HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

In the paper “A database of plagioclase crystal preferred orientations (CPO) and microstructures – implications for CPO origin, strength, symmetry and seismic anisotropy in gabbroic rocks” by T. Satsukawa et al. (Solid Earth, 4, 511–542, doi:10.5194/se-4-511-2013, 2013) an error occurred in the second paragraph of Sect. 5.7. The correct paragraph should be as follows:

In the present study, there is a clear variation of the (010) and [100] pole figures from point maxima to girdle distributions, with associated changes in the (001) pole figures. We introduce the BA-index (similar to the LS index used Ulrich and Mainprice (2005) to describe variations between the symmetry of (010) and [001] pole figures in omphacite) to characterize the symmetry variation of the (010) and [100] pole figures, which is defined as $1/2[2 - P_{(010)}/(G_{(010)} + P_{(010)}) - G_{[100]}/(G_{[100]} + P_{[100]})]$. P and G are defined in Sect. 3.2 above.
