HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

# A $h p$-Hybrid High-Order method for variable diffusion on general meshes 

Joubine Aghili ${ }^{1}$, Daniele A. Di Pietro ${ }^{1}$, Berardo Ruffini ${ }^{1}$

#### Abstract

In this work, we introduce and analyze a $h p$-Hybrid High-Order method for a variable diffusion problem. The proposed method is valid in arbitrary space dimension and for fairly general polytopal meshes. Variable approximation degrees are also supported. We formulate $h p$-convergence estimates for both the energy- and $L^{2}$-norms of the error, which are the first results of this kind for Hybrid High-Order methods. The estimates are fully robust with respect to the heterogeneity of the diffusion coefficient, and show only a mild dependence on its (local) anisotropy. The expected exponential convergence behaviour is numerically shown on a variety of meshes for both isotropic and strongly anisotropic diffusion problems.

Keywords: Hybrid High-Order methods, discontinuous skeletal methods, polytopal methods, $h p$-error analysis, variable diffusion

## 1. Introduction

In the last few years, discretization technologies have appeared that support arbitrary approximation orders on general polytopal meshes. In this work, we focus on a particular instance of such technologies, the so-called Hybrid High-Order (HHO) methods originally introduced in [1, 2]. So far, the literature on HHO methods has focused on the $h$-version of the method with uniform polynomial degree. Our goal is to provide a first example of variable-degree $h p$-HHO method and carry out a full $h p$-convergence analysis valid for fairly general meshes and arbitrary space dimension. Let $\Omega \subset \mathbb{R}^{d}, d \geqslant 1$, denote a bounded connected polytopal domain. We consider the variable diffusion model problem

$$
\begin{align*}
&-\boldsymbol{\nabla} \cdot(\boldsymbol{\kappa} \boldsymbol{\nabla} u)=f \\
& \text { in } \Omega,  \tag{1}\\
& u=0 \\
& \text { on } \partial \Omega,
\end{align*}
$$

where $\kappa$ is a uniformly positive, symmetric, tensor-valued field on $\Omega$, while $f \in L^{2}(\Omega)$ denotes a volumetric source. For the sake of simplicity, we assume that $\kappa$ is piecewise constant on a partition $P_{\Omega}$ of $\Omega$ into polytopes. The weak formulation of problem (1) reads: Find $u \in U:=H_{0}^{1}(\Omega)$ such that

$$
\begin{equation*}
(\boldsymbol{\kappa} \boldsymbol{\nabla} u, \boldsymbol{\nabla} v)=(f, v) \quad \forall v \in U, \tag{2}
\end{equation*}
$$

where we have used the notation $(\cdot, \cdot)$ for the usual inner products of both $L^{2}(\Omega)$ and $L^{2}(\Omega)^{d}$. Here, the scalar-valued field $u$ represents a potential, and the vector-valued field $\boldsymbol{\kappa} \boldsymbol{\nabla} u$ the corresponding flux.

For a given polytopal mesh $\mathcal{T}_{h}=\{T\}$ of $\Omega$, the $h p$-HHO discretization of problem (2) is based on two sets of degrees of freedom (DOFs): (i) Skeletal DOFs, consisting in ( $d-1$ )-variate polynomials of total degree $p_{F} \geqslant 0$ on each mesh face $F$, and (ii) elemental DOFs, consisting in $d$-variate polynomials of degree $p_{T}$ on each mesh element $T$, where $p_{T}$ denotes the lowest degree of skeletal DOFs on the boundary of $T$. Skeletal DOFs are globally coupled and can be alternatively interpreted as traces of the potential on the mesh faces or as Lagrange multipliers enforcing the continuity of the normal flux at the discrete level; cf. [3, 4] for further insight. Elemental DOFs, on the other hand,

[^0]are bubble-like auxiliary DOFs that can be locally eliminated by static condensation, as detailed in [4, Section 2.4] for the case where $p_{F}=p$ for all mesh faces $F$.

Two key ingredients are devised locally from skeletal and elemental DOFs attached to each mesh element $T$ : (i) A reconstruction of the potential of degree $\left(p_{T}+1\right)$ (i.e., one degree higher than elemental DOFs in $T$ ) obtained solving a small Neumann problem and (ii) a stabilisation term penalizing face-based residuals and polynomially consistent up to degree $\left(p_{T}+1\right)$. The local contributions obtained from these two ingredients are then assembled following a standard, finite element-like procedure. The resulting discretization has several appealing features, the most prominent of which are summarized hereafter: (i) It is valid for fairly general polytopal meshes; (ii) the construction is dimensionindependent, which can significantly ease the practical implementation; (iii) it enables the local adaptation of the approximation order, a highly desirable feature when combined with a regularity estimator (whose development will be addressed in a separate work); (iv) it exhibits only a moderate dependence on the diffusion coefficient $\boldsymbol{\kappa}$; (v) it has a moderate computational cost thanks to the possibility of eliminating elemental DOFs locally via static condensation; (vi) parallel implementations can be simplified by the fact that processes communicate via skeletal unknowns only.

The seminal works on the $p$ - and $h p$-conforming finite element method on standard meshes date back the early 80 s ; cf. [5, 6, 7]. Starting from the late 90s, nonconforming methods on standard meshes supporting arbitrary-order have received a fair amount of attention; a (by far) nonexhaustive list of contributions focusing on scalar diffusive problems similar to the one considered here includes [8, 9, 10, 11, 12]. The possibility of refining both in $h$ and in $p$ on general meshes is, on the other hand, a much more recent research topic. We cite, in particular, $h p$-composite [13, 14] and polyhedral [15] discontinuous Galerkin methods, and the two-dimensional virtual element method proposed in [16].

The main results of this paper, summarized in Section 3.2, are $h p$-energy- and $L^{2}$-estimates of the error between the approximate and the exact solution. These are the first results of this kind for HHO methods, and among the first for discontinuous skeletal methods in general (a prominent example of discontinuous skeletal methods are the Hybridizable Discontinuous Galerkin methods of [17]; cf. [4] for a precise study of their relation with HHO methods). The cornerstone of the analysis is the extension of the classical Babuška-Suri hp-approximation results to regular mesh sequences in the sense of [18, Chapter 1] and arbitrary space dimension $d \geqslant 1$; cf. Lemma 1 . Similar results had been derived in [16] for $d=2$ and, under different assumptions on the mesh, in [15] for $d \in\{2,3\}$. A key point is here to show that the regularity assumptions on the mesh imply uniform bounds for the Lipschitz constant of mesh elements. The resulting energy-norm estimate confirms the characteristic $h$-superconvergence behaviour of HHO methods, whereas we have a more standard scaling as $\left(p_{T}+1\right)^{-p_{T}}$ with respect to the polynomial degree $p_{T}$ of elemental DOFs. This scaling is analogous to the best available results for discontinuous Galerkin (dG) methods on rectangular meshes based on polynomials of degree $p_{T}$, cf. [11] (on more general meshes, the scaling for the symmetric interior penalty dG method is $p_{T}^{-\left(p_{T}-1 / 2\right)}$, half a power less than for the $h p$-HHO method studied here). Classically, when elliptic regularity holds, the $h$-convergence order can be increased by 1 for the $L^{2}$-norm. In our error estimates, the dependence on the diffusion coefficient is carefully tracked, showing full robustness with respect to its heterogeneity and only a moderate dependence with a power of $1 / 2$ on its local anisotropy when the error in the energy-norm is considered. Numerical experiments confirm the expected exponentially convergent behaviour for both isotropic and strongly anisotropic diffusion coefficients on a variety of two-dimensional meshes.

The rest of the paper is organized as follows. In Section 2 we introduce the main notations and prove the basic results required in the analysis including, in particular, Lemma 1 (whose proof is detailed in Appendix A). In Section 3 we formulate the $h p-\mathrm{HHO}$ method, state our main results, and provide some numerical examples. The proofs of the main results, preceeded by the required preparatory material, are collected in Section 4 .

## 2. Setting

In this section we introduce the main notations and prove the basic results required in the analysis.

### 2.1. Mesh and notation

Let $\mathcal{H} \subset \mathbb{R}_{*}^{+}$denote a countable set of meshsizes having 0 as its unique accumulation point. We consider mesh sequences $\left(\mathcal{T}_{h}\right)_{h \in \mathcal{H}}$ where, for all $h \in \mathcal{H}, \mathcal{T}_{h}=\{T\}$ is a finite collection of nonempty disjoint open polytopal elements such that $\bar{\Omega}=\bigcup_{T \in \mathcal{T}_{h}} \bar{T}$ and $h=\max _{T \in \mathcal{T}_{h}} h_{T}$ ( $h_{T}$ stands for the diameter of $T$ ). A hyperplanar closed connected subset $F$ of $\bar{\Omega}$ is called a face if it has positive ( $d-1$ )-dimensional measure and (i) either there exist $T_{1}, T_{2} \in \mathcal{T}_{h}$ such that
$F=\partial T_{1} \cap \partial T_{2}$ (and $F$ is an interface) or (ii) there exists $T \in \mathcal{T}_{h}$ such that $F=\partial T \cap \partial \Omega$ (and $F$ is a boundary face). The set of interfaces is denoted by $\mathcal{F}_{h}^{\mathrm{i}}$, the set of boundary faces by $\mathcal{F}_{h}^{\mathrm{b}}$, and we let $\mathcal{F}_{h}:=\mathcal{F}_{h}^{\mathrm{i}} \cup \mathcal{F}_{h}^{\mathrm{b}}$. For all $T \in \mathcal{T}_{h}$, the set $\mathcal{F}_{T}:=\left\{F \in \mathcal{F}_{h} \mid F \subset \partial T\right\}$ collects the faces lying on the boundary of $T$ and, for all $F \in \mathcal{F}_{T}$, we denote by $\boldsymbol{n}_{T F}$ the normal vector to $F$ pointing out of $T$.

The following assumptions on the mesh will be kept throughout the exposition.
Assumption 1 (Admissible mesh sequence). We assume that $\left(\mathcal{T}_{h}\right)_{h \in \mathcal{H}}$ is admissible in the sense of [18] Chapter 1], i.e., for all $h \in \mathcal{H}, \mathcal{T}_{h}$ admits a matching simplicial submesh $\mathfrak{T}_{h}$ and there exists a real number $\varrho>0$ (the mesh regularity parameter) independent of $h$ such that the following conditions hold: (i) For all $h \in \mathcal{H}$ and all simplex $S \in \mathfrak{T}_{h}$ of diameter $h_{S}$ and inradius $r_{S}, \varrho h_{S} \leqslant r_{S}$; (ii) for all $h \in \mathcal{H}$, all $T \in \mathcal{T}_{h}$, and all $S \in \mathfrak{T}_{h}$ such that $S \subset T$, $\varrho h_{T} \leqslant h_{S}$; (iii) every mesh element $T \in \mathcal{T}_{h}$ is star-shaped with respect to every point of a ball of radius $\varrho h_{T}$.

Assumption 2 (Compliant mesh sequence). We assume that the mesh sequence is compliant with the partition $P_{\Omega}$ on which the diffusion tensor $\kappa$ is piecewise constant, so that jumps only occur at interfaces and, for all $T \in \mathcal{T}_{h}$,

$$
\boldsymbol{\kappa}_{T}:=\boldsymbol{\kappa}_{\mid T} \in \mathbb{P}^{0}(T)^{d \times d} .
$$

In what follows, for all $T \in \mathcal{T}_{h}, \bar{\kappa}_{T}$ and $\underline{K}_{T}$ denote the largest and smallest eigenvalue of $\boldsymbol{\kappa}_{T}$, respectively, and $\lambda_{\kappa, T}:=\bar{\kappa}_{T} / \underline{\kappa}_{T}$ the local anisotropy ratio.

### 2.2. Basic results

Let $X$ be a subset of $\mathbb{R}^{N}, N \geqslant 1$, ( $X$ will be a mesh element $T \in \mathcal{T}_{h}$ or face $F \in \mathcal{F}_{h}$ in what follows) $\mathcal{A}_{X}$ the affine space spanned by $X, d_{X}$ its dimension, and assume that $X$ has a non-empty interior in $\mathcal{A}_{X}$. For an index $q, H^{q}(X)$ denotes the Hilbert space of functions which are in $L^{2}(X)$ together with their weak derivatives of order $\leqslant q$, equipped with the usual inner product $(\cdot, \cdot)_{q, X}$ and associated norm $\|\cdot\|_{q, X}$. When $q=0$, we recover the Lebesgue space $L^{2}(X)$, and the subscript 0 is omitted from both the inner product and the norm. The subscript $X$ is also omitted when $X=\Omega$. For a given integer $l \geqslant 0$, we denote by $\mathbb{P}^{l}(X)$ the space of $d_{X}$-variate polynomials on $\mathcal{A}_{X}$ of degree $\leqslant l$. For further use, we also introduce the $L^{2}$-projector $\pi_{X}^{l}: L^{1}(X) \rightarrow \mathbb{P}^{l}(X)$ such that, for all $w \in L^{1}(X)$,

$$
\begin{equation*}
\left(\pi_{X}^{l} w-w, v\right)_{X}=0 \quad \forall v \in \mathbb{P}^{l}(X) \tag{3}
\end{equation*}
$$

We recall hereafter a few known results on admissible mesh sequences and refer to [18, Chapter 1] and [19] for a more comprehensive collection. By [18, Lemma 1.41], there exists an integer $N_{\partial} \geqslant(d+1)$ (possibly depending on $d$ and $\varrho$ ) such that the maximum number of faces of one mesh element is bounded,

$$
\begin{equation*}
\max _{h \in \mathcal{H}, T \in \mathcal{T}_{h}} \operatorname{card}\left(\mathcal{F}_{T}\right) \leqslant N_{\partial} . \tag{4}
\end{equation*}
$$

The following multiplicative trace inequality, valid for all $h \in \mathcal{H}$, all $T \in \mathcal{T}_{h}$, and all $v \in H^{1}(T)$, is proved in [18, Lemma 1.49]:

$$
\begin{equation*}
\|v\|_{\partial T}^{2} \leqslant C\left(\|v\|_{T}\|\nabla v\|_{T}+h_{T}^{-1}\|v\|_{T}^{2}\right), \tag{5}
\end{equation*}
$$

where $C$ only depends on $d$ and $\varrho$. We also note the following local Poincaré's inequality valid for all $T \in \mathcal{T}_{h}$ and all $v \in H^{1}(T)$ such that $(v, 1)_{T}=0$ :

$$
\begin{equation*}
\|v\|_{T} \leqslant C_{\mathrm{P}} h_{T}\|\boldsymbol{\nabla} v\|_{T} \tag{6}
\end{equation*}
$$

where $C_{\mathrm{P}}=\pi^{-1}$ when $T$ is convex, while it can be estimated in terms of $\varrho$ for nonconvex elements (cf., e.g., [20]).
The following functional analysis results lie at the heart of the $h p$-analysis carried out in Section 4 ,
Lemma 1 (Approximation). There is a real number $C>0$ (possibly depending on $d$ and $\varrho$ ) such that, for all $h \in \mathcal{H}$, all $T \in \mathcal{T}_{h}$, all integer $l \geqslant 1$, all $s \geqslant 0$, and all $v \in H^{s+1}(T)$, there exists a polynomial $\Pi_{T}^{l} v \in \mathbb{P}^{l}(T)$ satisfying, for all $0 \leqslant q \leqslant s+1$,

$$
\begin{equation*}
\left\|v-\Pi_{T}^{l} v\right\|_{q, T} \leqslant C \frac{h_{T}^{\min (l, s)-q+1}}{l^{s+1-q}}\|v\|_{s+1, T} \tag{7}
\end{equation*}
$$

Proof. See Appendix A

Lemma 2 (Discrete trace inequality). There is a real number $C>0$ (possibly depending on $d$ and $\varrho$ ) such that, for all $h \in \mathcal{H}$, all $T \in \mathcal{T}_{h}$, all integer $l \geqslant 1$, and all $v \in \mathbb{P}^{l}(T)$, it holds

$$
\begin{equation*}
\|v\|_{\partial T} \leqslant C \frac{l}{h_{T}^{1 / 2}}\|v\|_{T} . \tag{8}
\end{equation*}
$$

Proof. When all meshes in the sequence $\left(\mathcal{T}_{h}\right)_{h \in \mathcal{H}}$ are simplicial and conforming, the proof of (8) can be found in [21, Theorem 4.76] for $d=2$; for $d \geqslant 2$ the proof is analogous. The extension to admissible mesh sequences in the sense of Assumption 1 can be done following the reasoning in [18, Lemma 1.46].

## 3. Discretization

In this section, we formulate the $h p-\mathrm{HHO}$ method, state our main results, and provide some numerical examples.

### 3.1. The hp-HHO method

We present in this section an extension of the classical HHO method of [1] accounting for variable polynomial degrees. Let a vector $\underline{p}_{h}=\left(p_{F}\right)_{F \in \mathcal{F}_{h}} \in \mathbb{N}^{\mathcal{F}_{h}}$ of skeletal polynomial degrees be given. For all $T \in \mathcal{T}_{h}$, we denote by $\underline{p}_{T}=\left(p_{F}\right)_{F \in \mathcal{F}_{T}}$ the restriction of $\underline{p}_{h}$ to $\mathcal{F}_{T}$, and we introduce the following local space of DOFs:

$$
\begin{equation*}
\underline{U}_{T}^{\underline{p}_{T}}:=\mathbb{P}^{p_{T}}(T) \times\left(\underset{F \in \mathcal{F}_{T}}{X} \mathbb{P}^{p_{F}}(F)\right), \quad p_{T}:=\min _{F \in \mathcal{F}_{T}} p_{F} . \tag{9}
\end{equation*}
$$

We use the notation $\underline{v}_{T}=\left(v_{T},\left(v_{F}\right)_{F \in \mathcal{F}_{T}}\right)$ for a generic element of $\underline{U}_{T}^{\underline{p}}$. We define the local potential reconstruction operator $r_{T}^{p_{T}+1}: \underline{U}_{T}^{\underline{p}_{T}} \rightarrow \mathbb{P}^{p_{T}+1}(T)$ such that, for all $\underline{v}_{T} \in \underline{U}_{T}^{\underline{p}_{T}}$,

$$
\begin{equation*}
\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} r_{T}^{p_{T}+1} \underline{v}_{T}, \boldsymbol{\nabla} w\right)_{T}=-\left(v_{T}, \boldsymbol{\nabla} \cdot\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} w\right)\right)_{T}+\sum_{F \in \mathcal{F}_{T}}\left(v_{F}, \boldsymbol{\kappa}_{T} \boldsymbol{\nabla} w \cdot \boldsymbol{n}_{T F}\right)_{F} \quad \forall w \in \mathbb{P}^{p_{T}+1}(T) \tag{10}
\end{equation*}
$$

and

$$
\begin{equation*}
\left(r_{T}^{p_{T}+1} \underline{v}_{T}-v_{T}, 1\right)_{T}=0 \tag{11}
\end{equation*}
$$

Note that computing $r_{T}^{p_{T}+1} \underline{v}_{T}$ according to (10) requires to invert the $\kappa_{T}$-weighted stiffness matrix of $\mathbb{P}^{k+1}(T)$, which can be efficiently accomplished by a Cholesky solver.

We define on $\underline{U}_{T}^{\underline{p}_{T}} \times \underline{U}_{T}^{\underline{p}_{T}}$ the local bilinear form $\mathrm{a}_{T}$ such that

$$
\begin{equation*}
\mathrm{a}_{T}\left(\underline{u}_{T}, \underline{v}_{T}\right):=\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} r_{T}^{p_{T}+1} \underline{u}_{T}, \boldsymbol{\nabla} r_{T}^{p_{T}+1} \underline{v}_{T}\right)_{T}+\mathrm{s}_{T}\left(\underline{u}_{T}, \underline{v}_{T}\right), \quad \mathrm{s}_{T}\left(\underline{u}_{T}, \underline{v}_{T}\right):=\sum_{F \in \mathcal{F}_{T}} \frac{\kappa_{F}}{h_{T}}\left(\delta_{T F}^{\underline{p}_{T}} \underline{u}_{T}, \delta_{T F}^{\underline{p}_{T}} \underline{v}_{T}\right)_{F}, \tag{12}
\end{equation*}
$$

where, for all $F \in \mathcal{F}_{T}$, we have let $\kappa_{F}:=\boldsymbol{\kappa}_{T} \boldsymbol{n}_{T F} \cdot \boldsymbol{n}_{T F}$ and the face-based residual operator $\delta_{T F}^{\underline{p}_{T}}: \underline{U}_{T}^{\underline{p}_{T}} \rightarrow \mathbb{P}^{p_{F}}(F)$ is such that, for all $\underline{v}_{T} \in \underline{U}_{T}^{\underline{p}}$,

$$
\begin{equation*}
\delta_{T F}^{\underline{p}_{T}} \underline{v}_{T}:=\pi_{F}^{p_{F}}\left(v_{F}-r_{T}^{p_{T}+1} \underline{v}_{T}+\pi_{T}^{p_{T}} r_{T}^{p_{T}+1} \underline{v}_{T}-v_{T}\right) \tag{13}
\end{equation*}
$$

The first contribution in $\mathrm{a}_{T}$ is in charge of consistency, whereas the second ensures stability by a least-square penalty of the face-based residuals $\delta_{T F}^{\underline{p}_{T}}$. This subtle form for $\delta_{T F}^{\underline{p}_{T}}$ ensures that the residual vanishes when its argument is the interpolate of a function in $\mathbb{P}^{p_{T}+1}(T)$, and is required for high-order $h$-convergence (a detailed motivation is provided in [1, Remark 6]).

The global space of DOFs and its subspace with strongly enforced boundary conditions are defined, respectively, as

$$
\begin{equation*}
\underline{U}_{h}^{\underline{p}_{h}}:=\left(\underset{T \in \mathcal{T}_{h}}{X} \mathbb{P}^{p_{T}}(T)\right) \times\left(\underset{F \in \mathcal{F}_{h}}{X} \mathbb{P}^{p_{F}}(F)\right), \quad \underline{U}_{h, 0}^{\underline{p}_{h}}:=\left\{\underline{v}_{h} \in \underline{U}_{h}^{\underline{p}_{h}} \mid v_{F} \equiv 0 \quad \forall F \in \mathcal{F}_{h}^{\mathrm{b}}\right\} . \tag{14}
\end{equation*}
$$

Note that interface DOFs in $\underline{U}_{h}^{\underline{p}_{h}}$ are single-valued. We use the notation $\underline{v}_{h}=\left(\left(v_{T}\right)_{T \in \mathcal{T}_{h}},\left(v_{F}\right)_{F \in \mathcal{F}_{h}}\right)$ for a generic DOF vector in $\underline{U}_{h}^{\underline{p}_{h}}$ and, for all $T \in \mathcal{T}_{h}$, we denote by $\underline{v}_{T} \in \underline{U}_{T}^{\underline{p_{T}}}$ its restriction to $T$. For further use, we also introduce the global interpolator $\underline{I}_{h}^{\underline{I}_{h}}: H^{1}(\Omega) \rightarrow \underline{U}_{h}^{\underline{p}_{h}}$ such that, for all $v \in H^{1}(\Omega)$,

$$
\begin{equation*}
\underline{I}_{h}^{\underline{p}_{h}} v=\left(\left(\pi_{T}^{p_{T}} v\right)_{T \in \mathcal{T}_{h}},\left(\pi_{F}^{p_{F}} v\right)_{F \in \mathcal{F}_{h}}\right), \tag{15}
\end{equation*}
$$

and denote by $\underline{I}_{T}^{\underline{p_{T}}}$ its restriction to $T \in \mathcal{T}_{h}$.
The $h p$-HHO discretization of problem (2) consists in seeking $\underline{u}_{h} \in \underline{U}_{h, 0}^{\underline{p}_{h}}$ such that

$$
\begin{equation*}
\mathrm{a}_{h}\left(\underline{u}_{h}, \underline{v}_{h}\right)=\mathrm{l}_{h}\left(\underline{v}_{h}\right) \quad \forall \underline{v}_{h} \in \underline{U}_{h, 0}^{\underline{p}_{h}}, \tag{16}
\end{equation*}
$$

where the global bilinear form a $\mathrm{a}_{h}$ on $\underline{U}_{h}^{\underline{p}_{h}} \times \underline{U}_{h}^{\underline{p}_{h}}$ and the linear form $\mathrm{l}_{h}$ on $\underline{U}_{h}^{\underline{p}_{h}}$ are assembled element-wise setting

$$
\mathrm{a}_{h}\left(\underline{u}_{h}, \underline{v}_{h}\right):=\sum_{T \in \mathcal{T}_{h}} \mathrm{a}_{T}\left(\underline{u}_{T}, \underline{v}_{T}\right), \quad 1_{h}\left(\underline{v}_{h}\right):=\sum_{T \in \mathcal{T}_{h}}\left(f, v_{T}\right)_{T} .
$$

Remark 3 (Static condensation). Using a standard static condensation procedure, it is possible to eliminate elementbased DOFs locally and solve (16) by inverting a system in the skeletal unknowns only. For the sake of conciseness, we do not repeat the details here and refer instead to [4] Section 2.4]. Accounting for the strong enforcement of boundary conditions, the size of the system after static condensation is

$$
\begin{equation*}
N_{\mathrm{dof}}=\sum_{F \in \mathscr{F}_{h}^{\prime}}\binom{p_{F}+d-1}{p_{F}} . \tag{17}
\end{equation*}
$$

Remark 4 (Finite element interpretation). A finite element interpretation of the scheme (16) is possible following the extension proposed in [4] Remark 3] of the ideas originally developed in [22] in the context of nonconforming Virtual Element Methods. For all $F \in \mathcal{F}_{h}^{\mathrm{i}}$, we denote by $[\cdot]_{F}$ the usual jump operator (the sign is irrelevant), which we extend to boundary faces $F \in \mathcal{F}_{h}^{\mathrm{b}}$ setting $[\varphi]_{F}:=\varphi$. Let

$$
\mathfrak{L}_{h, 0}^{\underline{p}_{h}}:=\left\{\mathfrak{v}_{h} \in L^{2}(\Omega) \mid \mathfrak{v}_{h \mid T} \in \mathfrak{U}_{T}^{T} \text { for all } T \in \mathcal{T}_{h} \text { and } \pi_{F}^{p_{F}}\left(\left[\mathfrak{v}_{T}\right]_{F}\right)=0 \text { for all } F \in \mathcal{F}_{h}\right\},
$$

where, for all $T \in \mathcal{T}_{h}$, we have introduced the local space

$$
\mathfrak{U}_{T}^{\underline{p}_{T}}:=\left\{\mathfrak{v}_{T} \in H^{1}(T) \mid \boldsymbol{\nabla} \cdot\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} \mathfrak{v}_{T}\right) \in \mathbb{P}^{p_{T}}(T) \text { and } \boldsymbol{\kappa}_{T} \boldsymbol{\nabla} \mathfrak{v}_{T \mid F} \cdot \boldsymbol{n}_{T F} \in \mathbb{P}^{p_{F}}(F) \text { for all } F \in \mathcal{F}_{T}\right\} .
$$

It can be proved that, for all $T \in \mathcal{T}_{h}, \underline{I}_{T}^{\underline{p}}: \mathfrak{U}_{T}^{\underline{p}_{T}} \rightarrow \underline{U}_{T}^{\underline{p}}$ is an isomorphism. Thus, the triplet $\left(T, \mathfrak{U}_{T}^{p_{T}}, \underline{I}_{T}^{\underline{p}_{T}}\right)$ defines a finite element in the sense of Ciarlet [23]. Additionally, problem (16] can be reformulated as the nonconforming finite element method: Find $\mathfrak{u}_{h} \in \mathfrak{U}_{h, 0}^{\underline{p}_{h}}$ such that

$$
\mathfrak{a}_{h}\left(\mathfrak{u}_{h}, \mathfrak{v}_{h}\right)=\mathfrak{l}_{h}\left(\mathfrak{v}_{h}\right) \quad \forall \mathfrak{v}_{h} \in \mathfrak{U}_{h, 0}^{p_{n}},
$$

where $\mathfrak{a}_{h}\left(\mathfrak{u}_{h}, \mathfrak{v}_{h}\right):=\mathrm{a}_{h}\left(\underline{I}_{h}^{p_{h}} \mathfrak{u}_{h}, \underline{I}_{h}^{p_{h}} \mathfrak{v}_{h}\right), \mathrm{l}_{h}\left(\mathfrak{v}_{h}\right):=1_{h}\left(I_{h}^{p_{h}} \mathfrak{v}_{h}\right)$, and it can be proved that $\mathfrak{u}_{h}$ is the unique element of $\mathfrak{U}_{h, 0}^{p_{n}}$ such that $\underline{u}_{h}=\underline{I}_{h}^{p_{h}} \mathfrak{u}_{h}$ with $\underline{u}_{h}$ unique solution to (16).

### 3.2. Main results

We next state our main results. The proofs are postponed to Section 4 For all $T \in \mathcal{T}_{h}$, we denote by $\|\cdot\|_{\mathrm{a}, T}$ and $|\cdot|_{\mathrm{s}, T}$ the seminorms defined on $\underline{U}_{T}^{\underline{p_{T}}}$ by the bilinear forms $\mathrm{a}_{T}$ and $\mathrm{s}_{T}$, respectively, and by $\|\cdot\|_{\mathrm{a}, h}$ the seminorm defined by the bilinear form a $\mathrm{a}_{h}$ on $\underline{U}_{h}^{\underline{p}_{h}}$. We also introduce the penalty seminorm $|\cdot|_{s, h}$ such that, for all $\underline{v}_{h} \in \underline{U}_{h}^{\underline{p}_{h}}$, $\left|\underline{v}_{h}\right|_{\mathrm{s}, h}^{2}:=\sum_{T \in \mathcal{T}_{h}}\left|\underline{v}_{T}\right|_{\mathrm{s}, T}^{2}$. Note that $\|\cdot\|_{\mathrm{a}, h}$ is a norm on the subspace $\underline{U}_{h, 0}^{\underline{p}_{h}}$ with strongly enforced boundary conditions
(the arguments are essentially analogous to that of [2, Proposition 5]). We will also need the global reconstruction operator $r_{h}^{\underline{p}_{h}}: \underline{U}_{h}^{\underline{p}_{h}} \rightarrow L^{2}(\Omega)$ such that, for all $\underline{v}_{h} \in \underline{U}_{h}^{\underline{p}_{h}}$,

$$
\left(r_{h}^{p_{h}} \underline{v}_{h}\right)_{\mid T}=r_{T}^{p_{T}+1} \underline{v}_{T} \quad \forall T \in \mathcal{T}_{h} .
$$

Finally, for the sake of conciseness, throughout the rest of the paper we note $a \lesssim b$ the inequality $a \leqslant C b$ with real number $C>0$ independent of $h, \underline{p}_{h}$, and $\boldsymbol{\kappa}$.

Our first estimate concerns the error measured in energy-like norms.
Theorem 5 (Energy error estimate). Let $u \in U$ and $\underline{u}_{h} \in \underline{U}_{h, 0}^{\underline{p}_{h}}$ denote the unique solutions of problems (2) and (16), respectively, and set

$$
\begin{equation*}
\underline{\underline{u}}_{h}:=\underline{I}_{h}^{\frac{p^{h}}{}} u . \tag{18}
\end{equation*}
$$

Assuming that $u_{\mid T} \in H^{p_{T}+2}(T)$ for all $T \in \mathcal{T}_{h}$, it holds

$$
\begin{equation*}
\left\|\underline{u}_{h}-\underline{\hat{u}}_{h}\right\|_{\mathrm{a}, h} \lesssim\left(\sum_{T \in \mathcal{T}_{h}} \bar{\kappa}_{T} \lambda_{\kappa, T} \frac{h_{T}^{2\left(p_{T}+1\right)}}{\left(p_{T}+1\right)^{2 p_{T}}}\|u\|_{p_{T}+2, T}^{2}\right)^{1 / 2} \tag{19}
\end{equation*}
$$

Consequently, we have, denoting by $\boldsymbol{\nabla}_{h}$ the broken gradient on $\mathcal{T}_{h}$ (whose restriction to every element $T \in \mathcal{T}_{h}$ coincides with the usual gradient),

$$
\begin{equation*}
\left\|\boldsymbol{\kappa}^{1 / 2} \boldsymbol{\nabla}_{h}\left(u-r_{h}^{\underline{p}_{h}} \underline{u}_{h}\right)\right\|^{2}+\left|\underline{u}_{h}\right|_{\mathrm{s}, h}^{2} \lesssim \sum_{T \in \mathcal{T}_{h}} \bar{\kappa}_{T} \lambda_{\kappa, T} \frac{h_{T}^{2\left(p_{T}+1\right)}}{\left(p_{T}+1\right)^{2 p_{T}}}\|u\|_{p_{T}+2, T}^{2} . \tag{20}
\end{equation*}
$$

Proof. See Section 4.3
In (19p and (20), we observe the characteristic improved $h$-convergence of HHO methods (cf. [1]), whereas, in terms of $p$-convergence, we have a more standard scaling as $\left(p_{T}+1\right)^{-p_{T}}$ (i.e., half a power more than discontinuous Galerkin methods based on polynomials of degree $p_{T}$, cf., e.g., [10]). In (20), we observe that the left-hand side has the same convergence rate (both in $h$ and in $p$ ) as the interpolation error

$$
\left\|\boldsymbol{\kappa}^{1 / 2} \boldsymbol{\nabla}_{h}\left(u-r_{h}^{p_{h}} \underline{\hat{u}}_{h}\right)\right\|^{2}+\left|\underline{\hat{u}}_{h}\right|_{\mathrm{s}, h}^{2},
$$

as can be verified combining (25) and (27) below. Note that, in this case, the $p$-convergence is limited by the second term, which measures the discontinuity of the potential reconstruction at interfaces. An inspection of formulas (19) and $(20)$ also shows that the method is fully robust with respect to the heterogeneity of the diffusion coefficient, while only a moderate dependence (with a power of $1 / 2$ ) is observed with respect to its local anisotropy ratio.

For the sake of completeness, we also provide an estimate of the $L^{2}$-error between the piecewise polynomial fields $u_{h}$ and $\hat{u}_{h}$ such that

$$
u_{h \mid T}:=u_{T} \quad \text { and } \quad \widehat{u}_{h \mid T}:=\widehat{u}_{T}=\pi_{T}^{p_{T}} u \quad \forall T \in \mathcal{T}_{h}
$$

To this end, we need elliptic regularity in the following form: For all $g \in L^{2}(\Omega)$, the unique element $z \in U$ such that

$$
\begin{equation*}
(\boldsymbol{\kappa} \boldsymbol{\nabla} z, \boldsymbol{\nabla} v)=(g, v) \quad \forall v \in U \tag{21}
\end{equation*}
$$

satisfies the a priori estimate

$$
\begin{equation*}
\|z\|_{2} \lesssim \underline{K}^{-1}\|g\|_{L^{2}(\Omega)}, \quad \underline{K}:=\min _{T \in \mathcal{T}_{h}} \underline{K}_{T} . \tag{22}
\end{equation*}
$$

The following result is proved in Section 4.4.
Theorem 6 ( $L^{2}$-error estimate). Under the assumptions of Theorem 5. and further assuming elliptic regularity 22) and that $f \in H^{p_{T}+\Delta_{T}}(T)$ for all $T \in \mathcal{T}_{h}$ with $\Delta_{T}=1$ if $p_{T}=0$ while $\Delta_{T}=0$ otherwise,

$$
\begin{equation*}
\underline{\kappa}\left\|u_{h}-\widehat{u}_{h}\right\| \lesssim \bar{\kappa}^{1 / 2} \lambda_{\kappa} h\left(\sum_{T \in \mathcal{T}_{h}} \lambda_{\kappa, T} \bar{\kappa}_{T} \frac{h_{T}^{2\left(p_{T}+1\right)}}{\left(p_{T}+1\right)^{2 p_{T}}}\|u\|_{p_{T}+2, T}^{2}\right)^{1 / 2}+\left(\sum_{T \in \mathcal{T}_{h}} \frac{h_{T}^{2\left(p_{T}+2\right)}}{\left(p_{T}+\Delta_{T}\right)^{2\left(p_{T}+2\right)}}\|f\|_{p_{T}+\Delta_{T}}^{2}\right)^{1 / 2} . \tag{23}
\end{equation*}
$$

with $\lambda_{\kappa}:=\max _{T \in \mathcal{T}_{h}} \lambda_{\kappa, T}, \bar{\kappa}:=\max _{T \in \mathcal{T}_{h}} \bar{\kappa}_{T}$.

Figure 1: Meshes considered in the $p$-convergence test of Section 3.3. The triangular, Cartesian, refined, and staggered meshes originate from the FVCA5 benchmark [25]; the hexagonal mesh was originally introduced in [26]; the Voronoi mesh was obtained using the PolyMesher algorithm of [27].

### 3.3. Numerical examples

We close this section with some numerical examples. The $h$-convergence properties of the method 16 have been numerically investigated in [1] Section 4]. To illustrate its $p$-convergence properties, we solve on the unit square domain $\Omega=(0,1)^{2}$ the homogeneous Dirichlet problem with exact solution $u=\sin \left(\pi x_{1}\right) \sin \left(\pi x_{2}\right)$ and right-hand side $f$ chosen accordingly. We consider two values for the diffusion coefficients:

$$
\boldsymbol{\kappa}_{1}=\boldsymbol{I}_{2}, \quad \boldsymbol{\kappa}_{2}=\left(\begin{array}{cc}
\left(x_{2}-\bar{x}_{2}\right)^{2}+\epsilon\left(x_{1}-\bar{x}_{1}\right)^{2} & -(1-\epsilon)\left(x_{1}-\bar{x}_{1}\right)\left(x_{2}-\bar{x}_{2}\right) \\
-(1-\epsilon)\left(x_{1}-\bar{x}_{1}\right)\left(x_{2}-\bar{x}_{2}\right) & \left(x_{1}-\bar{x}_{1}\right)^{2}+\epsilon\left(x_{2}-\bar{x}_{2}\right)^{2}
\end{array}\right)
$$

where $\boldsymbol{I}_{2}$ denotes the identity matrix of dimension $2, \overline{\boldsymbol{x}}:=-(0.1,0.1)$, and $\epsilon=1 \cdot 10^{-2}$. The choice $\boldsymbol{\kappa}=\boldsymbol{\kappa}_{1}$ ("regular" test case) yields a homogeneous isotropic problem, while the choice $\boldsymbol{\kappa}=\boldsymbol{\kappa}_{2}$ ("Le Potier's" test case [24]) corresponds to a highly anisotropic problem where the principal axes of the diffusion tensor vary at each point of the domain. Figures $2-3$ depict the energy- and $L^{2}$-errors as a function of the number of skeletal DOFs $N_{\text {dof }}$ (cf. (17)) when $p_{F}=p$ for all $F \in \mathcal{F}_{h}$ and $p \in\{0, \ldots, 9\}$ for the proposed choices for $\kappa$ on the meshes of Figure 1 . In all the cases, the expected exponentially convergent behaviour is observed. Interestingly, the best performance in terms of error vs. $N_{\text {dof }}$ is obtained for the Cartesian and Voronoi meshes. A comparison of the results for the two values of the diffusion coefficients allows to appreciate the robustness of the method with respect to anisotropy.

## 4. Convergence analysis

In this section we prove the results stated in Section 3.2

### 4.1. Consistency of the potential reconstruction

Preliminary to the convergence analysis is the study of the approximation properties of the potential reconstruction $r_{T}^{p_{T}+1}$ defined by (10) when its argument is the interpolate of a regular function. Let a mesh element $T \in \mathcal{T}_{h}$ be

Figure 2: Convergence with $p$-refinement (regular test case)

Figure 3: Convergence with p-refinement (Le Potier's test case)
fixed. For any integer $l \geqslant 1$, we define the elliptic projector $\varpi_{\kappa, T}^{l}: H^{1}(T) \rightarrow \mathbb{P}^{l}(T)$ such that, for all $v \in H^{1}(T)$, $\left(\varpi_{\kappa, T}^{l} v-v, 1\right)_{T}=0$ and it holds

$$
\begin{equation*}
\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla}\left(\varpi_{\kappa, T}^{l} v-v\right), \boldsymbol{\nabla} w\right)_{T}=0 \quad \forall w \in \mathbb{P}^{l}(T) \tag{24}
\end{equation*}
$$

Proposition 7 (Characterization of $\left(r_{T}^{p_{T}+1} \circ \underline{\underline{I}}_{T}^{\underline{p}}\right)$ ). It holds, for all $T \in \mathcal{T}_{h}$,

$$
r_{T}^{p_{T}+1} \circ \underline{I}_{T}^{\underline{p}_{T}}=\varpi_{\kappa, T}^{p_{T}+1}
$$

Proof. For a generic $v \in H^{1}(T)$, letting $\underline{v}_{T}=\underline{I}_{T}^{\underline{p_{T}}} v$ in we infer, for all $w \in \mathbb{P}^{p_{T}+1}(T)$,

$$
\begin{aligned}
\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla}\left(r_{T}^{p_{T}+1} \circ \underline{I}_{T}^{\underline{p}}\right) v, \boldsymbol{\nabla} w\right)_{T} & =-\left(\pi_{T}^{p_{T}} v, \boldsymbol{\nabla} \cdot\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} w\right)\right)_{T}+\sum_{F \in \mathcal{F}_{T}}\left(\pi_{F}^{p_{F}} v, \boldsymbol{\kappa}_{T} \boldsymbol{\nabla} w \cdot \boldsymbol{n}_{T F}\right)_{F} \\
& =-\left(v, \boldsymbol{\nabla} \cdot\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} w\right)\right)_{T}+\sum_{F \in \mathcal{F}_{T}}\left(v, \boldsymbol{\kappa}_{T} \boldsymbol{\nabla} w \cdot \boldsymbol{n}_{T F}\right)_{F}=\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} v, \boldsymbol{\nabla} w\right)_{T},
\end{aligned}
$$

where we have used the fact that $\boldsymbol{\nabla} \cdot\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} w\right) \in \mathbb{P}^{p_{T}-1}(T) \subset \mathbb{P}^{p_{T}}(T)$ and $\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} w\right)_{\mid F} \cdot \boldsymbol{n}_{T F} \in \mathbb{P}^{p_{T}}(F) \subset \mathbb{P}^{p_{F}}(F)$ (cf. the definition (9) of $p_{T}$ ) to pass to the second line, and an integration by parts to conclude.

We next study the approximation properties of $\varpi_{\kappa, T}^{l}$, from which those of $\left(r_{T}^{p_{T}+1} \circ \underline{I}_{T}^{\underline{p}}\right.$ ) follow in the light of Proposition 7

Lemma 8 (Approximation properties of $\varpi_{\kappa, T}^{l}$ ). For all integer $l \geqslant 1$, all mesh element $T \in \mathcal{T}_{h}$, all $0 \leqslant s \leqslant l$, and all $v \in H^{s+1}(T)$, it holds

$$
\begin{equation*}
\left\|\boldsymbol{\kappa}_{T}^{1 / 2} \boldsymbol{\nabla}\left(v-\varpi_{\kappa, T}^{l} v\right)\right\|_{T}+\frac{h_{T}^{1 / 2}}{l}\left\|\boldsymbol{\kappa}_{T}^{1 / 2} \boldsymbol{\nabla}\left(v-\varpi_{\kappa, T}^{l} v\right)\right\|_{\partial T}+\frac{\kappa_{T}^{1 / 2}}{h_{T}}\left\|v-\varpi_{\kappa, T}^{l} v\right\|_{T}+\frac{\kappa_{T}^{1 / 2}}{h_{T}^{1 / 2}}\left\|v-\varpi_{\kappa, T}^{l} v\right\|_{\partial T} \lesssim \bar{\kappa}_{T}^{1 / 2} \frac{h_{T}^{\min (l, s)}}{l^{s}}\|v\|_{s+1, T} \tag{25}
\end{equation*}
$$

Proof. By definition (24) of $\varpi_{\kappa, T}^{l}$, it holds,

$$
\begin{equation*}
\left\|\boldsymbol{\kappa}_{T}^{1 / 2} \boldsymbol{\nabla}\left(v-\varpi_{\kappa, T}^{l} v\right)\right\|_{T}=\min _{w \in \mathbb{P}^{l}(T)}\left\|\boldsymbol{\kappa}_{T}^{1 / 2} \boldsymbol{\nabla}(v-w)\right\|_{T} \leqslant \bar{\kappa}_{T}^{1 / 2}\left\|\boldsymbol{\nabla}\left(v-\Pi_{T}^{l} v\right)\right\|_{T}, \tag{26}
\end{equation*}
$$

hence, using (7) with $q=1$, it is readily inferred

$$
\left\|\boldsymbol{\kappa}_{T}^{1 / 2} \boldsymbol{\nabla}\left(v-\varpi_{\kappa, T}^{l} v\right)\right\|_{T} \lesssim \bar{\kappa}_{T}^{1 / 2} \frac{h_{T}^{\min (l, s)}}{l^{s}}\|v\|_{s+1, T}
$$

To prove the second bound in 25, use the triangle inequality to infer

$$
\left\|\boldsymbol{\kappa}_{T}^{1 / 2} \boldsymbol{\nabla}\left(v-\varpi_{\kappa, T}^{l} v\right)\right\|_{\partial T} \leqslant\left\|\boldsymbol{\kappa}_{T}^{1 / 2} \boldsymbol{\nabla}\left(v-\Pi_{T}^{l} v\right)\right\|_{\partial T}+\left\|\boldsymbol{\kappa}_{T}^{1 / 2} \boldsymbol{\nabla}\left(\Pi_{T}^{l} v-\varpi_{\kappa} l, T\right)\right\|_{\partial T}:=\mathfrak{T}_{1}+\mathfrak{T}_{2}
$$

For the first term, the multiplicative trace inequality (5) combined with (7) (with $q=1,2$ ) gives

$$
\mathfrak{T}_{1} \lesssim \bar{\kappa}_{T}^{1 / 2} \frac{h_{T}^{\min (l, s)-1 / 2}}{l^{s-1 / 2}}\|v\|_{s+1, T}
$$

For the second term, we have,

$$
\begin{aligned}
\mathfrak{T}_{2} & \lesssim \frac{l}{h_{T}^{1 / 2}}\left\|\boldsymbol{\kappa}_{T}^{1 / 2} \boldsymbol{\nabla}\left(\Pi_{T}^{l} v-\varpi_{\kappa, T}^{l} v\right)\right\|_{T} \\
& \leqslant \frac{l}{h_{T}^{1 / 2}}\left(\left\|\boldsymbol{\kappa}^{1 / 2} \boldsymbol{\nabla}\left(\Pi_{T}^{l} v-v\right)\right\|_{T}+\left\|\boldsymbol{\kappa}_{T}^{1 / 2} \boldsymbol{\nabla}\left(v-\varpi_{\kappa, T}^{l} v\right)\right\|_{T}\right) \\
& \lesssim \bar{\kappa}_{T}^{-1 / 2} \frac{l}{h_{T}^{1 / 2}}\left\|\boldsymbol{\nabla}\left(\Pi_{T}^{l} v-v\right)\right\|_{T} \lesssim \bar{\kappa}_{T}^{1 / 2} \frac{h_{T}^{\min (l, s)-1 / 2}}{l^{s-1}}\|v\|_{s+1, T},
\end{aligned}
$$

where we have used the discrete trace inequality $(8)$ in the first line, the triangle inequality in the second line, the estimate 26 in the third, and the approximation result (7) with $q=1$ to conclude. To obtain the third bound in (25), after recalling that $\left(v-\varpi_{\kappa, T}^{l} v, 1\right)_{T}=0$, we apply the local Poincare's inequality (6) to infer

$$
\left\|v-\varpi_{\kappa, T}^{l} v\right\|_{T} \lesssim \frac{h_{T}}{\underline{\kappa}_{T}^{1 / 2}}\left\|\boldsymbol{\kappa}^{1 / 2} \boldsymbol{\nabla}\left(v-\varpi_{\kappa, T}^{l} v\right)\right\|_{T} \lesssim \frac{\bar{\kappa}_{T}^{1 / 2}}{\underline{\kappa}_{T}^{1 / 2}} \frac{h_{T}^{\min (l, s)+1}}{l^{s}}\|v\|_{s+1, T}
$$

where the conclusion follows from the first bound in (25). Finally, to obtain the last bound, we use the multiplicative trace inequality (5) to infer

$$
\left\|v-\varpi_{\kappa, T}^{l} v\right\|_{\partial T}^{2} \lesssim \underline{\kappa}_{T}^{-1 / 2}\left\|v-\varpi_{\kappa, T}^{l} v\right\|_{T}\left\|\boldsymbol{\kappa}^{1 / 2} \boldsymbol{\nabla}\left(v-\varpi_{\kappa, T}^{l} v\right)\right\|_{T}+h_{T}^{-1}\left\|v-\varpi_{\kappa, T}^{l} v\right\|_{T}^{2},
$$

and use the first and third bound in (25) to estimate the various terms.

### 4.2. Consistency of the stabilization term

The consistency properties of the stabilization bilinear form $s_{T}$ defined by (12) are summarized in the following Lemma.

Lemma 9 (Consistency of the stabilization term). For all $T \in \mathcal{T}_{h}$, all $0 \leqslant q \leqslant p_{T}$, and all $v \in H^{q+2}(T)$, it holds

$$
\begin{equation*}
\left|\underline{I}_{T}^{\underline{p}_{T}} v\right|_{\mathrm{s}, T} \lesssim \bar{\kappa}_{T}^{1 / 2} \lambda_{\kappa, T}^{1 / 2} \frac{h_{T}^{\min \left(p_{T}, q\right)+1}}{\left(p_{T}+1\right)^{q}}\|v\|_{q+2, T} \tag{27}
\end{equation*}
$$

Proof. Let $T \in \mathcal{T}_{h}$ and $v \in H^{q+2}(T)$ and set, for the sake of brevity, $\breve{v}_{T}:=\left(r_{T}^{p_{T}+1} \circ \underline{I}_{T}^{p_{T}}\right) v=\varpi_{\kappa, T}^{p_{T}+1} v$ (cf. Proposition 7 . For all $F \in \mathcal{F}_{T}$, recalling the definitions of the face residual $\delta_{T F}^{p_{T}}$ (cf. (13)) and of the local interpolator $\underline{I}_{T}^{\underline{p}}$ (cf. (15)), together with the fact that $p_{T} \leqslant p_{F}$ by definition (9), we get

$$
\delta_{T F}^{\underline{p}_{T}} \underline{I}_{T}^{\underline{p_{T}}} v=\pi_{F}^{p_{F}}\left(\breve{v}_{T}-v\right)-\pi_{T}^{p_{T}}\left(\check{v}_{T}-v\right)
$$

Using the triangle inequality and the $L^{2}(F)$-stability of $\pi_{F}^{p_{F}}$, we infer,

$$
\begin{equation*}
\left\|\delta_{T F}^{\underline{p}_{T}} \underline{I}_{T}^{\underline{p}} v\right\|_{F} \leqslant\left\|\check{v}_{T}-v\right\|_{F}+\left\|\pi_{T}^{p_{T}}\left(\check{v}_{T}-v\right)\right\|_{F}:=\mathfrak{T}_{1}+\mathfrak{T}_{2} . \tag{28}
\end{equation*}
$$

For the first term, the approximation properties 25 of $\varpi_{\kappa, T}^{p_{T}+1}$ (with $l=p_{T}+1$ and $s=q+1$ ) readily yield

$$
\begin{equation*}
\mathfrak{T}_{1} \lesssim \lambda_{\kappa, T}^{1 / 2} \frac{h_{T}^{\min \left(p_{T}, q\right)+3 / 2}}{\left(p_{T}+1\right)^{q}}\|v\|_{q+2, T} . \tag{29}
\end{equation*}
$$

For the second term, on the other hand, the discrete trace inequality (8) followed by the $L^{2}(T)$-stability of $\pi_{T}^{p_{T}}$ and (25) (with $l=p_{T}+1$ and $s=q+1$ ) gives

$$
\begin{equation*}
\mathfrak{T}_{2} \lesssim \frac{\left(p_{T}+1\right)}{h_{T}^{1 / 2}}\left\|\pi_{T}^{p_{T}}\left(\breve{v}_{T}-v\right)\right\|_{T} \leqslant \frac{\left(p_{T}+1\right)}{h_{T}^{1 / 2}}\left\|\breve{v}_{T}-v\right\|_{T} \lesssim \lambda_{\kappa, T}^{1 / 2} \frac{h_{T}^{\min \left(p_{T}, q\right)+3 / 2}}{\left(p_{T}+1\right)^{q}}\|v\|_{q+2, T} \tag{30}
\end{equation*}
$$

The bound 27) follows using (29)-30) in the right-hand side of 28), squaring the resulting inequality, multiplying it by $\kappa_{F} / h_{T}$, summing over $F \in \mathcal{F}_{T}$, and using the bound (4) on $\operatorname{card}\left(\mathcal{F}_{T}\right)$.

### 4.3. Energy error estimate

Proof of Theorem 5. We start by noting the following abstract error estimate:

$$
\begin{equation*}
\left\|\underline{u}_{h}-\hat{\underline{u}}_{h}\right\|_{\mathrm{a}, h} \leqslant \sup _{\underline{v}_{h} \in \underline{U}_{h, 0}^{\underline{p}_{h}, \|}\left\|_{\underline{v}_{h}}\right\|_{\mathrm{a}, h}=1} \mathrm{E}_{h}\left(\underline{v}_{h}\right), \tag{31}
\end{equation*}
$$

with consistency error

$$
\begin{equation*}
\mathrm{E}_{h}\left(\underline{v}_{h}\right):=\mathrm{l}_{h}\left(\underline{v}_{h}\right)-\mathrm{a}_{h}\left(\underline{\hat{u}}_{h}, \underline{v}_{h}\right) \tag{32}
\end{equation*}
$$

To prove (31), it suffices to observe that

$$
\begin{aligned}
\left\|\underline{u}_{h}-\hat{\underline{u}}_{h}\right\|_{\mathrm{a}, h}^{2} & =\mathrm{a}_{h}\left(\underline{u}_{h}-\hat{\hat{u}}_{h}, \underline{u}_{h}-\underline{\hat{u}}_{h}\right) \\
& =\mathrm{a}_{h}\left(\underline{u}_{h}, \underline{u}_{h}-\hat{\hat{u}}_{h}\right)-\mathrm{a}_{h}\left(\hat{\hat{u}}_{h}, \underline{u}_{h}-\hat{\hat{u}}_{h}\right) \\
& =\mathrm{l}_{h}\left(\underline{u}_{h}-\underline{\hat{u}}_{h}\right)-\mathrm{a}_{h}\left(\underline{\hat{u}}_{h}, \underline{u}_{h}-\underline{\hat{u}}_{h}\right)
\end{aligned}
$$

where we have used the definition of the $\|\cdot\|_{\mathrm{a}, h}$-norm in the first line, the linearity of $\mathrm{a}_{h}$ in its first argument in the second line, and the discrete problem (16) in the third. The conclusion follows dividing both sides by $\left\|\underline{u}_{h}-\underline{\underline{u}}_{h}\right\|_{\mathrm{a}, h}$, using linearity, and passing to the supremum.

We next bound the consistency error $\mathrm{E}_{h}\left(\underline{v}_{h}\right)$ for a generic vector of DOFs $\underline{v}_{h} \in \underline{U}_{h, 0}^{\underline{p}_{h}}$. A preliminary step consists in finding a more appropriate rewriting for $\mathrm{E}_{h}\left(\underline{v}_{h}\right)$. Observing that $f=-\boldsymbol{\nabla} \cdot(\boldsymbol{\kappa} \boldsymbol{\nabla} u)$ a.e. in $\Omega$, integrating by parts element-by-element, and using the continuity of the normal component of $\boldsymbol{\kappa} \boldsymbol{\nabla} u$ across interfaces together with the strongly enforced boundary conditions in $\underline{U}_{h, 0}^{p_{h}}$ to insert $v_{F}$ into the second term in parentheses, we infer

$$
\begin{equation*}
\mathrm{l}_{h}\left(\underline{v}_{h}\right)=\sum_{T \in \mathcal{T}_{h}}\left(\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} u, \boldsymbol{\nabla} v_{T}\right)_{T}+\sum_{F \in \mathcal{F}_{T}}\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} u \cdot \boldsymbol{n}_{T F}, v_{F}-v_{T}\right)_{F}\right) \tag{33}
\end{equation*}
$$

Setting, for the sake of conciseness (cf. Proposition 7),

$$
\begin{equation*}
\check{u}_{T}:=r_{T}^{p_{T}+1} \underline{\hat{u}}_{T}=\varpi_{\kappa, T}^{p_{T}+1} u \tag{34}
\end{equation*}
$$

and using the definition (10) of $r_{T}^{p_{T}+1} \underline{v}_{T}$ with $w=\check{u}_{T}$, we have

$$
\begin{equation*}
\mathrm{a}_{h}\left(\underline{\hat{u}}_{h}, \underline{v}_{h}\right)=\sum_{T \in \mathcal{T}_{h}}\left(\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} \check{u}_{T}, \boldsymbol{\nabla} v_{T}\right)_{T}+\sum_{F \in \mathcal{F}_{T}}\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} \check{u}_{T} \cdot \boldsymbol{n}_{T F}, v_{F}-v_{T}\right)_{F}+\mathrm{s}_{T}\left(\underline{\hat{u}}_{T}, \underline{v}_{T}\right)\right) . \tag{35}
\end{equation*}
$$

Subtracting (35) from (33), and observing that the first terms inside the summations cancel out owing to (24), we have

$$
\begin{equation*}
\mathrm{E}_{h}\left(\underline{v}_{h}\right)=\sum_{T \in \mathcal{T}_{h}}\left(\sum_{F \in \mathcal{F}_{T}}\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla}\left(\breve{u}_{T}-u\right) \cdot \boldsymbol{n}_{T F}, v_{F}-v_{T}\right)_{F}+\mathrm{s}_{T}\left(\underline{\hat{u}}_{T}, \underline{v}_{T}\right)\right) \tag{36}
\end{equation*}
$$

Denote by $\mathfrak{T}_{1}(T)$ and $\mathfrak{T}_{2}(T)$ the two summands in parentheses. Using the Cauchy-Schwarz inequality followed by the approximation properties (25) of $\breve{u}_{T}$ (with $l=s=p_{T}+1$ ) and (39) below, we have for the first term

$$
\begin{equation*}
\left|\mathfrak{T}_{1}(T)\right| \leqslant h_{T}^{1 / 2}\left\|\boldsymbol{\kappa}_{T}^{1 / 2} \boldsymbol{\nabla}\left(\breve{u}_{T}-u\right)\right\|_{\partial T} \times\left(\sum_{F \in \mathcal{F}_{T}} \frac{\kappa_{F}}{h_{T}}\left\|v_{F}-v_{T}\right\|_{F}^{2}\right)^{1 / 2} \lesssim \bar{\kappa}_{T}^{1 / 2} \lambda_{\kappa, T}^{1 / 2} \frac{h_{T}^{p_{T}+1}}{\left(p_{T}+1\right)^{p_{T}}}\|u\|_{p_{T}+2, T}\left\|_{v_{T}}\right\|_{\mathrm{a}, T} \tag{37}
\end{equation*}
$$

For the second term, the Cauchy-Schwarz inequality followed by 27 (with $q=p_{T}$ ) readily yields

$$
\begin{equation*}
\left|\mathfrak{T}_{2}(T)\right| \lesssim \bar{\kappa}_{T}^{1 / 2} \lambda_{\kappa, T}^{1 / 2} \frac{h_{T}^{p_{T}+1}}{\left(p_{T}+1\right)^{p_{T}}}\|u\|_{p_{T}+2, T}\left|\underline{v}_{T}\right|_{\mathrm{s}, T} \lesssim \bar{\kappa}_{T}^{1 / 2} \lambda_{\kappa, T}^{1 / 2} \frac{h_{T}^{p_{T}+1}}{\left(p_{T}+1\right)^{p_{T}}}\|u\|_{p_{T}+2, T}\left\|_{\underline{v}_{T}}\right\|_{\mathrm{a}, T} \tag{38}
\end{equation*}
$$

Using (37)-38) to estimate the right-hand side of (36), applying the Cauchy-Schwarz inequality, and passing to the supremum yields (19). To prove (20), it suffices to observe that, inserting $\underline{\underline{u}}_{h}$ and using the triangle inequality,

$$
\left\|\boldsymbol{\kappa}^{1 / 2} \nabla_{h}\left(u-r_{h}^{p_{h}} \underline{u}_{h}\right)\right\|^{2}+\left|\underline{u}_{h}\right|_{\mathrm{s}, h}^{2} \lesssim\left\|\boldsymbol{\kappa}^{1 / 2} \nabla_{h}\left(u-r_{h}^{p_{h}} \widehat{\underline{u}}_{h}\right)\right\|^{2}+\left|\underline{\underline{u}}_{h}\right|_{\mathrm{s}, h}^{2}+\left\|\underline{u}_{h}-\underline{\underline{u}}_{h}\right\|_{\mathrm{a}, h}^{2},
$$

and (20) follows using the estimates (25, 27, and (19) to bound the terms in the right-hand side.

Proposition 10 (Estimate of boundary difference seminorm). It holds, for all $\underline{v}_{T} \in \underline{U}_{T}^{\underline{p}}$,

$$
\begin{equation*}
\sum_{F \in \mathcal{F}_{T}} \frac{\kappa_{F}}{h_{T}}\left\|v_{F}-v_{T}\right\|_{F}^{2} \lesssim \lambda_{\kappa, T}\left\|\underline{v}_{T}\right\|_{\mathrm{a}, T}^{2} \tag{39}
\end{equation*}
$$

Proof. Let $T \in \mathcal{T}_{h}, \underline{v}_{T} \in \underline{U}_{T}^{\underline{p_{T}}}$, and set, for the sake of brevity $\breve{v}_{T}:=r_{T}^{p_{T}+1} \underline{v}_{T}$. We have, for all $F \in \mathcal{F}_{T}$,

$$
\begin{align*}
\left\|v_{F}-v_{T}\right\|_{F} & =\left\|\pi_{F}^{p_{F}}\left(v_{F}-v_{T}\right)\right\|_{F} \\
& =\| \pi_{F}^{p_{F}}\left(v_{F}-\check{v}_{T}+\pi_{T}^{p_{T} \breve{v}_{T}}-v_{T}+\check{v}_{T}-\pi_{T}^{\left.p_{T} \breve{v}_{T}\right) \|_{F}}\right.  \tag{40}\\
& \leqslant\left\|\delta_{T F}^{p_{T}} \underline{v}_{T}\right\|_{F}+\| \check{v}_{T}-\pi_{T}^{p_{T} \breve{v}_{T} \|_{F}},
\end{align*}
$$

where we have used the fact that $p_{T} \leqslant p_{F}$ (cf. (9)) to infer that $v_{T \mid F} \in \mathbb{P}^{p_{F}}(F)$ and thus insert $\pi_{F}^{p_{F}}$ in the first line, added and subtracted $\left(\breve{v}_{T}-\pi_{T}^{p_{T}} \breve{v}_{T}\right)$ in the second line, used the triangle inequality together with the definition (13) of the face-based residual $\delta_{T F}^{p_{T}}$ and the $L^{2}(F)$-stability of $\pi_{F}^{p_{F}}$ in the third. To conclude, we observe that, if $p_{T}=0$, the discrete trace inequality (8) followed by Poincaré's inequality yield $\left\|\breve{v}_{T}-\pi_{T}^{0} \breve{v}_{T}\right\|_{F} \lesssim h_{T}^{1 / 2} \underline{K}_{T}^{-1 / 2}\left\|\boldsymbol{\kappa} \nabla^{\breve{v}_{T}}\right\|_{T}$ while, if $p_{T} \geqslant 1$,

$$
\begin{aligned}
\| \check{v}_{T}-\pi_{T}^{p_{T} \breve{v}_{T} \|_{F}} & =\left\|\check{v}_{T}-\pi_{T}^{0} \breve{v}_{T}-\pi_{T}^{p_{T}}\left(\breve{v}_{T}-\pi_{T}^{0} \breve{v}_{T}\right)\right\|_{F} \\
& \lesssim \frac{p_{T}+1}{h_{T}^{1 / 2}}\left\|\check{v}_{T}-\pi_{T}^{0} \breve{v}_{T}-\pi_{T}^{p_{T}}\left(\breve{v}_{T}-\pi_{T}^{0} \breve{v}_{T}\right)\right\|_{T} \\
& \lesssim \frac{p_{T}+1}{h_{T}^{1 / 2}} \frac{h_{T}}{p_{T}}\left\|\check{v}_{T}-\pi_{T}^{0} \check{v}_{T}\right\|_{1, T} \lesssim h_{T}^{1 / 2} \underline{K}_{T}^{-1 / 2}\left\|\kappa_{T}^{1 / 2} \nabla \check{v}_{T}\right\|_{T}
\end{aligned}
$$

where we have inserted $\pm \pi_{T}^{0} \breve{v}_{T}$ in the first line, used the discrete trace inequality (8) in the second line, the $L^{2}(T)$ optimality of $\pi_{T}^{p_{T}}$ together with the approximation properties (7) (with $l=p_{T}$ and $q=s=0$ ) in the third line, and we have concluded observing that $\frac{p_{T}+1}{p_{T}} \leqslant 2$ and using the local Poincaré's inequality (6) to infer $\left\|\check{v}_{T}-\pi_{T}^{0} \breve{v}_{T}\right\|_{1, T} \lesssim h_{T}^{1 / 2}\left\|\nabla \breve{v}_{T}\right\|_{T}$. Plugging the above bounds for $\left\|\check{v}_{T}-\pi_{T}^{p_{T}} \breve{v}_{T}\right\|_{F}$ into (40), squaring the resulting inequality, multiplying it by $\kappa_{F} / h_{T}$, summing over $F \in \mathcal{F}_{T}$, and recalling the bound (4) on $\operatorname{card}\left(\mathcal{F}_{T}\right)$, 39 follows.

## 4.4. $L^{2}$-error estimate

Proof of Theorem 6. We let $z \in U$ solve (21) with $g=\hat{u}_{h}-u$ and set $\underline{\hat{z}}_{h}:=\underline{I}_{h}^{p_{h}} z$ and, for all $T \in \mathcal{T}_{h}$ (cf. Proposition 7),

$$
\begin{equation*}
\check{z}_{T}:=r_{T}^{p_{T}+1} \underline{\underline{z}}_{T}=\varpi_{\kappa, T}^{p_{T}+1} z . \tag{41}
\end{equation*}
$$

For the sake of brevity, we also let $\underline{e}_{h}:=\underline{\hat{u}}_{h}-\underline{u}_{h} \in \underline{U}_{h, 0}^{\underline{p}_{h}}$ (recall the definition (18) of $\underline{\hat{u}}_{h}$ ), so that $\hat{u}_{T}-u_{T}=e_{T}$ for all $T \in \mathcal{T}_{h}$. We start by observing that

$$
\begin{equation*}
\left\|e_{h}\right\|^{2}=-\left(\boldsymbol{\nabla} \cdot(\boldsymbol{\kappa} z), e_{h}\right)=\sum_{T \in \mathcal{T}_{h}}\left(\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} z, \boldsymbol{\nabla} e_{T}\right)_{T}+\sum_{F \in \mathcal{F}_{T}}\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} z \cdot \boldsymbol{n}_{T F}, e_{F}-e_{T}\right)_{F}\right) \tag{42}
\end{equation*}
$$

where we have used the fact that $-\boldsymbol{\nabla} \cdot(\boldsymbol{\kappa} z)=e_{h}$ a.e. in $\Omega$ followed by element-by-element partial integration together with the continuity of the normal component of $\kappa_{T} \nabla z$ across interfaces and the strongly enforced boundary conditions in $\underline{U}_{h, 0}^{\underline{p}_{h}}$ to insert $e_{F}$ into the last term.

In view of adding and subtracting $\mathrm{a}_{h}\left(\underline{e}_{h}, \underline{\underline{z}}_{h}\right)$ to the right-hand side of 42), we next provide two useful reformulations of this quantity. First, we have

$$
\begin{align*}
\mathrm{a}_{h}\left(\underline{e}_{h}, \hat{z}_{h}\right) & =\mathrm{a}_{h}\left(\hat{\underline{u}}_{h}, \hat{z}_{h}\right)-\mathrm{a}_{h}\left(\underline{u}_{h}, \hat{z}_{h}\right)+(f, z)-(\boldsymbol{\kappa} \boldsymbol{\nabla} u, \boldsymbol{\nabla} z) \\
& =\sum_{T \in \mathcal{T}_{h}}\left(\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} \breve{u}_{T}, \boldsymbol{\nabla} \check{z}_{T}\right)_{T}-\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} u, \boldsymbol{\nabla} z\right)_{T}+\mathrm{s}_{T}\left(\underline{u}_{T}, \hat{z}_{T}\right)+\left(f, z-\pi_{T}^{p_{T}} z\right)_{T}\right)  \tag{43}\\
& =\sum_{T \in \mathcal{T}_{h}}\left(\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla}\left(\breve{u}_{T}-u\right), \boldsymbol{\nabla}\left(\check{z}_{T}-z\right)\right)_{T}+\mathrm{s}_{T}\left(\hat{\underline{u}}_{T}, \hat{z}_{T}\right)+\left(f-\pi_{T}^{p_{T}} f, z-\pi_{T}^{1-\Delta_{T}} z\right)_{T}\right),
\end{align*}
$$

where we have added the quantity $(f, z)-(\boldsymbol{\kappa} \boldsymbol{\nabla} u, \boldsymbol{\nabla} z)=0$ (cf. (2)) in the first line, we have passed to the second line using the definition (12) of $\mathrm{a}_{T}$ (with $\underline{u}_{T}=\underline{\hat{u}}_{T}$ and $\underline{v}_{T}=\underline{\hat{}}_{T}$ ) together with the discrete problem (16) to infer

$$
\mathrm{a}_{h}\left(\underline{u}_{h}, \underline{\hat{z}}_{h}\right)=\left(f, z_{h}\right)=\sum_{T \in \mathcal{T}_{h}}\left(f, \pi_{T}^{p_{T}} z\right)_{T},
$$

and we have concluded using the definitions (24) of $\varpi_{\kappa, T}^{p_{T}+1}$ (together with (34) and (41)) and (3) of $\pi_{T}^{p_{T}}$ and $\pi_{T}^{1-\Delta_{T}}$. Second, using the definition (10) of $r_{T}^{p_{T}+1}$ (with $\underline{v}_{T}=\underline{e}_{T}$ ), we obtain

$$
\begin{equation*}
\mathrm{a}_{h}\left(\underline{e}_{h}, \hat{\underline{z}}_{h}\right)=\sum_{T \in \mathcal{T}_{h}}\left(\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} z, \boldsymbol{\nabla} e_{T}\right)_{T}+\sum_{F \in \mathcal{F}_{T}}\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla} \check{z}_{T}, e_{F}-e_{T}\right)_{F}+\mathrm{s}_{T}\left(\underline{\hat{z}}_{T}, \underline{e}_{T}\right)\right), \tag{44}
\end{equation*}
$$

where we have additionally used the fact that $\check{z}_{T}=\varpi_{\kappa, T}^{p_{T}+1} z$ (cf. 41p) together with the definition 24] of $\varpi_{\kappa, T}^{p_{T}+1}$ to replace $\check{z}_{T}$ by $z$ in the first term in parentheses.

Thus, adding (43) and subtracting (44) from (42), we obtain after rearranging

$$
\begin{equation*}
\left\|e_{h}\right\|^{2}=\sum_{T \in \mathcal{T}_{h}}\left(\mathfrak{T}_{1}(T)+\mathfrak{T}_{2}(T)+\mathfrak{T}_{3}(T)\right), \tag{45}
\end{equation*}
$$

with

$$
\begin{aligned}
& \mathfrak{T}_{1}(T):=\sum_{F \in \mathcal{F}_{T}}\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla}\left(z-\check{z}_{T}\right) \cdot \boldsymbol{n}_{T F}, e_{F}-e_{T}\right)_{F}+\mathrm{s}_{T}\left(\hat{z}_{T}, \underline{e}_{T}\right), \\
& \mathfrak{T}_{2}(T):=\left(\boldsymbol{\kappa}_{T} \boldsymbol{\nabla}\left(\breve{u}_{T}-u\right), \boldsymbol{\nabla}\left(\check{z}_{T}-z\right)\right)_{T}+\mathrm{s}_{T}\left(\hat{\underline{u}}_{T}, \hat{z}_{T}\right), \\
& \mathfrak{T}_{3}(T):=\left(f-\pi_{T}^{p_{T}} f, z-\pi_{T}^{1-\Delta_{T}} z\right)_{T} .
\end{aligned}
$$

Using the Cauchy-Schwarz inequality, the approximation properties (25) of $\check{z}_{T}$ (with $l=p_{T}+1$ and $s=1$ ) together with the consistency properties 27 ) of $s_{T}$ (with $q=0$ ) for the first factor, and the bound $\sqrt{39}$ ) for the second factor, we get,

$$
\begin{equation*}
\left|\mathfrak{T}_{1}(T)\right| \leqslant\left(h_{T}\left\|\boldsymbol{\kappa}_{T}^{1 / 2} \nabla\left(z-\check{z}_{T}\right)\right\|_{\partial T}^{2}+\left|\underline{z}_{T}\right|_{\mathrm{s}, T}^{2}\right)^{1 / 2} \times\left(\sum_{F \in \mathcal{F}_{T}} \frac{\kappa_{F}}{h_{T}}\left\|e_{F}-e_{T}\right\|_{F}^{2}+\left|\underline{e}_{T}\right|_{\mathrm{s}, T}^{2}\right)^{1 / 2} \lesssim \bar{\kappa}_{T}^{1 / 2} \lambda_{\kappa, T} h_{T}\left\|\underline{e}_{T}\right\|_{\mathrm{a}, T}\|z\|_{2, T} \tag{46}
\end{equation*}
$$

For the second term, the Cauchy-Schwarz inequality followed by the approximation properties (25) of $\breve{u}_{T}$ (with $q=$ $p_{T}$ ) and $\check{z}_{T}$ (with $q=1$ ), and the consistency properties 27) of $\mathrm{s}_{T}$ (with $q=p_{T}$ and $q=0$ for the first and second factor, respectively) yield

$$
\begin{align*}
\left|\mathfrak{T}_{2}(T)\right| & \leqslant\left(\left\|\boldsymbol{\kappa}^{1 / 2} \boldsymbol{\nabla}\left(\check{u}_{T}-u\right)\right\|_{T}^{2}+\left|\underline{\hat{u}}_{T}\right|_{\mathrm{s}, T}^{2}\right)^{1 / 2} \times\left(\left\|\boldsymbol{\kappa}^{1 / 2} \boldsymbol{\nabla}\left(\check{z}_{T}-z\right)\right\|_{T}^{2}+\left|\hat{z}_{T}\right|_{\mathrm{s}, T}^{2}\right)^{1 / 2} \\
& \lesssim \bar{\kappa}_{T} \lambda_{\boldsymbol{\kappa}, T} \frac{h_{T}^{p_{T}+2}}{\left(p_{T}+1\right)^{p_{T}}}\|u\|_{p_{T}+2, T}\|z\|_{2, T} . \tag{47}
\end{align*}
$$

Finally, for the third term we have, when $p_{T}=0$,

$$
\begin{equation*}
\left|\mathfrak{T}_{3}(T)\right| \leqslant\left\|f-\pi_{T}^{0} f\right\|_{T}\left\|z-\pi_{T}^{0} z\right\|_{T} \lesssim h_{T}^{2}\|f\|_{1, T}\|z\|_{1, T} \leqslant h_{T}^{2}\|f\|_{1, T}\|z\|_{2, T} \tag{48}
\end{equation*}
$$

while, when $p_{T} \geqslant 1$,

$$
\begin{align*}
\left|\mathfrak{T}_{3}(T)\right| & \leqslant\left\|f-\pi_{T}^{p_{T}} f\right\|_{T}\left\|z-\pi_{T}^{1} z\right\|_{T} \\
& \leqslant\left\|f-\Pi_{T}^{p_{T}} f\right\|_{T}\left\|z-\Pi_{T}^{1} z\right\|_{T} \\
& \lesssim \frac{h_{T}^{p_{T}+2}}{p_{T}^{p_{T}+2}}\|f\|_{p_{T}}\|z\|_{2, T} \leqslant \frac{h_{T}^{p_{T}+2}}{p_{T}^{p_{T}+2}}\|f\|_{p_{T}, T}\|z\|_{2, T}, \tag{49}
\end{align*}
$$

where we have used the optimality of $\pi_{T}^{p_{T}}$ in the $L^{2}(T)$-norm to pass to the second line and the approximation properties (7) of $\Pi_{T}^{p_{T}}$ to conclude. Using (46)-(49) to bound the right-hand side of (45), and recalling the energy error estimate (19) and elliptic regularity (22), the conclusion follows.

## Appendix A. Proof of Lemma 1

Let $\hat{K} \subset \mathbb{R}^{N}$ be a $L$-Lipschitz set (that is, such that its boundary can be locally parametrized by means of $L$-Lipschitz functions) with $\operatorname{diam}(\widehat{K})=1$, and fix $r_{0}>1$ and a $d$-cube $R\left(r_{0}\right)$ containing $\hat{K}$. In the proof of [6, Lemma 4.1] it is shown the following: Given a function $v \in H^{s+1}(\hat{K})$, its projection $\Pi_{\hat{K}}^{l} v$ on $\mathbb{P}^{l}(\dot{\hat{K}})$ satisfies

$$
\begin{equation*}
\left\|v-\Pi_{\widehat{K}}^{l} v\right\|_{q, \widehat{K}} \lesssim \frac{1}{l^{s+1-q}}\|v\|_{s+1, \widehat{K}} \tag{A.1}
\end{equation*}
$$

for $q \leqslant s+1$ as long as there exists an extension operator $E: H^{s+1}(\hat{K}) \rightarrow H^{s+1}\left(R\left(2 r_{0}\right)\right)$ such that

$$
\begin{equation*}
\|E(v)\|_{s+1, R\left(2 r_{0}\right)} \leqslant C\|v\|_{s+1, R(\hat{K})}, \quad E(v)=0 \text { on } R\left(2 r_{0}\right) \backslash R\left(\frac{3}{2} r_{0}\right) \tag{A.2}
\end{equation*}
$$

The existence of such an extension (in any dimension $d \geqslant 1$ ), is granted by [28, Theorem 5] provided $\hat{K}$ satisfies some regularity conditions. Namely, by means of a careful inspection of [28, Theorems $\left.5 \& 5^{\prime}\right]$, and in particular formulas (25), (30) and the end of the proof of Theorem 5 (p. 192), we get that the constant $C$ in A.2) depends on the Lipschitz constant $L$ and on the (minimal) number of $L$-Lipschitz coverings of $\hat{K}$, that is, the number of open sets which cover $\partial \widehat{K}$ and in each of whom $\partial \widehat{K}$ can be parametrized by means of an $L$-Lipschitz function. Thus, we get the hp-estimate (7) provided we show that replacing $\widehat{K}$ with an element $T$ of the mesh, formula A.1 holds with the appropriate scaling in $h_{T}$.
(i) Proof of (7) for regular elements. Assume, for the moment being, that the regularity of $T \in \mathcal{T}_{h}$ descends from Assumption 1 Let $\widehat{T}:=\frac{T}{h_{T}}$ and suppose, without loss of generality, that the barycenter of $T$ (and thus of $\widehat{T}$ ) is $\mathbf{0}$. Then, by homogeneity, we get that, for every $f \in H^{r}(T)$, letting $\hat{f}(\boldsymbol{x}):=f(\boldsymbol{x} / \lambda)$,

$$
\begin{equation*}
\|f\|_{r, T} \lesssim \lambda^{\frac{d}{2}-r}\|\hat{f}\|_{r, \frac{T}{\lambda}} \tag{A.3}
\end{equation*}
$$

where $C$ is a dimensional constant. Thus, setting $r=s+1, \lambda=h_{T}$ and $f=v-\mathfrak{q}$, where $\mathfrak{q}$ is a generic polynomial of degree $l$, we get by A.1) (applied to $v-\mathfrak{q}$ and $\Pi_{T}^{l}(v-\mathfrak{q})$ in place of $v$ and $\Pi_{T}^{l} v$, respectively),

$$
\begin{equation*}
\left\|v-\Pi_{T}^{l} v\right\|_{q, T}=\left\|(v-\mathfrak{q})-\Pi_{T}^{l}(v-\mathfrak{q})\right\|_{q, T} \lesssim \frac{h_{T}^{\frac{d}{2}-q}}{l^{s+1-q}}\|\hat{v}-\widehat{\mathfrak{q}}\|_{s+1, \widehat{T}} \tag{A.4}
\end{equation*}
$$

Using [29, Theorem 3.2] and again A.3] to return to norms on $T$, we conclude that

$$
\left\|v-\Pi_{T}^{l} v\right\|_{q, T} \lesssim \frac{h_{T}^{\frac{d}{2}-q}}{l^{s+1-q}}\left(\sum_{i=\min (l, s)}^{s+1}|\hat{v}|_{i, \widehat{T}}^{2}\right)^{\frac{1}{2}} \lesssim \frac{h_{T}^{\min (l, s)-q+1}}{l^{s+1-q}}\|v\|_{s+1, T}
$$

(ii) Proof of regularity under Assumption 1 To conclude the proof, we are left to show that Assumption 1 entails uniform bounds only in terms of $\rho$ for the Lipschitz constant of every element $T \in \mathcal{T}_{h}$. To this aim, consider $\boldsymbol{x} \in \partial T$. Then, $\boldsymbol{x} \in S$ for some (convex) element of the submesh $S \in \mathfrak{T}_{h}$ contained in $T$. Since $S \subset T$, it is clear that a bound on the Lipschitz regularity of $\partial S$ immediately implies a bound on the Lipschitz regularity of $\partial T$. Thus, we focus on the regularity of $S$. Since $S$ is convex, we can cover $\partial S$ by means of $2(d+1)$ open sets $U_{i}$, such that $\partial S \cap U_{i}$ admits a local convex (and thus Lipschitz) parametrization $\phi_{i}$, i.e., there exists an orthogonal coordinate system such that $\partial S \cap U_{i}$ is the graph of a Lipschitz function $\phi_{i}: I_{i} \subset \mathbb{R}^{d-1} \rightarrow \mathbb{R}$. This bound on the number of open sets $U_{i}$ is crucial to get [28, Theorem 5] to work (clearly, thanks to (4], the bound on the number of Lipschitz coverings of $T$ is bounded by a constant $2^{d} N_{\partial}=c(d, \rho)$ ). We claim that each $\phi_{i}$ is $1 / \rho-$ Lipschitz.
Suppose that $\boldsymbol{x} \in U_{i}=: U$ and set $\phi:=\phi_{i}$. Up to a rotation and a rescaling, we can suppose that $\boldsymbol{x}=\mathbf{0}$ and $\phi(\boldsymbol{x})=\phi(\mathbf{0})=0$. Let now $r_{s}$ be the inradius of $S$ and $h_{S}$ be its diameter. By Assumption 1 . we know that $\frac{h_{s}}{r_{s}} \leqslant \frac{1}{\rho}$. Let $B_{r_{s}}$ be a ball contained in $S$ of radius $r_{S}$. Up to a further rotation of center $\boldsymbol{x}=\mathbf{0}$ of the coordinate system, we can suppose that $B_{r_{s}}$ is centered on the $x_{d}$ axis. In place of $\phi: I \rightarrow \mathbb{R}$, it is useful to consider its Lipschitz extension $\widetilde{\phi}: \mathbb{R}^{d-1} \rightarrow \mathbb{R}$ defined by, denoting by $|\cdot|$ the usual Euclidian norm,

$$
\widetilde{\phi}(\boldsymbol{x}):=\inf \left\{\phi(\boldsymbol{y})+\operatorname{Lip}(\phi)|\boldsymbol{y}-\boldsymbol{x}| \mid \boldsymbol{y} \in \mathbb{R}^{d-1}\right\}
$$

Figure A.4: Illustration for point (ii) in the proof of Lemma 1 .

We know that $\tilde{\phi}$ is Lipschitz on $\mathbb{R}^{d-1}$ and that $\operatorname{Lip}(\widetilde{\phi})=\operatorname{Lip}(\phi)$ (see for instance [30, Proposition 2.12]). Moreover, it is clear that $\tilde{\phi}$ is convex on $\mathbb{R}^{d-1}$. The fact that $B_{r_{S}} \subset S$ and it is centered on the $x_{d}$-axis (without loss of generality, we can suppose that its center is $\boldsymbol{\xi}=\left(\mathbf{0}, \xi_{d}\right)$ with $\left.\xi_{d}>0\right)$ translates into the fact that $B_{r_{S}}$ is contained in the epigraph of $\widetilde{\phi}$ and its center has distance from $\mathbf{0} \in \mathbb{R}^{d}$ at most $h_{S}$. Let now $\boldsymbol{p} \in \partial \widetilde{\phi}(0)$, where $\partial \widetilde{\phi}$ is the subdifferential of $\widetilde{\phi}$. Then, for every $\boldsymbol{y} \in \mathbb{R}^{d-1}$ we have

$$
\widetilde{\phi}(\boldsymbol{y}) \geqslant \boldsymbol{p} \cdot \boldsymbol{y} .
$$

By choosing $\boldsymbol{y}=\lambda \boldsymbol{p}$, with $\lambda \neq 0$, we get the inequality

$$
\begin{equation*}
\frac{\widetilde{\phi}(\lambda \boldsymbol{p})}{\lambda|\boldsymbol{p}|} \geqslant|\boldsymbol{p}| . \tag{A.5}
\end{equation*}
$$

Since the epigraph of $\widetilde{\phi}$ contains $B_{r_{S}}$, which is centered at a height less than $h_{S}$ on the $x_{d}$-axis, and by the convexity of $\widetilde{\phi}$, we have that the truncated cone

$$
C=\left\{\left(\boldsymbol{x}^{\prime}, x_{n}\right) \in \mathbb{R}^{d-1} \times \mathbb{R}: h_{S} \geqslant x_{n} \geqslant \frac{h_{S}}{r_{S}}\left|\boldsymbol{x}^{\prime}\right|\right\},
$$

is contained in the epigraph of $\tilde{\phi}$ (see Figure A.4). Then we get from A.5

$$
|\boldsymbol{p}|^{2} \leqslant \widetilde{\phi}(\boldsymbol{p}) \leqslant \frac{h_{S}}{r_{S}}|\boldsymbol{p}|
$$

and so, by Assumption 1 ,

$$
|\boldsymbol{p}| \leqslant \frac{h_{S}}{r_{S}} \leqslant \frac{1}{\rho}
$$

Let now $\boldsymbol{y} \in \mathbb{R}^{d-1}$. Then

$$
|\widetilde{\phi}(y)-\widetilde{\phi}(x)| \leqslant|p \cdot(y-x)| \leqslant|\boldsymbol{p} \| y-x| \leqslant \rho^{-1}|y-x|
$$

Since $\boldsymbol{x}$ is arbitrary, this shows that $\operatorname{Lip}(\phi)=\operatorname{Lip}(\widetilde{\phi})=\rho^{-1}$, and so that $\partial S$ is $\rho^{-1}-$ Lipschitz.
