HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Building zero energy districts in tropical climates. Development of design tools for morphology/comfort/energy coupled optimization.

Coupling multiple weather-based simulation models and tools via a Rhino-Grasshopper platform.

AYMERIC DELMAS
 PhD candidate at PIMENT

APPROACH

The couple Rhino-Grasshopper is a **parametric modelling** tool that is able to algorithmically control 3D models and geometrically optimize them to any defined criteria.

Grasshopper as a script-based Rhino plugin makes generating **complex geometries** easy. Architectural building designs belong to these complex geometries and are nowadays a reality.

Environmental sustainable building design requires the use of **multiple weather-based simulation tools** to assess the effect of the built environment on the local weather conditions.

OBJECTIVES *How to design bioclimatic neighborhoods in dense tropical urban areas?*

Current design practice for buildings located in dense urban tropical areas imply multiple, independent and multi-scale models, tools and interfaces making continuity of the overall building environmental study (from mesoscale to microscale) impossible. This **modeling issue** makes the efficiency of passive design strategies adapted to tropical climates **uncertain**.

The **objectives** of the presented thesis are:

- To take into account both thermal and airflow transfers at the urban scale
- To improve currently available models ;
- To couple them ;
- To make them suitable for urban tropical microclimate simulation .
- To develop a unique, reactive and flexible environmental models coupling platform via Rhino-Grasshopper.

METHODOLOGY - DESIGN PROCESS

"Design is the process of realizing intentions."

Developing design tools for morphology/comfort/energy coupled optimization involves a development methodology following a **global design process**.

This thesis' methodology is built around selected design principles and **experiences** drawn from zero energy built and monitored projects in the **tropical climate of La Reunion**. The methodology can be illustrated by the following spiral.

From zero energy building design experience to passively optimized urban form.

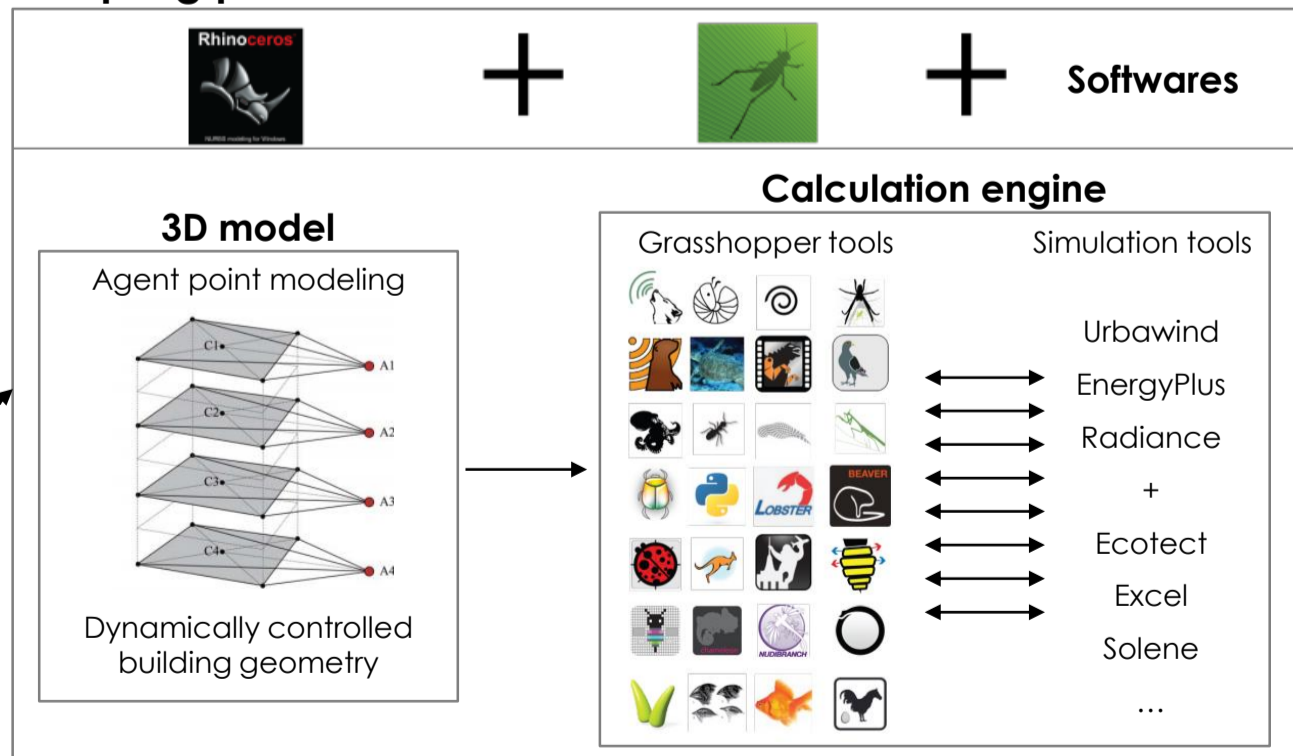

EXPECTED RESULTS

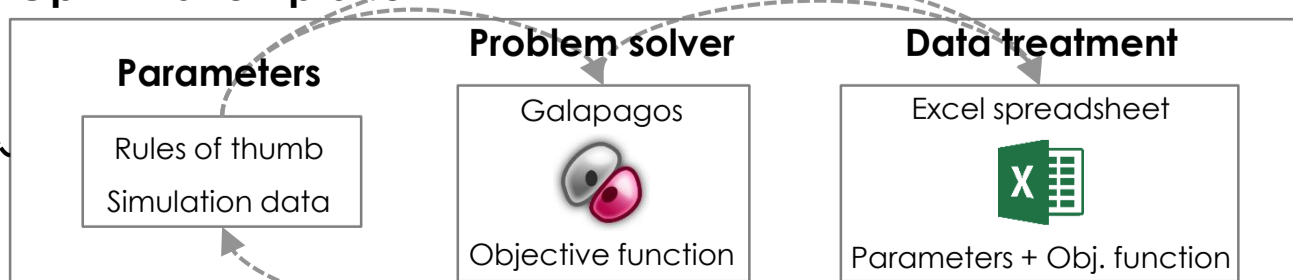

The expected achievement of this thesis is a **coupling platform**, solving continuity (temporal and spatial) issues of current **global environmental study** of buildings in tropical urban areas.

It will use the great range of weather-based simulation tools to assess the impact of the urban microclimate on buildings, occupants and pedestrians' comfort and ultimately **optimize the urban form to passive design strategies**.
