KERNEL AND CAPACITY ESTIMATES IN DIRICHLET SPACES

O. EL-FALLAH, Y. ELMADANI, K. KELLAY

ABSTRACT. We study the capacity in the sense of Beurling-Deny associated with the Dirichlet space $\mathcal{D}(\mu)$ where μ is a finite positive Borel measure on the unit circle. First, we obtain a sharp asymptotic estimate of the norm of the reproducing kernel of $\mathcal{D}(\mu)$. It allows us to give an estimates of the capacity of points and arcs of the unit circle. We also provide a new conditions on closed sets to be polar. Our method is based on sharp estimates of norms of some outer functions which allow us to transfer these problems to an estimate of the reproducing kernel of an appropriate weighted Sobolev space.

1. INTRODUCTION

The *reproducing kernel* plays an important role in the study of Hilbert spaces of analytic functions. In particular, it allows to determine the rate of growth of functions near the boundary and its tangential behavior; their properties are closely related to embedding theorems, sampling and interpolation sets, and other topics. Here we shall be concerned with Dirichlet spaces $\mathcal{D}(\mu)$.

Let H^2 denote the classical *Hardy space* of analytic functions on the unit disc \mathbb{D} having square summable Taylor coefficients at the origin. Every function $f \in H^2$ has non-tangential limits almost everywhere on the unit circle $\mathbb{T} = \partial\mathbb{D}$. We denote by $f(\zeta)$ the non-tangential limit of f at $\zeta \in \mathbb{T}$ if it exists. Let μ be a positive finite measure on \mathbb{T} , the *Dirichlet space* $\mathcal{D}(\mu)$ is the set of analytic functions $f \in H^2$, such that

$$\mathcal{D}_\mu(f) := \frac{1}{2\pi} \int_{\mathbb{T}} \int_{\mathbb{T}} \frac{|f(\zeta) - f(\xi)|^2}{|\zeta - \xi|^2} |d\zeta| d\mu(\xi) < \infty.$$

The space $\mathcal{D}(\mu)$ is endowed with the norm

$$\|f\|_\mu^2 := \|f\|_{H^2}^2 + \mathcal{D}_\mu(f).$$

If $\mu = 0$, then $\mathcal{D}(\mu) = H^2$ and if $d\mu(e^{it}) = dm(t) = dt/2\pi$, the normalized arc measure on \mathbb{T} , then $\mathcal{D}(\mu)$ is the classical *Dirichlet space* \mathcal{D} .

Key words and phrases. Dirichlet spaces, reproducing kernel, capacity, polar set.

Research partially supported by "Hassan II Academy of Science and Technology" for the first and the second authors.

These spaces were introduced by Richter in [14] by examining the *2-isometries* on the Hilbert spaces. A bounded operator T in a Hilbert space \mathcal{H} is called *2-isometry* operator if

$$T^{*2}T^2 - 2T^*T - I = 0,$$

is said to be *cyclic* if there exists $x \in \mathcal{H}$ such that $\text{span}\{T^n x, n \geq 0\}$ is dense in \mathcal{H} and is called *analytic* if $\bigcap_{n \geq 0} T^n \mathcal{H} = \{0\}$. Richter in [14] proved that every cyclic, analytic 2–isometry can be represented as a multiplication by z on a Dirichlet space $\mathcal{D}(\mu)$ for some positive finite measure μ on \mathbb{T} . As consequence [13, 14] Richter gave an analogue of Beurling’s theorem for the classical Dirichlet space : every invariant subspace for \mathcal{D} is of the form $\phi \mathcal{D}(\mu_\phi)$ where $d\mu_\phi = |\phi|^2 dm$ and ϕ is an extremal function for \mathcal{D} , that is

$$\|\phi\|_\mu = 1, \quad \text{and} \quad \langle \phi, z^n \phi \rangle = 0, \quad n \geq 1.$$

We refer to the monograph [7] for numerous results on the Dirichlet space.

By representation theorem for bounded linear functionals on a Hilbert space, to each $z \in \mathbb{D}$, there is unique element $k^\mu(\cdot, z)$ in $\mathcal{D}(\mu)$, such that

$$f(z) = \langle f, k^\mu(\cdot, z) \rangle_{\mathcal{D}(\mu)}, \quad f \in \mathcal{D}(\mu).$$

The function $k^\mu(\zeta, z)$, with $(\zeta, z) \in \mathbb{D} \times \mathbb{D}$, is called the reproducing kernel for $\mathcal{D}(\mu)$. Let us Shimorin [16] proved that all Dirichlet spaces have complete Nevanlinna–Pick reproducing kernels. Let $P[\mu]$ be the Poisson integral of the positive finite measure μ on \mathbb{T}

$$P[\mu](z) = \int_{\mathbb{T}} \frac{1 - |z|^2}{|\zeta - z|^2} d\mu(\zeta), \quad z \in \mathbb{D}.$$

In the following theorem, we provide an asymptotic estimate of the reproducing kernel k^μ of $\mathcal{D}(\mu)$ on the diagonal.

Theorem 1. *Let μ be a finite positive measure on \mathbb{T} . We have*

$$k^\mu(z, z) \asymp 1 + \int_0^{|z|} \frac{dr}{(1-r)P[\mu](rz/|z|) + (1-r)^2},$$

where the implied constants are absolute.

Our second aim here is to give estimates of capacity associated to the Dirichlet space $\mathcal{D}(\mu)$ which is closely related to some notions of potential theory. Let $\mathcal{D}^h(\mu)$ be the harmonic version of $\mathcal{D}(\mu)$ given by

$$\mathcal{D}^h(\mu) := \left\{ f \in L^2(\mathbb{T}) : \|f\|_\mu^2 := \|f\|_{L^2(\mathbb{T})}^2 + \mathcal{D}_\mu(f) < \infty \right\}.$$

$\mathcal{D}^h(\mu)$ is a Dirichlet space in the sense of Beurling–Deny [2]. Some aspects of the potential theory associated to the general Dirichlet spaces were studied in several papers (see for instance [10]). In this paper we will focus on the notion of capacity. We recall at first, the

definition of capacity in the sense of Beurling–Deny. Let U be an open subset of the unit circle. The c_μ -capacity of U is defined by

$$c_\mu(U) := \inf \{ \|u\|_\mu^2 : u \in \mathcal{D}^h(\mu), u \geq 0 \text{ and } u \geq 1 \text{ a.e. on } U \}. \quad (1)$$

As usual we define the c_μ -capacity of any subset $F \subset \mathbb{T}$ by

$$c_\mu(F) = \inf \{ c_\mu(U) : U \text{ open, } F \subset U \}.$$

Since the L^2 norm dominates the Dirichlet norm, it is completely obvious that sets having c_μ -capacity 0 have Lebesgue measure 0. We say that a property holds c_μ -quasi-everywhere (c_μ -q.e.) if it holds everywhere outside a set of c_μ -capacity 0. So, c_μ -q.e. implies a.e.. A closed set of capacity zero will be called, throughout this paper, μ -polar set. If $\mu = m$ is the Lebesgue measure on \mathbb{T} , then $c_\mu = c_m$ is comparable to the logarithmic capacity c , see [12, Theorem 14] and [1, Theorem 2.5.5]. Every function $f \in \mathcal{D}(\mu)$ has non-tangential limits c_μ -q.e. Furthermore, if E is a closed subset of \mathbb{T} such that $c_\mu(E) = 0$, then there exists a cyclic function $f \in \mathcal{D}(\mu)$ continuous on \mathbb{T} and vanishing on E , see [9]. The generalized Brown–Shields conjecture asserts that an outer function $f \in \mathcal{D}(\mu)$ is cyclic if and only if $c_\mu(\mathcal{Z}(f)) = 0$, where $\mathcal{Z}(f)$ is the zero set of f . In [6, Theorem 1] we prove that this conjecture is true for measures with countable support. We also give in this case a complete and explicit characterization of invariant subspaces see [6, Theorem 2]. The generalized Brown–Shields conjecture is still open.

Let $\zeta \in \mathbb{T}$, if $\mu = m$ then $c_m(\zeta) = c(\zeta) = 0$ (c is the logarithmic capacity) and if $\mu = \delta_\zeta$, the dirac measure on ζ , then $c_{\delta_\zeta}(\zeta) > 0$. In a more general way, since $c_\mu(\zeta) \asymp 1/\sup_{0 < \rho < 1} k^\mu(\rho\zeta, \rho\zeta)$ (see [6, Lemma 3.2]), we get from Theorem 1

$$c_\mu(\{e^{i\theta}\}) > 0 \iff \int_0^1 \frac{dr}{(1-r)P[\mu](re^{i\theta}) + (1-r)^2} < \infty. \quad (2)$$

This allows to construct examples of positive measure μ and a countable closed set E such that $\mu(E) = 0$ and E is uniqueness set for $D(\mu)$ [5, Corollary 3.6]. We obtain an estimate of capacity of arcs, more precisely we have

Theorem 2. *Let $I \subset \mathbb{T}$ be the arc of length $|I| = 1 - \rho$ with the midpoint at $\zeta \in \mathbb{T}$. Then*

$$\frac{1}{c_\mu(I)} \asymp 1 + \int_0^\rho \frac{dr}{(1-r)P[\mu](r\zeta) + (1-r)^2}.$$

In the sequel we will suppose that E is a closed set which has Lebesgue measure zero and μ is a finite positive measure on \mathbb{T} . Now our goal is to give sufficient condition on E to be μ -polar. Let us introduce the local modulus of continuity of μ on E which will play a crucial role in this paper. It is defined by

$$\rho_{\mu,E}(t) := \sup \{ \mu(\zeta e^{-it}, \zeta e^{it}) : \zeta \in E \}. \quad (3)$$

Note that $\rho_{\mu, \mathbb{T}} = \rho_{\mu}$ is the classical modulus of continuity of μ . Let us write

$$E_t := \{\zeta \in \mathbb{T} : \text{dist}(\zeta, E) \leq t\},$$

where dist denotes the distance with respect to arc-length, and denote by $|E_t|$ the Lebesgue measure of E_t . We can express the function $|E_t|$ in terms of

$$N_E(t) := 2 \sum_j \mathbf{1}_{\{|I_j| > 2t\}},$$

where (I_j) are the components of $\mathbb{T} \setminus E$, as follows

$$\int_0^t N_E(s) ds = |E_t|.$$

In Theorem 5.4, we give a sufficient conditions on a closed subset E , in terms of $\rho_{\mu, E}$ and N_E , to be μ -polar. To illustrate this theorem we give here some of its corollaries.

(i) If

$$\int_0^{\pi} \frac{dt}{\int_0^t (\rho_{\mu, E}(s) N_E(s) / s) ds} = +\infty,$$

then $c_{\mu}(E) = 0$.

This result can be viewed as an extension of Carleson's Theorem [3, section IV, Theorem 2] which says that if

$$\int_0^{\pi} \frac{dt}{|E_t|} = \infty,$$

then $c(E) = 0$.

In fact if $\mu = m$ then $\rho_{\mu, E}(t) = t$ and $c_{\mu} \asymp c$ (c is the logarithmic capacity).

(ii) Suppose that $\rho_{\mu, E}(t) = O(t^{\alpha})$ with $1 \leq \alpha < 2$. If

$$\int_0^{\pi} \frac{dt}{t^{\alpha-1} |E_t|} = +\infty,$$

then $c_{\mu}(E) = 0$.

Our proof is different from the one given in [3]

(iii) If $\rho_{\mu, E}(t) = O(t^{\alpha})$ with $\alpha > 2$, we have $c_{\mu}(E) = 0$.

Note also that if $t^{\alpha} = O(\rho_{\mu, \{1\}}(t))$ with $\alpha < 1$, then by (2), $c_{\mu}(\{1\}) > 0$.

The plan of the paper is the following. In the next section we recall two formulas of the Dirichlet norm; we also give punctual estimates of some outer functions. In Section 3, we obtain norm estimates of our test functions. In Section 4, we state diagonal asymptotic estimates of reproducing kernel. To prove the lower estimates of $k^{\mu}(z, z)$, we establish a sharp norm estimates of some outer functions which peak near z . This allows us to transfer

our problem to an estimation of the norm of the kernel of an appropriate weighted Sobolev space. In fact and roughly speaking, Theorem 1 says that $k^\mu(z, z) \asymp K_\varphi(1 - |z|, 1 - |z|)$ where K_φ is the reproducing kernel of the weighted Sobolev space defined by

$$W^2(\varphi) := \left\{ f \in C((0, 2\pi]) : f(x) = f(1) + \int_x^{2\pi} g(t)dt, g \in L^2((0, 2\pi), \varphi dt) \right\},$$

where $\varphi(t) = tP[\mu]((1-t)z/|z|) + t^2$.

In section 5, we prove the results on capacities cited above. The proof of Theorem 5.4 uses an idea analogous to the proof of Theorem 1. However, our test functions must peak on the whole set E and the desired weighted Sobolev spaces will depend on μ and E . In fact, we prove that there is no bounded point evaluation at 0 for $W^2(\varphi)$ (where φ depends on $\rho_{\mu, E}$ and N_E), then $c_\mu(E) = 0$. Note finally, that there is no bounded point evaluation at 0 for $W^2(\varphi)$ if and only if $\lim_{t \rightarrow 0^+} K_\varphi(t, t) = \infty$.

Throughout the paper, we use the following notations:

- $A \lesssim B$ means that there is an absolute constant C such that $A \leq CB$.
- $A \asymp B$ if both $A \lesssim B$ and $B \lesssim A$ hold.
- $C(x_1, \dots, x_n)$ denote a constant which depends only on variables x_1, \dots, x_n .

2. PRELIMINARIES AND TECHNICAL LEMMAS

2.1. Norm formulas. In this subsection we recall some results about norm formulas in Dirichlet spaces which will be used in what follows.

For a finite positive measure μ on \mathbb{T} , the harmonic Dirichlet space $\mathcal{D}^h(\mu)$ consists of functions $f \in L^2(\mathbb{T})$ such that

$$\mathcal{D}_\mu(f) := \int_{\mathbb{T}} \mathcal{D}_\xi(f) d\mu(\xi) < \infty,$$

where $\mathcal{D}_\xi(f)$ is the *local Dirichlet integral* of f at $\xi \in \mathbb{T}$ given by

$$\mathcal{D}_\xi(f) := \int_{\mathbb{T}} \frac{|f(e^{it}) - f(\xi)|^2 dt}{|e^{it} - \xi|^2} \frac{dt}{2\pi}.$$

The Douglas' formula, see [7, Theorem 7.1.3], expresses the Dirichlet integral of a function f in terms of the Poisson transform of μ , namely

$$D_\mu(f) = \int_{\mathbb{D}} |\nabla P[f]|^2 P[\mu] dA, \quad f \in \mathcal{D}^h(\mu),$$

where $dA(z) = dxdy/\pi$ stands for the normalized area measure in \mathbb{D} . In particular, if $f \in \mathcal{D}(\mu) (= \mathcal{D}^h(\mu) \cap H^2)$, Douglas' Formula becomes

$$\mathcal{D}_\mu(f) := \int_{\mathbb{D}} |f'(z)|^2 P[\mu](z) dA(z) < \infty.$$

Another useful formula, due to Richter and Sundberg [15, Theorem 3.1], gives the local Dirichlet integral of function f in terms of their zero sequence, their singular measure and the modulus of their radial limit. We will need, throughout this paper, the Richter–Sundberg formula mainly for outer functions. Recall that outer functions are given by

$$f(z) = \exp \int_{\mathbb{T}} \frac{\zeta + z}{\zeta - z} \log \varphi(\zeta) \frac{|d\zeta|}{2\pi}, \quad (z \in \mathbb{D}),$$

where φ is a positive function such that $\log \varphi \in L^1(\mathbb{T})$. Note that the radial limit of f , noted also by f , exists a.e. and $|f| = \varphi$ a.e. on \mathbb{T} . We have the following Richter–Sundberg formula [15] (see also [7, Theorem 7.4.2])

Theorem 2.1. *Let $f \in H^2$ be an outer function such that $f(\zeta)$ exists at $\zeta \in \mathbb{T}$. Then*

$$\mathcal{D}_\zeta(f) = \int_{\mathbb{T}} \frac{|f(\lambda)|^2 - |f(\zeta)|^2 - 2|f(\zeta)|^2 \log |f(\lambda)/f(\zeta)|}{|\lambda - \zeta|^2} \frac{|d\lambda|}{2\pi}. \quad (4)$$

2.2. Punctual estimates of test functions. The result obtained in this subsection will be used in the proof of the lower estimate of the kernel.

Lemma 2.2. *Let $1/2 < r = 1 - a < 1$ and let $I_k = [e^{ia_k}, e^{ia_{k+1}}]$ with $a_0 = 0$, $a_k = 2^k a$ ($k \geq 1$). Let N be the integer such that $2^N a \leq \pi < 2^{N+1} a$, then*

$$\sum_{k=0}^{N-1} (k+1) \varpi(r, I_k, \mathbb{D}) \asymp 1,$$

where $\varpi(r, I_k, \mathbb{D})$ denotes the harmonic measure of I_k at r in \mathbb{D} .

Proof. Without loss of generality, we may suppose that $2^N a = \pi$. Note that

$$\sum_{k=0}^{N-1} (k+1) \varpi(r, I_k, \mathbb{D}) \geq \sum_{k=0}^{N-1} \varpi(r, I_k, \mathbb{D}) \asymp 1.$$

For the reverse inequality, let $g(z) = \log 1/|1 - rz|$. Since g is harmonic in the neighbourhood of $\overline{\mathbb{D}}$,

$$g(z) = \frac{1}{2\pi} \int_{-\pi}^{\pi} \frac{1 - |z|^2}{|1 - ze^{-i\theta}|^2} \log \frac{1}{|1 - re^{i\theta}|} d\theta.$$

So,

$$g(r) = \log \frac{1}{1 - r^2} = \sum_{k=0}^{N-1} \frac{1}{\pi} \int_{a_k}^{a_{k+1}} \frac{1 - r^2}{|1 - re^{-i\theta}|^2} \log \frac{1}{|1 - re^{i\theta}|} d\theta. \quad (5)$$

For $k = 0, \dots, N - 1$, and $\theta \in (a_k, a_{k+1})$, we have

$$\frac{1}{|1 - re^{i\theta}|} \asymp \frac{1}{2^k} \frac{1}{1 - r}.$$

By (5), we get

$$\log \frac{1}{1-r^2} = \log \frac{1}{1-r} - \log 2 \sum_{k=0}^{N-1} k \varpi(r, I_k, \mathbb{D}) + O(1)$$

and our result follows. \square

Let $w : (0, \pi) \rightarrow (0, +\infty)$ be a continuous positive function such that $\log w \in L^1(\mathbb{T})$. As before f_w denote the outer function satisfying

$$|f_w(e^{it})| = w(|t|) \quad \text{a.e. on } (-\pi, \pi). \quad (6)$$

Proposition 2.3. *Let $w : (-\pi, \pi) \rightarrow (0, +\infty)$ be an even continuous positive decreasing function such that $\log w \in L^1(\mathbb{T})$. Suppose that $w(x) \leq 2w(2x)$. Let f_w be an outer function given by (6). Then*

$$w(1-r) \lesssim |f_w(r)|, \quad 0 \leq r < 1.$$

Proof. Let a , I_k and N as in lemma 2.2, and suppose that $a_N = \pi$. We have

$$\begin{aligned} |f_w(r)| &= \exp \left\{ \sum_{k=0}^{N-1} \frac{1}{\pi} \int_{I_k} \frac{1-r^2}{|1-re^{i\theta}|^2} \log w(\theta) d\theta \right\} \\ &\geq \exp \left\{ \sum_{k=0}^{N-1} \log \omega(2^{k+1}a) \frac{1}{\pi} \int_{I_k} \frac{1-r^2}{|1-re^{i\theta}|^2} d\theta \right\} \\ &\geq \exp \left\{ \sum_{k=0}^{N-1} (\log \omega(a) - (k+1) \log 2) \frac{1}{\pi} \int_{I_k} \frac{1-r^2}{|1-re^{i\theta}|^2} d\theta \right\} \\ &\geq \exp \left\{ \log w(a) \sum_{k=0}^{N-1} \varpi(r, I_k, \mathbb{D}) - \log 2 \sum_{k=0}^{N-1} (k+1) \varpi(r, I_k, \mathbb{D}) \right\}. \end{aligned}$$

We obtain from Lemma 2.2, that $w(1-r) \lesssim |f_w(r)|$. The case $a_N < \pi$ can be treated in the same way by taking into account the interval $[e^{ia_N}, e^{i\pi}]$. \square

2.3. Regularization lemma. Let μ be a positive finite measure on \mathbb{T} , we set $d\mu(s) = d\mu(e^{is})$. Denote by

$$\widehat{\mu}(s) = \mu([e^{-is}, e^{is}]) \quad (0 \leq s \leq \pi) \quad \text{and} \quad \widehat{\mu}(s) = \widehat{\mu}(\pi) \quad (s > \pi).$$

Let

$$F_\mu(x) = \int_{-\pi}^{\pi} \frac{x^2}{x^2 + s^2} d\mu(s) \quad x > 0. \quad (7)$$

Note that F_μ is increasing and $F_\mu(x)/x^2$ is decreasing. We extend F_μ at the origin by $F_\mu(0) = F_\mu(0^+)$. In the following lemma we collect some elementary properties of F_μ which will be used in the sequel.

Lemma 2.4. *Let ν be a positive finite measure on \mathbb{T} . We have the following*

(1) $F_\nu(x) \asymp xP[\nu](1-x)$, for $x > 0$,

(2) $\widehat{\nu}(x) \lesssim F_\nu(x)$ for $x \geq 0$,

(3) $\int_{x \leq |s| \leq \pi} \frac{d\nu(s)}{s^2} \lesssim \frac{F_\nu(x)}{x^2}$, for $x > 0$,

(4) If h is a positive monotone function on $(0, \pi)$. Then

$$\int_{-a}^a h(|x|) d\nu(x) \lesssim \int_0^a \frac{h(x)}{x} \widehat{\nu}(2x) dx,$$

(5) If $\widehat{\nu}(2x) \leq c\widehat{\nu}(x)$ for some constant $c < 4$, then $F_\nu(x) \lesssim \frac{\widehat{\nu}(x)}{4-c}$.

Proof. (1) For $x \in (0, 1/2)$ we have obviously $x(1 - (1-x)^2) \asymp x^2$ and $|e^{i\theta} - (1-x)|^2 \asymp x^2 + \theta^2$. Hence

$$xP[\nu](1-x) = \int_{-\pi}^{\pi} \frac{x(1 - (1-x)^2)}{|e^{i\theta} - (1-x)|^2} d\nu(\theta) \asymp \int_{-\pi}^{\pi} \frac{x^2}{x^2 + \theta^2} d\nu(\theta) = F_\nu(x).$$

(2) Let $x \geq 0$, we have

$$\begin{aligned} \widehat{\nu}(x) &= \int_{-x}^x d\nu(\theta) \\ &= \int_{-x}^x \frac{x^2}{x^2 + \theta^2} d\nu(\theta) + \int_{-x}^x \frac{\theta^2}{x^2 + \theta^2} d\nu(\theta) \\ &\leq 2 \int_{-x}^x \frac{x^2}{x^2 + \theta^2} d\nu(\theta) \\ &= 2F_\mu(x). \end{aligned}$$

(3) Fix $x > 0$, we have

$$\begin{aligned} \int_{x < |s| < \pi} \frac{d\nu(s)}{s^2} &= \sum_{n=0}^{+\infty} \int_{2^n x}^{2^{n+1} x} \frac{d\nu(s)}{s^2} \\ &\asymp \frac{1}{x^2} \sum_{n=0}^{+\infty} \frac{1}{2^{2n} x^2} \int_{2^n x}^{2^{n+1} x} d\nu(s) \\ &= \frac{1}{x^2} \sum_{n=0}^{+\infty} \frac{1}{2^{2n}} \int_{2^n x}^{2^{n+1} x} \frac{x^2 + s^2}{x^2 + s^2} d\nu(s) \\ &\leq \frac{4}{x^2} \sum_{n=0}^{+\infty} \int_{2^n x}^{2^{n+1} x} \frac{x^2}{x^2 + s^2} d\nu(s) \\ &\leq 4 \frac{F_\nu(x)}{x^2}. \end{aligned}$$

To prove (4) suppose that h is a decreasing function. Clearly if $\nu(\{0\}) > 0$, then (4) is obvious. So, suppose that $\nu(\{0\}) = 0$. We have

$$\begin{aligned} \int_{-a}^a h(|x|)d\nu(x) &= \sum_{n \geq 0} \int_{2^{-(n+1)}a}^{2^{-n}a} h(x)(d\nu(x) + d\nu(-x)) \\ &\lesssim \sum_{n=0}^m h(2^{-n}a)\widehat{\nu}(2^{-n}a) \\ &\lesssim \int_0^a \frac{h(x)}{x}\widehat{\nu}(2x)dx. \end{aligned}$$

Analogue argument works if h is increasing.

Finally to prove (5), suppose that $\widehat{\nu}(2x) \leq c\widehat{\nu}(x)$ with $c < 4$. We have $\widehat{\nu}(2^n x) \leq c^n \widehat{\nu}(x)$ and

$$\int_{|t| \geq x} \frac{d\nu(t)}{t^2} dt = \sum_{n \geq 0} \int_{2^n x \leq |t| \leq 2^{n+1}x} \frac{d\nu(t)}{t^2} \leq \sum_{n \geq 0} \frac{\widehat{\nu}(2^{n+1}x)}{2^{2n}x^2} \leq \frac{4c}{4-c} \frac{\widehat{\nu}(x)}{x^2}.$$

So

$$F_\nu(x) \leq \widehat{\nu}(x) + \int_{|\theta| > x} \frac{x^2}{x^2 + \theta^2} d\nu(\theta) \leq \widehat{\nu}(x) + x^2 \int_{\theta \geq x} \frac{d\nu(x)}{\theta^2} \lesssim \frac{\widehat{\nu}(x)}{4-c}.$$

□

3. NORM ESTIMATE OF TEST FUNCTIONS

3.1. Norm estimate of analytic test functions. The purpose of this subsection is to give an estimate of norms of some outer functions which play an important role in what follows.

The following lemma is the first step to prove Theorem 3.2.

Lemma 3.1. *Let $w : [0, \pi] \rightarrow (0, +\infty)$ be a C^1 decreasing convex function such that $w(x) \leq 2w(2x)$. Suppose that $x^2|w'(x)|$ is increasing and let f_w be the outer function given by (6). Then*

$$\mathcal{D}_\mu(f_w) \lesssim \mathcal{J}_1 + \mathcal{J}_2 + \mathcal{J}_3,$$

where

$$\begin{aligned} \mathcal{J}_1 &:= \int_{x=0}^{\pi} \int_{y=0}^x |w'(y)|w(y) \frac{|w'(x)|}{w(x)} \frac{\widehat{\mu}(y)}{x} dx dy, \\ \mathcal{J}_2 &:= \int_{s=-\pi}^{\pi} w'(s)^2 s d\mu(s), \\ \mathcal{J}_3 &:= \int_{x=0}^{\pi} \int_{y=x}^{\pi} x |w'(y)|w(y) \frac{|w'(x)|}{w(x)} \left(\int_{y \leq |s| \leq \pi} \frac{d\mu(s)}{s^2} \right) dx dy. \end{aligned}$$

Proof. Without loss of generality, we may assume that $d\mu(s) = d\mu(-s)$. By Richter-Sundberg formula (4) we have

$$\mathcal{D}_{e^{is}}(f_w) = \frac{8}{2\pi} \int_{t=0}^{\pi} \int_{x=s}^{\pi} \int_{y=s}^x w'(y)w(y) \frac{w'(x)}{w(x)} dy dx \frac{dt}{|e^{is} - e^{it}|^2}.$$

So,

$$\begin{aligned} \mathcal{D}_{\mu}(f_w) &= \frac{16}{2\pi} \int_{s=0}^{\pi} \int_{t=0}^{\pi} \int_{x=s}^{\pi} \int_{y=s}^x w'(y)w(y) \frac{w'(x)}{w(x)} dy dx dt \frac{d\mu(s)}{|e^{is} - e^{it}|^2} \\ &= \underbrace{\int_{s=0}^{\pi} \int_{t=2s}^{\pi} \dots}_{\mathcal{I}_1} + \underbrace{\int_{s=0}^{\pi} \int_{t=s/2}^{2s} \dots}_{\mathcal{I}_2} + \underbrace{\int_{s=0}^{\pi} \int_{t=0}^{s/2} \dots}_{\mathcal{I}_3} \end{aligned}$$

To complete the proof we will estimate each term separately.

If $2s \leq t \leq \pi$, we have $|t - s| \geq t/2$,

$$\begin{aligned} \mathcal{I}_1 &\lesssim \int_{s=0}^{\pi} \int_{t=s}^{\pi} \int_{x=s}^t \int_{y=s}^x |w'(y)|w(y) \frac{|w'(x)|}{w(x)} dy dx \frac{dt}{t^2} d\mu(s) \\ &\lesssim \int_{t=0}^{\pi} \int_{x=0}^t \int_{y=0}^x |w'(y)|w(y) \frac{|w'(x)|}{w(x)} \left(\int_{|s| \leq y} d\mu(s) \right) \frac{dt}{t^2} dy dx \\ &\lesssim \int_{x=0}^{\pi} \int_{y=0}^x |w'(y)|w(y) \frac{|w'(x)|}{w(x)} \frac{\widehat{\mu}(y)}{x} dy dx \end{aligned}$$

Since $w(2x) \asymp w(x)$ and $w'(2x) \asymp w'(x)$, we have

$$\begin{aligned} \mathcal{I}_2 &= \int_{s=0}^{\pi} \int_{t=s/2}^{2s} \int_{x=s}^t \int_{y=s}^x w'(y)w'(x) \frac{w(y)}{w(x)} dy dx dt \frac{d\mu(s)}{|e^{is} - e^{it}|^2} \\ &\asymp \int_{s=0}^{\pi} w'(s)^2 \int_{t=s/2}^{2s} \int_{x=s}^t \int_{y=s}^x dy dx dt \frac{d\mu(s)}{(s-t)^2} \\ &= \frac{1}{2} \int_{s=0}^{\pi} w'(s)^2 \int_{t=s/2}^{2s} (s-t)^2 dt \frac{d\mu(s)}{(s-t)^2} \\ &= \frac{3}{4} \int_{s=-\pi}^{\pi} w'(s)^2 s d\mu(s). \end{aligned}$$

Hence

$$\mathcal{I}_2 \asymp \int_{s=-\pi}^{\pi} w'(s)^2 s d\mu(s).$$

If $0 \leq t \leq s/2$, then $|t - s| \geq s/2$,

$$\begin{aligned}
 \mathcal{I}_3 &\lesssim \int_{s=0}^{\pi} \int_{t=0}^s \int_{x=t}^s \int_{y=x}^s |w'(y)|w(y) \frac{|w'(x)|}{w(x)} dy dx \frac{d\mu(s)}{s^2} dt \\
 &\lesssim \int_{t=0}^{\pi} \int_{x=t}^{\pi} \int_{y=x}^{\pi} |w'(y)|w(y) \frac{|w'(x)|}{w(x)} \left(\int_{y \leq |s| \leq \pi} \frac{d\mu(s)}{s^2} \right) dt \\
 &\lesssim \int_{x=0}^{\pi} \int_{y=x}^{\pi} |w'(y)|w(y) \frac{|w'(x)|}{w(x)} \left(\int_{y \leq |s| \leq \pi} \frac{d\mu(s)}{s^2} \right) x dx dy.
 \end{aligned}$$

□

Theorem 3.2. *Let $w : [0, \pi] \rightarrow (0, +\infty)$ be a C^1 decreasing convex function such that $w(x) \leq 2w(2x)$. Suppose that $x^2|w'(x)|$ is increasing and let f_w be the outer function given by (6). Then*

$$\mathcal{D}_{\mu}(f_w) \lesssim \|F_{\mu}w'\|_{\infty} \|w\|_{\infty},$$

where F_{μ} is given by (7).

Proof. By (3) of Lemma 2.4, we have $\hat{\mu} \leq F_{\mu}$. Now Lemma 3.1 gives

$$\begin{aligned}
 \mathcal{J}_3 &\lesssim \int_{x=0}^{\pi} \int_{y=x}^{\pi} |w'(y)|w(y) \frac{|w'(x)|}{w(x)} \frac{F_{\mu}(y)}{y^2} x dy dx \\
 &\lesssim \|F_{\mu}w'\|_{\infty} \int_{x=0}^{\pi} \int_{y=x}^{\pi} |w'(x)| \frac{w(y)x}{w(x)y^2} dy dx \\
 &\lesssim \|F_{\mu}w'\|_{\infty} \int_{x=0}^{\pi} \int_{y=x}^{\pi} |w'(x)| \frac{x}{y^2} dy dx \\
 &\lesssim \|F_{\mu}w'\|_{\infty} \|w\|_{\infty}.
 \end{aligned}$$

Note that $x|w'(x)| \lesssim w(x)$ for all $x \in]0, \pi]$. Indeed, since $w(2x) \asymp w(x)$ and $|w'(2x)| \asymp |w'(x)|$, it suffices to prove the inequality for $x \in [0, \pi/2]$. We have

$$w(x) \geq \int_x^{\pi} t^2 |w'(t)| \frac{dt}{t^2} \geq x^2 |w'(x)| \left(\frac{1}{x} - \frac{1}{\pi} \right) \geq \frac{x}{2} |w'(x)|.$$

So, again by Lemma 2.4 we get

$$\begin{aligned}
 \mathcal{J}_1 &\lesssim \|F_{\mu}w'\|_{\infty} \int_{x=0}^{\pi} \int_{y=0}^x |w'(x)| \frac{w(y)}{w(x)x} dy dx \\
 &\lesssim \|F_{\mu}w'\|_{\infty} \int_{x=0}^{\pi} \int_{y=0}^x \int_{u=y}^{\pi} \frac{|w'(x)||w'(u)|}{w(x)x} du dy dx \\
 &+ \|F_{\mu}w'\|_{\infty} \int_{x=0}^{\pi} \int_{y=0}^x |w'(x)| \frac{w(\pi)}{w(x)x} dy dx \\
 &= \mathcal{J}_{12} + \mathcal{J}_{22}.
 \end{aligned}$$

We have

$$\begin{aligned}
\mathcal{J}_{12} &\lesssim \|F_\mu w'\|_\infty \int_{u=0}^\pi \int_{x=0}^\pi \int_{y=0}^{\min(u,x)} \frac{|w'(x)||w'(u)|}{w(x)x} dudydx \\
&\lesssim \|F_\mu w'\|_\infty \left(\int_{u=0}^\pi \int_{x=0}^u \frac{|w'(x)w'(u)|}{w(x)} dudx + \int_{u=0}^\pi \int_{x=u}^\pi \frac{u|w'(x)w'(u)|}{xw(x)} dudx \right) \\
&\lesssim \|F_\mu w'\|_\infty \left(\int_{x=0}^\pi |w'(x)| dx + \int_{u=0}^\pi \int_{x=u}^\pi \frac{u|w'(x)w'(u)|}{xw(x)} dudx \right) \\
&\lesssim \|F_\mu w'\|_\infty \left(\|w\|_\infty + \int_{u=0}^\pi \int_{x=u}^\pi \frac{u|w'(u)|}{x^2} dudx \right) \\
&\lesssim \|F_\mu w'\|_\infty \|w\|_\infty.
\end{aligned}$$

Since w is decreasing, we get

$$\begin{aligned}
\mathcal{J}_{22} &\leq \|F_\mu w'\|_\infty \int_{x=0}^\pi \int_{y=0}^x |w'(x)| \frac{dx}{x} dy \\
&\leq \|F_\mu w'\|_\infty \|w\|_\infty.
\end{aligned}$$

Finally, applying (4) of Lemma 2.4 with $d\nu(s) = sd\mu(s)$, we have $\widehat{\nu}(t) \leq t\widehat{\mu}(t)$ and

$$\mathcal{J}_2 \lesssim \int_0^\pi \frac{w'(t)^2}{t} \widehat{\nu}(2t) dt \lesssim \|F_\mu w'\|_\infty \|w\|_\infty.$$

□

3.2. Norm estimate of test functions in $\mathcal{D}^h(\mu)$. Our goal here is to give an estimate of the norm of some distance functions in $\mathcal{D}^h(\mu)$ (For analytic distance functions see [8]). The result of this subsection will be used in the proof of Theorem 5.4.

Let E be a closed subset of \mathbb{T} , μ be a positive finite measure and denote by $\rho_{\mu,E}$ the local modulus of continuity of μ on E given by

$$\rho_{\mu,E}(t) = \sup_{\zeta \in E} \mu(\zeta e^{-it}, \zeta e^{-it}).$$

Note that $\rho_{\mu,\{1\}}(t) = \widehat{\mu}(t)$. Recall that

$$N_E(t) := 2 \sum_j \mathbf{1}_{\{|I_j| > 2t\}}$$

where (I_j) are the components of $\mathbb{T} \setminus E$. Note also that for every measurable function $\Omega : (0, \pi] \rightarrow \mathbb{R}^+$

$$\int_{\mathbb{T}} \Omega(\text{dist}(\zeta, E)) |d\zeta| = \int_0^\pi \Omega(t) N_E(t) dt. \tag{8}$$

Lemma 3.3. *Let $\Omega : (0, \pi] \rightarrow \mathbb{R}^+$ be a positive decreasing function, then*

$$\int_{\mathbb{T}} \Omega(\text{dist}(\zeta, E)) d\mu(\zeta) \lesssim \int_0^1 \Omega(t) \frac{\rho_{\mu, E}(t)}{t} N_E(t) dt.$$

Proof. Write $\mathbb{T} \setminus E = \cup_n I_n$, where $(I_n)_n = (e^{i\alpha_n}, e^{i\beta_n})_n$ are the components of $\mathbb{T} \setminus E$. Let $d\mu_n(t) = d\mu(t + \alpha_n) + d\mu(\beta_n - t)$, By Lemma 2.4

$$\begin{aligned} \int_{I_n} \Omega(\text{dist}(\zeta, E)) d\mu(\zeta) &\asymp \int_0^{|I_n|/2} \Omega(t) d\mu_n(t) \\ &\lesssim \int_0^{|I_n|/2} \Omega(t) \frac{\widehat{\mu}_n(t)}{t} dt \\ &\lesssim \int_0^{|I_n|/2} \Omega(t) \frac{\rho_{\mu, E}(t)}{t} dt. \end{aligned}$$

Summing over all I_n , we get

$$\int_{\mathbb{T}} \Omega(\text{dist}(\zeta, E)) d\mu(\zeta) \lesssim \int_0^1 \Omega(t) \frac{\rho_{\mu, E}(t)}{t} N_E(t) dt,$$

and the proof is complete. \square

Lemma 3.4. *Let E be a closed subset of \mathbb{T} . Let w be a convex decreasing function and let $\Omega(\zeta) = w(\text{dist}(\zeta, E))$. Then*

$$\mathcal{D}_\mu(\Omega) \lesssim \mathcal{I}_1 + \mathcal{I}_2 + \mathcal{I}_3,$$

where

$$\begin{aligned} \mathcal{I}_1 &:= \int_0^\pi \int_0^\pi \frac{(w(t) - w(t+s))^2}{s^2} \frac{\rho_{\mu, E}(t)}{t} N_E(t) ds dt, \\ \mathcal{I}_2 &= \int_0^\pi w'(t)^2 \rho_{\mu, E}(2t) N_E(t) dt, \\ \mathcal{I}_3 &:= \int_{t=0}^\pi \int_{s=t}^\pi \frac{(w(t) - w(t+s))^2}{s^2} \frac{\rho_{\mu, E}(s)}{s} N_E(t) ds dt, \end{aligned}$$

Proof. Set $\delta = \text{dist}(\zeta, E)$ and $\delta' = d(\zeta', E)$. By Lemma 3.3 we have

$$\begin{aligned} \mathcal{J}_1 &= \frac{1}{2\pi} \int_{\mathbb{T}} \int_{\delta' \leq \delta} \frac{(w(\delta) - w(\delta'))^2}{|\zeta - \zeta'|^2} |d\zeta| d\mu(\zeta') \\ &\lesssim \int_{\mathbb{T}} \int_{\delta' \leq \delta} \frac{(w(\delta') - w(\delta' + |\zeta - \zeta'|))^2}{|\zeta - \zeta'|^2} |d\zeta| d\mu(\zeta') \\ &\lesssim \int_{\mathbb{T}} \int_{s=0}^\pi \frac{(w(\delta') - w(\delta' + s))^2}{s^2} ds d\mu(\zeta') \\ &\lesssim \int_0^\pi \int_0^\pi \frac{(w(t) - w(t+s))^2}{s^2} \frac{\rho_{\mu, E}(t)}{t} N_E(t) ds dt, \end{aligned}$$

and

$$\begin{aligned}
\mathcal{J}_2 &= \frac{1}{2\pi} \int_{\mathbb{T}} \int_{\delta \leq \delta'} \frac{(w(\delta) - w(\delta'))^2}{|\zeta - \zeta'|^2} d\mu(\zeta') |d\zeta| \\
&\lesssim \int_{\mathbb{T}} \int_{\mathbb{T}} \frac{(w(\delta) - w(\delta + |\zeta - \zeta'|))^2}{|\zeta - \zeta'|^2} d\mu(\zeta') |d\zeta| \\
&\lesssim \int_{\zeta \in \mathbb{T}} \int_{|\zeta' - \zeta| \leq \delta} + \int_{\zeta \in \mathbb{T}} \int_{|\zeta' - \zeta| \geq \delta} = \mathcal{J}_{21} + \mathcal{J}_{22}.
\end{aligned}$$

Clearly we have

$$\mathcal{J}_{21} = \int_{\mathbb{T}} \int_{|\zeta - \zeta'| \leq \delta} w'(x_{\delta, |\zeta - \zeta'|})^2 d\mu(\zeta') |d\zeta|,$$

where $x_{\delta, |\zeta - \zeta'|} \in (\delta, \delta + |\zeta - \zeta'|)$. Since w is convex, then

$$\begin{aligned}
\mathcal{J}_{21} &\leq \int_{\mathbb{T}} w'(2\delta)^2 \int_{|\zeta - \zeta'| \leq \delta} d\mu(\zeta') |d\zeta| \\
&\leq \int_{\mathbb{T}} w'(2\delta)^2 \rho_{\mu, E}(\delta) |d\zeta|.
\end{aligned}$$

Hence by (8) we get

$$\mathcal{J}_{21} \lesssim \int_{\mathbb{T}} w'(\delta)^2 \rho_{\mu, E}(2\delta) |d\zeta| \lesssim \int_0^\pi w'(t)^2 \rho_{\mu, E}(2t) N_E(t) dt.$$

With the same calculation, as in Lemma 3.3, we have

$$\int_{\mathbb{T}} \int_{\mathbb{T}} \Omega(\text{dist}(\zeta', F)) d\mu(\zeta') |d\zeta|$$

where $\Omega(s) = \mathbf{1}_{\{s \geq \delta\}} \left(\frac{w(\delta) - w(\delta + s)}{s} \right)^2$ and $F = \{\zeta\}$. Then

$$\begin{aligned}
\mathcal{J}_{22} &\lesssim \int_{\mathbb{T}} \int_0^\pi \Omega(s) \frac{\mu(\zeta e^{-is}, \zeta e^{is})}{s} ds |d\zeta| \\
&= \int_{\mathbb{T}} \int_0^\pi \left(\frac{w(\delta) - w(\delta + s)}{s} \right)^2 \frac{\mu(\zeta e^{-is}, \zeta e^{is})}{s} ds |d\zeta|.
\end{aligned}$$

Again by (8) we get

$$\mathcal{J}_{22} \lesssim \int_{t=0}^\pi \int_{s=t}^\pi \frac{(w(t) - w(t + s))^2}{s^2} \frac{\rho_{\mu, E}(s)}{s} N_E(t) ds dt.$$

Since $\mathcal{D}_\mu(w) = \mathcal{J}_1 + \mathcal{J}_2$, we get our result. \square

For a positive increasing function ψ such that $\psi(0) = 0$, we set

$$M_{\psi, E}(s) = \max \left(\int_0^s \frac{\psi(t)}{t} N_E(t) dt, \frac{\psi(s)}{s} |E_s| \right), \quad (9)$$

where $E_t = \{\zeta \in E : \text{dist}(\zeta, E) \leq t\}$.

If ψ is concave, then $\psi(x)/x$ is decreasing and

$$\frac{\psi(s)}{s}|E_s| \leq \frac{\psi(s)}{s} \int_0^s N_E(t)dt \leq \int_0^s \frac{\psi(t)}{t} N_E(t)dt = M_{\psi,E}(s).$$

And if ψ is convex then $\psi(x)/x$ is increasing, so

$$\int_0^s \frac{\psi(t)}{t} N_E(t)dt \leq \frac{\psi(s)}{s} \int_0^s N_E(t)dt = \frac{\psi(s)}{s}|E_s| = M_{\psi,E}(s).$$

The function ψ is called α -admissible if ψ is concave or convex and $\psi(s)/s^\alpha$ is decreasing for some $\alpha > 0$. Now we can state the main result of this subsection

Theorem 3.5. *Let E be a closed subset of \mathbb{T} . Let w be a convex decreasing function and let $\Omega(\zeta) = w(\text{dist}(\zeta, E))$. Suppose that there exists an α -admissible function ψ , with $\alpha < 2$, such that $\rho_{\mu,E}(s) \leq \psi(s)$. Then*

$$\mathcal{D}_\mu(\Omega) \leq C(\alpha) \|w' M_{\psi,E}\|_\infty \|w\|_\infty.$$

Proof. We apply lemma 3.4. An analogue calculation, as in the proof of Theorem 3.2, gives

$$\mathcal{I}_1 + \mathcal{I}_2 \lesssim \|w' M_{\rho_{\mu,E},E}\|_\infty \|w\|_\infty.$$

Estimates of \mathcal{I}_1 : we have

$$\begin{aligned} \mathcal{I}_1 &= \int_0^\pi \int_0^\pi \frac{(w(t) - w(t+s))^2 \rho_{\mu,E}(t)}{s^2 t} N_E(t) ds dt, \\ &= \int_0^\pi \int_0^\pi w'(x_{t,s})^2 \frac{\rho_{\mu,E}(t)}{t} N_E(t) ds dt, \end{aligned}$$

where $x_{t,s} \in (t, t+s)$. Since w is convex, we get

$$\begin{aligned} \mathcal{I}_1 &\leq \int_{t=0}^\pi \int_{s=0}^\pi w'(t+s)^2 \frac{\rho_{\mu,E}(t)}{t} N_E(t) ds dt \\ &= \int_{t=0}^\pi \int_{s=0}^t \dots + \int_{t=0}^\pi \int_{s=t}^\pi \\ &\leq \int_{t=0}^\pi w'(2t)^2 \rho_{\mu,E} N_E(t) dt + \int_{t=0}^\pi \int_{s=t}^\pi w'(2s)^2 \frac{\rho_{\mu,E}(t)}{t} N_E(t) ds dt \\ &\leq \int_{t=0}^\pi w'(2t)^2 \rho_{\mu,E} N_E(t) dt + \int_{s=0}^\pi w'(2s)^2 \int_{t=0}^s \frac{\rho_{\mu,E}(t)}{t} N_E(t) dt ds \\ &\leq 2 \int_0^\pi w'(t)^2 M_{\rho_{\mu,E}}(t) dt \\ &\leq 2 \|w' M_{\psi,E}\|_\infty \|w\|_\infty. \end{aligned}$$

Estimates of \mathcal{I}_2 , we have

$$\begin{aligned}\mathcal{I}_2 &= \int_0^\pi w'(t)^2 \rho_{\mu,E}(t) N_E(t) dt \\ &\leq 2 \int_0^\pi w'(t)^2 M_{\rho_{\mu,E}}(t) dt \\ &\leq 2 \|w' M_{\psi,E}\|_\infty \|w\|_\infty.\end{aligned}$$

Now we consider the integral \mathcal{I}_3 . We have

$$\begin{aligned}\mathcal{I}_3 &= 2 \int_{t=0}^\pi \int_{s=t}^\pi \int_{u=t}^{t+s} \int_{v=t}^{t+s} w'(u) w'(v) \frac{\rho_{\mu,E}(s)}{s^3} N_E(t) dv du ds dt \\ &\lesssim \int_{t=0}^\pi \int_{s=t}^\pi \int_{u=t}^{2s} \int_{v=t}^{2s} |w'(u)| |w'(v)| \frac{\rho_{\mu,E}(s)}{s^3} N_E(t) dv du ds dt \\ &\lesssim \int_{v=0}^\pi |w'(v)| \frac{\psi(v)}{v^2} \int_{u=0}^v |w'(u)| |E_u| du dv \\ &\lesssim \int_{v=0}^\pi |w'(v)| \frac{1}{v^{2-\alpha}} \int_{u=0}^v |w'(u)| \frac{\psi(u)}{u^\alpha} |E_u| du dv \\ &\leq C(\alpha) \sup_u \left(|w'(u)| \frac{\psi(u)}{u} |E_u| \right) \int_{v=0}^\pi |w'(v)| \frac{1}{v^{2-\alpha}} v^{2-\alpha} dv \\ &\leq C(\alpha) \sup_u \left(|w'(u)| \frac{\psi(u)}{u} |E_u| \right) \|w\|_\infty.\end{aligned}$$

□

Corollary 3.6. *Let E be a closed subset of \mathbb{T} . Let w be a convex decreasing function and let $\Omega(\zeta) = w(\text{dist}(\zeta, E))$. Suppose that $\rho_{\mu,E}(t) = O(t^\alpha)$ for some $\alpha > 0$. Then*

- (1) $\mathcal{D}_\mu(\Omega) \leq C(\alpha) \sup_{t \geq 0} \left| w'(t) \int_t^\pi t^{\alpha-1} N_E(t) dt \right| \times \|w\|_\infty$, if $0 < \alpha \leq 1$,
- (2) $\mathcal{D}_\mu(\Omega) \leq C(\alpha) \sup_{t \geq 0} |w'(t) t^{\alpha-1} |E_t|| \times \|w\|_\infty$, if $1 \leq \alpha < 2$,
- (3) $\mathcal{D}_\mu(\Omega) \leq C(\alpha) \sup_{t \geq 0} |w'(t)| \log t |E_t| \times \|w\|_\infty$, if $\alpha = 2$,
- (4) $\mathcal{D}_\mu(\Omega) \leq C(\alpha, h) \sup_{t \geq 0} |w'(t) h(t) |E_t|| \times \|w\|_\infty$, if $\alpha > 2$,

where h is a positive increasing function such that $h(0) = 0$ and $\int_0^\infty ds/h(s) < \infty$.

Proof. (1) and (2) are direct consequences of Theorem 3.5.

Now we prove (3). The proof of Theorem 3.5 gives

$$\mathcal{I}_3 \lesssim \int_{v=0}^\pi |w'(v)| \log \frac{1}{v} \int_{u=0}^v |w'(u)| |E_u| du dv,$$

and we get our estimate.

Finally we prove (4). Since $|E_t| \rightarrow 0$, then there exists a positive increasing function h , $h(0) = 0$, such that $\int_0^\infty ds/h(s) < \infty$. Again, by the proof of Theorem 3.5 we have

$$\mathcal{I}_3 \lesssim C(\alpha) \int_{v=0}^\pi |w'(v)| \int_{u=0}^v \frac{h(u)}{h(v)} |w'(u)| |E_u| dudv,$$

which gives the desired estimate. \square

4. KERNEL ESTIMATE

In this section we will prove Theorem 1. The reproducing kernel k^μ of $\mathcal{D}(\mu)$ is defined by,

$$f(z) = \langle f, k^\mu(\cdot, z) \rangle, \quad f \in \mathcal{D}(\mu), \quad z \in \mathbb{D}.$$

So,

$$k^\mu(z, z) = \sup\{|f(z)|^2 : f \in \mathcal{D}(\mu), \|f\|_\mu^2 \leq 1\}. \quad (10)$$

It follows obviously that for $|z| \leq 1/2$ we have

$$k^\mu(z, z) \asymp 1 + \int_0^{|z|} \frac{dr}{(1-r)P[\mu](rz/|z|) + (1-r)^2}.$$

By Littlewood–Paley identity, we have

$$\begin{aligned} \|f\|_\mu^2 &= \|f\|_{H^2}^2 + \mathcal{D}_\mu(f) \\ &= |f(0)|^2 + \int_{\mathbb{D}} |f'(w)|^2 [|\log |w|| + P[\mu](w)] dA(w) \\ &\asymp |f(0)|^2 + \int_{\mathbb{D}} |f'(w)|^2 [(1-|w|) + P[\mu](w)] dA(w). \end{aligned}$$

Let $f \in \mathcal{D}(\mu) \setminus \{0\}$ and let $f = I_f O_f$ be the inner–outer factorization of f . Then $O_f \in \mathcal{D}(\mu)$ and $\mathcal{D}_\mu(O_f) \leq \mathcal{D}_\mu(f)$ (see [15]). Thus by (10), we get

$$k^\mu(z, z) = \sup\{|f(z)|^2 : f \in \mathcal{D}(\mu) \text{ outer function and } \|f\|_\mu \leq 1\}. \quad (11)$$

This observation will be useful in the proof of the lower estimate.

4.1. Proof of the upper estimate. Let $z = \rho \in [1/2, 1)$. By Lemma 2.4, it suffices to prove that

$$k^\mu(\rho, \rho) \lesssim 1 + \int_{1-\rho}^1 \frac{dx}{F_\mu(x) + x^2}.$$

Let $f \in \mathcal{D}(\mu)$, since $f \in H^2$,

$$|f(iy)| \leq \frac{\|f\|_{H^2}}{\sqrt{1-y}} \leq \sqrt{2} \|f\|_{H^2}, \quad 0 < y < 1/2.$$

So, for $0 < y < 1/2$, we have

$$\begin{aligned} |f(\rho + i(1-\rho)y)| &= \left| f(iy) + \int_0^\rho f'(t + i(1-t)y) dt \right| \\ &\lesssim \int_0^\rho |f'(t + i(1-t)y)| dt + \|f\|_{H^2}. \end{aligned}$$

Let Δ be the triangle with vertices $-i/2, 1, i/2$ and let $\Delta_\rho = \{x + iy \in \Delta : 0 \leq x \leq \rho\}$. By change of variables $w = u + iv = t + i(1-t)y$, we get

$$\begin{aligned} \frac{1}{1-\rho} \int_{-(1-\rho)/2}^{(1-\rho)/2} |f(\rho + i\eta)| d\eta &= \int_{-1/2}^{1/2} |f(\rho + i(1-\rho)y)| dy \\ &\lesssim \int_0^\rho \int_{-1/2}^{1/2} |f'(t + i(1-t)y)| dy dt + \|f\|_{H^2} \\ &\lesssim \int_{\Delta_\rho} |f'(w)| \frac{dudv}{1-u} + \|f\|_{H^2} \\ &\lesssim \mathcal{D}_\mu(f)^{1/2} \left[\int_{\Delta_\rho} \frac{dA(w)}{(1-u)^2((1-|w|) + P[\mu](w))} \right]^{1/2} + \|f\|_{H^2} \\ &\lesssim \mathcal{D}_\mu(f)^{1/2} \left[\int_0^\rho \frac{du}{(1-u)^2 + (1-u)P[\mu](u)} \right]^{1/2} + \|f\|_{H^2} \\ &\lesssim \mathcal{D}_\mu(f)^{1/2} \left[\int_{1-\rho}^1 \frac{dx}{F_\mu(x) + x^2} \right]^{1/2} + \|f\|_{H^2}. \end{aligned} \quad (12)$$

Denote by $D(\lambda, r)$ the disc of radius r centered at λ . Since

$$D(\rho, (1-\rho)/4) \subset \{z = x + iy : |x - \rho| \leq (1-\rho)/4 \text{ and } |y| \leq (1-x)/4\},$$

by (12) and the subharmonicity of $|f|$ we obtain

$$\begin{aligned} |f(\rho)| &\lesssim \frac{1}{(1-\rho)^2} \int_{x=\rho-\frac{1-\rho}{4}}^{\rho+\frac{1-\rho}{4}} \left(\int_{y=-\frac{1-x}{2}}^{\frac{1-x}{2}} |f(x+iy)| dy \right) dx \\ &\lesssim \mathcal{D}_\mu(f)^{1/2} \left[\int_{\frac{5}{4}(1-\rho)}^1 \frac{dx}{F_\mu(x) + x^2} \right]^{1/2} + \|f\|_{H^2} \end{aligned} \quad (13)$$

Now from (10), we get

$$\begin{aligned} k^\mu(\rho, \rho) &\lesssim 1 + \int_{1-\rho}^1 \frac{dx}{F_\mu(x) + x^2} \\ &\asymp 1 + \int_0^{|\rho|} \frac{dr}{(1-r)P[\mu](rz/|z|) + (1-r)^2}. \end{aligned}$$

This achieves the proof.

4.2. Lower estimate.

4.2.1. *Weighted Sobolev spaces.* In this subsection we introduce weighted Sobolev spaces which will be used in the proof of lower estimate of the norm of the kernel of $\mathcal{D}(\mu)$ and in the proof of Theorem 5.4. Let φ be a nondecreasing continuous function. The Sobolev space associated with φ , $W^\infty(\varphi)$, consists of real continuous functions f on $]0, 2\pi]$ given by

$$f(x) = f(2\pi) + \int_x^{2\pi} g(s) ds, \quad 0 < x \leq 2\pi, \quad (14)$$

where g is a measurable function satisfying

$$\|g\varphi\|_\infty = \sup_{0 < x} |g(x)|\varphi(x) < \infty.$$

As usual g will be denoted by f' . Equipped with the following norm

$$\|f\|_{W^\infty(\varphi)} = \|f'\varphi\|_\infty,$$

$W^\infty(\varphi)$ is a Banach space. It becomes a topological Banach algebra, if and only if,

$$\int_0^{2\pi} \frac{dx}{\varphi(x)} < \infty.$$

We say that f is regular, and write $f \in \mathcal{R}$, if f is a C^1 convex decreasing function on $[0, 2\pi]$, satisfying $f(2t) \leq 2f(t)$ and $t^2|f'(t)|$ is increasing.

Our goal is to estimate

$$\gamma_\varphi(a) = \sup \{f^2(a) : f \in W^\infty(\varphi) \cap \mathcal{R}, \|f\|_{W^\infty(\varphi)}\|f\|_\infty + \|f\|_2^2 \leq 1\}.$$

First we will examine the Hilbertian case

$$W^2(\varphi) = \{f \text{ of the form (14)} : \|f\|_{W^2(\varphi)}^2 = \|f\|_2^2 + \int_0^{2\pi} |f'(t)|^2 \varphi(t) dt < \infty\}.$$

We also need the following subspace of $W^2(\varphi)$

$$W_0^2(\varphi) = \{f \text{ of the form (14)} : f(2\pi) = 0, \text{ and } \|f\|_{W_0^2(\varphi)}^2 = \int_0^{2\pi} |f'(t)|^2 \varphi(t) dt < \infty\}.$$

Clearly, evaluations at points of $]0, 2\pi]$ define continuous linear functionals on $W^2(\varphi)$ and on $W_0^2(\varphi)$. Let K_φ, L_φ be the reproducing kernels of $W^2(\varphi)$ and of $W_0^2(\varphi)$ respectively. A simple computation gives the following expression of the reproducing kernel L_φ of $W_0^2(\varphi)$. We have

$$L_\varphi(t, s) = \begin{cases} \int_t^{2\pi} \frac{dx}{\varphi(x)} & t \geq s, \\ L_\varphi(s, s) & t \leq s. \end{cases}$$

The estimates of K_φ , on the diagonal is given by

$$K_\varphi(a, a) \asymp 1 + L_\varphi(a, a) = 1 + \int_a^{2\pi} \frac{dx}{\varphi(x)}.$$

It means that

$$\sup \{f(a)^2 : f \in W^2(\varphi), \|f\|_{W^2(\varphi)}^2 \leq 1\} \asymp 1 + \int_a^{2\pi} \frac{dx}{\varphi(x)}.$$

We have the following proposition.

Proposition 4.1. *Suppose that $t^2/\varphi(t)$ is increasing and $\varphi(t) \geq t^2$. Let $a < 1/2$, we have*

$$\gamma_\varphi(a) \asymp K_\varphi(a, a).$$

Proof. Since $\|f\|_{W^2(\varphi)}^2 \leq \|f\|_{W^\infty(\varphi)}\|f\|_\infty$, then $\gamma_\varphi(a) \leq K_\varphi(a, a)$.

Conversely, let $f = f_0 + 1$, where

$$f_0(x) = \int_{2\pi \frac{x+a}{2\pi+a}}^{2\pi} \frac{ds}{\varphi(s)}, \quad 0 < x \leq 2\pi.$$

Clearly $f \in \mathcal{R}$. Since $\varphi(2t) \asymp \varphi(t)$, we have

$$\begin{aligned} \|f_0\|_2^2 &= \int_0^{2\pi} f_0(t)^2 dt \\ &\lesssim \int_0^\pi \int_{u=t+a}^{2\pi} \int_{v=t+a}^{2\pi} \frac{1}{\varphi(u)\varphi(v)} dudvdt \\ &\lesssim \int_{t=0}^a \int_{u=a}^{2\pi} \int_{v=a}^{2\pi} \frac{1}{\varphi(u)\varphi(v)} dudvdt + \int_{t=a}^\pi \int_{u=t}^{2\pi} \int_{v=t}^{2\pi} \frac{1}{\varphi(u)\varphi(v)} dudvdt \\ &\lesssim \int_{u=a}^{2\pi} \int_{v=a}^{2\pi} \frac{a}{\varphi(u)v^2} dudv + \int_{u=a}^{2\pi} \int_{v=u}^{2\pi} \frac{u}{\varphi(u)v^2} dudv \\ &\lesssim \|f_0\|_\infty. \end{aligned}$$

Then we obtain

$$K_\varphi(a, a) \lesssim \frac{f(a)^2}{\|f\|_{W^\infty(\varphi)}\|f\|_\infty + \|f\|_2^2} \leq \gamma_\varphi(a).$$

And the proof is complete. \square

4.2.2. *Proof of the lower estimates.* Let $z = r \in]1/2, 1[$ and let $w \in \mathcal{R}$. We consider the outer function f_w given by

$$|f_w(e^{it})| = w(|t|), \quad \text{a.e on } [-\pi, \pi].$$

Let $\varphi(x) = F_\mu(x) + x^2$. By (11), Proposition 2.3 and Theorem 3.2 we have

$$\begin{aligned} k^\mu(r, r) &\gtrsim \frac{|f_w(r)|^2}{\|f_w\|_{\mathcal{D}(\mu)}^2} \\ &\gtrsim \frac{w^2(1-r)}{\|w\|_{W^\infty(F_\mu)}\|w\|_\infty + \|w\|_2^2} \\ &\gtrsim \frac{w^2(1-r)}{\|w\|_{W^\infty(\varphi)}\|w\|_\infty + \|w\|_2^2}. \end{aligned}$$

Thus

$$k^\mu(r, r) \gtrsim \gamma_\varphi(1-r).$$

By Proposition 4.1, we obtain the result.

5. CAPACITY

Let μ be a positive finite measure on \mathbb{T} and let c_μ be the associated capacity given by (1). The capacity c_μ is a Choquet capacity [3, 11] and so for every borelian set of \mathbb{T} we have

$$c_\mu(E) = \sup\{c_\mu(K) : K \text{ compact}, K \subset E\}.$$

Note that c_μ satisfies a weak-type inequality. Namely:

$$c_\mu(\{\zeta \in \mathbb{T} : |f(\zeta)| \geq t \quad c_\mu\text{-q.e.}\}) \leq \frac{\|f\|_\mu^2}{t^2}, \quad f \in \mathcal{D}^h(\mu).$$

As consequence of this inequality we have the following properties.

Proposition 5.1. *The following properties are satisfied*

- (1) *Let $E \subset \mathbb{T}$ be a Borel set and let $\mathcal{M}_\mu(E) := \{f \in \mathcal{D}(\mu) : g|_E = 0 \quad c_\mu\text{-q.e.}\}$. Then the set $\mathcal{M}_\mu(E)$ is closed in $\mathcal{D}(\mu)$.*
- (2) *If $f \in \mathcal{D}(\mu)$ is cyclic for $\mathcal{D}(\mu)$ then f is outer function and $c_\mu(Z_{\mathbb{T}}(f)) = 0$.*
- (3) *The radial limit $\lim_{r \rightarrow 1^-} f(r\zeta)$ exists and is finite for every $f \in \mathcal{D}^h(\mu)$ if and only if $c_\mu(\zeta) > 0$.*

Proof. See [4, 11]. □

Now we will give the proof of the estimate of the capacity of arcs.

Proof Theorem 2. Suppose that $\zeta = 1$. Let $w \in \mathcal{R}$ and let f_w be the outer function satisfying

$$|f_w(e^{it})| = w(|t|), \quad \text{a.e on } [-\pi, \pi].$$

It's clear that $w(|I|) \lesssim w(x)$ for $|x| \leq 2|I|$. We have

$$\gamma_\varphi(|I|) \lesssim 1/c_\mu(I).$$

By proposition 4.1, we obtain

$$c_\mu(I) \lesssim 1/k^\mu(\rho, \rho), \quad (\rho = 1 - |I|).$$

For the reverse inequality note that

$$c_\mu(I) = \inf\{\|f\|_\mu^2 : f \in C^1, 0 \leq f \leq 1 \text{ and } f = 1 \text{ on } I\}.$$

Consider the function $u \in \mathcal{D}^h(\mu)$ such that $0 \leq u \leq 1$ and $u|_I = 1$. Hence $u \in \mathcal{D}^h(\mu) \cap C^1$. We have $P[u](1 - |I|) \asymp 1$. Let $\rho = 1 - |I|$, a similar argument, as in the proof of (13), gives

$$P[u](\rho) \lesssim \mathcal{D}_\mu(u)^{1/2} \sqrt{k^\mu(\rho, \rho)} + \|u\|_{L^2(\mathbb{T})}.$$

So $k^\mu(\rho, \rho)^{-1/2} \lesssim \mathcal{D}_\mu(u)^{1/2}$, and

$$c_\mu(I) \geq \frac{1}{k^\mu(\rho, \rho)}.$$

□

As an immediate consequence, we obtain

Corollary 5.2. *Let $\lambda \in \mathbb{T}$.*

$$c_\mu(\{\lambda\}) > 0 \iff \int_0^1 \frac{dx}{(1-x)P[\mu](x\lambda) + (1-x)^2} < \infty.$$

Now we will give some sufficient conditions on a closed subset of \mathbb{T} to be μ -polar. Let E be a closed subset of \mathbb{T} . We define $n_E(\varepsilon)$, the ε -covering number of E , to be the smallest number of the closed arcs of length 2ε that cover E . Note that

$$\varepsilon n_E(\varepsilon) \leq |E_\varepsilon| \leq 4\varepsilon n_E(\varepsilon), \quad 0 < \varepsilon \leq \pi.$$

Let

$$\kappa_\mu(r) = \inf\{k^\mu(r\zeta, r\zeta) : \zeta \in \text{supp } \mu\}.$$

It's easy to see that κ_μ is unbounded if and only if, for each $\zeta \in \mathbb{T}$, we have $c_\mu(\zeta) = 0$. In this case one can prove easily, by the sub-additivity property of capacity, that

Corollary 5.3. *Let E be a closed subset of \mathbb{T} such that $\lim_{r \rightarrow 1^-} \kappa_\mu(r) = \infty$. If*

$$n_E(\varepsilon) = o(\kappa_\mu(1 - \varepsilon)), \quad \varepsilon \rightarrow 0,$$

then $c_\mu(E) = 0$.

Proof. Let $(I_i)_{0 \leq i \leq n_E(\varepsilon)}$ be a ε -covering of E , then

$$\begin{aligned} c_\mu(E) &\leq \sum_{i=0}^{n_E(\varepsilon)} c_\mu(I_i) \\ &\lesssim \sum_{i=0}^{n_E(\varepsilon)} 1/k^\mu((1-\varepsilon)\zeta_i, (1-\varepsilon)\zeta_i) \\ &\leq \frac{n_E(\varepsilon)}{k^\mu(1-\varepsilon)} = o(1). \end{aligned}$$

□

Recall that the function ψ is called α -admissible if ψ is concave or convex and $\psi(s)/s^\alpha$ is decreasing for some $\alpha > 0$. For a positive increasing function ψ on $(0, 2\pi)$ such that $\psi(0) = 0$, we set

$$M_{\psi,E}(s) = \max \left(\int_0^s \frac{\psi(t)}{t} N_E(t) dt, \frac{\psi(s)}{s} |E_s| \right), \quad s \in (0, 2\pi).$$

Now we can state the main result of this section.

Theorem 5.4. *Let E be closed subset of \mathbb{T} such that $\rho_{\mu,E} \leq \psi$ where ψ is α -admissible for some $\alpha < 2$. If*

$$\int_0^\pi \frac{dt}{M_{\psi,E}(t)} = +\infty,$$

then $c_\mu(E) = 0$.

Proof. Note that $M_{\psi,E}$ is given by (5), so $M_{\psi,E}(s)$ is increasing. Let $a > 0$. By the definition of capacity and using Theorem 3.5 and Proposition 4.1 we have

$$K_{M_{\psi,E}}(a, a) \asymp \gamma_{M_{\psi,E}}^2(a) \lesssim \frac{1}{c_\mu(E)}.$$

When a goes to zero, we get

$$\int_0^\pi \frac{dt}{M_{\psi,E}(t)} \lesssim \frac{1}{c_\mu(E)}.$$

And the proof is complete. □

Remarks. Now we give some examples:

(i) Let E be a closed subset of \mathbb{T} and let

$$\widetilde{M}_{\mu,E}(t) = \int_0^t (\rho_\mu(s) N_E(s) / s) ds.$$

If

$$\int_0^\pi \frac{dt}{\widetilde{M}_{\mu,E}(t)} = \infty,$$

then $c_\mu(E) = 0$.

(ii) If $\mu = m$ is the Lebesgue measure, then c_μ is comparable to the logarithmic capacity and $\widetilde{M}_{\mu,E}(s) = |E_s|$. Theorem 5.4 says that if

$$\int_0^\infty \frac{dt}{|E_t|} = +\infty,$$

then $c(E) = 0$. This result is due to Carleson [3, Theorem 2, p.30].

(iii) Let K be a closed subset of \mathbb{T} such that $\rho_{\mu,K}(s) = O(s^{1+\beta})$ for some $0 < \beta$. If $\beta < 1$, then every subset of K with Hausdorff dimension less than β is μ -polar. If $\beta > 1$, then every subset E of K with $|E| = 0$ is μ -polar. The following measures $d\mu(\zeta) = \text{dist}(\zeta, K)^\beta dm(\zeta)$ provide such examples.
