}{N}} k^{-p_c}, \qquad \text{meas } \{|\nabla u| > k\} \le C_4 M^{\frac{N+2}{N+1}} k^{-m_c}, \forall k > 0.$$
 (4.21)

To see last inequality, we do in the following way:

$$\begin{split} \max \left\{ |\nabla v| > k \right\} & \leq \frac{1}{k^p} \int_0^{k^p} \max \left( \left\{ |\nabla v|^p > s \right\} \right) ds \\ & \leq \max \left\{ |v| > M^{\frac{1}{N+1}} k^{\frac{N}{N+1}} \right\} + \frac{1}{k^p} \int_0^{k^p} \max \left\{ |\nabla v|^p > s, |v| \leq M^{\frac{1}{N+1}} k^{\frac{N}{N+1}} \right\} ds \\ & \leq C_4 M^{\frac{N+2}{N+1}} k^{-m_c}. \end{split}$$

**Proposition 4.10** Let  $\{\mu_n\} \subset \mathcal{M}_b(Q)$ , and  $\{u_{0,n}\} \subset L^1(\Omega)$ , with

$$\sup_{n} |\mu_{n}|\left(Q\right) < \infty, \ and \ \sup_{n} ||u_{0,n}||_{1,\Omega} < \infty.$$

Let  $u_n$  be a R-solution of (1.1) with data  $\mu_n = \mu_{n,0} + \mu_{n,s}$  and  $u_{0,n}$ , relative to a decomposition  $(f_n, g_n, h_n)$  of  $\mu_{n,0}$ , and  $v_n = u_n - h_n$ . Assume that  $\{f_n\}$  is bounded in  $L^1(Q)$ ,  $\{g_n\}$  bounded in  $(L^{p'}(Q))^N$  and  $\{h_n\}$  bounded in X.

Then, up to a subsequence,  $\{v_n\}$  converges a.e. to a function v, such that  $T_k(v) \in X$  and  $v \in L^{\sigma}((0,T);W_0^{1,\sigma}(\Omega)) \cap L^{\infty}((0,T);L^1(\Omega))$  for any  $\sigma \in [1, m_c)$ . And

- (i)  $\{v_n\}$  converges to v strongly in  $L^{\sigma}(Q)$  for any  $\sigma \in [1, m_c)$ , and  $\sup \|v_n\|_{L^{\infty}((0,T);L^1(\Omega))} < \infty$ ,
- (ii)  $\sup_{k>0} \sup_n \frac{1}{k+1} \int_Q |\nabla T_k(v_n)|^p < \infty$ ,
- (iii)  $\{T_k(v_n)\}\$  converges to  $T_k(v)$  wealthy in X, for any k > 0,
- (iv)  $\{|\nabla (T_k(v_n) + h_n)|^{p-2}\nabla (T_k(v_n) + h_n)\}\$  converges to some  $F_k$  weakly in  $(L^{p'}(Q))^N$ .

**Proof.** Take  $S \in W^{2,\infty}(\mathbb{R})$  such that S' has compact support on  $\mathbb{R}$  and S(0) = 0. We combine (4.6) with (4.16), and deduce that  $\{S(v_n)_t\}$  is bounded in  $X' + L^1(Q)$  and  $\{S(v_n)\}$  bounded in X. Hence,  $\{S(v_n)\}$  is relatively compact in  $L^1(Q)$ . On the other hand, we choose  $S = S_k$  such that  $S_k(z) = z$ , if |z| < k and  $S(z) = 2k \operatorname{sign} z$ , if |z| > 2k. Thanks to (4.17), we obtain

$$\max \{|v_{n} - v_{m}| > \sigma\} \leq \max \{|v_{n}| > k\} + \max \{|v_{m}| > k\} + \max \{|S_{k}(v_{n}) - S_{k}(v_{m})| > \sigma\} 
\leq \frac{1}{k} (\|v_{n}\|_{1,Q} + \|v_{m}\|_{1,Q}) + \max \{|S_{k}(v_{n}) - S_{k}(v_{m})| > \sigma\} 
\leq \frac{C}{k} + \max \{|S_{k}(v_{n}) - S_{k}(v_{m})| > \sigma\}.$$
(4.22)

Thus, up to a subsequence  $\{u_n\}$  is a Cauchy sequence in measure, and converges a.e. in Q to a function u. Thus,  $\{T_k(v_n)\}$  converges to  $T_k(v)$  weakly in X, since  $\sup_n \|T_k(v_n)\|_X < \infty$  for any k > 0. And  $\{|\nabla (T_k(v_n) + h_n)|^{p-2}\nabla (T_k(v_n) + h_n)\}$  converges to some  $F_k$  weakly in  $(L^{p'}(Q))^N$ . Furthermore, from (4.18),  $\{v_n\}$  converges to v strongly in  $L^{\sigma}(Q)$ , for any  $\sigma < p_c$ .

## 5 The convergence theorem

We first recall some properties of the measures, see [49, Lemma 5], [32].

**Proposition 5.1** Let  $\mu_s = \mu_s^+ - \mu_s^- \in \mathcal{M}_b(Q)$ , where  $\mu_s^+$  and  $\mu_s^-$  are concentrated, respectively, on two disjoint sets  $E^+$  and  $E^-$  of zero  $c_p^Q$ -capacity. Then, for any  $\delta > 0$ , there exist two compact sets  $K_{\delta}^+ \subseteq E^+$  and  $K_{\delta}^- \subseteq E^-$  such that

$$\mu_s^+(E^+\backslash K_\delta^+) \le \delta, \qquad \mu_s^-(E^-\backslash K_\delta^-) \le \delta,$$

and there exist  $\psi_{\delta}^+, \psi_{\delta}^- \in C_c^1(Q)$  with values in [0,1], such that  $\psi_{\delta}^+, \psi_{\delta}^- = 1$  respectively on  $K_{\delta}^+, K_{\delta}^-$ , and  $supp(\psi_{\delta}^+) \cap supp(\psi_{\delta}^-) = \emptyset$ , and

$$||\psi_{\delta}^{+}||_{X} + ||(\psi_{\delta}^{+})_{t}||_{X'+L^{1}(Q)} \le \delta, \qquad ||\psi_{\delta}^{-}||_{X} + ||(\psi_{\delta}^{-})_{t}||_{X'+L^{1}(Q)} \le \delta.$$

There exist decompositions  $(\psi_{\delta}^+)_t = (\psi_{\delta}^+)_t^1 + (\psi_{\delta}^+)_t^2$  and  $(\psi_{\delta}^-)_t = (\psi_{\delta}^-)_t^1 + (\psi_{\delta}^-)_t^2$  in  $X' + L^1(Q)$ , such that

$$\left\| \left( \psi_{\delta}^{+} \right)_{t}^{1} \right\|_{X'} \leq \frac{\delta}{3}, \qquad \left\| \left( \psi_{\delta}^{+} \right)_{t}^{2} \right\|_{1,Q} \leq \frac{\delta}{3}, \qquad \left\| \left( \psi_{\delta}^{-} \right)_{t}^{1} \right\|_{X'} \leq \frac{\delta}{3}, \qquad \left\| \left( \psi_{\delta}^{-} \right)_{t}^{2} \right\|_{1,Q} \leq \frac{\delta}{3}. \tag{5.1}$$

Both  $\{\psi_{\delta}^+\}$  and  $\{\psi_{\delta}^-\}$  converge to 0, \*-weakly in  $L^{\infty}(Q)$ , and strongly in  $L^1(Q)$  and up to subsequences, a.e. in Q, as  $\delta$  tends to 0.

Moreover if  $\rho_n$  and  $\eta_n$  are as in Theorem 2.1, we have, for any  $\delta, \delta_1, \delta_2 > 0$ ,

$$\int_{Q} \psi_{\delta}^{-} d\rho_{n} + \int_{Q} \psi_{\delta}^{+} d\eta_{n} = \omega(n, \delta), \qquad \int_{Q} \psi_{\delta}^{-} d\mu_{s}^{+} \leq \delta, \qquad \int_{Q} \psi_{\delta}^{+} d\mu_{s}^{-} \leq \delta, \tag{5.2}$$

$$\int_{Q} (1 - \psi_{\delta_{1}}^{+} \psi_{\delta_{2}}^{+}) d\rho_{n} = \omega(n, \delta_{1}, \delta_{2}), \qquad \int_{Q} (1 - \psi_{\delta_{1}}^{+} \psi_{\delta_{2}}^{+}) d\mu_{s}^{+} \leq \delta_{1} + \delta_{2}, \tag{5.3}$$

$$\int_{Q} (1 - \psi_{\delta_{1}}^{-} \psi_{\delta_{2}}^{-}) d\eta_{n} = \omega(n, \delta_{1}, \delta_{2}), \qquad \int_{Q} (1 - \psi_{\delta_{1}}^{-} \psi_{\delta_{2}}^{-}) d\mu_{s}^{-} \leq \delta_{1} + \delta_{2}.$$
 (5.4)

Hereafter, if  $n, \varepsilon, ..., \nu$  are real numbers, and a function A depends on  $n, \varepsilon, ..., \nu$  and eventual other parameters  $\alpha, \beta, ..., \gamma$ , and  $n \to n_0, \varepsilon \to \varepsilon_0, ..., \nu \to \nu_0$ , we write  $A = \omega(n, \varepsilon, ..., \nu)$ , then this means  $\overline{\lim}_{\nu \to \nu_0}...\overline{\lim}_{\varepsilon \to \varepsilon_0}\overline{\lim}_{n \to n_0}|A| = 0$ , when the parameters  $\alpha, \beta, ..., \gamma$  are fixed. In the same way,  $A \le \omega(n, \varepsilon, \delta, ..., \nu)$  means  $\overline{\lim}_{\nu \to \nu_0}...\overline{\lim}_{\varepsilon \to \varepsilon_0}\overline{\lim}_{n \to n_0}A \le 0$ , and  $A \ge \omega(n, \varepsilon, ..., \nu)$  means  $-A \le \omega(n, \varepsilon, ..., \nu)$ .

**Remark 5.2** In the sequel we use a convergence property, consequence of the Dunford-Pettis theorem, still used in [32]: If  $\{a_n\}$  is a sequence in  $L^1(Q)$  converging to a weakly in  $L^1(Q)$  and  $\{b_n\}$  a bounded sequence in  $L^{\infty}(Q)$  converging to b, a.e. in Q, then  $\lim_{n\to\infty} \int_Q a_n b_n = \int_Q ab$ .

Next we prove Thorem 2.1.

Scheme of the proof. Let  $\{\mu_n\}$ ,  $\{u_{0,n}\}$  and  $\{u_n\}$  satisfying the assumptions of Theorem 2.1. Then we can apply Proposition 4.10. Setting  $v_n = u_n - h_n$ , up to subsequences,  $\{u_n\}$  converges a.e. in Q to some function u, and  $\{v_n\}$  converges a.e. to v = u - h, such that  $T_k(v) \in X$  and  $v \in L^{\sigma}((0,T); W_0^{1,\sigma}(\Omega)) \cap L^{\infty}((0,T); L^1(\Omega))$  for every  $\sigma \in [1, m_c)$ . And  $\{v_n\}$  satisfies the conclusions (i) to (iv) of Proposition 4.10. We have

$$\mu_n = (f_n - \operatorname{div} g_n + (h_n)_t) + (\rho_n^1 - \operatorname{div} \rho_n^2) - (\eta_n^1 - \operatorname{div} \eta_n^2) + \rho_{n,s} - \eta_{n,s}$$
  
=  $\mu_{n,0} + (\rho_{n,s} - \eta_{n,s})^+ - (\rho_{n,s} - \eta_{n,s})^-,$ 

where

$$\mu_{n,0} = \lambda_{n,0} + \rho_{n,0} - \eta_{n,0}, \quad \text{with } \lambda_{n,0} = f_n - \operatorname{div} g_n + (h_n)_t, \quad \rho_{n,0} = \rho_n^1 - \operatorname{div} \rho_n^2, \quad \eta_{n,0} = \eta_n^1 - \operatorname{div} \eta_n^2.$$
(5.5)

Hence

$$\rho_{n,0}, \eta_{n,0} \in \mathcal{M}_b^+(Q) \cap \mathcal{M}_0(Q), \quad \text{and} \quad \rho_n \ge \rho_{n,0}, \quad \eta_n \ge \eta_{n,0}. \tag{5.6}$$

Let  $E^+, E^-$  be the sets where, respectively,  $\mu_s^+$  and  $\mu_s^-$  are concentrated. For any  $\delta_1, \delta_2 > 0$ , let  $\psi_{\delta_1}^+, \psi_{\delta_2}^+$  and  $\psi_{\delta_1}^-, \psi_{\delta_2}^-$  as in Proposition 5.1 and set

$$\Phi_{\delta_1,\delta_2} = \psi_{\delta_1}^+ \psi_{\delta_2}^+ + \psi_{\delta_1}^- \psi_{\delta_2}^-.$$

Suppose that we can prove the two estimates, near E

$$I_1 := \int_{\{|v_n| \le k\}} \Phi_{\delta_1, \delta_2} |\nabla u_n|^{p-2} \nabla u_n. \nabla \left(v_n - \langle T_k(v) \rangle_{\nu}\right) \le \omega(n, \nu, \delta_1, \delta_2), \tag{5.7}$$

and far from E,

$$I_2 := \int_{\{|v_n| \le k\}} (1 - \Phi_{\delta_1, \delta_2}) |\nabla u_n|^{p-2} \nabla u_n \cdot \nabla (v_n - \langle T_k(v) \rangle_{\nu}) \le \omega(n, \nu, \delta_1, \delta_2).$$
 (5.8)

Then it follows that

$$\overline{\lim}_{n,\nu} \int_{\{|v_n| \le k\}} |\nabla u_n|^{p-2} \nabla u_n \cdot \nabla \left( v_n - \langle T_k(v) \rangle_{\nu} \right) \le 0, \tag{5.9}$$

which implies

$$\overline{\lim}_{n \to \infty} \int_{\{|v_n| \le k\}} |\nabla u_n|^{p-2} \nabla u_n \cdot \nabla \left(v_n - T_k(v)\right) \le 0, \tag{5.10}$$

since  $\{\langle T_k(v)\rangle_{\nu}\}$  converges to  $T_k(v)$  in X. On the other hand, from the weak convergence of  $\{T_k(v_n)\}$  to  $T_k(v)$  in X, we verify that

$$\int_{\{|v_n| \le k\}} |\nabla \left(T_k(v) + h_n\right)|^{p-2} \nabla \left(T_k(v) + h_n\right) \nabla \left(T_k(v_n) - T_k(v)\right) = \omega(n).$$

Thus we get

$$\int_{\{|v_n| \le k\}} (|\nabla u_n|^{p-2} \nabla u_n - |\nabla (T_k(v) + h_n)|^{p-2} \nabla (T_k(v) + h_n)) \cdot \nabla (u_n - (T_k(v) + h_n)) = \omega(n).$$

Then, it is easy to show that, up to a subsequence,

$$\{\nabla u_n\}$$
 converges to  $\nabla u$ , a.e. in  $Q$ . (5.11)

Therefore,  $\{|\nabla u_n|^{p-2}\nabla u_n\}$  converges to  $|\nabla u|^{p-2}\nabla u$  weakly in  $(L^{p'}(Q))^N$ ; and from (5.10) we find

$$\overline{\lim}_{n\to\infty} \int_Q |\nabla u_n|^{p-2} \nabla u_n \cdot \nabla T_k(v_n) \le \int_Q |\nabla u|^{p-2} \nabla u \cdot \nabla T_k(v).$$

Otherwise,  $\{|\nabla (T_k(v) + h_n)|^{p-2}\nabla (T_k(v) + h_n)\}$  converges weakly in  $(L^{p'}(Q))^N$  to some  $F_k$ , from Proposition 4.10, and we obtain that  $F_k = |\nabla (T_k(v) + h)|^{p-2}\nabla (T_k(v) + h)$ . Hence

$$\overline{\lim}_{n\to\infty} \int_{Q} |\nabla (T_k(v_n) + h_n)|^p \leq \overline{\lim}_{n\to\infty} \int_{Q} |\nabla u_n|^{p-2} \nabla u_n \nabla T_k(v_n) 
+ \overline{\lim}_{n\to\infty} \int_{Q} |\nabla (T_k(v_n) + h_n)|^{p-2} \nabla (T_k(v_n) + h_n) \cdot \nabla h_n 
\leq \int_{Q} |\nabla (T_k(v) + h)|^p.$$

As a consequence

$$\{T_k(v_n)\}\$$
converges to  $T_k(v)$ , strongly in  $X$ ,  $\forall k > 0$ . (5.12)

Then to finish the proof we have to check that u is a solution of (1.1).

In order to prove (5.7) we need a first Lemma, inspired of [32, Lemma 6.1], extending [49, Lemma 6 and Lemma 7]:

**Lemma 5.3** Let  $\psi_{1,\delta}, \psi_{2,\delta} \in C^1(Q)$  be uniformly bounded in  $W^{1,\infty}(Q)$  with values in [0,1], such that  $\int_Q \psi_{1,\delta} d\mu_s^- \leq \delta$  and  $\int_Q \psi_{2,\delta} d\mu_s^+ \leq \delta$ . Then, under the assumptions of Theorem 2.1,

$$\frac{1}{m} \int_{\{m \le v_n < 2m\}} |\nabla u_n|^p \psi_{2,\delta} = \omega(n, m, \delta), \qquad \frac{1}{m} \int_{\{m \le v_n < 2m\}} |\nabla v_n|^p \psi_{2,\delta} = \omega(n, m, \delta), \tag{5.13}$$

$$\frac{1}{m} \int_{-2m < v_n \le -m} |\nabla u_n|^p \psi_{1,\delta} = \omega(n, m, \delta), \qquad \frac{1}{m} \int_{-2m < v_n \le -m} |\nabla v_n|^p \psi_{1,\delta} = \omega(n, m, \delta), \tag{5.14}$$

and for any k > 0,

$$\int_{\{m \le v_n < m+k\}} |\nabla u_n|^p \psi_{2,\delta} = \omega(n, m, \delta), \qquad \int_{\{m \le v_n < m+k\}} |\nabla v_n|^p \psi_{2,\delta} = \omega(n, m, \delta), \tag{5.15}$$

$$\int_{\{-m-k < v_n \le -m\}} |\nabla u_n|^p \psi_{1,\delta} = \omega(n, m, \delta), \qquad \int_{\{-m-k < v_n \le -m\}} |\nabla v_n|^p \psi_{1,\delta} = \omega(n, m, \delta).$$
 (5.16)

**Proof.** (i) Proof of (5.13), (5.14). Set for any  $r \in \mathbb{R}$  and any  $m, \ell \geq 1$ 

$$S_{m,\ell}(r) = \int_0^r \left( \frac{-m+\tau}{m} \chi_{[m,2m]}(\tau) + \chi_{(2m,2m+\ell]}(\tau) + \frac{4m+2h-\tau}{2m+\ell} \chi_{(2m+\ell,4m+2h]}(\tau) \right) d\tau,$$
$$S_m(r) = \int_0^r \left( \frac{-m+\tau}{m} \chi_{[m,2m]}(\tau) + \chi_{(2m,\infty)}(\tau) \right) d\tau.$$

Note that  $S''_{m,\ell} = \chi_{[m,2m]}/m - \chi_{[2m+\ell,2(2m+\ell)]}/(2m+\ell)$ . We choose  $(\xi, J, S) = (\psi_{2,\delta}, T_1, S_{m,\ell})$  as test functions in (4.15) for  $u_n$ , and observe that, from (5.5),

$$\widehat{\mu_{n,0}} = \mu_{n,0} - (h_n)_t = \widehat{\lambda_{n,0}} + \rho_{n,0} - \eta_{n,0} = f_n - \operatorname{div} g_n + \rho_{n,0} - \eta_{n,0}.$$
(5.17)

Thus we can write  $\sum_{i=1}^{6} A_i \leq \sum_{i=7}^{12} A_i$ , where

$$\begin{split} A_1 &= -\int_{\Omega} \psi_{2,\delta}(0) T_1(S_{m,\ell}(u_{0,n})) S_{m,\ell}(u_{0,n}), \quad A_2 = -\int_{Q} (\psi_{2,\delta})_t \overline{T_1}(S_{m,\ell}(v_n)), \\ A_3 &= \int_{Q} S'_{m,\ell}(v_n) T_1(S_{m,\ell}(v_n)) |\nabla u_n|^{p-2} \nabla u_n. \nabla \psi_{2,\delta}, \\ A_4 &= \int_{Q} S'_{m,\ell}(v_n)^2 \psi_{2,\delta} T'_1(S_{m,\ell}(v_n)) |\nabla u_n|^{p-2} \nabla u_n. \nabla v_n, \\ A_5 &= \frac{1}{m} \int_{\{m \leq v_n \leq 2m\}} \psi_{2,\delta} T_1(S_{m,\ell}(v_n)) |\nabla u_n|^{p-2} \nabla u_n. \nabla v_n, \end{split}$$

$$\begin{split} A_6 &= -\frac{1}{2m+\ell} \int\limits_{\{2m+\ell \leq v_n < 2(2m+\ell)\}} \psi_{2,\delta} |\nabla u_n|^{p-2} \nabla u_n. \nabla v_n, \\ A_7 &= \int_Q S'_{m,\ell}(v_n) T_1(S_{m,\ell}(v_n)) \psi_{2,\delta} f_n, \qquad A_8 = \int_Q S'_{m,\ell}(v_n) T_1(S_{m,\ell}(v_n)) g_n. \nabla \psi_{2,\delta}, \\ A_9 &= \int_Q \left( S'_{m,\ell}(v_n) \right)^2 T'_1(S_{m,\ell}(v_n)) \psi_{2,\delta} g_n. \nabla v_n, \qquad A_{10} = \frac{1}{m} \int\limits_{m \leq v_n \leq 2m} T_1(S_{m,\ell}(v_n)) \psi_{2,\delta} g_n. \nabla v_n, \\ A_{11} &= -\frac{1}{2m+\ell} \int\limits_{\{2m+\ell \leq v_n < 2(2m+\ell)\}} \psi_{2,\delta} g_n. \nabla v_n, \quad A_{12} &= \int_Q S'_{m,\ell}(v_n) T_1(S_{m,\ell}(v_n)) \psi_{2,\delta} d\left(\rho_{n,0} - \eta_{n,0}\right). \end{split}$$

Since  $||S_{m,\ell}(u_{0,n})||_{1,\Omega} \leq \int_{\{m \leq u_{0,n}\}} u_{0,n} dx$ , we find  $A_1 = \omega(\ell, n, m)$ . Otherwise

$$|A_2| \leq \|\psi_{2,\delta}\|_{W^{1,\infty}(Q)} \int_{\{m \leq v_n\}} v_n, \qquad |A_3| \leq \|\psi_{2,\delta}\|_{W^{1,\infty}(Q)} \int_{\{m \leq v_n\}} |\nabla u_n|^{p-1},$$

which implies  $A_2 = \omega(\ell, n, m)$  and  $A_3 = \omega(\ell, n, m)$ . Using (4.3) for  $u_n$ , we have

$$A_6 = -\int_Q \psi_{2,\delta} d(\rho_{n,s} - \eta_{n,s})^+ + \omega(\ell) = \omega(\ell, n, m, \delta).$$

Hence  $A_6 = \omega(\ell, n, m, \delta)$ , since  $(\rho_{n,s} - \eta_{n,s})^+$  converges to  $\mu_s^+$  as  $n \to \infty$  in the narrow topology, and  $\int_Q \psi_{2,\delta} d\mu_s^+ \leq \delta$ . We also obtain  $A_{11} = \omega(\ell)$  from (4.10).

Now  $\left\{S'_{m,\ell}(v_n)T_1(S_{m,\ell}(v_n))\right\}_{\ell}$  converges to  $S'_m(v_n)T_1(S_m(v_n))$ ,  $\left\{S'_m(v_n)T_1(S_m(v_n))\right\}_{n}$  converges to  $S'_m(v)$   $T_1(S_m(v))$ ,  $\left\{S'_m(v)T_1(S_m(v))\right\}_{m}$  converges to 0, \*-weakly in  $L^{\infty}(Q)$ , and  $\{f_n\}$  converges to f weakly in  $L^1(Q)$ ,  $\{g_n\}$  converges to g strongly in  $(L^{p'}(Q))^N$ . From Remark 5.2, we obtain

$$A_{7} = \int_{Q} S'_{m}(v_{n}) T_{1}(S_{m}(v_{n})) \psi_{2,\delta} f_{n} + \omega(\ell) = \int_{Q} S'_{m}(v) T_{1}(S_{m}(v)) \psi_{2,\delta} f + \omega(\ell,n) = \omega(\ell,n,m),$$

$$A_{8} = \int_{Q} S'_{m}(v_{n}) T_{1}(S_{m}(v_{n})) g_{n} \cdot \nabla \psi_{2,\delta} + \omega(\ell) = \int_{Q} S'_{m}(v) T_{1}(S_{m}(v)) g \nabla \psi_{2,\delta} + \omega(\ell,n) = \omega(\ell,n,m).$$

Otherwise,  $A_{12} \leq \int_Q \psi_{2,\delta} d\rho_n$ , and  $\left\{ \int_Q \psi_{2,\delta} d\rho_n \right\}$  converges to  $\int_Q \psi_{2,\delta} d\mu_s^+$ , thus  $A_{12} \leq \omega(\ell, n, m, \delta)$ . Using Holder inequality, we have

$$g_{n}.\nabla v_{n} - |\nabla u_{n}|^{p-2}\nabla u_{n}.\nabla v_{n} = g_{n}.\nabla u_{n} - g_{n}.\nabla h_{n} - |\nabla u_{n}|^{p} + |\nabla u_{n}|^{p-2}\nabla u_{n}.\nabla h_{n}$$

$$\leq C_{1}|g_{n}|^{p'} + \frac{1}{2}|\nabla u_{n}|^{p} - g_{n}.\nabla h_{n} - |\nabla u_{n}|^{p} + \frac{1}{2}|\nabla u_{n}|^{p} + C_{2}|\nabla h_{n}|^{p}$$

$$\leq C_{3}(|g_{n}|^{p'} + |\nabla h_{n}|^{p}),$$

for some  $C_i = C_i(p)$ , i = 1-3, which implies

$$A_9 - A_4 \leq C_3 \int_{\Omega} (S'_{m,\ell}(v_n))^2 T'_1(S_{m,\ell}(v_n)) \psi_{2,\delta} (|g_n|^{p'} + |h_n|^p) = \omega(\ell, n, m).$$

Similarly we also show that  $A_{10} - A_5/2 \le \omega(\ell, n, m)$ . Combining the estimates, we get  $A_5/2 \le \omega(\ell, n, m, \delta)$ . Thus,

$$\frac{1}{m} \int_{\{m \le v_n < 2m\}} |\nabla u_n|^p \psi_{2,\delta} T_1(S_{m,\ell}(v_n)) = \omega(\ell, n, m, \delta).$$

Note that for all m > 4,  $S_{m,\ell}(r) \ge 1$  for any  $r \in [\frac{3}{2}m, 2m]$ ; hence  $T_1(S_{m,\ell}(r) = 1$ . So,

$$\frac{1}{m} \int_{\left\{\frac{3}{2}m \leq v_n < 2m\right\}} |\nabla u_n|^p \psi_{2,\delta} = \omega(\ell, n, m, \delta).$$

Since  $|\nabla v_n|^p \leq 2^{p-1} |\nabla u_n|^p + 2^{p-1} |\nabla h_n|^p$ , there also holds

$$\frac{1}{m} \int_{\left\{\frac{3}{2}m \leq v_n < 2m\right\}} |\nabla v_n|^p \psi_{2,\delta} = \omega(\ell, n, m, \delta).$$

We deduce (5.13) by summing on each set  $\{(\frac{4}{3})^{\nu}m \leq v_n \leq (\frac{4}{3})^{\nu+1}m\}$  for  $\nu = 0, 1, 2$ . Similarly, we can choose  $(\xi, \psi, S) = (\psi_{1,\delta}, T_1, \tilde{S}_{m,\ell})$  as test functions in (4.15) for  $u_n$ , where  $\tilde{S}_{m,\ell}(r) = S_{m,\ell}(-r)$ , and we obtain (5.14).

(ii) Proof of (5.15), (5.16). We set, for any  $k, m, \ell \ge 1$ ,

$$S_{k,m,\ell}(r) = \int_0^r \left( T_k(\tau - T_m(\tau)) \chi_{[m,k+m+\ell]} + k \frac{2(k+\ell+m) - \tau}{k+m+\ell} \chi_{(k+m+\ell,2(k+m+\ell)]} \right) d\tau$$
$$S_{k,m}(r) = \int_0^s T_k(\tau - T_m(\tau)) \chi_{[m,\infty)} d\tau.$$

We choose  $(\xi, \psi, S) = (\psi_{2,\delta}, T_1, S_{k,m,\ell})$  as test functions in (4.15) for  $u_n$ . In the same way we also obtain

$$\int_{\{m \leq v_n < m+k\}} |\nabla u_n|^p \psi_{2,\delta} T_1(S_{k,m,\ell}(v_n)) = \omega(\ell, n, m, \delta).$$

Note that  $T_1(S_{k,m,\ell}(r)) = 1$  for any  $r \ge m+1$ , thus  $\int_{\{m+1 \le v_n < m+k\}} |\nabla u_n|^p \psi_{2,\delta} = \omega(n,m,\delta), \text{ which implies (5.15) by changing } m \text{ into } m-1. \text{ Similarly, we obtain (5.16).}$ 

Next we look at the behaviour near E.

Lemma 5.4 Estimate (5.7) holds.

**Proof.** There holds

$$I_1 = \int_Q \Phi_{\delta_1, \delta_2} |\nabla u_n|^{p-2} \nabla u_n \cdot \nabla T_k(v_n) - \int_{\{|v_n| \le k\}} \Phi_{\delta_1, \delta_2} |\nabla u_n|^{p-2} \nabla u_n \cdot \nabla \langle T_k(v) \rangle_{\nu}.$$

From Proposition 4.10, (iv),  $\{|\nabla (T_k(v_n) + h_n)|^{p-2}\nabla (T_k(v_n) + h_n)\nabla \langle T_k(v)\rangle_{\nu}\}$  converges weakly in  $L^1(Q)$  to  $F_k\nabla \langle T_k(v)\rangle_{\nu}$ . And  $\{\chi_{\{|v_n|\leq k\}}\}$  converges to  $\chi_{|v|\leq k}$ , a.e.. in Q, and  $\Phi_{\delta_1,\delta_2}$  converges to 0 a.e.. in Q as  $\delta_1\to 0$ , and  $\Phi_{\delta_1,\delta_2}$  takes its values in [0,1]. Thanks to Remark 5.2, we have

$$\begin{split} &\int\limits_{\{|v_n| \leq k\}} \Phi_{\delta_1,\delta_2} |\nabla u_n|^{p-2} \nabla u_n. \nabla \langle T_k(v) \rangle_{\nu} \\ &= \int_Q \chi_{\{|v_n| \leq k\}} \Phi_{\delta_1,\delta_2} |\nabla \left( T_k(v_n) + h_n \right)|^{p-2} \nabla \left( T_k(v_n) + h_n \right) \nabla \langle T_k(v) \rangle_{\nu} \\ &= \int_Q \chi_{|v| \leq k} \Phi_{\delta_1,\delta_2} F_k. \nabla \langle T_k(v) \rangle_{\nu} + \omega(n) = \omega(n,\nu,\delta_1). \end{split}$$

Therefore, if we prove that

$$\int_{Q} \Phi_{\delta_{1},\delta_{2}} |\nabla u_{n}|^{p-2} \nabla u_{n} \cdot \nabla T_{k}(v_{n}) \leq \omega(n,\delta_{1},\delta_{2}), \tag{5.18}$$

then we get (5.7). As noticed in [32], [49], it is precisely for this estimate that we need the double cut  $\psi_{\delta_1}^+ \psi_{\delta_2}^+$ . To do this, we set, for any m > k > 0, and any  $r \in \mathbb{R}$ ,

$$\hat{S}_{k,m}(r) = \int_0^r \left(k - T_k(\tau)\right) H_m(\tau) d\tau,$$

where  $H_m$  is defined at (4.14). Hence  $\operatorname{supp} \hat{S}_{k,m} \subset [-2m,k]$ ; and  $\hat{S}''_{k,m} = -\chi_{[-k,k]} + \frac{2k}{m}\chi_{[-2m,-m]}$ . We choose  $(\varphi, S) = (\psi_{\delta_1}^+ \psi_{\delta_2}^+, \hat{S}_{k,m})$  as test functions in (4.2). From (5.17), we can write

$$A_1 + A_2 - A_3 + A_4 + A_5 + A_6 = 0$$

where

$$A_{1} = -\int_{Q} (\psi_{\delta_{1}}^{+} \psi_{\delta_{2}}^{+})_{t} \hat{S}_{k,m}(v_{n}), \quad A_{2} = \int_{Q} (k - T_{k}(v_{n})) H_{m}(v_{n}) |\nabla u_{n}|^{p-2} \nabla u_{n}. \nabla (\psi_{\delta_{1}}^{+} \psi_{\delta_{2}}^{+}),$$

$$A_{3} = \int_{Q} \psi_{\delta_{1}}^{+} \psi_{\delta_{2}}^{+} |\nabla u_{n}|^{p-2} \nabla u_{n}. \nabla T_{k}(v_{n}), \quad A_{4} = \frac{2k}{m} \int_{\{-2m < v_{n} \le -m\}} \psi_{\delta_{1}}^{+} \psi_{\delta_{2}}^{+} |\nabla u_{n}|^{p-2} \nabla u_{n}. \nabla v_{n},$$

$$A_{5} = -\int_{Q} (k - T_{k}(v_{n})) H_{m}(v_{n}) \psi_{\delta_{1}}^{+} \psi_{\delta_{2}}^{+} d\widehat{\lambda_{n,0}}, \quad A_{6} = \int_{Q} (k - T_{k}(v_{n})) H_{m}(v_{n}) \psi_{\delta_{1}}^{+} \psi_{\delta_{2}}^{+} d \left(\eta_{n,0} - \rho_{n,0}\right);$$

and we estimate  $A_3$ . As in [49, p.585], since  $\{\hat{S}_{k,m}(v_n)\}$  converges to  $\hat{S}_{k,m}(v)$  weakly in X, and  $\hat{S}_{k,m}(v) \in L^{\infty}(Q)$ , and from (5.1), there holds

$$A_{1} = -\int_{O} (\psi_{\delta_{1}}^{+})_{t} \psi_{\delta_{2}}^{+} \hat{S}_{k,m}(v) - \int_{O} \psi_{\delta_{1}}^{+} (\psi_{\delta_{2}}^{+})_{t} \hat{S}_{k,m}(v) + \omega(n) = \omega(n, \delta_{1}).$$

Next consider  $A_2$ . Notice that  $v_n = T_{2m}(v_n)$  on  $\operatorname{supp} H_m(v_n)$ . From Proposition 4.10, (iv), the sequence  $\left\{ |\nabla \left( T_{2m}(v_n) + h_n \right)|^{p-2} \nabla \left( T_{2m}(v_n) + h_n \right) \nabla \left( \psi_{\delta_1}^+ \psi_{\delta_2}^+ \right) \right\}$  converges to  $F_{2m}.\nabla \left( \psi_{\delta_1}^+ \psi_{\delta_2}^+ \right)$  weakly in  $L^1(Q)$ . Thanks to Remark 5.2 and the convergence of  $\psi_{\delta_1}^+ \psi_{\delta_2}^+$  in X to 0 as  $\delta_1$  tends to 0, we find

$$A_{2} = \int_{Q} (k - T_{k}(v)) H_{m}(v) F_{2m} \cdot \nabla(\psi_{\delta_{1}}^{+} \psi_{\delta_{2}}^{+}) + \omega(n) = \omega(n, \delta_{1}).$$

Then consider  $A_4$ . There holds

$$|A_4| \leq \frac{2k}{m} \left( \int_{\{-2m < v_n \leq -m\}} |\nabla u_n|^p \psi_{\delta_1}^+ \psi_{\delta_2}^+ + \int_{\{-2m < v_n \leq -m\}} |\nabla v_n|^p \psi_{\delta_1}^+ \psi_{\delta_2}^+ \right).$$

Since  $\psi_{\delta_1}^+$  takes its values in [0,1], from Lemma 5.3, we get in particular  $A_4 = \omega(n,\delta_1,m,\delta_2)$ .

Now estimate  $A_5$ . The sequence  $\left\{(k-T_k(v_n))H_m(v_n)\psi_{\delta_1}^+\psi_{\delta_2}^+\right\}$  converges weakly in X to  $(k-T_k(v))H_m(v)\psi_{\delta_1}^+\psi_{\delta_2}^+$ , and  $\left\{(k-T_k(v_n))H_m(v_n)\right\}$  converges \*-weakly in  $L^\infty(Q)$  and a.e. in Q to  $(k-T_k(v))H_m(v)$ . Otherwise  $\{f_n\}$  converges to f weakly in  $L^1(Q)$  and  $\{g_n\}$  converges to f strongly

in  $(L^{p'}(Q))^N$ . Thanks to Remark 5.2 and the convergence of  $\psi_{\delta_1}^+ \psi_{\delta_2}^+$  to 0 in X and a.e. in Q as  $\delta_1 \to 0$ , we deduce that

$$A_5 = -\int_{Q} (k - T_k(v_n)) H_m(v) \psi_{\delta_1}^+ \psi_{\delta_2}^+ d\widehat{\nu}_0 + \omega(n) = \omega(n, \delta_1),$$

where  $\widehat{\nu_0} = f - \operatorname{div} g$ .

Finally  $A_6 \leq 2k \int_Q \psi_{\delta_1}^+ \psi_{\delta_2}^+ d\eta_n$ ; using (5.2) we also find  $A_6 \leq \omega(n, \delta_1, m, \delta_2)$ . By addition, since  $A_3$  does not depend on m, we obtain

$$A_3 = \int_Q \psi_{\delta_1}^+ \psi_{\delta_2}^+ |\nabla u_n|^{p-2} \nabla u_n \cdot \nabla T_k(v_n) \le \omega(n, \delta_1, \delta_2).$$

Reasoning as before with  $(\psi_{\delta_1}^- \psi_{\delta_2}^-, \check{S}_{k,m})$  as test function in (4.2), where  $\check{S}_{k,m}(r) = -\hat{S}_{k,m}(-r)$ , we get in the same way

$$\int_{Q} \psi_{\delta_{1}}^{-} \psi_{\delta_{2}}^{-} |\nabla u_{n}|^{p-2} \nabla u_{n}. \nabla T_{k}(v_{n}) \leq \omega(n, \delta_{1}, \delta_{2}).$$

Then, (5.18) holds.

Next we look at the behaviour far from E.

Lemma 5.5 . Estimate (5.8) holds.

**Proof.** Here we estimate  $I_2$ ; we can write

$$I_2 = \int_{\{|v_n| \le k\}} (1 - \Phi_{\delta_1, \delta_2}) |\nabla u_n|^{p-2} \nabla u_n \cdot \nabla \left( T_k(v_n) - \langle T_k(v) \rangle_{\nu} \right).$$

Following the ideas of [51], used also in [49], we define, for any  $r \in \mathbb{R}$  and  $\ell > 2k > 0$ ,

$$R_{n,\nu,\ell} = T_{\ell+k} \left( v_n - \langle T_k(v) \rangle_{\nu} \right) - T_{\ell-k} \left( v_n - T_k \left( v_n \right) \right).$$

Recall that  $\|\langle T_k(v)\rangle_{\nu}\|_{\infty,Q} \leq k$ , and observe that

$$R_{n,\nu,\ell} = 2k \operatorname{sign}(v_n)$$
 in  $\{|v_n| \ge \ell + 2k\}$ ,  $|R_{n,\nu,\ell}| \le 4k$ ,  $R_{n,\nu,\ell} = \omega(n,\nu,\ell)$  a.e. in  $Q$ , (5.19)

$$\lim_{n \to \infty} R_{n,\nu,\ell} = T_{\ell+k} \left( v - \langle T_k(v) \rangle_{\nu} \right) - T_{\ell-k} \left( v - T_k \left( v \right) \right), \qquad a.e. \text{ in } Q, \text{ and weakly in } X.$$
 (5.20)

Next consider  $\xi_{1,n_1} \in C_c^{\infty}([0,T)), \xi_{2,n_2} \in C_c^{\infty}((0,T])$  with values in [0,1], such that  $(\xi_{1,n_1})_t \leq 0$  and  $(\xi_{2,n_2})_t \geq 0$ ; and  $\{\xi_{1,n_1}(t)\}$  (resp.  $\{\xi_{1,n_2}(t)\}$ ) converges to 1, for any  $t \in [0,T]$  (resp.  $t \in (0,T]$ ); and moreover, for any  $a \in C([0,T];L^1(\Omega)), \{\int_Q a(\xi_{1,n_1})_t\}$  and  $\int_Q a(\xi_{2,n_2})_t$  converge respectively to  $-\int_\Omega a(T,.)$  and  $\int_\Omega a(0,.)$ . We set

$$\varphi = \varphi_{n,n_1,n_2,l_1,l_2,\ell} = \xi_{1,n_1}(1 - \Phi_{\delta_1,\delta_2})[T_{\ell+k} \left(v_n - \langle T_k(v) \rangle_{\nu}\right)]_{l_1} - \xi_{2,n_2}(1 - \Phi_{\delta_1,\delta_2})[T_{\ell-k} \left(v_n - T_k(v_n)\right)]_{-l_2} \ .$$

We can see that

$$\varphi - (1 - \Phi_{\delta_1, \delta_2}) R_{n, \nu, \ell} = \omega(l_1, l_2, n_1, n_2) \quad \text{in norm in } X \text{ and } a.e.. \text{ in } Q.$$
 (5.21)

We can choose  $(\varphi, S) = (\varphi_{n,n_1,n_2,l_1,l_2,\ell}, \overline{H_m})$  as test functions in (4.7) for  $u_n$ , where  $\overline{H_m}$  is defined at (4.14), with  $m > \ell + 2k$ . We obtain

$$A_1 + A_2 + A_3 + A_4 + A_5 = A_6 + A_7$$

with

$$A_{1} = \int_{\Omega} \varphi(T) \overline{H_{m}}(v_{n}(T)) dx, \qquad A_{2} = -\int_{\Omega} \varphi(0) \overline{H_{m}}(u_{0,n}) dx,$$

$$A_{3} = -\int_{Q} \varphi_{t} \overline{H_{m}}(v_{n}), \qquad A_{4} = \int_{Q} H_{m}(v_{n}) |\nabla u_{n}|^{p-2} \nabla u_{n} \cdot \nabla \varphi,$$

$$A_{5} = \int_{Q} \varphi H'_{m}(v_{n}) |\nabla u_{n}|^{p-2} \nabla u_{n} \cdot \nabla v_{n}, \qquad A_{6} = \int_{Q} H_{m}(v_{n}) \varphi d\widehat{\lambda_{n,0}},$$

$$A_{7} = \int_{Q} H_{m}(v_{n}) \varphi d(\rho_{n,0} - \eta_{n,0}).$$

**Estimate** of  $A_4$ . This term allows to study  $I_2$ . Indeed,  $\{H_m(v_n)\}$  converges to 1, a.e. in Q; thanks to (5.21), (5.19) (5.20), we have

$$A_{4} = \int_{Q} (1 - \Phi_{\delta_{1}, \delta_{2}}) |\nabla u_{n}|^{p-2} \nabla u_{n} \cdot \nabla R_{n, \nu, \ell} - \int_{Q} R_{n, \nu, \ell} |\nabla u_{n}|^{p-2} \nabla u_{n} \cdot \nabla \Phi_{\delta_{1}, \delta_{2}} + \omega(l_{1}, l_{2}, n_{1}, n_{2}, m)$$

$$= \int_{Q} (1 - \Phi_{\delta_{1}, \delta_{2}}) |\nabla u_{n}|^{p-2} \nabla u_{n} \cdot \nabla R_{n, \nu, \ell} + \omega(l_{1}, l_{2}, n_{1}, n_{2}, m, n, \nu, \ell)$$

$$= I_{2} + \int_{\{|v_{n}| > k\}} (1 - \Phi_{\delta_{1}, \delta_{2}}) |\nabla u_{n}|^{p-2} \nabla u_{n} \cdot \nabla R_{n, \nu, \ell} + \omega(l_{1}, l_{2}, n_{1}, n_{2}, m, n, \nu, \ell)$$

$$= I_{2} + B_{1} + B_{2} + \omega(l_{1}, l_{2}, n_{1}, n_{2}, m, n, \nu, \ell),$$

where

$$B_{1} = \int_{\{|v_{n}|>k\}} (1 - \Phi_{\delta,\eta}) (\chi_{|v_{n} - \langle T_{k}(v) \rangle_{\nu}| \leq \ell+k} - \chi_{||v_{n}|-k| \leq \ell-k}) |\nabla u_{n}|^{p-2} \nabla u_{n} \cdot \nabla v_{n},$$

$$B_{2} = -\int_{\{|v_{n}|>k\}} (1 - \Phi_{\delta_{1},\delta_{2}}) \chi_{|v_{n} - \langle T_{k}(v) \rangle_{\nu}| \leq \ell+k} |\nabla u_{n}|^{p-2} \nabla u_{n} \cdot \nabla \langle T_{k}(v) \rangle_{\nu}.$$

Now  $\{|\nabla (T_{\ell+2k}(v_n) + h_n)|^{p-2}\nabla (T_{\ell+2k}(v_n) + h_n)\nabla \langle T_k(v)\rangle_{\nu}\}$  converges to  $F_{\ell+2k}\nabla \langle T_k(v)\rangle_{\nu}$ , weakly in  $L^1(Q)$ . Otherwise  $\{\chi_{|v_n|>k}\chi_{|v_n-\langle T_k(v)\rangle_{\nu}}|\leq \ell+k\}$  converges to  $\chi_{|v|>k}\chi_{|v-\langle T_k(v)\rangle_{\nu}}|\leq \ell+k$ , a.e., in Q.

And  $\{\langle T_k(v)\rangle_{\nu}\}$  converges to  $T_k(v)$  strongly in X. Thanks to Remark 5.2 we get

$$B_{2} = -\int_{Q} (1 - \Phi_{\delta_{1}, \delta_{2}}) \chi_{|v| > k} \chi_{|v - \langle T_{k}(v) \rangle_{\nu}| \leq \ell + k} F_{\ell + 2k} \cdot \nabla \langle T_{k}(v) \rangle_{\nu} + \omega(n)$$

$$= -\int_{Q} (1 - \Phi_{\delta_{1}, \delta_{2}}) \chi_{|v| > k} \chi_{|v - T_{k}(v)| \leq \ell + k} F_{\ell + 2k} \cdot \nabla T_{k}(v) + \omega(n, \nu) = \omega(n, \nu),$$

since  $\nabla T_k(v) \chi_{|v|>k} = 0$ . Besides, we see that

$$|B_1| \le \int_{\{\ell-2k \le |v_n| < \ell+2k\}} (1 - \Phi_{\delta_1, \delta_2}) |\nabla u_n|^{p-1} |\nabla v_n|.$$

Using (5.3) and (5.4) and applying (5.15) and (5.16) to  $1 - \Phi_{\delta_1, \delta_2}$ , we obtain, for k > 0

$$\int_{\{m \le |v_n| < m+4k\}} (|\nabla u_n|^p + |\nabla v_n|^p)(1 - \Phi_{\delta_1, \delta_2}) = \omega(n, m, \delta_1, \delta_2).$$
(5.22)

Thus,  $B_1 = \omega(n, \nu, \ell, \delta_1, \delta_2)$ , hence  $B_1 + B_2 = \omega(n, \nu, \ell, \delta_1, \delta_2)$ . Then

$$A_4 = I_2 + \omega(l_1, l_2, n_1, n_2, m, n, \nu, \ell, \delta_1, \delta_2). \tag{5.23}$$

**Estimate** of  $A_5$ . For  $m > \ell + 2k$ , since  $|\varphi| \leq 2\ell$ , and (5.21) holds, we get, from the dominated convergence Theorem,

$$\begin{split} A_5 &= \int_{Q} (1 - \Phi_{\delta_1, \delta_2}) R_{n, \nu, \ell} H_m'(v_n) |\nabla u_n|^{p-2} \nabla u_n. \nabla v_n + \omega(l_1, l_2, n_1, n_2) \\ &= -\frac{2k}{m} \int\limits_{\{m \leq |v_n| < 2m\}} (1 - \Phi_{\delta_1, \delta_2}) |\nabla u_n|^{p-2} \nabla u_n. \nabla v_n + \omega(l_1, l_2, n_1, n_2); \end{split}$$

here, the final equality followed from the relation, since  $m > \ell + 2k$ .

$$R_{n,\nu,\ell}H'_m(v_n) = -\frac{2k}{m}\chi_{m \le |v_n| \le 2m}, \quad a.e. \text{ in } Q.$$
 (5.24)

Next we go to the limit in m, by using (4.3), (4.4) for  $u_n$ , with  $\phi = (1 - \Phi_{\delta_1, \delta_2})$ . There holds

$$A_5 = -2k \int_Q (1 - \Phi_{\delta_1, \delta_2}) d\left( (\rho_{n,s} - \eta_{n,s})^+ + (\rho_{n,s} - \eta_{n,s})^- \right) + \omega(l_1, l_2, n_1, n_2, m).$$

Then, from (5.3) and (5.4), we get  $A_5 = \omega(l_1, l_2, n_1, n_2, m, n, \nu, \ell, \delta_1, \delta_2)$ .

**Estimate** of  $A_6$ . Again, from (5.21),

$$A_{6} = \int_{Q} H_{m}(v_{n})\varphi f_{n} + \int_{Q} g_{n}.\nabla(H_{m}(v_{n})\varphi)$$

$$= \int_{Q} H_{m}(v_{n})(1 - \Phi_{\delta_{1},\delta_{2}})R_{n,\nu,\ell}f_{n} + \int_{Q} g_{n}.\nabla(H_{m}(v_{n})(1 - \Phi_{\delta_{1},\delta_{2}})R_{n,\nu,\ell}) + \omega(l_{1}, l_{2}, n_{1}, n_{2}).$$

Thus we can write  $A_6 = D_1 + D_2 + D_3 + D_4 + \omega(l_1, l_2, n_1, n_2)$ , where

$$D_{1} = \int_{Q} H_{m}(v_{n})(1 - \Phi_{\delta_{1}, \delta_{2}})R_{n,\nu,\ell}f_{n}, \qquad D_{2} = \int_{Q} (1 - \Phi_{\delta_{1}, \delta_{2}})R_{n,\nu,\ell}H'_{m}(v_{n})g_{n}.\nabla v_{n},$$

$$D_{3} = \int_{Q} H_{m}(v_{n})(1 - \Phi_{\delta_{1}, \delta_{2}})g_{n}.\nabla R_{n,\nu,\ell}, \qquad D_{4} = -\int_{Q} H_{m}(v_{n})R_{n,\nu,\ell}g_{n}.\nabla \Phi_{\delta_{1}, \delta_{2}}.$$

Since  $\{f_n\}$  converges to f weakly in  $L^1(Q)$ , and (5.19)-(5.20) hold, we get from Remark 5.2,

$$D_{1} = \int_{Q} (1 - \Phi_{\delta_{1}, \delta_{2}}) (T_{\ell+k} (v - \langle T_{k}(v) \rangle_{\nu}) - T_{\ell-k} (v - T_{k}(v))) f + \omega(m, n) = \omega(m, n, \nu, \ell).$$

We deduce from (4.10) that  $D_2 = \omega(m)$ . Next consider  $D_3$ . Note that  $H_m(v_n) = 1 + \omega(m)$ , and (5.20) holds, and  $\{g_n\}$  converges to g strongly in  $(L^{p'}(Q))^N$ , and  $\langle T_k(v) \rangle_{\nu}$  converges to  $T_k(v)$  strongly in X. Then we obtain successively that

$$D_{3} = \int_{Q} (1 - \Phi_{\delta_{1}, \delta_{2}}) g. \nabla \left( T_{\ell+k} \left( v - \langle T_{k}(v) \rangle_{\nu} \right) - T_{\ell-k} \left( v - T_{k} \left( v \right) \right) \right) + \omega(m, n)$$

$$= \int_{Q} (1 - \Phi_{\delta_{1}, \delta_{2}}) g. \nabla \left( T_{\ell+k} \left( v - T_{k}(v) \right) - T_{\ell-k} \left( v - T_{k} \left( v \right) \right) \right) + \omega(m, n, \nu)$$

$$= \omega(m, n, \nu, \ell).$$

Similarly we also get  $D_4 = \omega(m, n, \nu, \ell)$ . Thus  $A_6 = \omega(l_1, l_2, n_1, n_2, m, n, \nu, \ell, \delta_1, \delta_2)$ .

**Estimate** of  $A_7$ . We have

$$|A_{7}| = \left| \int_{Q} S'_{m}(v_{n}) (1 - \Phi_{\delta_{1}, \delta_{2}}) R_{n, \nu, \ell} d(\rho_{n, 0} - \eta_{n, 0}) \right| + \omega(l_{1}, l_{2}, n_{1}, n_{2})$$

$$\leq 4k \int_{Q} (1 - \Phi_{\delta_{1}, \delta_{2}}) d(\rho_{n} + \eta_{n}) + \omega(l_{1}, l_{2}, n_{1}, n_{2}).$$

From (5.3) and (5.4) we get  $A_7 = \omega(l_1, l_2, n_1, n_2, m, n, \nu, \ell, \delta_1, \delta_2)$ .

**Estimate** of  $A_1 + A_2 + A_3$ . We set

$$J(r) = T_{\ell-k} (r - T_k (r)), \quad \forall r \in \mathbb{R},$$

and use the notations  $\overline{J}$  and  $\mathcal{J}$  of (4.11). From the definitions of  $\xi_{1,n_1},\xi_{1,n_2}$ , we can see that

$$A_{1} + A_{2} = -\int_{\Omega} J(v_{n}(T)) \overline{H_{m}}(v_{n}(T)) - \int_{\Omega} T_{\ell+k}(u_{0,n} - z_{\nu}) \overline{H_{m}}(u_{0,n}) + \omega(l_{1}, l_{2}, n_{1}, n_{2})$$

$$= -\int_{\Omega} J(v_{n}(T)) v_{n}(T) - \int_{\Omega} T_{\ell+k}(u_{0,n} - z_{\nu}) u_{0,n} + \omega(l_{1}, l_{2}, n_{1}, n_{2}, m), \qquad (5.25)$$

where  $z_{\nu} = \langle T_k(v) \rangle_{\nu}(0)$ . We can write  $A_3 = F_1 + F_2$ , where

$$F_{1} = -\int_{Q} \left( \xi_{n_{1}} (1 - \Phi_{\delta_{1}, \delta_{2}}) [T_{\ell+k} (v_{n} - \langle T_{k}(v) \rangle_{\nu})]_{l_{1}} \right)_{t} \overline{H_{m}}(v_{n}),$$

$$F_{2} = \int_{Q} \left( \xi_{n_{2}} (1 - \Phi_{\delta_{1}, \delta_{2}}) [T_{\ell-k} (v_{n} - T_{k}(v_{n})))]_{-l_{2}} \right)_{t} \overline{H_{m}}(v_{n}).$$

**Estimate** of  $F_2$ . We write  $F_2 = G_1 + G_2 + G_3$ , with

$$G_{1} = -\int_{Q} (\Phi_{\delta_{1},\delta_{2}})_{t} \xi_{n_{2}} [T_{\ell-k} (v_{n} - T_{k} (v_{n}))]_{-l_{2}} \overline{H_{m}}(v_{n}),$$

$$G_{2} = \int_{Q} (1 - \Phi_{\delta_{1},\delta_{2}}) (\xi_{n_{2}})_{t} [T_{\ell-k} (v_{n} - T_{k} (v_{n}))]_{-l_{2}} \overline{H_{m}}(v_{n}),$$

$$G_{3} = \int_{Q} \xi_{n_{2}} (1 - \Phi_{\delta_{1},\delta_{2}}) ([T_{\ell-k} (v_{n} - T_{k} (v_{n}))]_{-l_{2}})_{t} \overline{H_{m}}(v_{n}).$$

We find easily

$$G_1 = -\int_Q (\Phi_{\delta_1, \delta_2})_t J(v_n) v_n + \omega(l_1, l_2, n_1, n_2, m),$$

$$G_2 = \int_Q (1 - \Phi_{\delta_1, \delta_2})(\xi_{n_2})_t J(v_n) \overline{H_m}(v_n) + \omega(l_1, l_2) = \int_{\Omega} J(u_{0,n}) u_{0,n} + \omega(l_1, l_2, n_1, n_2, m).$$

Next consider  $G_3$ . Setting  $b = \overline{H_m}(v_n)$ , there holds from (4.13) and (4.12),

$$(([J(b)]_{-l_2})_t b)(.,t) = \frac{b(.,t)}{l_2} (J(b)(.,t) - J(b)(.,t-l_2))$$

Hence

$$\left(\left[T_{\ell-k}\left(v_{n}-T_{k}\left(v_{n}\right)\right)\right]_{-l_{2}}\right)_{t}\overline{H_{m}}(v_{n}) \geq \left(\left[\mathcal{J}(\overline{H_{m}}(v_{n}))\right]_{-l_{2}}\right)_{t} = \left(\left[\mathcal{J}(v_{n})\right]_{-l_{2}}\right)_{t},$$

since  $\mathcal{J}$  is constant in  $\{|r| \geq m + \ell + 2k\}$ . Integrating by parts in  $G_3$ , we find

$$\begin{split} G_{3} & \geqq \int_{Q} \xi_{2,n_{2}} (1 - \Phi_{\delta_{1},\delta_{2}}) \big( [\mathcal{J}(v_{n})]_{-l_{2}} \big)_{t} \\ & = - \int_{Q} (\xi_{2,n_{2}} (1 - \Phi_{\delta_{1},\delta_{2}}))_{t} [\mathcal{J}(v_{n})]_{-l_{2}} + \int_{\Omega} \xi_{2,n_{2}} (T) [\mathcal{J}(v_{n})]_{-l_{2}} (T) \\ & = - \int_{Q} (\xi_{2,n_{2}})_{t} (1 - \Phi_{\delta_{1},\delta_{2}}) \mathcal{J}(v_{n}) \\ & + \int_{Q} \xi_{2,n_{2}} (\Phi_{\delta_{1},\delta_{2}})_{t} \mathcal{J}(v_{n}) + \int_{\Omega} \xi_{2,n_{2}} (T) \mathcal{J}(v_{n}(T)) + \omega(l_{1},l_{2}) \\ & = - \int_{\Omega} \mathcal{J}(u_{0,n}) + \int_{Q} (\Phi_{\delta_{1},\delta_{2}})_{t} \mathcal{J}(v_{n}) + \int_{\Omega} \mathcal{J}(v_{n}(T)) + \omega(l_{1},l_{2},n_{1},n_{2}). \end{split}$$

Therefore, since  $\mathcal{J}(v_n) - J(v_n)v_n = -\overline{J}(v_n)$  and  $\overline{J}(u_{0,n}) = J(u_{0,n})u_{0,n} - \mathcal{J}(u_{0,n})$ , we obtain

$$F_2 \ge \int_{\Omega} \overline{J}(u_{0,n}) - \int_{Q} (\Phi_{\delta_1,\delta_2})_t \overline{J}(v_n) + \int_{\Omega} \mathcal{J}(v_n(T)) + \omega(l_1, l_2, n_1, n_2, m).$$
 (5.26)

Estimate of  $F_1$ . Since  $m > \ell + 2k$ , there holds  $T_{\ell+k}(v_n - \langle T_k(v) \rangle_{\nu}) = T_{\ell+k}(\overline{H_m}(v_n) - \langle T_k(\overline{H_m}(v)) \rangle_{\nu})$  on supp $\overline{H_m}(v_n)$ . Hence we can write  $F_1 = L_1 + L_2$ , with

$$L_{1} = -\int_{Q} \left( \xi_{1,n_{1}} (1 - \Phi_{\delta_{1},\delta_{2}}) \left[ T_{\ell+k} \left( \overline{H_{m}}(v_{n}) - \langle T_{k}(\overline{H_{m}}(v)) \rangle_{\nu} \right) \right]_{l_{1}} \right)_{t} \left( \overline{H_{m}}(v_{n}) - \langle T_{k}(\overline{H_{m}}(v)) \rangle_{\nu} \right)$$

$$L_{2} = -\int_{Q} \left( \xi_{1,n_{1}} (1 - \Phi_{\delta_{1},\delta_{2}}) \left[ T_{\ell+k} \left( \overline{H_{m}}(v_{n}) - \langle T_{k}(\overline{H_{m}}(v)) \rangle_{\nu} \right) \right]_{l_{1}} \right)_{t} \langle T_{k}(\overline{H_{m}}(v)) \rangle_{\nu}.$$

Integrating by parts we have, by definition of the Landes-time approximation,

$$L_{2} = \int_{Q} \xi_{1,n_{1}} (1 - \Phi_{\delta_{1},\delta_{2}}) \left[ T_{\ell+k} \left( \overline{H_{m}}(v_{n}) - \langle T_{k}(\overline{H_{m}}(v)) \rangle_{\nu} \right) \right]_{l_{1}} \left( \langle T_{k}(\overline{H_{m}}(v)) \rangle_{\nu} \right)_{t}$$

$$+ \int_{\Omega} \xi_{1,n_{1}}(0) \left[ T_{\ell+k} \left( \overline{H_{m}}(v_{n}) - \langle T_{k}(\overline{H_{m}}(v)) \rangle_{\nu} \right) \right]_{l_{1}} (0) \langle T_{k}(\overline{H_{m}}(v)) \rangle_{\nu} (0)$$

$$= \nu \int_{Q} \left( 1 - \Phi_{\delta_{1},\delta_{2}} \right) T_{\ell+k} \left( v_{n} - \langle T_{k}(v) \rangle_{\nu} \right) \left( T_{k}(v) - \langle T_{k}(v) \rangle_{\nu} \right) + \int_{\Omega} T_{\ell+k} \left( u_{0,n} - z_{\nu} \right) z_{\nu} + \omega(l_{1}, l_{2}, n_{1}, n_{2}).$$

$$(5.27)$$

We decompose  $L_1$  into  $L_1 = K_1 + K_2 + K_3$ , where

$$\begin{split} K_1 &= -\int_Q (\xi_{1,n_1})_t (1 - \Phi_{\delta_1,\delta_2}) \big[ T_{\ell+k} \left( \overline{H_m}(v_n) - \langle T_k(\overline{H_m}(v)) \rangle_{\nu} \right) \big]_{l_1} \left( \overline{H_m}(v_n) - \langle T_k(\overline{H_m}(v)) \rangle_{\nu} \right) \\ K_2 &= \int_Q \xi_{1,n_1} (\Phi_{\delta_1,\delta_2})_t \big[ T_{\ell+k} \left( \overline{H_m}(v_n) - \langle T_k(\overline{H_m}(v)) \rangle_{\nu} \right) \big]_{l_1} \left( \overline{H_m}(v_n) - \langle T_k(\overline{H_m}(v)) \rangle_{\nu} \right) \\ K_3 &= -\int_Q \xi_{1,n_1} (1 - \Phi_{\delta_1,\delta_2}) \Big( \big[ T_{\ell+k} \left( \overline{H_m}(v_n) - \langle T_k(\overline{H_m}(v)) \rangle_{\nu} \right) \big]_{l_1} \Big)_t \left( \overline{H_m}(v_n) - \langle T_k(\overline{H_m}(v)) \rangle_{\nu} \right). \end{split}$$

Then we check easily that

$$K_1 = \int\limits_{\Omega} T_{\ell+k} \left( v_n - \langle T_k(v) \rangle_{\nu} \right) \left( T \right) \left( v_n - \langle T_k(v) \rangle_{\nu} \right) \left( T \right) dx + \omega(l_1, l_2, n_1, n_2, m),$$

$$K_2 = \int\limits_{Q} \left( \Phi_{\delta_1, \delta_2} \right)_t T_{\ell+k} \left( v_n - \langle T_k(v) \rangle_{\nu} \right) \left( v_n - \langle T_k(v) \rangle_{\nu} \right) + \omega(l_1, l_2, n_1, n_2, m).$$

Next consider  $K_3$ . Here we use the function  $\mathcal{T}_k$  defined at (4.13). We set  $b = \overline{H_m}(v_n) - \langle T_k(\overline{H_m}(v)) \rangle_{\nu}$ . Hence from (4.12),

$$(([T_{\ell+k}(b)]_{l_1})_t b)(.,t) = \frac{b(.,t)}{l_1} (T_{\ell+k}(b)(.,t+l_1) - T_{\ell+k}(b)(.,t))$$

$$\leq \frac{1}{l_1} (\mathcal{T}_{\ell+k}(b)((.,t+l_1)) - \mathcal{T}_{\ell+k}(b)(.,t)) = ([\mathcal{T}_{\ell+k}(b)]_{l_1})_t.$$

Thus

$$\begin{split} \left( \left[ T_{\ell+k} \left( \overline{H_m}(v_n) - \langle T_k(\overline{H_m}(v)) \rangle_{\nu} \right) \right]_{l_1} \right)_t \left( \overline{H_m}(v_n) - \langle T_k(\overline{H_m}(v)) \rangle_{\nu} \right) & \leq \left( \left[ \mathcal{T}_{\ell+k} \left( \overline{H_m}(v_n) - \langle T_k(\overline{H_m}(v)) \rangle_{\nu} \right) \right]_{l_1} \right)_t \\ & = \left( \left[ \mathcal{T}_{\ell+k} (v_n - \langle T_k(v) \rangle_{\nu}]_{l_1} \right)_t. \end{split}$$

Then

$$\begin{split} K_{3} & \geqq -\int_{Q} \xi_{1,n_{1}}(1-\Phi_{\delta_{1},\delta_{2}}) \Big( [\mathcal{T}_{\ell+k} \left(v_{n}-\langle T_{k}(v)\rangle_{\nu}\right)]_{l_{1}} \Big)_{t} \\ & = \int_{Q} (\xi_{1,n_{1}})_{t}(1-\Phi_{\delta_{1},\delta_{2}}) [\mathcal{T}_{\ell+k} \left(v_{n}-\langle T_{k}(v)\rangle_{\nu}\right)]_{l_{1}} - \int_{Q} \xi_{1,n_{1}} (\Phi_{\delta_{1},\delta_{2}})_{t} [\mathcal{T}_{\ell+k} \left(v_{n}-\langle T_{k}(v)\rangle_{\nu}\right)]_{l_{1}} \\ & + \int_{\Omega} \xi_{1,n_{1}}(0) [\mathcal{T}_{\ell+k} \left(v_{n}-\langle T_{k}(v)\rangle_{\nu}\right)]_{l_{1}}(0) \\ & = -\int_{\Omega} \mathcal{T}_{\ell+k} \left(v_{n}(T)-\langle T_{k}(v)\rangle_{\nu}(T)\right) - \int_{Q} (\Phi_{\delta_{1},\delta_{2}})_{t} \mathcal{T}_{\ell+k} \left(v_{n}-\langle T_{k}(v)\rangle_{\nu}\right) \\ & + \int_{\Omega} \mathcal{T}_{\ell+k} \left(u_{0,n}-z_{\nu}\right) + \omega(l_{1},l_{2},n_{1},n_{2}). \end{split}$$

We find by addition, since  $T_{\ell+k}(r) - \mathcal{T}_{\ell+k}(r) = \overline{T}_{\ell+k}(r)$  for any  $r \in \mathbb{R}$ ,

$$L_{1} \geq \int_{\Omega} \mathcal{T}_{\ell+k} \left( u_{0,n} - z_{\nu} \right) + \int_{\Omega} \overline{T}_{\ell+k} \left( v_{n}(T) - \langle T_{k}(v) \rangle_{\nu}(T) \right)$$

$$+ \int_{\Omega} \left( \Phi_{\delta_{1},\delta_{2}} \right)_{t} \overline{T}_{\ell+k} \left( v_{n} - \langle T_{k}(v) \rangle_{\nu} \right) + \omega(l_{1}, l_{2}, n_{1}, n_{2}, m).$$

$$(5.28)$$

We deduce from (5.28), (5.27), (5.26),

$$A_{3} \geq \int_{\Omega} \overline{J}(u_{0,n}) + \int_{\Omega} \mathcal{T}_{\ell+k} (u_{0,n} - z_{\nu}) + \int_{\Omega} \mathcal{T}_{\ell+k} (u_{0,n} - z_{\nu}) z_{\nu}$$

$$+ \int_{\Omega} \overline{T}_{\ell+k} (v_{n}(T) - \langle T_{k}(v) \rangle_{\nu}(T)) + \int_{\Omega} \mathcal{J}(v_{n}(T)) + \int_{Q} (\Phi_{\delta_{1},\delta_{2}})_{t} (\overline{T}_{\ell+k} (v_{n} - \langle T_{k}(v) \rangle_{\nu}) - \overline{J}(v_{n}))$$

$$+ \nu \int_{Q} (1 - \Phi_{\delta_{1},\delta_{2}}) T_{\ell+k} (v_{n} - \langle T_{k}(v) \rangle_{\nu}) (T_{k}(v) - \langle T_{k}(v) \rangle_{\nu}) + \omega(l_{1}, l_{2}, n_{1}, n_{2}, m).$$

$$(5.29)$$

Next we add (5.25) and (5.29). Note that  $\mathcal{J}(v_n(T)) - J(v_n(T))v_n(T) = -\overline{J}(v_n(T))$ , and also  $\mathcal{T}_{\ell+k}(u_{0,n} - z_{\nu}) - T_{\ell+k}(u_{0,n} - z_{\nu})(z_{\nu} - u_{0,n}) = -\overline{T}_{\ell+k}(u_{0,n} - z_{\nu})$ . Then we find

$$A_{1} + A_{2} + A_{3} \ge \int_{\Omega} \left( \overline{J}(u_{0,n}) - \overline{T}_{\ell+k} \left( u_{0,n} - z_{\nu} \right) \right) + \int_{\Omega} \left( \overline{T}_{\ell+k} \left( v_{n}(T) - \langle T_{k}(v) \rangle_{\nu}(T) \right) - \overline{J}(v_{n}(T)) \right)$$

$$+ \int_{Q} \left( \Phi_{\delta_{1},\delta_{2}} \right)_{t} \left( \overline{T}_{\ell+k} \left( v_{n} - \langle T_{k}(v) \rangle_{\nu} \right) - \overline{J}(v_{n}) \right)$$

$$+ \nu \int_{Q} \left( 1 - \Phi_{\delta_{1},\delta_{2}} \right) T_{\ell+k} \left( v_{n} - \langle T_{k}(v) \rangle_{\nu} \right) \left( T_{k}(v) - \langle T_{k}(v) \rangle_{\nu} \right) + \omega(l_{1}, l_{2}, n_{1}, n_{2}, m).$$

Notice that  $\overline{T}_{\ell+k}(r-s) - \overline{J}(r) \ge 0$  for any  $r, s \in \mathbb{R}$  such that  $|s| \le k$ ; thus

$$\int_{\Omega} \left( \overline{T}_{\ell+k} \left( v_n(T) - \langle T_k(v) \rangle_{\nu}(T) \right) - \overline{J}(v_n(T)) \right) \ge 0.$$

And  $\{u_{0,n}\}$  converges to  $u_0$  in  $L^1(\Omega)$  and  $\{v_n\}$  converges to v in  $L^1(Q)$  from Proposition 4.10. Thus we obtain

$$A_{1} + A_{2} + A_{3} \ge \int_{\Omega} \left( \overline{J}(u_{0}) - \overline{T}_{\ell+k} \left( u_{0} - z_{\nu} \right) \right) + \int_{Q} \left( \Phi_{\delta_{1}, \delta_{2}} \right)_{t} \left( \overline{T}_{\ell+k} \left( v - \langle T_{k}(v) \rangle_{\nu} \right) - \overline{J}(v) \right)$$
$$+ \nu \int_{Q} \left( 1 - \Phi_{\delta_{1}, \delta_{2}} \right) T_{\ell+k} \left( v - \langle T_{k}(v) \rangle_{\nu} \right) \left( T_{k}(v) - \langle T_{k}(v) \rangle_{\nu} \right) + \omega(l_{1}, l_{2}, n_{1}, n_{2}, m, n).$$

Moreover  $T_{\ell+k}(r-s)(T_k(r)-s) \ge 0$  for any  $r,s \in \mathbb{R}$  such that  $|s| \le k$ , hence

$$A_1 + A_2 + A_3 \ge \int_{\Omega} \left( \overline{J}(u_0) - \overline{T}_{\ell+k} \left( u_0 - z_{\nu} \right) \right) + \int_{Q} \left( \Phi_{\delta_1, \delta_2} \right)_t \left( \overline{T}_{\ell+k} \left( v - \langle T_k(v) \rangle_{\nu} \right) - \overline{J}(v) \right)$$

$$+\omega(l_1, l_2, n_1, n_2, m, n).$$

As  $\nu \to \infty$ ,  $\{z_{\nu}\}$  converges to  $T_k(u_0)$ , a.e., in  $\Omega$ , thus we get

$$A_1 + A_2 + A_3 \ge \int_{\Omega} \left( \overline{J}(u_0) - \overline{T}_{\ell+k} \left( u_0 - T_k(u_0) \right) \right) + \int_{Q} \left( \Phi_{\delta_1, \delta_2} \right)_t \left( \overline{T}_{\ell+k} \left( v - T_k(v) \right) - \overline{J}(v) \right) + \omega(l_1, l_2, n_1, n_2, m, n, \nu).$$

Finally  $|\overline{T}_{\ell+k}(r-T_k(r)) - \overline{J}(r)| \leq 2k|r|\chi_{\{|r| \geq \ell\}}$  for any  $r \in \mathbb{R}$ , thus

$$A_1 + A_2 + A_3 \ge \omega(l_1, l_2, n_1, n_2, m, n, \nu, \ell).$$

Combining all the estimates, we obtain  $I_2 \leq \omega(l_1, l_2, n_1, n_2, m, n, \nu, \ell, \delta_1, \delta_2)$  which implies (5.8), since  $I_2$  does not depend on  $l_1, l_2, n_1, n_2, m, \ell$ .

Next we conclude the proof of Theorem 2.1:

#### **Lemma 5.6** The function u is a R-solution of (1.1).

**Proof.** (i) First show that u satisfies (4.2). Here we proceed as in [49]. Let  $\varphi \in X \cap L^{\infty}(Q)$  such  $\varphi_t \in X' + L^1(Q)$ ,  $\varphi(.,T) = 0$ , and  $S \in W^{2,\infty}(\mathbb{R})$ , such that S' has compact support on  $\mathbb{R}$ , S(0) = 0. Let M > 0 such that supp $S' \subset [-M, M]$ . Taking successively  $(\varphi, S)$  and  $(\varphi\psi_{\delta}^{\pm}, S)$  as test functions in (4.2) applied to  $u_n$ , we can write

 $A_1 + A_2 + A_3 + A_4 = A_5 + A_6 + A_7,$   $A_{2,\delta,\pm} + A_{3,\delta,\pm} + A_{4,\delta,\pm} = A_{5,\delta,\pm} + A_{6,\delta,\pm} + A_{7,\delta,\pm},$ 

$$A_{1} = -\int_{\Omega} \varphi(0)S(u_{0,n}), \quad A_{2} = -\int_{Q} \varphi_{t}S(v_{n}), \quad A_{2,\delta,\pm} = -\int_{Q} (\varphi\psi_{\delta}^{\pm})_{t}S(v_{n}),$$

$$A_{3} = \int_{Q} S'(v_{n})|\nabla u_{n}|^{p-2}\nabla u_{n}.\nabla\varphi, \quad A_{3,\delta,\pm} = \int_{Q} S'(v_{n})|\nabla u_{n}|^{p-2}\nabla u_{n}.\nabla(\varphi\psi_{\delta}^{\pm}),$$

$$A_{4} = \int_{Q} S''(v_{n})\varphi|\nabla u_{n}|^{p-2}\nabla u_{n}.\nabla v_{n}, \quad A_{4,\delta,\pm} = \int_{Q} S''(v_{n})\varphi\psi_{\delta}^{\pm}|\nabla u_{n}|^{p-2}\nabla u_{n}.\nabla v_{n},$$

$$A_{5} = \int_{Q} S'(v_{n})\varphi d\widehat{\lambda_{n,0}}, \quad A_{6} = \int_{Q} S'(v_{n})\varphi d\rho_{n,0}, \quad A_{7} = -\int_{Q} S'(v_{n})\varphi d\eta_{n,0},$$

$$A_{5,\delta,\pm} = \int_{Q} S'(v_{n})\varphi\psi_{\delta}^{\pm} d\widehat{\lambda_{n,0}}, \quad A_{6,\delta,\pm} = \int_{Q} S'(v_{n})\varphi\psi_{\delta}^{\pm} d\rho_{n,0}, \quad A_{7,\delta,\pm} = -\int_{Q} S'(v_{n})\varphi\psi_{\delta}^{\pm} d\eta_{n,0}.$$

Since  $\{u_{0,n}\}$  converges to  $u_0$  in  $L^1(\Omega)$ , and  $\{S(v_n)\}$  converges to S(v) strongly in X and weak\* in  $L^{\infty}(Q)$ , there holds, from (5.2),

$$A_1 = -\int_Q \varphi(0)S(u_0) + \omega(n), \quad A_2 = -\int_Q \varphi_t S(v) + \omega(n), \quad A_{2,\delta,\psi_\delta^{\pm}} = \omega(n,\delta).$$

Moreover  $T_M(v_n)$  converges to  $T_M(v)$ , then  $T_M(v_n) + h_n$  converges to  $T_k(v) + h$  strongly in X, thus

$$A_{3} = \int_{Q} S'(v_{n}) |\nabla (T_{M}(v_{n}) + h_{n})|^{p-2} \nabla (T_{M}(v_{n}) + h_{n}) . \nabla \varphi$$

$$= \int_{Q} S'(v) |\nabla (T_{M}(v) + h)|^{p-2} \nabla (T_{M}(v) + h) . \nabla \varphi + \omega(n)$$

$$= \int_{Q} S'(v) |\nabla u|^{p-2} \nabla u . \nabla \varphi + \omega(n);$$

and

$$A_{4} = \int_{Q} S''(v_{n})\varphi|\nabla \left(T_{M}(v_{n}) + h_{n}\right)|^{p-2}\nabla \left(T_{M}(v_{n}) + h_{n}\right).\nabla T_{M}(v_{n})$$

$$= \int_{Q} S''(v)\varphi|\nabla \left(T_{M}(v) + h\right)|^{p-2}\nabla \left(T_{M}(v) + h\right).\nabla T_{M}(v) + \omega(n)$$

$$= \int_{Q} S''(v)\varphi|\nabla u|^{p-2}\nabla u.\nabla v + \omega(n).$$

In the same way, since  $\psi_{\delta}^{\pm}$  converges to 0 in X,

$$A_{3,\delta,\pm} = \int_{Q} S'(v) |\nabla u|^{p-2} \nabla u \nabla (\varphi \psi_{\delta}^{\pm}) + \omega(n) = \omega(n,\delta),$$
  

$$A_{4,\delta,\pm} = \int_{Q} S''(v) \varphi \psi_{\delta}^{\pm} |\nabla u|^{p-2} \nabla u \cdot \nabla v + \omega(n) = \omega(n,\delta).$$

And  $\{g_n\}$  converges strongly in  $(L^{p'}(\Omega))^N$ , thus

$$A_5 = \int_Q S'(v_n)\varphi f_n + \int_Q S'(v_n)g_n.\nabla\varphi + \int_Q S''(v_n)\varphi g_n.\nabla T_M(v_n)$$

$$= \int_Q S'(v)\varphi f + \int_Q S'(v)g.\nabla\varphi + \int_Q S''(v)\varphi g.\nabla T_M(v) + \omega(n)$$

$$= \int_Q S'(v)\varphi d\widehat{\mu_0} + \omega(n).$$

and  $A_{5,\delta,\pm} = \int_Q S'(v) \varphi \psi_{\delta}^{\pm} d\widehat{\lambda_{n,0}} + \omega(n) = \omega(n,\delta)$ . Then  $A_{6,\delta,\pm} + A_{7,\delta,\pm} = \omega(n,\delta)$ . From (5.2) we verify that  $A_{7,\delta,+} = \omega(n,\delta)$  and  $A_{6,\delta,-} = \omega(n,\delta)$ . Moreover, from (5.6) and (5.2), we find

$$|A_6 - A_{6,\delta,+}| \le \int_Q |S'(v_n)\varphi| (1 - \psi_{\delta}^+) d\rho_{n,0} \le ||S||_{W^{2,\infty}(\mathbb{R})} ||\varphi||_{L^{\infty}(Q)} \int_Q (1 - \psi_{\delta}^+) d\rho_n = \omega(n,\delta).$$

Similarly we also have  $|A_7 - A_{7,\delta,-}| \leq \omega(n,\delta)$ . Hence  $A_6 = \omega(n)$  and  $A_7 = \omega(n)$ . Therefore, we finally obtain (4.2):

$$-\int_{\Omega} \varphi(0)S(u_0) - \int_{Q} \varphi_t S(v) + \int_{Q} S'(v)|\nabla u|^{p-2} \nabla u \cdot \nabla \varphi + \int_{Q} S''(v)\varphi|\nabla u|^{p-2} \nabla u \cdot \nabla v = \int_{Q} S'(v)\varphi d\widehat{\mu_0}.$$
(5.30)

(ii) Next, we prove (4.3) and (4.4). We take  $\varphi \in C_c^{\infty}(Q)$  and take  $((1 - \psi_{\delta}^-)\varphi, \overline{H_m})$  as test functions in (5.30), with  $\overline{H_m}$  as in (4.14). We can write  $D_{1,m} + D_{2,m} = D_{3,m} + D_{4,m} + D_{5,m}$ , where

$$D_{1,m} = -\int_{Q} \left( (1 - \psi_{\delta}^{-}) \varphi \right)_{t} \overline{H_{m}}(v), \qquad D_{2,m} = \int_{Q} H_{m}(v) |\nabla u|^{p-2} \nabla u \cdot \nabla \left( (1 - \psi_{\delta}^{-}) \varphi \right),$$

$$D_{3,m} = \int_{Q} H_{m}(v) (1 - \psi_{\delta}^{-}) \varphi d\widehat{\mu_{0}}, \qquad D_{4,m} = \frac{1}{m} \int_{m \leq v \leq 2m} (1 - \psi_{\delta}^{-}) \varphi |\nabla u|^{p-2} \nabla u \cdot \nabla v,$$

$$(5.31)$$

$$D_{5,m} = -\frac{1}{m} \int_{-2m \le v \le -m} (1 - \psi_{\delta}^{-}) \varphi |\nabla u|^{p-2} \nabla u \cdot \nabla v.$$

Taking the same test functions in (4.2) applied to  $u_n$ , there holds  $D_{1,m}^n + D_{2,m}^n = D_{3,m}^n + D_{4,m}^n + D_{5,m}^n$ , where

$$D_{1,m}^n = -\int\limits_Q \left( (1 - \psi_{\delta}^-) \varphi \right)_t \overline{H_m}(v_n), \qquad D_{2,m}^n = \int\limits_Q H_m(v_n) |\nabla u_n|^{p-2} \nabla u_n. \nabla \left( (1 - \psi_{\delta}^-) \varphi \right),$$

$$D_{3,m}^{n} = \int_{Q} H_{m}(v_{n})(1 - \psi_{\delta}^{-})\varphi d(\widehat{\lambda_{n,0}} + \rho_{n,0} - \eta_{n,0}), \quad D_{4,m}^{n} = \frac{1}{m} \int_{m \leq v \leq 2m} (1 - \psi_{\delta}^{-})\varphi |\nabla u_{n}|^{p-2} \nabla u_{n}. \nabla v_{n},$$

$$D_{5,m}^{n} = -\frac{1}{m} \int_{-2m \le v_n \le -m} (1 - \psi_{\delta}^{-}) \varphi |\nabla u_n|^{p-2} \nabla u_n \cdot \nabla v_n.$$
(5.32)

In (5.32), we go to the limit as  $m \to \infty$ . Since  $\{\overline{H}_m(v_n)\}$  converges to  $v_n$  and  $\{H_m(v_n)\}$  converges to 1, a.e., in Q, and  $\{\nabla H_m(v_n)\}$  converges to 0, weakly in  $(L^p(Q))^N$ , we obtain the relation  $D_1^n + D_2^n = D_3^n + D^n$ , where

$$D_{1}^{n} = -\int_{Q} ((1 - \psi_{\delta}^{-})\varphi)_{t} v_{n}, \quad D_{2}^{n} = \int_{Q} |\nabla u_{n}|^{p-2} \nabla v_{n}. \nabla ((1 - \psi_{\delta}^{-})\varphi), \quad D_{3}^{n} = \int_{Q} (1 - \psi_{\delta}^{-})\varphi d\widehat{\lambda_{n,0}}$$

$$D^{n} = \int_{Q} (1 - \psi_{\delta}^{-})\varphi d(\rho_{n,0} - \eta_{n,0}) + \int_{Q} (1 - \psi_{\delta}^{-})\varphi d((\rho_{n,s} - \eta_{n,s})^{+} - (\rho_{n,s} - \eta_{n,s})^{-})$$

$$= \int_{Q} (1 - \psi_{\delta}^{-})\varphi d(\rho_{n} - \eta_{n}).$$

Clearly,  $D_{i,m} - D_i^n = \omega(n,m)$  for i = 1, 2, 3. From Proposition (4.3) and (5.2)-(5.4), we obtain  $D_{5,m} = \omega(n,m,\delta)$ , and

$$\frac{1}{m} \int_{\{m \le v < 2m\}} \psi_{\delta}^{-} \varphi |\nabla u|^{p-2} \nabla u \cdot \nabla v = \omega(n, m, \delta),$$

thus,

$$D_{4,m} = \frac{1}{m} \int_{\{m \le v < 2m\}} \varphi |\nabla u|^{p-2} \nabla u \cdot \nabla v + \omega(n, m, \delta).$$

Since  $\left| \int_Q (1 - \psi_{\delta}^-) \varphi d\eta_n \right| \leq \|\varphi\|_{L^{\infty}} \int_Q (1 - \psi_{\delta}^-) d\eta_n$ , it follows that  $\int_Q (1 - \psi_{\delta}^-) \varphi d\eta_n = \omega(n, m, \delta)$  from (5.4). And  $\left| \int_Q \psi_{\delta}^- \varphi d\rho_n \right| \leq \|\varphi\|_{L^{\infty}} \int_Q \psi_{\delta}^- d\rho_n$ , thus, from (5.2),  $\int_Q (1 - \psi_{\delta}^-) \varphi d\rho_n = \int_Q \varphi d\mu_s^+ + \omega(n, m, \delta)$ . Then  $D^n = \int_Q \varphi d\mu_s^+ + \omega(n, m, \delta)$ . Therefore by substraction, we get

$$\frac{1}{m} \int_{\{m \le v < 2m\}} \varphi |\nabla u|^{p-2} \nabla u \cdot \nabla v = \int_{Q} \varphi d\mu_{s}^{+} + \omega(n, m, \delta),$$

hence

$$\lim_{m \to \infty} \frac{1}{m} \int_{\{m \le v < 2m\}} \varphi |\nabla u|^{p-2} \nabla u \cdot \nabla v = \int_{Q} \varphi d\mu_s^+, \tag{5.33}$$

which proves (4.3) when  $\varphi \in C_c^{\infty}(Q)$ . Next assume only  $\varphi \in C^{\infty}(\overline{Q})$ . Then

$$\lim_{m \to \infty} \frac{1}{m} \int_{\{m \le v < 2m\}} \varphi |\nabla u|^{p-2} \nabla u \cdot \nabla v$$

$$= \lim_{m \to \infty} \frac{1}{m} \int_{\{m \le v < 2m\}} \varphi \psi_{\delta}^{+} |\nabla u|^{p-2} \nabla u \cdot \nabla v + \lim_{m \to \infty} \frac{1}{m} \int_{\{m \le v < 2m\}} \varphi (1 - \psi_{\delta}^{+}) |\nabla u|^{p-2} \nabla u \cdot \nabla v$$

$$= \int_{Q} \varphi \psi_{\delta}^{+} d\mu_{s}^{+} + \lim_{m \to \infty} \frac{1}{m} \int_{\{m \le v < 2m\}} \varphi (1 - \psi_{\delta}^{+}) |\nabla u|^{p-2} \nabla u \cdot \nabla v = \int_{Q} \varphi d\mu_{s}^{+} + D,$$

where,

$$D = \int_{Q} \varphi(1 - \psi_{\delta}^{+}) d\mu_{s}^{+} + \lim_{n \to \infty} \frac{1}{m} \int_{\{m \le v < 2m\}} \varphi(1 - \psi_{\delta}^{+}) |\nabla u|^{p-2} \nabla u \cdot \nabla v = \omega(\delta).$$

Therefore, (5.33) still holds for  $\varphi \in C^{\infty}(\overline{Q})$ , and we deduce (4.3) by density, and similarly, (4.4). This completes the proof of Theorem 2.1.

## 6 Equations with perturbation terms

Let  $\mathcal{G}: \Omega \times (0,T) \times \mathbb{R} \to \mathbb{R}$  be a Caratheodory function. If U is a function defined in Q we define the function  $\mathcal{G}(U)$  in Q by

$$\mathcal{G}(U)(x,t) = \mathcal{G}(x,t,U(x,t))$$
 for a.e.  $(x,t) \in Q$ .

We consider the problem (1.2):

$$\begin{cases} u_t - \Delta_p u + \mathcal{G}(u) = \mu & \text{in } Q, \\ u = 0 & \text{in } \partial\Omega \times (0, T), \\ u(0) = u_0 & \text{in } \Omega, \end{cases}$$

where  $\mu \in \mathcal{M}_b(Q)$ ,  $u_0 \in L^1(\Omega)$ . We say that u is a R-solution of problem (1.2) if  $\mathcal{G}(u) \in L^1(Q)$  and u is a R-solution of (1.1) with data  $(\mu - \mathcal{G}(u), u_0)$ .

#### 6.1 Subcritical type results

For proving Theorem 2.2, we begin by an integration Lemma:

**Lemma 6.1** Let G satisfying (2.3). If a measurable function V in Q satisfies

$$\operatorname{meas}\{|V| \ge t\} \le Mt^{-p_c}, \qquad \forall t \ge 1,$$

for some M > 0, then for any L > 1,

$$\int_{\{|V| \ge L\}} G(|V|) \le p_c M \int_L^\infty G(s) s^{-1-p_c} ds. \tag{6.1}$$

**Proof.** Indeed, setting  $G_L(s) = \chi_{[L,\infty)}(s)G(s)$ , we have

$$\int_{\{|V| \ge L\}} G(|V|) dx dt = \int_{Q} G_L(|V|) dx dt \le \int_{0}^{\infty} G_L(|V|^*(s)) ds$$

where  $|V|^*$  is and the rearrangement of |V|, defined by

$$|V|^*(s) = \inf\{a > 0 : \max\{|V| > a\}\} \le s\}, \quad \forall s \ge 0.$$

From the assumption, we get  $|V|^*(s) \leq \sup ((Ms^{-1})^{p_c^{-1}}, 1)$ . Thus, for any L > 1,

$$\int_{\{|V| \ge L\}} G(|V|) dx dt \le \int_0^\infty G_L\left(\sup\left((Ms^{-1})^{p_c^{-1}}, 1\right)\right) ds = p_c M \int_L^\infty G(s) s^{-1-p_c} ds,$$

which implies (6.1).

**Proof of Theorem 2.2.** Let  $\mu = \mu_0 + \mu_s \in \mathcal{M}_b(Q)$ , with  $\mu_0 \in \mathcal{M}_0(Q), \mu_s \in \mathcal{M}_s(Q)$ , and  $u_0 \in L^1(\Omega)$ . Then  $\mu_0^+, \mu_0^-$  can be decomposed as  $\mu_0^+ = (f_1, g_1, h_1), \ \mu_0^- = (f_2, g_2, h_2)$ . Let  $\mu_{n,s,i} \in C_c^{\infty}(Q), \ \mu_{n,s,i} \geq 0$ , converging respectively to  $\mu_s^+, \mu_s^-$  in the narrow topology. By Lemma 3.1, we can find  $f_{n,i}, g_{n,i}, h_{n,i} \in C_c^{\infty}(Q)$  which strongly converge to  $f_i, g_i, h_i$  in  $L^1(Q), \left(L^{p'}(Q)\right)^N$  and X respectively, i = 1, 2, such that  $\mu_0^+ = (f_1, g_1, h_1), \ \mu_0^- = (f_2, g_2, h_2)$ , and  $\mu_{n,0,i} = (f_{n,i}, g_{n,i}, h_{n,i})$ , converging respectively to  $\mu_0^+, \mu_0^-$  in the narrow topology. Furthermore, if we set

$$\mu_n = \mu_{n,0,1} - \mu_{n,0,2} + \mu_{n,s,1} - \mu_{n,s,2},$$

then  $|\mu_n|(Q) \leq |\mu|(Q)$ . Consider a sequence  $\{u_{0,n}\} \subset C_c^{\infty}(\Omega)$  which strongly converges to  $u_0$  in  $L^1(\Omega)$  and satisfies  $||u_{0,n}||_{1,\Omega} \leq ||u_0||_{1,\Omega}$ .

**Proof of (i)** Let  $u_n$  be a solution of

$$\begin{cases} (u_n)_t - \Delta_p u_n + \mathcal{G}(u_n) = \mu_n & \text{in } Q, \\ u_n = 0 & \text{on } \partial\Omega \times (0, T), \\ u_n(0) = u_{0,n} & \text{in } \Omega. \end{cases}$$

We can choose  $\varphi = \varepsilon^{-1} T_{\varepsilon}(u_n)$  as test function of above problem. Then we find

$$\int_{Q} \left( \varepsilon^{-1} \overline{T_{\varepsilon}}(u_{n}) \right)_{t} + \int_{Q} \varepsilon^{-1} |\nabla T_{\varepsilon}(u_{n})|^{p} + \int_{Q} \mathcal{G}(x, t, u_{n}) \varepsilon^{-1} T_{\varepsilon}(u_{n}) = \int_{Q} \varepsilon^{-1} T_{\varepsilon}(u_{n}) d\mu_{n}.$$

Since

$$\int_{Q} \left( \varepsilon^{-1} \overline{T_{\varepsilon}}(u_{n}) \right)_{t} = \int_{\Omega} \varepsilon^{-1} \overline{T_{\varepsilon}}(u_{n}(T)) dx - \int_{\Omega} \varepsilon^{-1} \overline{T_{\varepsilon}}(u_{0,n}) dx \ge -||u_{0,n}||_{L^{1}(\Omega)},$$

there holds

$$\int_{Q} \mathcal{G}(x, t, u_n) \varepsilon^{-1} T_{\varepsilon}(u_n) \leq |\mu_n|(Q) + ||u_{0,n}||_{L^{1}(\Omega)} \leq |\mu|(Q) + ||u_0||_{1,\Omega}.$$

Letting  $\varepsilon \to 0$ , we obtain

$$\int_{\Omega} |\mathcal{G}(x, t, u_n)| \le |\mu|(Q) + ||u_0||_{1,\Omega}. \tag{6.2}$$

Next apply Proposition 4.8 and Remark 4.9 to  $u_n$  with initial data  $u_{0,n}$  and measure data  $\mu_n - \mathcal{G}(u_n) \in L^1(Q)$ , we get

$$\operatorname{meas}\left\{|u_n| \geq s\right\} \leq C(|\mu|(Q) + ||u_0||_{L^1(\Omega)})^{\frac{p+N}{N}} s^{-p_c}, \qquad \forall s > 0, \forall n \in \mathbb{N},$$

for some C = C(N, p). Since  $|\mathcal{G}(x, t, u_n)| \leq G(|u_n|)$ , we deduce from (6.1) that  $\{|\mathcal{G}(u_n)|\}$  is equiintegrable. Then, thanks to Proposition 4.10, up to a subsequence,  $\{u_n\}$  converges to some function u, a.e. in Q, and  $\{\mathcal{G}(u_n)\}$  converges to  $\mathcal{G}(u)$  in  $L^1(Q)$ . Therefore, by Theorem 2.1, u is a R-solution of (2.4).

**Proof of (ii).** Let  $\{u_n\}_{n\geq 1}$  be defined by induction as R-solutions of

$$\begin{cases} (u_1)_t - \Delta_p u_1 = \mu_1 & \text{in } Q, \\ u_1 = 0 & \text{on } \partial\Omega \times (0, T), \\ u_1(0) = u_{0,1} & \text{in } \Omega, \end{cases} \begin{cases} (u_{n+1})_t - \Delta_p u_{n+1} = \mu_{n+1} - \lambda \mathcal{G}(u_n) & \text{in } Q, \\ u_{n+1} = 0 & \text{on } \partial\Omega \times (0, T), \\ u_{n+1}(0) = u_{0,n+1} & \text{in } \Omega, \end{cases}$$

As above, we apply Proposition 4.8 to  $u_{n+1}$  with initial data  $u_{0,n+1}$  and measure data  $\mu_{n+1} - \lambda \mathcal{G}(u_n)$ , and obtain

$$\operatorname{meas}\{|u_n| \ge s\} \le c_1 K_n s^{-p_c}, \qquad s > 0, \forall n \in \mathbb{N}, \tag{6.3}$$

where

$$K_{1} = (||u_{0,1}||_{1,\Omega} + |\mu_{1}|(Q))^{\frac{p+N}{N}},$$
  

$$K_{n+1} = (||u_{0,n+1}||_{1,\Omega} + |\mu_{n+1}|(Q) + \lambda||\mathcal{G}(u_{n})||_{1,Q}),$$

for any  $n \ge 1$ . Take  $\varepsilon = \lambda + |\mu|(Q) + ||u_0||_{L^1(\Omega)} \le 1$ . There holds  $K_1 \le c_1 \varepsilon$ , and for  $n \ge 1$ ,

$$K_{n+1} \leq c_2 \varepsilon (||\mathcal{G}(u_n)||_{1,O}^{1+\frac{p}{N}} + 1),$$

where  $c_1, c_2$  do not depend on  $n, \varepsilon$ . Thanks to (6.1) and (6.3), we have

$$\|\mathcal{G}(u_n)\|_{L^1(Q)} \le |Q| G(2) + \int_{\{u_n|\ge 2\}|} G(|u_n|) dx dt \le |Q| G(2) + p_c C_1 K_n \int_2^\infty G(s) s^{-1-p_c} ds.$$

Thus,  $K_{n+1} \leq c_3 \varepsilon (K_n^{1+\frac{p}{N}}+1)$ , where  $c_3$  does not depend on  $n, \varepsilon$ . Therefore, if  $\varepsilon$  is small enough,  $\{K_n\}$  is bounded. Then, again from (6.1) and the relation  $|\mathcal{G}(x,t,u_n)| \leq G(|u_n|)$  we verify that  $\mathcal{G}(|u_n|)$  is equi-integrable. As above, from Proposition 4.10 and Theorem 2.1, up to a subsequence,  $\{u_n\}$  converges to a R-solution u of (2.5).

Finally, assume that  $\mathcal{G}(x,t,r)r \leq 0$  for any  $(x,t,r) \in Q \times \mathbb{R}$ , and  $u_0 \geq 0$ ,  $\mu \geq 0$ . We can assume that  $f_{n,2}, g_{n,2}, h_{n,2}, \mu_{n,s,2}$  are zero. Then,  $u_n$ , u are nonnegative.

## 6.2 General case with absorption terms

We recall a result obtained in [17] in the elliptic case:

**Theorem 6.2** Let  $\Omega$  be a bounded domain of  $\mathbb{R}^N$ . Then there exists a constant  $K_{N,p}$  depending on N, p, such that, if  $\omega \in \mathcal{M}_b(\Omega)$  and u is a R-solution of problem

$$\begin{cases} -\Delta_p u = \omega & \text{in } \Omega, \\ u = 0 & \text{on } \partial\Omega, \end{cases}$$

there holds

$$-K_{N,p}\mathbf{W}_{1,p}^{2\operatorname{diam}\Omega}[\omega^{-}] \leq u \leq K_{N,p}\mathbf{W}_{1,p}^{2\operatorname{diam}\Omega}[\omega^{+}]. \tag{6.4}$$

Next we give a general result in case of absorption terms:

**Theorem 6.3** Let p < N and  $\mathcal{G} : Q \times \mathbb{R} \longmapsto \mathbb{R}$  be a Caratheodory function such that the map  $s \mapsto \mathcal{G}(x,t,s)$  is nondecreasing and odd, for a.e. (x,t) in Q.

Let  $\mu_1, \mu_2 \in \mathcal{M}_b^+(Q)$  such that there exist  $\omega_n \in \mathcal{M}_b^+(\Omega)$  and nondecreasing sequences  $\{\mu_{1,n}\}, \{\mu_{2,n}\}$  in  $\mathcal{M}_b^+(Q)$  with compact support in Q, converging to  $\mu_1, \mu_2$ , respectively in the narrow topology, and

$$\mu_{1,n}, \mu_{2,n} \leq \omega_n \otimes \chi_{(0,T)}, \qquad \mathcal{G}((n + K_{N,p} \mathbf{W}_{1,p}^{2\operatorname{diam}(\Omega)} [\omega_n])) \in L^1(Q),$$

where the constant  $K_{N,p}$  is given at Theorem 6.2. Let  $u_0 \in L^1(\Omega)$ , and  $\mu = \mu_1 - \mu_2$ . Then there exists a R-solution u of problem (1.2).

Moreover if  $u_0 \in L^{\infty}(\Omega)$ , and  $\omega_n \leq \gamma$  for any  $n \in \mathbb{N}$ , for some  $\gamma \in \mathcal{M}_b^+(\Omega)$ , then a.e. in Q,

$$|u(x,t)| \le K_{N,p} \mathbf{W}_{1,p}^{2\operatorname{diam}\Omega} \gamma(x) + ||u_0||_{\infty,\Omega}.$$
(6.5)

For proving this result, we need two Lemmas:

**Lemma 6.4** Let  $\mathcal{G}$  satisfy the assumptions of Theorem 6.3 and  $\mathcal{G} \in L^{\infty}(Q \times \mathbb{R})$ . For i = 1, 2, let  $u_{0,i} \in L^{\infty}(\Omega)$  be nonnegative, and  $\lambda_i = \lambda_{i,0} + \lambda_{i,s} \in \mathcal{M}_b^+(Q)$  with compact support in Q,  $\gamma \in \mathcal{M}_b^+(\Omega)$  with compact support in  $\Omega$  such that  $\lambda_i \leq \gamma \otimes \chi_{(0,T)}$ . Let  $\lambda_{i,0} = (f_i, g_i, h_i)$  be a decomposition of  $\lambda_{i,0}$  into functions with compact support in Q. Then, there exist R-solutions  $u, u_1, u_2$ , to problems

$$u_t - \Delta_p u + \mathcal{G}(u) = \lambda_1 - \lambda_2 \quad in \ Q, \qquad u = 0 \quad on \ \partial\Omega \times (0, T), \qquad u(0) = u_{0,1} - u_{0,2}, \quad (6.6)$$

$$(u_i)_t - \Delta_p u_i + \mathcal{G}(u_i) = \lambda_i \quad \text{in } Q, \qquad u_i = 0 \quad \text{on } \partial\Omega \times (0, T), \qquad u_i(0) = u_{0,i}, \tag{6.7}$$

relative to decompositions  $((f_{1,n} - f_{2,n} - \mathcal{G}(u_n), g_{1,n} - g_{2,n}, h_{1,n} - h_{2,n}), (f_{i,n} - \mathcal{G}(u_{i,n}), g_{i,n}, h_{i,n}),$  such that a.e. in Q,

$$-||u_{0,2}||_{\infty,\Omega} - K_{N,p} \mathbf{W}_{1,p}^{2\text{diam}\Omega} \gamma(x) \leq -u_2(x,t) \leq u(x,t) \leq u_1(x,t) \leq K_{N,p} \mathbf{W}_{1,p}^{2\text{diam}\Omega} \gamma(x) + ||u_{0,1}||_{\infty,\Omega},$$
(6.8)

and

$$\int_{Q} |\mathcal{G}(u)| \leq \sum_{i=1,2} \left( \lambda_{i}(Q) + ||u_{0,i}||_{L^{1}(\Omega)} \right), \quad and \quad \int_{Q} \mathcal{G}(u_{i}) \leq \lambda_{i}(Q) + ||u_{0,i}||_{1,\Omega}, \quad i = 1, 2. \quad (6.9)$$

Furthermore, assume that  $\mathcal{H}, \mathcal{K}$  have the same properties as  $\mathcal{G}$ , and  $\mathcal{H}(x,t,s) \leq \mathcal{G}(x,t,s) \leq \mathcal{K}(x,t,s)$  for any  $s \in (0,+\infty)$  and a.e. in Q. Then, one can find solutions  $u_i(\mathcal{H}), u_i(\mathcal{K})$ , corresponding to  $\mathcal{H}, \mathcal{K}$  with data  $\lambda_i$ , such that  $u_i(\mathcal{H}) \geq u_i \geq u_i(\mathcal{K})$ , i = 1, 2.

Assume that  $\omega_i$ ,  $\theta_i$  have the same properties as  $\lambda_i$  and  $\omega_i \leq \lambda_i \leq \theta_i$ ,  $u_{0,i,1}, u_{0,i,2} \in L^{\infty+}(\Omega)$ ,  $u_{0,i,2} \leq u_{0,i} \leq u_{0,i,1}$ . Then one can find solutions  $u_i(\omega_i), u_i(\theta_i)$ , corresponding to  $(\omega_i, u_{0,i,2}), (\theta_i, u_{0,i,1})$ , such that  $u_i(\omega_i, u_{0,i,2}) \leq u_i \leq u_i(\theta_i, u_{0,i,1})$ .

**Proof.** Let  $\{\varphi_{1,n}\}$ ,  $\{\varphi_{2,n}\}$  be sequences of mollifiers in  $\mathbb{R}$  and  $\mathbb{R}^N$ , and  $\varphi_n = \varphi_{1,n}\varphi_{2,n}$ . Set  $\gamma_n = \varphi_{2,n} * \gamma$ , and for  $i = 1, 2, u_{0,i,n} = \varphi_{2,n} * u_{0,i}$ ,

$$\lambda_{i,n} = \varphi_n * \lambda_i = f_{i,n} - \operatorname{div}(g_{i,n}) + (h_{i,n})_t + \lambda_{i,s,n},$$

where  $f_{i,n} = \varphi_n * f_i$ ,  $g_{i,n} = \varphi_n * g_i$ ,  $h_{i,n} = \varphi_n * h_i$ ,  $\lambda_{i,s,n} = \varphi_n * \lambda_{i,s}$ , and

$$\lambda_n = \lambda_{1,n} - \lambda_{2,n} = f_n - \operatorname{div}(g_n) + (h_n)_t + \lambda_{s,n},$$

where  $f_n = f_{1,n} - f_{2,n}$ ,  $g_n = g_{1,n} - g_{2,n}$ ,  $h_n = h_{1,n} - h_{2,n}$ ,  $\lambda_{s,n} = \lambda_{1,s,n} - \lambda_{2,s,n}$ . Then for n large enough,  $\lambda_{1,n}, \lambda_{2,n}, \lambda_n \in C_c^{\infty}(Q)$ ,  $\gamma_n \in C_c^{\infty}(\Omega)$ . Thus there exist unique solutions  $u_n, u_{i,n}, v_{i,n}, i = 1, 2$ , of problems

$$(u_n)_t - \Delta_p u_n + \mathcal{G}(u_n) = \lambda_{1,n} - \lambda_{2,n} \quad \text{in } Q, \quad u_n = 0 \quad \text{on } \partial\Omega \times (0,T), \quad u_n(0) = u_{0,1,n} - u_{0,2,n} \quad \text{in } \Omega$$

$$(u_{i,n})_t - \Delta_p u_{i,n} + \mathcal{G}(u_{i,n}) = \lambda_{i,n} \quad \text{in } Q, \qquad u_{i,n} = 0 \quad \text{on } (0,T) \times \partial\Omega, \qquad u_{i,n}(0) = u_{0,i,n} \quad \text{in } \Omega,$$

$$-\Delta_p w_n = \gamma_n \quad \text{in } \Omega, \qquad w_n = 0 \quad \text{on } \partial\Omega,$$

such that

$$-||u_{0,2}||_{\infty,\Omega} - w_n(x) \le -u_{2,n}(x,t) \le u_n(x,t) \le u_{1,n}(x,t) \le w_n(x) + ||u_{0,1}||_{\infty,\Omega}, \quad a.e. \text{ in } Q.$$

Moreover, as in the Proof of Theorem 2.2, (i), there holds

$$\int_{Q} |\mathcal{G}(u_n)| \leq \sum_{i=1,2} (\lambda_i(Q) + ||u_{0,i,n}||_{1,\Omega}), \quad \text{and} \quad \int_{Q} \mathcal{G}(u_{i,n}) \leq \lambda_i(Q) + ||u_{0,i,n}||_{1,\Omega}, \quad i = 1, 2.$$

By Proposition 4.10, up to a common subsequence,  $\{u_n, u_{1,n}, u_{2,n}\}$  converge to some  $(u, u_1, u_2)$ , a.e. in Q. Since  $\mathcal{G}$  is bounded, in particular,  $\{\mathcal{G}(u_n)\}$  converges to  $\mathcal{G}(u)$  and  $\{\mathcal{G}(u_{i,n})\}$  converges to  $\mathcal{G}(u_i)$  in  $L^1(Q)$ . Thus, (6.9) is satisfied. Morover  $\{\lambda_{i,n} - \mathcal{G}(u_{i,n}), f_{i,n} - \mathcal{G}(u_{i,n}), g_{i,n}, h_{i,n}, \lambda_{i,s,n}, u_{0,i,n}\}$  and  $\{\lambda_n - \mathcal{G}(u_n), f_n - \mathcal{G}(u_n), g_n, h_n, \lambda_{s,n}, u_{0,1,n} - u_{0,2,n}\}$  are approximations of  $(\lambda_i - \mathcal{G}(u_i), f_i - \mathcal{G}(u_i), g_i, h_i, \lambda_{i,s}, u_{0,i})$  and  $(\lambda - \mathcal{G}(u), f - \mathcal{G}(u), g, h, \lambda_s, u_{0,1} - u_{0,2})$ , in the sense of Theorem 2.1. Thus, we can find (different) subsequences converging a.e. to  $u, u_1, u_2$ , R-solutions of (6.6) and

(6.7). Furthermore, from [47, Corollary 3.4], up to a subsequence,  $\{w_n\}$  converges a.e. in Q to a R-solution

$$-\Delta_p w = \gamma$$
 in  $\Omega$ ,  $w = 0$  on  $\partial \Omega$ ,

such that  $w \leq K \mathbf{W}_{1,p}^{2 \text{diam} \Omega} \gamma$  a.e. in  $\Omega$ . Hence, we get the inequality (6.8). The other conclusions follow in the same way.

**Lemma 6.5** Let  $\mathcal{G}$  satisfy the assumptions of Theorem 6.3. For i = 1, 2, let  $u_{0,i} \in L^{\infty}(\Omega)$  be nonnegative,  $\lambda_i \in \mathcal{M}_b^+(Q)$  with compact support in Q, and  $\gamma \in \mathcal{M}_b^+(\Omega)$  with compact support in  $\Omega$ , such that

$$\lambda_i \leq \gamma \otimes \chi_{(0,T)}, \qquad \mathcal{G}((||u_{0,i}||_{\infty,\Omega} + K_{N,p} \mathbf{W}_{1,p}^{2\operatorname{diam}(\Omega)} \gamma)) \in L^1(Q).$$
 (6.10)

Then, there exist R-solutions  $u, u_1, u_2$  of the problems (6.6) and (6.7), respectively relative to the decompositions  $(f_1 - f_2 - \mathcal{G}(u), g_1 - g_2, h_1 - h_2)$ ,  $(f_i - \mathcal{G}(u_i), g_i, h_i)$ , satisfying (6.8) and (6.9).

Moreover, assume that  $\omega_i$ ,  $\theta_i$  have the same properties as  $\lambda_i$  and  $\omega_i \leq \lambda_i \leq \theta_i$ ,  $u_{0,i,1}, u_{0,i,2} \in L^{\infty+}(\Omega)$ ,  $u_{0,i,2} \leq u_{0,i} \leq u_{0,i,1}$ . Then, one can find solutions  $u_i(\omega_i, u_{0,i,2})$ ,  $u_i(\theta_i, u_{0,i,1})$ , corresponding with  $(\omega_i, u_{0,i,2})$ ,  $(\theta_i, u_{0,i,1})$ , such that  $u_i(\omega_i, u_{0,i,2}) \leq u_i \leq u_i(\theta_i, u_{0,i,1})$ .

**Proof.** From Lemma 6.4 there exist R-solutions  $u_n$ ,  $u_{i,n}$  to problems

$$(u_n)_t - \Delta_p u_n + T_n(\mathcal{G}(u_n)) = \lambda_1 - \lambda_2 \text{ in } Q, \qquad u_n = 0 \text{ on } \partial\Omega \times (0, T), \qquad u_n(0) = u_{0,1} - u_{0,2}$$

$$(u_{i,n})_t - \Delta_p u_{i,n} + T_n(\mathcal{G}(u_{i,n})) = \lambda_i \quad \text{in } Q, \qquad u_{i,n} = 0 \quad \text{on } \partial\Omega \times (0,T), \qquad u_{i,n}(0) = u_{0,i},$$

relative to the decompositions  $(f_1 - f_2 - T_n(\mathcal{G}(u_n), g_1 - g_2, h_1 - h_2), (f_i - T_n(\mathcal{G}(u_{i,n}), g_i, h_i);$  and they satisfy

$$-||u_{0,2}||_{\infty,\Omega} - K_{N,p} \mathbf{W}_{1,p}^{2\text{diam}\Omega} \gamma(x) \leq -u_{2,n}(x,t) \leq u_n(x,t)$$

$$\leq u_{1,n}(x,t) \leq K_{N,p} \mathbf{W}_{1,p}^{2\text{diam}\Omega} \gamma(x) + ||u_{0,1}||_{\infty,\Omega}, \tag{6.11}$$

$$\int_{Q} |T_{n}(\mathcal{G}(u_{n}))| \leq \sum_{i=1,2} (\lambda_{i}(Q) + ||u_{0,i}||_{1,\Omega}), \quad \text{and} \quad \int_{Q} T_{n}(\mathcal{G}(u_{i,n})) \leq \lambda_{i}(Q) + ||u_{0,i}||_{1,\Omega}.$$

As in Lemma 6.4, up to a common subsequence,  $\{u_n, u_{1,n}, u_{2,n}\}$  converges a.e. in Q to  $\{u, u_1, u_2\}$  for which (6.8) is satisfied a.e. in Q. From (6.10), (6.11) and the dominated convergence Theorem, we deduce that  $\{T_n(\mathcal{G}(u_n))\}$  converges to  $\mathcal{G}(u)$  and  $\{T_n(\mathcal{G}(u_{i,n}))\}$  converges to  $\mathcal{G}(u_i)$  in  $L^1(Q)$ . Thus, from Theorem 2.1, u and  $u_i$  are respective R-solutions of (6.6) and (6.7) relative to the decompositions  $(f_1 - f_2 - \mathcal{G}(u), g_1 - g_2, h_1 - h_2)$ ,  $(f_i - \mathcal{G}(u_i), g_i, h_i)$ , and (6.8) and (6.9 hold. The last statement follows from the same assertion in Lemma 6.4.

**Proof of Theorem 6.3.** By Proposition 3.2, for i = 1, 2, there exist  $f_{i,n}, f_i \in L^1(Q), g_{i,n}, g_i \in (L^{p'}(Q))^N$  and  $h_{i,n}, h_i \in X$ ,  $\mu_{i,n,s}, \mu_{i,s} \in \mathcal{M}_s^+(Q)$  such that

$$\mu_i = f_i - \text{div } g_i + (h_i)_t + \mu_{i,s}, \qquad \mu_{i,n} = f_{i,n} - \text{div } g_{i,n} + (h_{i,n})_t + \mu_{i,n,s},$$

and  $\{f_{i,n}\}, \{g_{i,n}\}, \{h_{i,n}\}$  strongly converge to  $f_i, g_i, h_i$  in  $L^1(Q), (L^{p'}(Q))^N$  and X respectively, and  $\{\mu_{i,n}\}, \{\mu_{i,n,s}\}$  converge to  $\mu_i, \mu_{i,s}$  (strongly) in  $\mathcal{M}_b(Q)$ , and

$$||f_{i,n}||_{1,Q} + ||g_{i,n}||_{p',Q} + ||h_{i,n}||_X + \mu_{i,n,s}(\Omega) \leq 2\mu(Q).$$

By Lemma 6.5, there exist R-solutions  $u_n$ ,  $u_{i,n}$  to problems

$$(u_n)_t - \Delta_p u_n + \mathcal{G}(u_n) = \mu_{1,n} - \mu_{2,n}$$
 in  $Q$ ,  $u_n = 0$  on  $\partial \Omega \times (0,T)$ ,  $u_n(0) = T_n(u_0)$  (6.12)

$$(u_{i,n})_t - \Delta_p u_{i,n} + \mathcal{G}(u_{i,n}) = \mu_{i,n} \text{ in } \Omega, \qquad u_i = 0 \text{ on } \partial\Omega \times (0,T), \quad u_{i,n}(0) = T_n(u_0^{\pm}), \quad (6.13)$$

for i=1,2, relative to the decompositions  $(f_{1,n}-f_{2,n}-\mathcal{G}(u_n),g_{1,n}-g_{2,n},h_{1,n}-h_{2,n}), (f_{i,n}-\mathcal{G}(u_{i,n}),g_{i,n},h_{i,n}),$  such that  $\{u_{i,n}\}$  is nonnegative and nondecreasing, and  $-u_{2,n} \leq u_n \leq u_{1,n};$  and

$$\int_{Q} |\mathcal{G}(u_n)| \le \mu_1(Q) + \mu_2(Q) + ||u_0||_{1,\Omega}, \quad \text{and} \quad \int_{Q} \mathcal{G}(u_{i,n}) \le \mu_i(Q) + ||u_0||_{1,\Omega}, \quad i = 1, 2. \quad (6.14)$$

As in the proof of Lemma 6.5, up to a common subsequence  $\{u_n, u_{1,n}, u_{2,n}\}$  converge a.e. in Q to  $\{u, u_1, u_2\}$ . Since  $\{\mathcal{G}(u_{i,n})\}$  is nondecreasing, and nonnegative, from the monotone convergence Theorem and (6.14), we obtain that  $\{\mathcal{G}(u_{i,n})\}$  converges to  $\mathcal{G}(u_i)$  in  $L^1(Q)$ , i = 1, 2. Finally,  $\{\mathcal{G}(u_n)\}$  converges to  $\mathcal{G}(u)$  in  $L^1(Q)$ , since  $|\mathcal{G}(u_n)| \leq \mathcal{G}(u_{1,n}) + \mathcal{G}(u_{2,n})$ . Thus, we can see that

$$\left\{\mu_{1,n} - \mu_{2,n} - \mathcal{G}(u_n), f_{1,n} - f_{2,n} - \mathcal{G}(u_n), g_{1,n} - g_{2,n}, h_{1,n} - h_{2,n}, \mu_{1,s,n} - \mu_{2,s,n}, T_n(u_0^+) - T_n(u_0^-)\right\}$$

is an approximation of  $(\mu_1 - \mu_2 - \mathcal{G}(u), f_1 - f_2 - \mathcal{G}(u), g_1 - g_2, h_1 - h_2, \mu_{1,s} - \mu_{2,s}, u_0)$ , in the sense of Theorem 2.1; and

$$\{\mu_{i,n} - \mathcal{G}(u_{i,n}), f_{i,n} - \mathcal{G}(u_{i,n}), g_{i,n}, h_{i,n}, \mu_{i,s,n}, T_n(u_0^{\pm})\}$$

is an approximation of  $(\mu_i - \mathcal{G}(u_i), f_i - \mathcal{G}(u_i), g_i, h_i, \mu_{i,s}, u_0^{\pm})$ . Therefore, u is a R-solution of (1.2), and (6.5) holds if  $u_0 \in L^{\infty}(\Omega)$  and  $\omega_n \leq \gamma$  for any  $n \in \mathbb{N}$  and some  $\gamma \in \mathcal{M}_b^+(\Omega)$ .

As a consequence we prove Theorem 2.3. We use the following result of [17]:

**Proposition 6.6** (see [17]) Let q > p-1,  $\alpha \in (0, N/p)$ , r > 0 and  $\nu \in \mathcal{M}_b^+(\Omega)$ . If  $\nu$  does not charge the sets of  $C_{\alpha p, \frac{q}{q+1-p}}$ -capacity zero, there exists a nondecreasing sequence  $\{\nu_n\} \subset \mathcal{M}_b^+(\Omega)$  with compact support in  $\Omega$  which converges to  $\nu$  in the narrow topology and such that  $\mathbf{W}_{\alpha,p}^r[\nu_n] \in L^q(\mathbb{R}^N)$ , for any  $n \in \mathbb{N}$ .

**Proof of Theorem 2.3.** Let  $f \in L^1(Q)$ ,  $u_0 \in L^1(\Omega)$ , and  $\mu \in \mathcal{M}_b(Q)$  such that  $|\mu| \leq \omega \otimes F$ , where  $F \in L^1((0,T))$  and  $\omega$  does not charge the sets of  $C_{p,\frac{q}{q+1-p}}$ -capacity zero. From Proposition 6.6, there exists a nondecreasing sequence  $\{\omega_n\} \subset \mathcal{M}_b^+(\Omega)$  with compact support in  $\Omega$  which converges to  $\omega$ , strongly in  $\mathcal{M}_b(\Omega)$ , such that  $\mathbf{W}_{1,p}^{2diam\Omega}[\omega_n] \in L^q(\mathbb{R}^N)$ . We can write

$$f + \mu = \mu_1 - \mu_2, \qquad \mu_1 = f^+ + \mu^+, \qquad \mu_2 = f^- + \mu^-,$$
 (6.15)

and  $\mu^+, \mu^- \leq \omega \otimes F$ . We set

$$Q_n = \{(x,t) \in \Omega \times (\frac{1}{n}, T - \frac{1}{n}) : d(x,\partial\Omega) > \frac{1}{n}\}, \qquad F_n = T_n(\chi_{(\frac{1}{n}T - \frac{1}{n})}F), \tag{6.16}$$

$$\mu_{1,n} = T_n(\chi_{Q_n} f^+) + \inf\{\mu^+, \omega_n \otimes F_n\}, \qquad \mu_{2,n} = T_n(\chi_{Q_n} f^-) + \inf\{\mu^-, \omega_n \otimes F_n\}.$$
 (6.17)

Then  $\{\mu_{1,n}\}$ ,  $\{\mu_{2,n}\}$  are nondecreasing sequences with compact support in Q, and  $\mu_{1,n}, \mu_{2,n} \leq \tilde{\omega}_n \otimes \chi_{(0,T)}$ , with  $\tilde{\omega}_n = n(\chi_{\Omega} + \omega_n)$  and  $(n + K_{N,p} \mathbf{W}_{1,p}^{2diam\Omega}[\omega_n])^q \in L^1(Q)$ . Besides,  $\omega_n \otimes F_n$  converges to  $\omega \otimes F$  strongly in  $\mathcal{M}_b(Q)$ : indeed we easily check that

$$||\omega_n \otimes F_n - \omega \otimes F||_{\mathcal{M}_b(Q)} \le ||F_n||_{L^1((0,T))} ||\omega_n - \omega||_{\mathcal{M}_b(\Omega)} + ||\omega||_{\mathcal{M}_b(\Omega)} ||F_n - F||_{L^1((0,T))}$$

Observe that for any measures  $\nu, \theta, \eta \in \mathcal{M}_b(Q)$ , there holds

$$\left|\inf\{\nu,\theta\} - \inf\{\nu,\eta\}\right| \leq \left|\theta - \eta\right|,$$

hence  $\{\mu_{1,n}\}$ ,  $\{\mu_{2,n}\}$  converge to  $\mu_1, \mu_2$  respectively in  $\mathcal{M}_b(Q)$ . Therefore, the result follows from Theorem 6.3.

**Remark 6.7** Our result improves the existence results of [50], where  $\mu \in \mathcal{M}_0(Q)$ . Indeed, let  $p_e = N(p-1)/(N-p)$  be the critical exponent for the elliptic problem

$$-\Delta_p w + |w|^{q-1} w = \omega \quad in \ \Omega, \qquad w = 0 \quad on \ \partial\Omega.$$

Notice that  $p_c < p_e$ , since  $p > p_1$ . If  $q \ge p_e$ , there exist measures  $\omega \in \mathcal{M}_b^+(\Omega)$  which do not charge the sets of  $C_{p,\frac{q}{q+1-p}}$ -capacity zero, such that  $\omega \notin \mathcal{M}_{0,e}(\Omega)$ . Then for any  $F \in L^1((0,T))$ ,  $F \ge 0$ , we have  $\omega \otimes F \notin \mathcal{M}_0(Q)$ .

**Remark 6.8** Let  $\mathcal{G}: Q \times \mathbb{R} \to \mathbb{R}$  be a Caratheodory function such that the map  $s \mapsto \mathcal{G}(x,t,s)$  is nondecreasing and odd, for a.e. (x,t) in Q. Assume that  $\omega \in \mathcal{M}_{0,e}(\Omega)$ . Thus, we have  $\omega(\{x: W^{2diam(\Omega)}[\omega](x) = \infty\}) = 0$ . As in the proof of Theorem 2.3 with  $\omega_n = \chi_{W_{1,p}^{2diam\Omega}[\omega] \leq n} \omega$ , we get that (1.2) has a R-solution.

**Remark 6.9** As in [17], from Theorem 6.3, we can extend Theorem 2.3 given for  $\mathcal{G}(u) = |u|^{q-1}u$ , to the case of a function  $\mathcal{G}(x,t,.)$ , odd for a.e.  $(x,t) \in Q$ , such that

$$|\mathcal{G}(x,t,u)| \leq G(|u|), \qquad \int_{1}^{\infty} G(s)s^{-q-1}ds < \infty,$$

where G is a nondecreasing continuous, under the condition that  $\omega$  does not charge the sets of zero  $C_{p,\frac{q}{q-p+1},1}$ -capacity, where for any Borel set  $E\subset\mathbb{R}^N$ ,

$$C_{p,\frac{q}{q-p+1},1}(E) = \inf\{||\varphi||_{L^{\frac{q}{q-p+1},1}(\mathbb{R}^N)} : \varphi \in L^{\frac{q}{q-p+1},1}(\mathbb{R}^N), \quad G_p * \varphi \ge \chi_E\}$$

where  $L^{\frac{q}{q-p+1},1}(\mathbb{R}^N)$  is the Lorentz space of order  $(\frac{q}{q-p+1},1)$ .

In case  $\mathcal{G}$  is of exponential type, we introduce the notion of maximal fractional operator, defined for any  $\eta \geq 0$ , R > 0, by

$$\mathbf{M}_{p,R}^{\eta}[\omega] = \sup_{t \in (0,R)} \frac{\omega(B(x_0,t))}{t^{N-p}h_n(t)}, \quad \text{where } h_{\eta}(t) = \inf((-\ln t)^{-\eta}, (\ln 2)^{-\eta})).$$

We obtain the following:

**Theorem 6.10** Let p < N and  $\tau > 0, \beta > 1, \mu \in \mathcal{M}_b(Q)$  and  $u_0 \in L^1(\Omega)$ . Assume that  $|\mu| \leq \omega \otimes F$ , with  $\omega \in \mathcal{M}_b^+(\Omega)$ ,  $F \in L^1((0,T))$  be nonnegative. Assume that one of the following assumptions is satisfied:

(i)  $||F||_{L^{\infty}((0,T))} \leq 1$  and for some  $M_0 = M_0(N, p, \beta, \tau, \operatorname{diam}\Omega)$ ,

$$||\mathbf{M}_{p,2\mathrm{diam}_{\Omega}}^{\frac{p-1}{\beta'}}[\omega]||_{L^{\infty}(\mathbb{R}^{N})} < M_{0}, \tag{6.18}$$

ii) There exists  $\beta_0 > \beta$  such that  $\mathbf{M}_{p,2diam\Omega}^{\frac{p-1}{\beta_0'}}[\omega] \in L^{\infty}(\mathbb{R}^N)$ .

Then there exists a R-solution to the problem

$$\begin{cases} u_t - \Delta_p u + (e^{\tau |u|^{\beta}} - 1)\operatorname{sign} u = F + \mu & \text{in } Q, \\ u = 0 & \text{on } \partial\Omega \times (0, T), \\ u(0) = u_0 & \text{in } \Omega. \end{cases}$$

$$(6.19)$$

For the proof we use the following result of [17]:

**Proposition 6.11 (see [17], Theorem 2.4)** Suppose  $1 . Let <math>\nu \in \mathcal{M}_b^+(\Omega)$ ,  $\beta > 1$ , and  $\delta_0 = ((12\beta)^{-1})^{\beta} p \ln 2$ . There exists  $C = C(N, p, \beta, \operatorname{diam}\Omega)$  such that, for any  $\delta \in (0, \delta_0)$ ,

$$\int_{\Omega} \exp(\delta \frac{(\mathbf{W}_{1,p}^{2\operatorname{diam}\Omega}[\nu])^{\beta}}{||\mathbf{M}_{p,2\operatorname{diam}\Omega}^{\frac{p-1}{\beta'}}[\nu]||_{L^{\infty}(\mathbb{R}^{N})}^{\frac{\beta}{p-1}})} \leq \frac{C}{\delta_{0} - \delta}.$$

**Proof of Theorem 6.10.** Let  $Q_n$  be defined at (6.16), and  $\omega_n = \omega \chi_{\Omega_n}$ , where  $\Omega_n = \{x \in \Omega : d(x, \partial\Omega) > 1/n\}$ . We still consider  $\mu_1, \mu_2, F_n, \mu_{1,n}, \mu_{2,n}$  as in (6.15), (6.17). Case 1: Assume that  $||F||_{L^{\infty}((0,T))} \leq 1$  and (6.18) holds. We have  $\mu_{1,n}, \mu_{2,n} \leq n\chi_{\Omega} + \omega$ . For any  $\varepsilon > 0$ , there exists  $c_{\varepsilon} = c_{\varepsilon}(\varepsilon, N, p, \beta, K_{N,p}, \operatorname{diam}\Omega) > 0$  such that

$$(n + K_{N,p} \mathbf{W}_{1,p}^{2\text{diam}\Omega}[n\chi_{\Omega} + \omega])^{\beta} \leq c_{\varepsilon} n^{\frac{\beta}{p-1}} + (1 + \varepsilon) K_{N,p}^{\beta} (\mathbf{W}_{1,p}^{2\text{diam}\Omega}[\omega])^{\beta}$$

a.e. in  $\Omega$ . Thus,

$$\exp\left(\tau(n+K_{N,p}\mathbf{W}_{1,p}^{2\mathrm{diam}\Omega}[n\chi_{\Omega}+\omega])^{\beta}\right) \leq \exp\left(\tau c_{\varepsilon}n^{\frac{\beta}{p-1}}\right)\exp\left(\tau(1+\varepsilon)K_{N,p}^{\beta}(\mathbf{W}_{1,p}^{2\mathrm{diam}\Omega}[\omega])^{\beta}\right)$$

If (6.18) holds with  $M_0 = \left(\frac{\delta_0}{\tau K_{N,p}^{\beta}}\right)^{\frac{p-1}{\beta}}$  then we can chose  $\varepsilon$  such that

$$\tau(1+\varepsilon)K_{N,p}^{\beta}||\mathbf{M}_{p,\mathrm{2diam}_{\Omega}}^{\frac{p-1}{\beta'}}[\nu]||_{L^{\infty}(\mathbb{R}^{N})}^{\frac{\beta}{p-1}}<\delta_{0}.$$

From Proposition 6.11, we get  $\exp(\tau(1+\varepsilon)K_{N,p}^{\beta}\mathbf{W}_{1,p}^{2\mathrm{diam}\Omega}[\omega])^{\beta}) \in L^{1}(\Omega)$ , which implies  $\exp(\tau(n+K_{N,p}\mathbf{W}_{1,p}^{2\mathrm{diam}\Omega}[n\chi_{\Omega}+\omega])^{\beta}) \in L^{1}(\Omega)$  for all n. We conclude from Theorem 6.3.

Case 2: Assume that there exists  $\varepsilon > 0$  such that  $\mathbf{M}_{p,2diam\Omega}^{\frac{p-1}{(\beta+\varepsilon)'}}[\omega] \in L^{\infty}(\mathbb{R}^N)$ . Now we use the inequality  $\mu_{1,n}, \mu_{2,n} \leq n(\chi_{\Omega} + \omega)$ . For any  $\varepsilon > 0$  and  $n \in \mathbb{N}$  there exists  $c_{\varepsilon,n} > 0$  such that

$$(n + K_{N,p} \mathbf{W}_{1,p}^{2\text{diam}\Omega}[n(\chi_{\Omega} + \omega)])^{\beta} \leq c_{\varepsilon,n} + \varepsilon (\mathbf{W}_{1,p}^{2\text{diam}\Omega}[\omega])^{\beta_0}$$

Thus, from Proposition 6.11 we get  $\exp(\tau(n+K_{N,p}\mathbf{W}_{1,p}^{2\mathrm{diam}\Omega}[n(\chi_{\Omega}+\omega)])^{\beta})\in L^{1}(\Omega)$  for all n. We conclude from Theorem 6.3.

## 6.3 Equations with source term

As a consequence of Theorem 6.3, we get a first result for problem (1.1):

Corollary 6.12 Let  $u_0 \in L^{\infty}(\Omega)$ , and  $\mu \in \mathcal{M}_b(Q)$  such that  $|\mu| \leq \omega \otimes \chi_{(0,T)}$  for some  $\omega \in \mathcal{M}_b^+(\Omega)$ . Then there exist a R-solution u of (1.1), such that

$$|u(x,t)| \le K_{N,p} \mathbf{W}_{1,p}^{2\operatorname{diam}(\Omega)}[\omega](x) + ||u_0||_{\infty,\Omega}, \quad \text{for } a.e.(x,t) \in Q,$$
(6.20)

where  $K_{N,p}$  is defined at Theorem 6.2.

**Proof.** Let  $\{\phi_n\}$  be a nonnegative, nondecreasing sequence in  $C_c^{\infty}(Q)$  which converges to 1, a.e.. in Q. Since  $\{\phi_n\mu^+\}, \{\phi_n\mu^-\}$  are nondecreasing sequences, the result follows from Theorem 6.3.

Our proof of Theorem 2.4 is based on a property of Wölf potentials:

**Theorem 6.13 (see [53])** Let q > p - 1,  $0 , <math>\omega \in \mathcal{M}_{b}^{+}(\Omega)$ . If for some  $\lambda > 0$ ,

$$\omega(E) \leq \lambda C_{p,\frac{q}{p-q+1}}(E)$$
 for any compact set  $E \subset \mathbb{R}^N$ , (6.21)

then  $(\mathbf{W}_{1,p}^{2\mathrm{diam}\Omega}[\omega])^q \in L^1(\Omega)$ , and there exists  $M = M(N,p,q,\mathrm{diam}(\Omega))$  such that, a.e.. in  $\Omega$ ,

$$\mathbf{W}_{1,p}^{2\operatorname{diam}\Omega} \left[ \mathbf{W}_{1,p}^{2\operatorname{diam}\Omega}[\omega] \right]^{q} \leq M \lambda^{\frac{q-p+1}{(p-1)^2}} \mathbf{W}_{1,p}^{2\operatorname{diam}\Omega}[\omega] < \infty.$$
 (6.22)

We deduce the following:

**Lemma 6.14** Let  $\omega \in \mathcal{M}_b^+(\Omega)$ , and  $b \geq 0$  and K > 0. Suppose that  $\{u_m\}_{m \geq 1}$  is a sequence of nonnegative functions in  $\Omega$  that satisfies

$$u_1 \leq K \mathbf{W}_{1,p}^{2 \operatorname{diam}\Omega}[\omega] + b, \qquad u_{m+1} \leq K \mathbf{W}_{1,p}^{2 \operatorname{diam}\Omega}[u_m^q + \omega] + b \qquad \forall m \geq 1.$$

Assume that  $\omega$  satisfies (6.21) for some  $\lambda > 0$ . Then there exist  $\lambda_0$  and  $b_0$ , depending on N, p, q, K, and diam $\Omega$ , such that, if  $\lambda \leq \lambda_0$  and  $b \leq b_0$ , then  $\mathbf{W}_{1,p}^{2\mathrm{diam}\Omega}[\mu] \in L^q(\Omega)$  and for any  $m \geq 1$ ,

$$u_m \le 2\beta_p K \mathbf{W}_{1,p}^{2\text{diam}\Omega}[\omega] + 2b, \qquad \beta_p = \max(1, 3^{\frac{2-p}{p-1}}).$$
 (6.23)

**Proof.** Clearly, (6.23) holds for m=1. Now, assume that it holds at the order m. Then

$$u_m^q \le 2^{q-1} (2\beta_p)^q K^q (\mathbf{W}_{1,p}^{2\text{diam}\Omega}[\omega])^q + 2^{q-1} (2b)^q$$

Using (6.22) we get

$$\begin{aligned} u_{m+1} &\leq K \mathbf{W}_{1,p}^{2 \operatorname{diam}\Omega} \left[ 2^{q-1} (2\beta_{p})^{q} K^{q} (W_{1,p}^{2 \operatorname{diam}\Omega}[\omega])^{q} + 2^{q-1} (2b)^{q} + \omega \right] + b \\ &\leq \beta_{p} K \left( A_{1} \mathbf{W}_{1,p}^{2 \operatorname{diam}\Omega} \left[ (W_{1,p}^{2 \operatorname{diam}\Omega}[\omega])^{q} \right] + \mathbf{W}_{1,p}^{2 \operatorname{diam}\Omega} \left[ (2b)^{q} \right] + W_{1,p}^{2 \operatorname{diam}\Omega}[\omega] \right) + b \\ &\leq \beta_{p} K (A_{1} M \lambda^{\frac{q-p+1}{(p-1)^{2}}} + 1) \mathbf{W}_{1,p}^{2 \operatorname{diam}\Omega}[\omega] + \beta_{p} K \mathbf{W}_{1,p}^{2 \operatorname{diam}\Omega} \left[ (2b)^{q} \right] + b \\ &= \beta_{p} K (A_{1} M \lambda^{\frac{q-p+1}{(p-1)^{2}}} + 1) \mathbf{W}_{1,p}^{2 \operatorname{diam}\Omega}[\omega] + A_{2} b^{\frac{q}{p-1}} + b, \end{aligned}$$

where M is as in (6.22) and  $A_1 = \left(2^{q-1}(2\beta_p)^q K^q\right)^{\frac{1}{p-1}}$ ,  $A_2 = \beta_p K 2^{\frac{q}{p-1}} |B_1|^{\frac{1}{p-1}} \frac{p-1}{p} (2\text{diam}\Omega)^{\frac{p}{p-1}}$ . Thus, (6.23) holds for m = n+1 if we prove that

$$A_1 M \lambda^{\frac{q-p+1}{(p-1)^2}} \le 1 \text{ and } A_2 b^{\frac{q}{p-1}} \le b,$$

which is equivalent to

$$\lambda \le (A_1 M)^{-\frac{(p-1)^2}{q-p+1}}$$
 and  $b \le A_2^{-\frac{p-1}{q-p+1}}$ .

Therefore, we obtain the result with  $\lambda_0 = (A_1 M)^{-\frac{(p-1)^2}{q-p+1}}$  and  $b_0 = A_2^{-\frac{p-1}{q-p+1}}$ 

**Proof of Theorem 2.4.** From Theorem 6.12 and (6.14), we can construct a sequence of nonnegative R-solutions  $\{u_m\}_{m\geq 1}$  defined in the following way:  $u_1$  is a R-solution of (1.1), and  $u_{m+1}$  is a nonnegative R-solution of

$$\begin{cases} (u_{m+1})_t - \Delta_p u_{m+1} = u_m^q + \mu & \text{in } Q, \\ u_{m+1} = 0 & \text{on } \partial\Omega \times (0, T), \\ u_{m+1}(0) = u_0 & \text{in } \Omega. \end{cases}$$

Setting  $\overline{u}_m = \sup_{t \in (0,T)} u_m(t)$  for all  $m \ge 1$ , there holds

$$\overline{u}_1 \leqq K_{N,p} \mathbf{W}_{1,p}^{2\mathrm{diam}\Omega}[\omega] + ||u_0||_{\infty,\Omega}, \qquad \overline{u}_{m+1} \leqq K_{N,p} \mathbf{W}_{1,p}^{2\mathrm{diam}\Omega}[\overline{u}_m^q + \omega] + ||u_0||_{\infty,\Omega} \qquad \forall m \geqq 1.$$

Then, from Lemma 6.14, we can find  $\lambda_0 = \lambda_0(N, p, q, diam\Omega)$  and  $b_0 = b_0(N, p, q, diam\Omega)$  such that if (??) is satisfied with  $\lambda_0$  and  $b_0$ , then

$$u_m \le \overline{u}_m \le 2\beta_p K_{N,p} \mathbf{W}_{1,p}^{2\text{diam}\Omega}[\omega] + 2||u_0||_{\infty,\Omega} \qquad \forall m \ge 1.$$
 (6.24)

Since  $\sup_m (\int_Q u_m^q dt dx + \mu(Q)) < \infty$ , by Proposition 4.10, up to a subsequence,  $\{u_n\}$  converges a.e. in Q to a function u, for which (2.8) is satisfied in  $\Omega$  with  $C_{N,p} = 2\beta_p K_{N,p}$ . Furthermore, from (6.24) and the dominated convergence Theorem,  $\{u_m^q\}$  converges to  $u^q$  strongly in  $L^1(Q)$ . Finally, one can apply Theorem 2.1 to the sequence of measures  $\{u_m^q + \mu\}$ , and obtain that u is a R-solution of (2.7).

Next we consider the exponential case.

**Theorem 6.15** Let  $\tau > 0, l \in \mathbb{N}$  and  $\beta \geq 1$  such that  $l\beta > p-1$ . Let

$$\mathcal{E}(s) = e^s - \sum_{j=0}^{l-1} \frac{s^j}{j!}, \qquad \forall s \in \mathbb{R}.$$
 (6.25)

Let  $\mu \in \mathcal{M}_b^+(Q)$ ,  $\omega \in \mathcal{M}_b^+(\Omega)$  such that  $\mu \leq \chi_{(0,T)} \otimes \omega$ . Then, there exist  $b_0$  and  $M_0$  depending on  $N, p, \beta, \tau, l$  and diam $\Omega$ , such that if

$$||\mathbf{M}_{p,2\mathrm{diam}\Omega}^{\frac{(p-1)(\beta-1)}{\beta}}[\omega]||_{L^{\infty}(\mathbb{R}^{N})} \leq M_{0}, \qquad ||u_{0}||_{\infty,\Omega} \leq b_{0},$$

the problem

$$\begin{cases} u_t - \Delta_p u = \mathcal{E}(\tau u^\beta) + \mu & \text{in } Q, \\ u = 0 & \text{on } \partial\Omega \times (0, T), \\ u(0) = u_0 & \text{in } \Omega \end{cases}$$
 (6.26)

admits nonnegative R- solution u, which satisfies, a.e. in Q, for some  $C_{N,p}$ , depending on N,p,

$$u(x,t) \leq C_{N,p} \mathbf{W}_{1,p}^{2\operatorname{diam}\Omega}[\omega](x) + 2b_0.$$
(6.27)

For the proof we first recall the corresponding approximation property, which is a consequence of [47, Theorem 2.5]:

**Theorem 6.16** Let  $\tau > 0$ ,  $b \ge 0$ , K > 0,  $l \in \mathbb{N}$  and  $\beta \ge 1$  such that  $l\beta > p-1$ . Let  $\mathcal{E}$  be defined by (6.25). Let  $\{v_m\}$  be a sequence of nonnegative functions in  $\Omega$  such that, for some K > 0,

$$v_1 \leqq K\mathbf{W}_{1,p}^{2\mathrm{diam}\Omega}[\mu] + b, \qquad v_{m+1} \leqq K\mathbf{W}_{1,p}^{2\mathrm{diam}\Omega}[\mathcal{E}(\tau u_m^\beta) + \mu] + b, \quad \forall m \geqq 1.$$

Then, there exist  $b_0$  and  $M_0$ , depending on  $N, p, \beta, \tau, l, K$  and  $\operatorname{diam}\Omega$  such that if  $b \leq b_0$  and

$$||\mathbf{M}_{n,2\operatorname{diam}\Omega}^{\frac{(p-1)(\beta-1)}{\beta}}[\mu]||_{\infty,\mathbb{R}^N} \leq M_0, \tag{6.28}$$

then, setting  $c_p = 2\max(1, 2^{\frac{2-p}{p-1}}),$ 

$$\exp(\tau (Kc_p \mathbf{W}_{1,p}^{2\operatorname{diam}\Omega}[\mu] + 2b_0)^{\beta}) \in L^1(\Omega),$$

$$v_m \leq Kc_p W_{1,p}^{2\operatorname{diam}\Omega}[\mu] + 2b_0, \quad \forall m \geq 1.$$
(6.29)

**Proof of Theorem 6.15.** From Corollary 6.12 we can construct a sequence of nonnegative R-solutions  $\{u_m\}_{m\geq 1}$  defined in the following way:  $u_1$  is a R-solution of problem (1.1), and by induction,  $u_{m+1}$  is a R-solution of

$$\begin{cases} (u_{m+1})_t - \Delta_p u_{m+1} = \mathcal{E}(\tau u_m^{\beta}) + \mu & \text{in } Q, \\ u_{m+1} = 0 & \text{on } \partial\Omega \times (0, T), \\ u_{m+1}(0) = u_0 & \text{in } \Omega, \end{cases}$$

and, setting  $\overline{u}_m = \sup_{t \in (0,T)} u_m(t)$ , there holds

$$\overline{u}_1 \leq K_{N,p} W_{1,p}^{2 \text{diam}\Omega}[\omega] + ||u_0||_{\infty,\Omega}, \qquad \overline{u}_{m+1} \leq K_{N,p} W_{1,p}^{2 \text{diam}\Omega}[\mathcal{E}(\tau \overline{u}_m^\beta) + \omega] + ||u_0||_{\infty,\Omega}, \qquad \forall m \geq 1.$$

Thus, by Theorem 6.16 there exist  $b_0 \in (0,1]$  and  $M_0 > 0$  depending on  $N, p, \beta, \tau, l$  and diam $\Omega$  such that if (6.28) holds then (6.29) is satisfied with  $v_m = \overline{u}_m$ . As a consequence,  $u_m$  is well defined and  $\sup_m \left( \int_Q \mathcal{E}(\tau u_m^\beta) + \mu(Q) \right) < \infty$ . Thus, by Proposition 4.10, up to a subsequence,  $\{u_m\}$  converges a.e. in Q to function u for which (6.27) is satisfied in  $\Omega$ . Furthermore, from (6.29) and the dominated convergence Theorem,  $\left\{ \mathcal{E}(\tau u_m^\beta) \right\}$  converges to  $\mathcal{E}(\tau u^\beta)$  in  $L^1(Q)$ . Finally, one can apply Theorem 2.1 to the sequence of measures  $\left\{ \mathcal{E}(\tau u_m^\beta) + \mu \right\}$ , and obtain that u is a R-solution of (6.26).

## 7 Appendix

**Proof of Lemma 4.7.** Let  $\mathcal{J}$  be defined by (4.11). Let  $\zeta \in C_c^1([0,T))$  with values in [0,1], such that  $\zeta_t \leq 0$ , and  $\varphi = \zeta \xi[j(S(v))]_l$ . Clearly,  $\varphi \in X \cap L^{\infty}(Q)$ ; we choose the pair of functions  $(\varphi, S)$  as test function in (4.2). Thanks to convergence properties of Steklov time-averages, we easily will obtain (4.15) if we prove that

$$\underline{\lim_{l \to 0, \zeta \to 1}} \left(-\int_Q \left(\zeta \xi[j(S(v))]_l\right)_t S(v)\right) \ge -\int_Q \xi_t J(S(v)).$$

We can write  $-\int_Q \left(\zeta \xi[j(S(v))]_l\right)_t S(v) = A + B$ , with

$$A = -\int_{Q} (\zeta \xi)_{t} [j(S(v))]_{l} S(v), \qquad B = -\int_{Q} \zeta \xi S(v) \frac{1}{l} (j(S(v))(x, t+l) - j(S(v))(x, t)).$$

Using (4.12) and integrating by parts we have

$$\begin{split} B &\geqq -\int_{Q} \zeta \xi \frac{1}{l} \left( \mathcal{J}(S(v))(x,t+l) - \mathcal{J}(S(v))(x,t) \right) \\ &= -\int_{Q} \zeta \xi \frac{\partial}{\partial t} \left( \left[ \mathcal{J}(S(v)) \right]_{l} \right) = \int_{Q} \left( \zeta \xi \right)_{t} \left[ \mathcal{J}(S(v)) \right]_{l} + \int_{\Omega} \zeta(0) \xi(0) \left[ \mathcal{J}(S(v)) \right]_{l}(0) \\ &\geqq \int_{Q} \left( \zeta \xi \right)_{t} \left[ \mathcal{J}(S(v)) \right]_{l}, \end{split}$$

since  $\mathcal{J}(S(v)) \geq 0$ . Hence,

$$-\int_{Q} \left(\zeta \xi [j(S(v))]_{l}\right)_{t} S(v) \geq \int_{Q} \left(\zeta \xi\right)_{t} [\mathcal{J}(S(v))]_{l} + A = \int_{Q} \left(\zeta \xi\right)_{t} \left([\mathcal{J}(S(v))]_{l} - [J(S(v))]_{l} S(v)\right) \leq \int_{Q} \left(\zeta \xi [j(S(v))]_{l} + A \right) \left(\zeta \xi [j(S(v))]_{l} + A \right) \leq \int_{Q} \left(\zeta \xi [j(S(v))]_{l} + A \right) \left(\zeta \xi [j(S(v))]_{l} + A \right) \leq \int_{Q} \left(\zeta \xi [j(S(v)]_{l} + A \right) \leq \int_{Q} \left(\zeta \xi [j(S$$

Otherwise,  $\mathcal{J}(S(v))$  and  $J(S(v) \in C([0,T]; L^1(\Omega))$ , thus  $\{(\zeta \xi)_t ([\mathcal{J}(S(u))]_l - [J(S(u))]_l S(u))\}$  converges to  $-(\zeta \xi)_t J(S(u))$  in  $L^1(Q)$  as  $l \to 0$ . Therefore,

$$\frac{\lim_{l \to 0, \zeta \to 1} \left(-\int_{Q} \left(\zeta \xi [J(S(v))]_{l}\right)_{t} S(v)\right) \geqq \underline{\lim}_{\zeta \to 1} \left(-\int_{Q} \left(\zeta \xi\right)_{t} J(S(v))\right)$$

$$\geqq \underline{\lim}_{\zeta \to 1} \left(-\int_{Q} \zeta \xi_{t} J(S(v))\right) = -\int_{Q} \xi_{t} J(S(v)),$$

which achieves the proof.
