HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

transcripts from the L9 region is strongly regulated in response to xylan. R. flavefaciens 17 was also found to produce activities likely to be involved in xylan debranching including esterases arabinofuranosidases, whose expression was regulated by xylan. A gene clone, that expresses activity against β-naphthyl acetate, has been isolated from a \(\lambda \text{EMBL3} \) phage library that is possible candidate for deacetylation of xylan. Cloned genes from R. flavefaciens have so far been analysed mainly in E. coli where proteolysis and internal starts were found often to result in anomalous products [3]. The xynD gene has now been expressed from its own promoter in Gram-positive hosts including Enterococcus faecalis, Lactococcus lactis and the rumen species Streptococcus bovis.

Some genetic and biochemical aspects of *Prevotella bryantii* B₁4 xylanases. R Marinšek-Logar¹, A Gasparic¹, FV Nekrep¹, HJ Flint² (¹University of Ljubljana, Biotechnical faculty, Groblje 3, 61230 Domzale, Slovenia; ²The Rowett Research Institute, Bucksburn, Aberdeen AB2 9SB, Scotland, UK)

Prevotella spp. are recognised as one of the most numerous groups of culturable bacteria inhabiting the rumen. Potentially significant activities include the degradation of plant cell wall polysaccharides, starch, proteins and peptides. Because of high degree of genetic diversity within the former *P. ruminicola* four new species were proposed recently, including *P. bryantii* which comprises B₁4 - related strains [1].

P. bryantii B₁4 is not cellulolytic but is actively xylanolytic and carries multiple xylanase genes. Four regions encoding xylanase activity have been identified, one of which corresponds to a broad-specifity endoglucanase [2]. Of the remaining regions, one encodes activities against p-nitrophenyl- β -xyloside (pNPX) and pnitrophenyl- α -L-arabinofuranoside(pNPA) in addition to xylanase activity. This region carries at least two linked genes (xynA and xynB), one of which encodes an endo-xylanase while the other encodes a novel oxygen-sensitive exo-xylanase that has associated pNPX and pNPA activities [3]. The gene xynC encodes an endoxylanase [4]. These enzymes probably act sequentially in the breakdown of xylan.

Xylanolytic activity in P. bryantii was found to be strongly inducible, the specific activity of cells grown on xylan being increased at least 20-fold by comparison with cells grown on glucose [2]. SDS PAGE xylanograms of cell proteins revealed two clear endoxylanolytic bands at 26 - 29kDa and 63 - 66kDa and the latter is thought to correspond to XynC. Fractionation procedures based on osmotic shock [5] were applied to late exponential phase cells grown with xylan as energy source. The majority of the cell-associated endoxylanase and carboxymethyl cellulase (CMCase) activity was found in the frac tion released by osmotic shock while most of the α-L-arabinofuranosidase and β-

Cell fraction	Xylanase	CMCase	pNP-arabino- furanosidase	pNP- xylosidase
	Specific activity (nmol.min ⁻¹ /mg protein)			
Washed cells	105.24	25.53	38.92	0.09
	% Total cell-associated activity			
Osmotic release (includes periplasm)	62.0	99.5	0.0	0.0
35,000 g supernatant (soluble)	4.5	0.5	24.3	12.9
35 000 g nellet (includes membranes)	33.4	0.0	75.7	87.1

Distribution of glycoside hydrolase activities in different cell fractions of xylan-grown P. bryantii B_14

xylosidase activities were found in the crude membrane fraction. Less than 30% of the total xylanase and CMCase activity was found to be extracellular. HPLC separation of B₁4 proteins released by osmotic shock was performed using DEAE based compact porous disks [6] and four peaks with endoxylanolytic activity were recovered. More work is needed to unravel the xylanolytic systems of *P. bryantii* which apparently includes not only cell surface [7] but also periplasmic and membrane components.

Xylooligosaccharide utilization by the ruminal bacterium Selenomonas ruminantium. MA Cotta, TR Whitehead (USDA, ARS, National Center for Agricultural Utilization Research, 1815 N. University St, Peoria, IL, 61604, USA)

Xylan is an abundant polysaccharide in plant cell walls and, as such, comprises a significant portion of the diets of ruminant livestock. The digestion of xylan is incomplete and this contributes to the inefficient conversion of feed into animal products. The enzymatic hydrolysis of xylan is accompanied by the formation of xylose, arabinose, and methyl-glucuronic acid containing oligosaccharides. These oligosaccharides can be utilized by several species of xylanolytic ruminal bacteria and by Selenomonas ruminantium, xylanolytic species. Co-culture experiments with S. ruminantium and xylanolytic ruminal microorganisms demonstrated that S. ruminantium reduced the accumulation of xylooligosaccharides, in some cases leading to enhancement of xylan degradation. The objective of the current work was to study the fermentation of xylooligosaccharides by strains of S. ruminantium and examine the enzymes and genes that may be important in the
