Introduction

- Zirconium and hafnium carbide (ZrC_x and HfC_x) are considered as Ultra High Temperature Ceramics (UHTC) which can be easily oxidized under flowing dioxygen.
- Oxygen atoms can substitute carbon atoms in the crystalline lattice of carbides involving the formation of oxycarbide phases $\text{ZrC}_{x,y}$ and $\text{HfC}_{x,y}$.
- The thermodynamic modeling of the C-Me-O ternary phase diagrams requires thermodynamic and diagrammatical data especially to determine the solubility of the oxygen into the carbide sublattice.

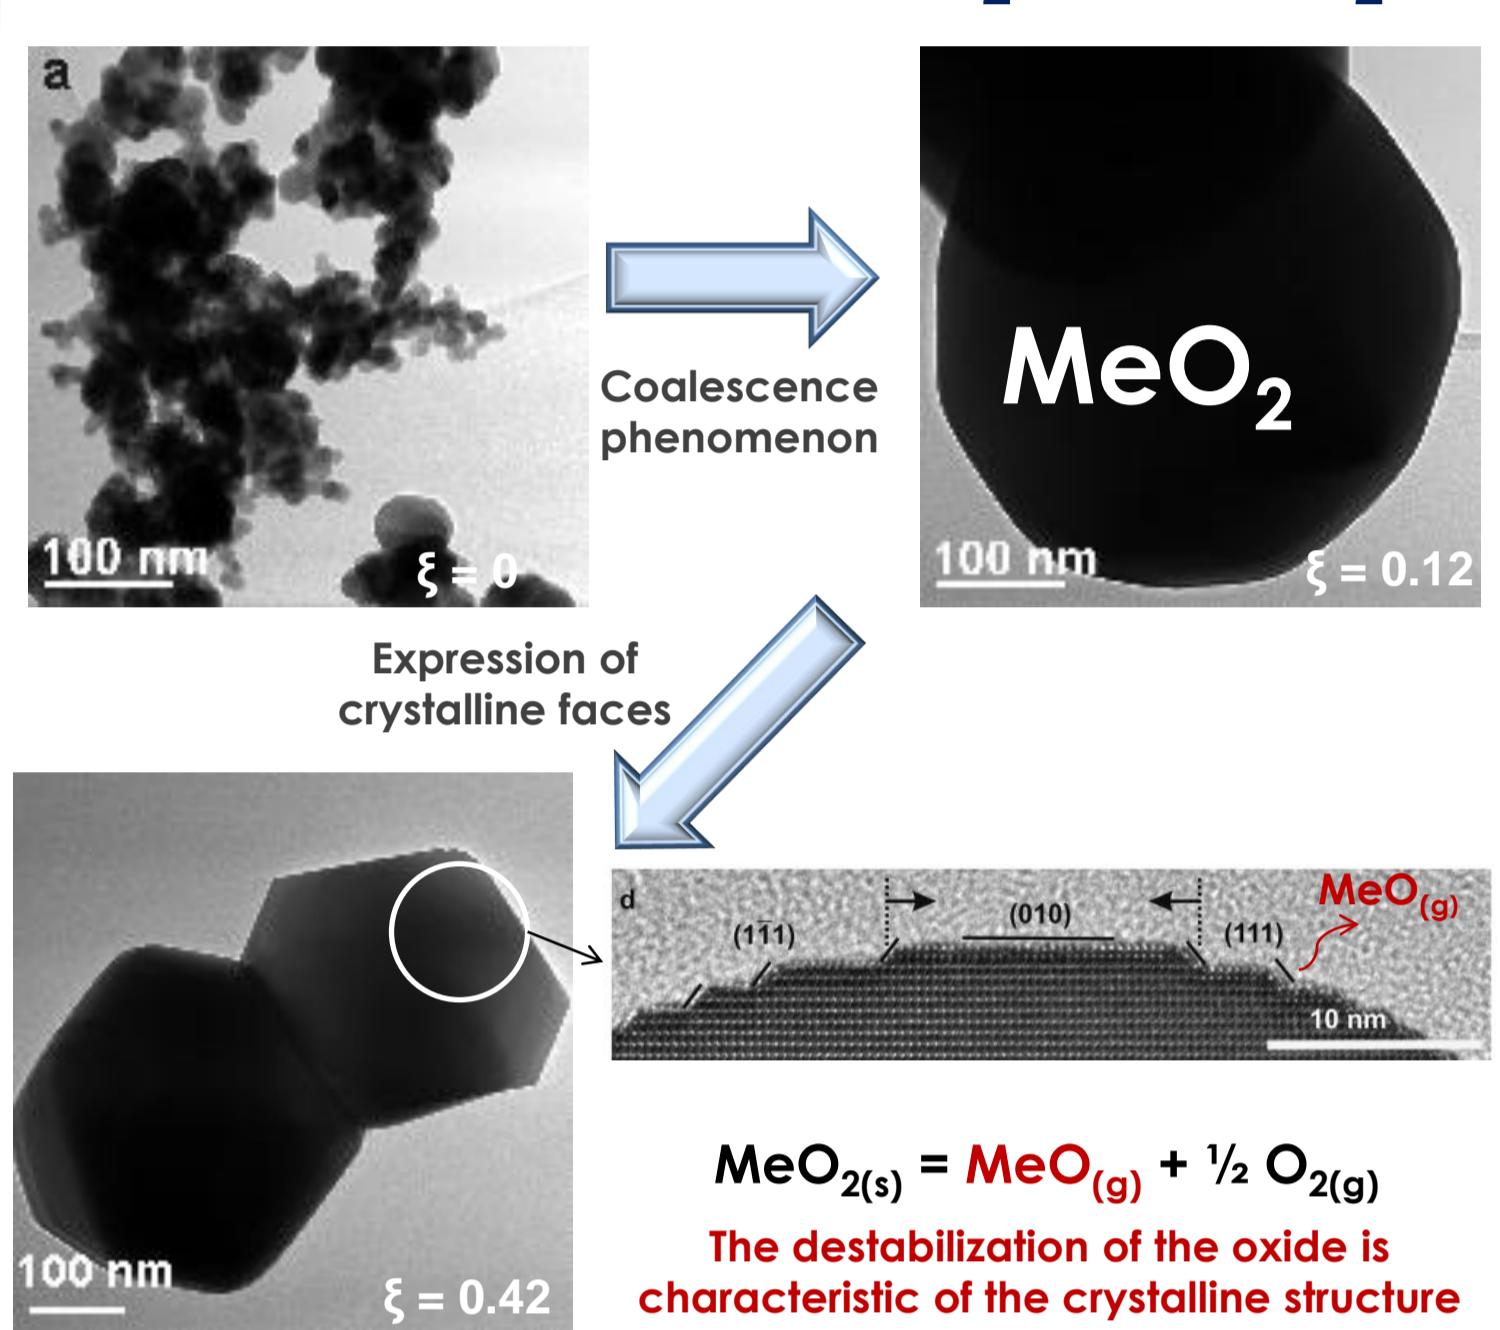

Experimental

Reaction mechanisms involved during the carbothermal reduction of ZrO_2 and HfO_2 ^{a, b}

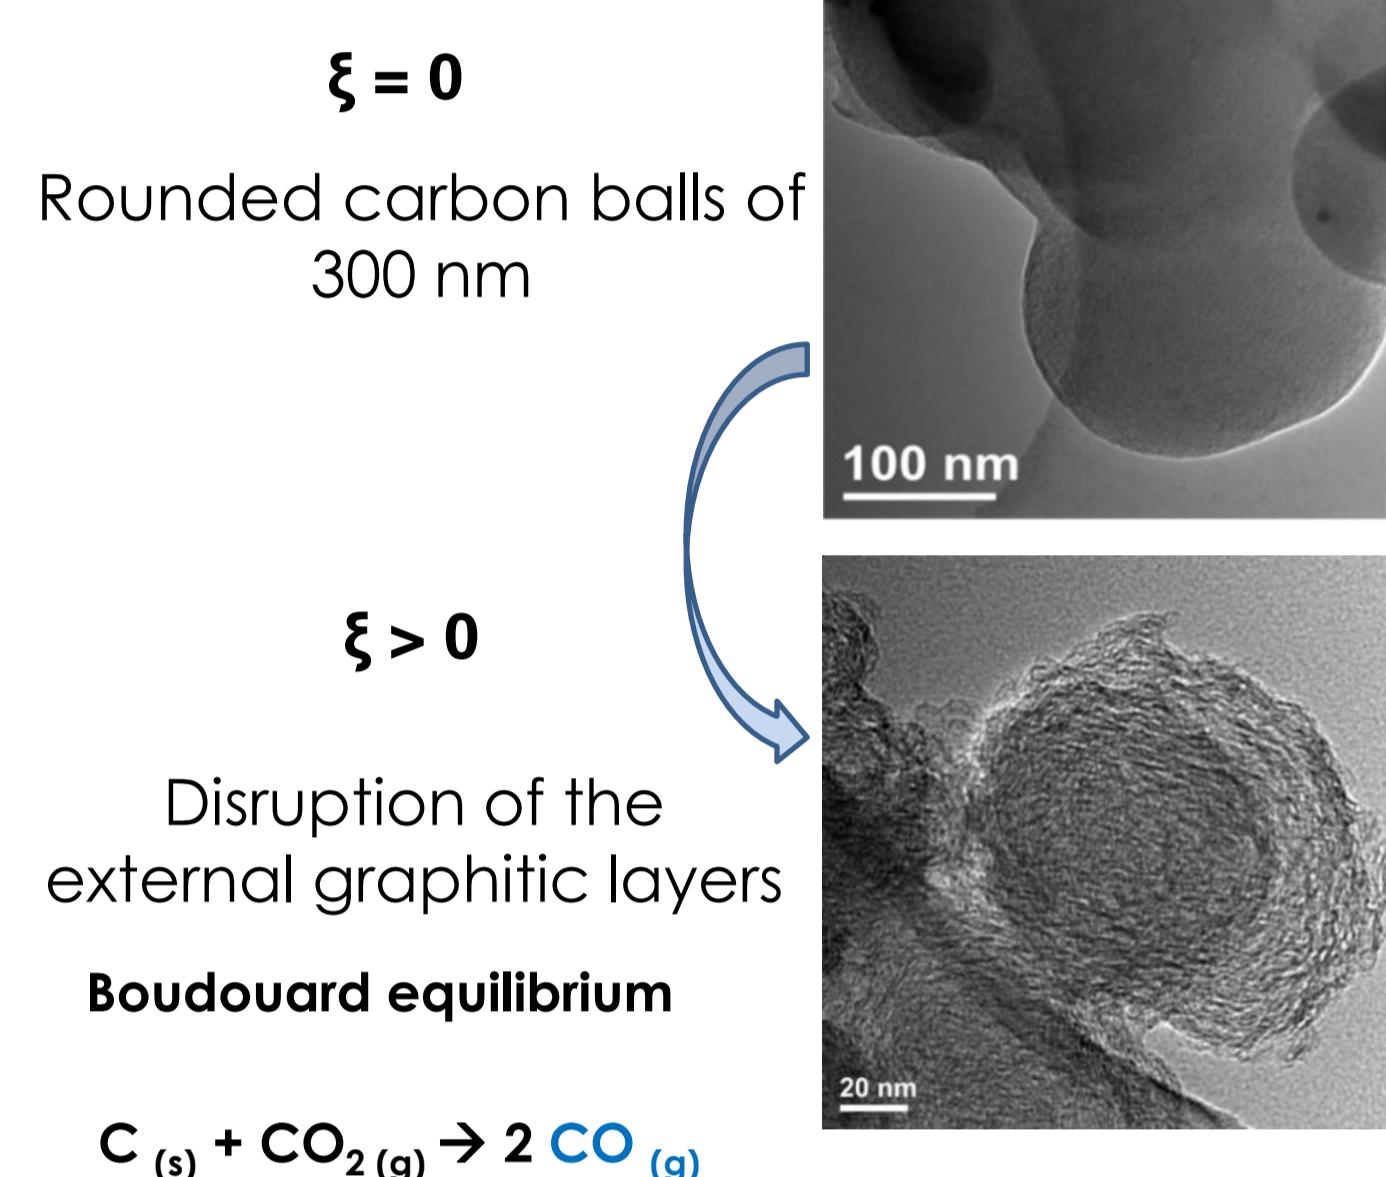

Structural approach by XRD and TEM → understanding of the reaction mechanisms involved for different advancements ξ .

Destabilization of ZrO_2 and HfO_2

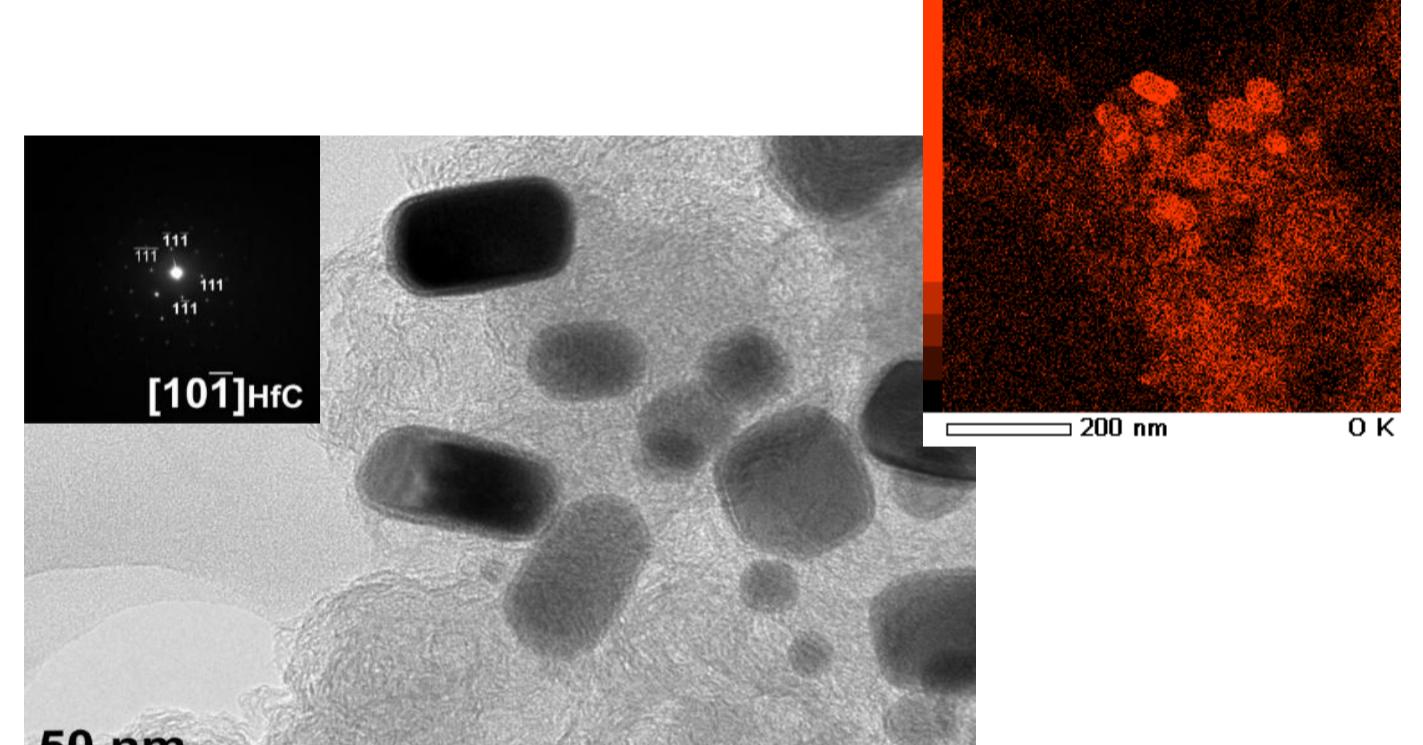

Destabilization of C

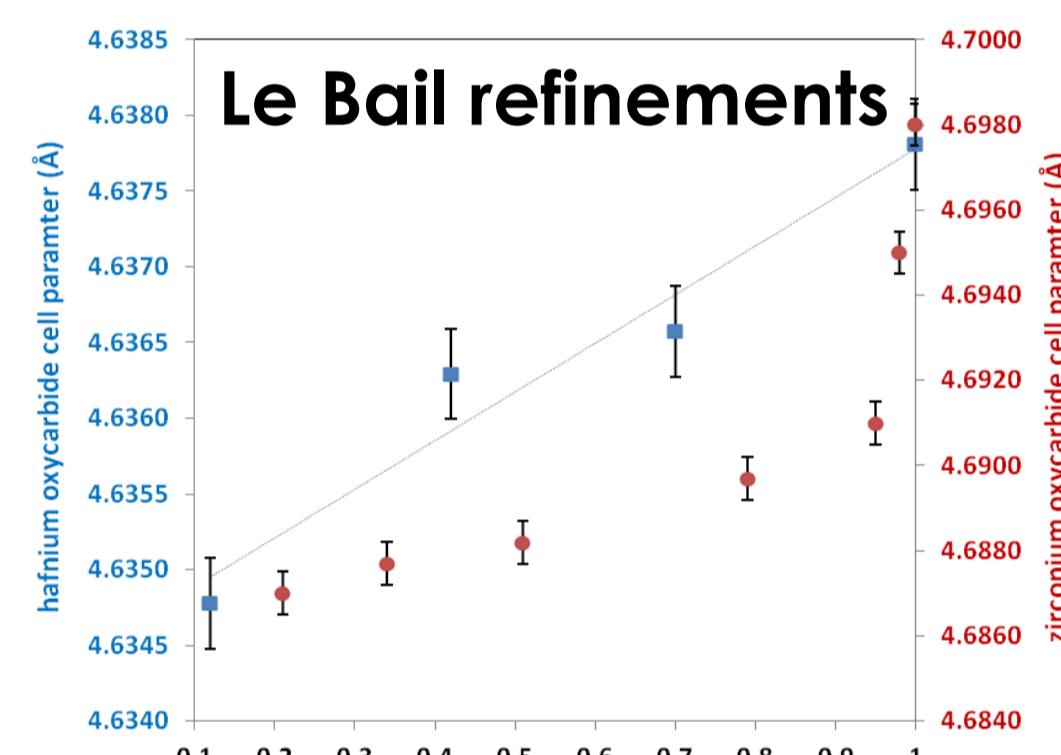

Nucleation of the $\text{MeC}_{x}\text{O}_{1-x}$ phase

Co-condensation reaction of $\text{MeO}_{(g)}$ and $\text{CO}_{(g)}$ within carbon-rich areas

Evolution of the $\text{MeC}_{x}\text{O}_{1-x}$ phase

The increase of the carbon amount in the crystalline structure implies the increase of the $\text{MeC}_{x}\text{O}_{1-x}$ lattice parameter.

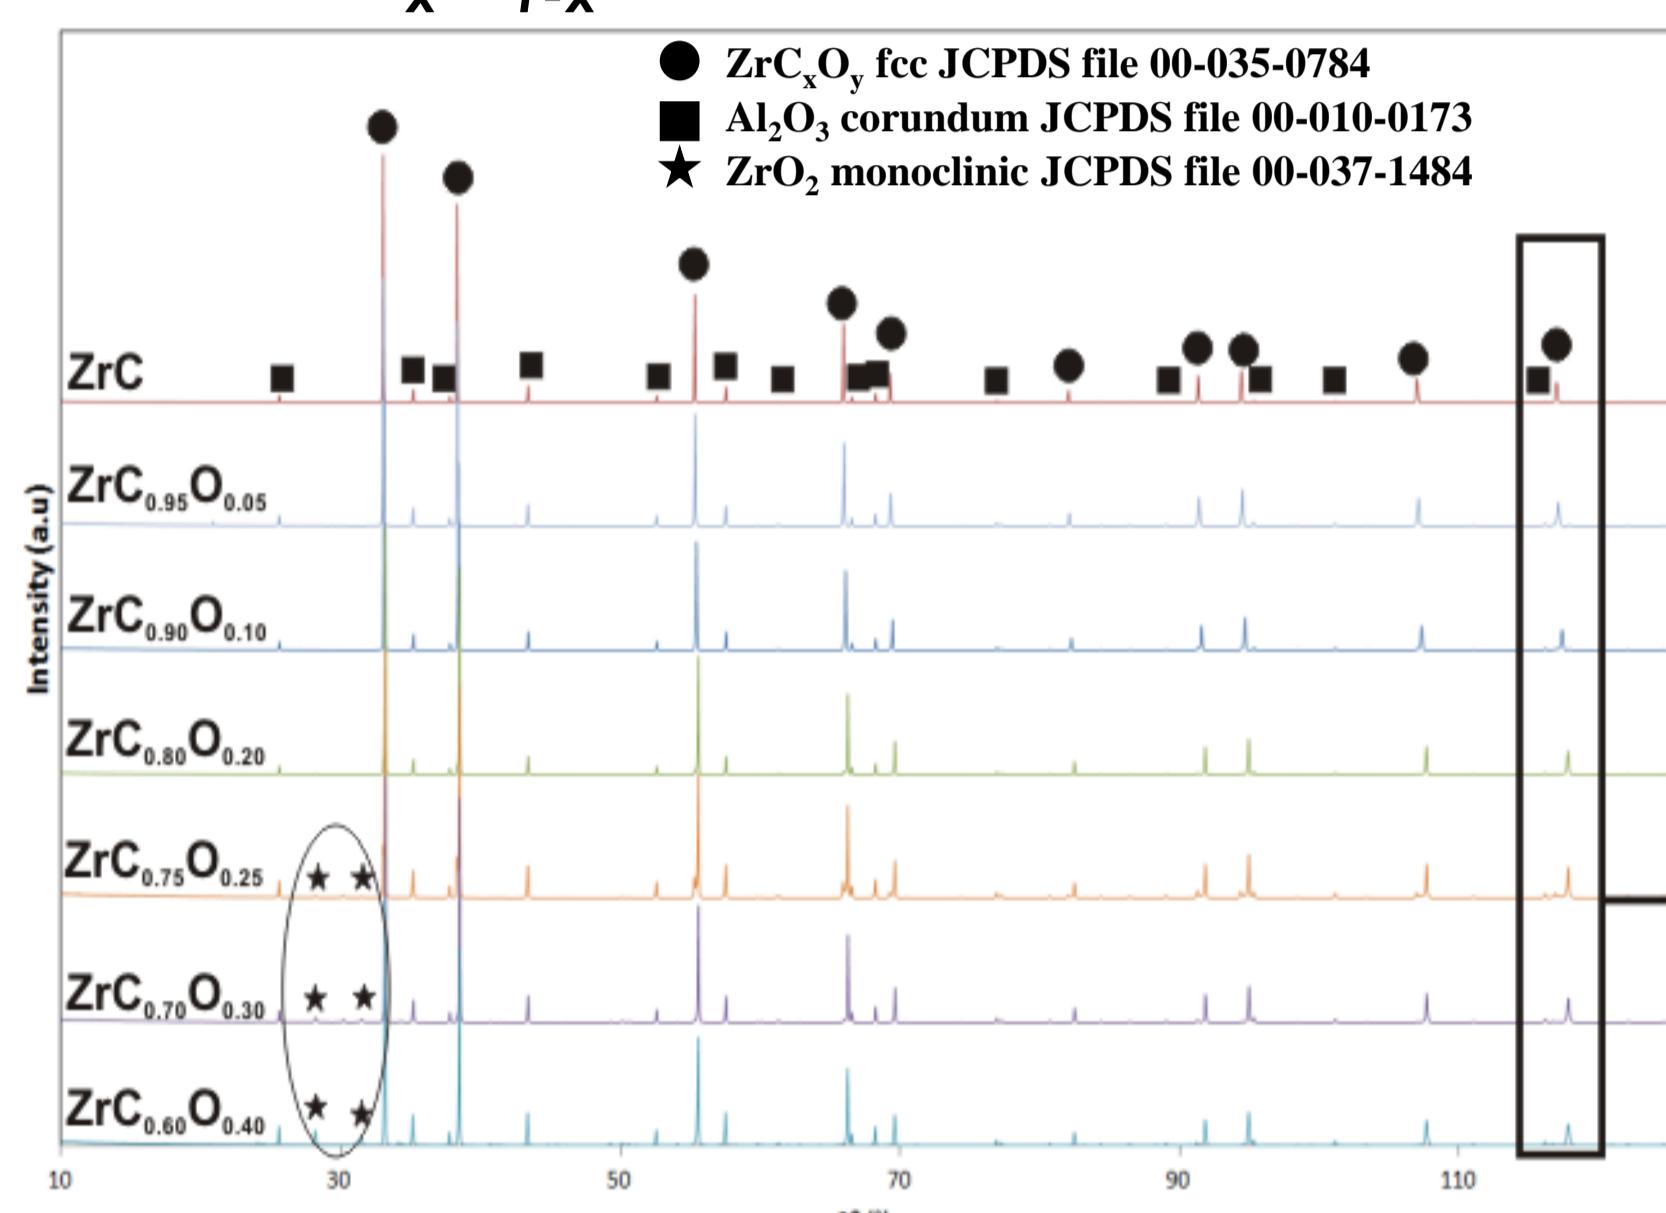

Purely reconstructive reaction → Impossible to obtain nanosized carbides by this synthesis way

Experimental determination of solid solution boundaries by carbothermal reduction

- The amount of initial reactants is adjusted to produce several oxycarbide stoichiometries.
- Heat treatment in a graphite furnace under flowing argon at 1650°C, 1750°C and 1850°C during 8 hours ($\xi = 1$).

→ For $\text{ZrC}_{x}\text{O}_{1-x}$

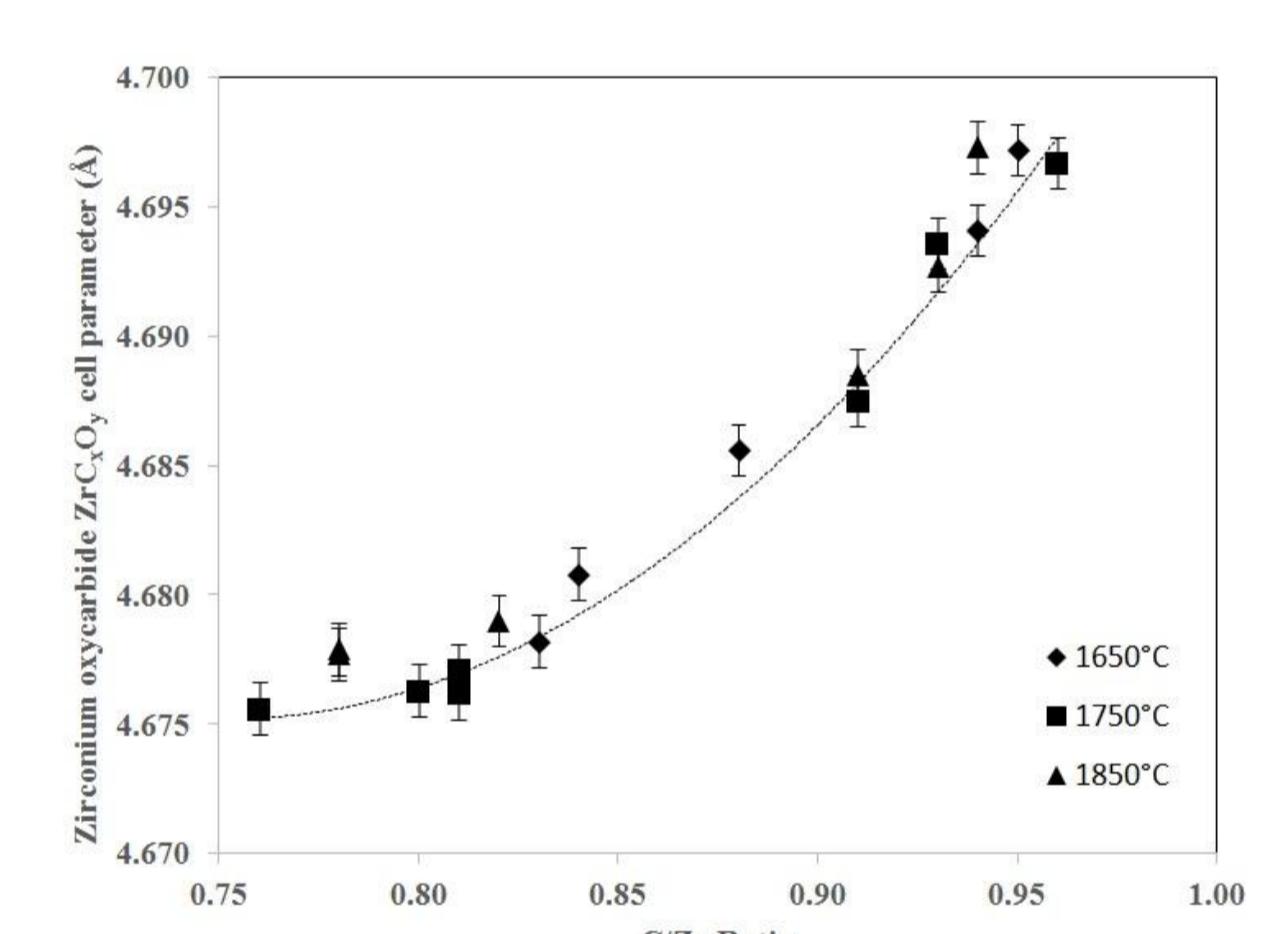

The diffraction peaks of the zirconium oxycarbide shift towards high angles
→ Oxygen doping

Stoichiometries in C and O of each sample computed by elemental analysis :

- Increase of the maximum solubility of O with the increase of the temperature
- No modification of the maximum solubility of C with the temperature

Temperatures	Low boundary	High boundary
1650°C	$\text{ZrC}_{0.83}\text{O}_{0.17}$	$\text{ZrC}_{0.94}\text{O}_{0.03}$
1750°C	$\text{ZrC}_{0.80}\text{O}_{0.20}$	$\text{ZrC}_{0.96}\text{O}_{0.04}$
1850°C	$\text{ZrC}_{0.78}\text{O}_{0.22}$	$\text{ZrC}_{0.94}\text{O}_{0.03}$

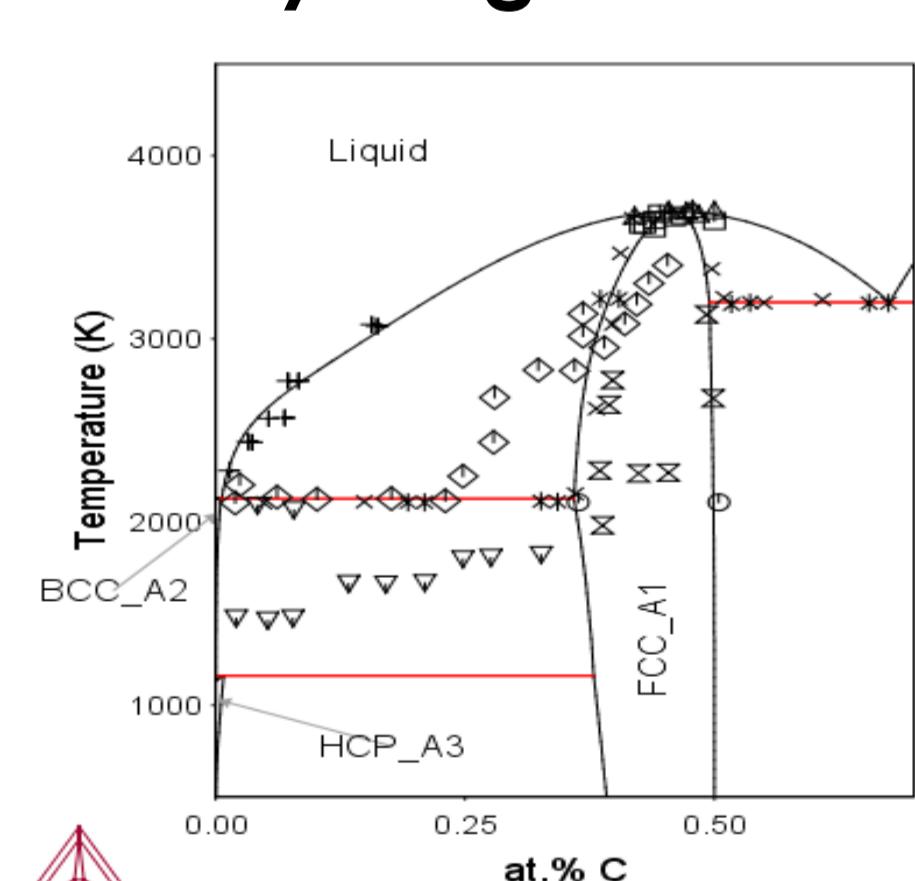

→ For $\text{HfC}_{x}\text{O}_{1-x}$

- Between 1650°C and 1750 °C : no evolution of the solubility of O
- At the same temperature, the stability domain of $\text{HfC}_{x}\text{O}_{1-x}$ solid solution is narrower than $\text{ZrC}_{x}\text{O}_{1-x}$

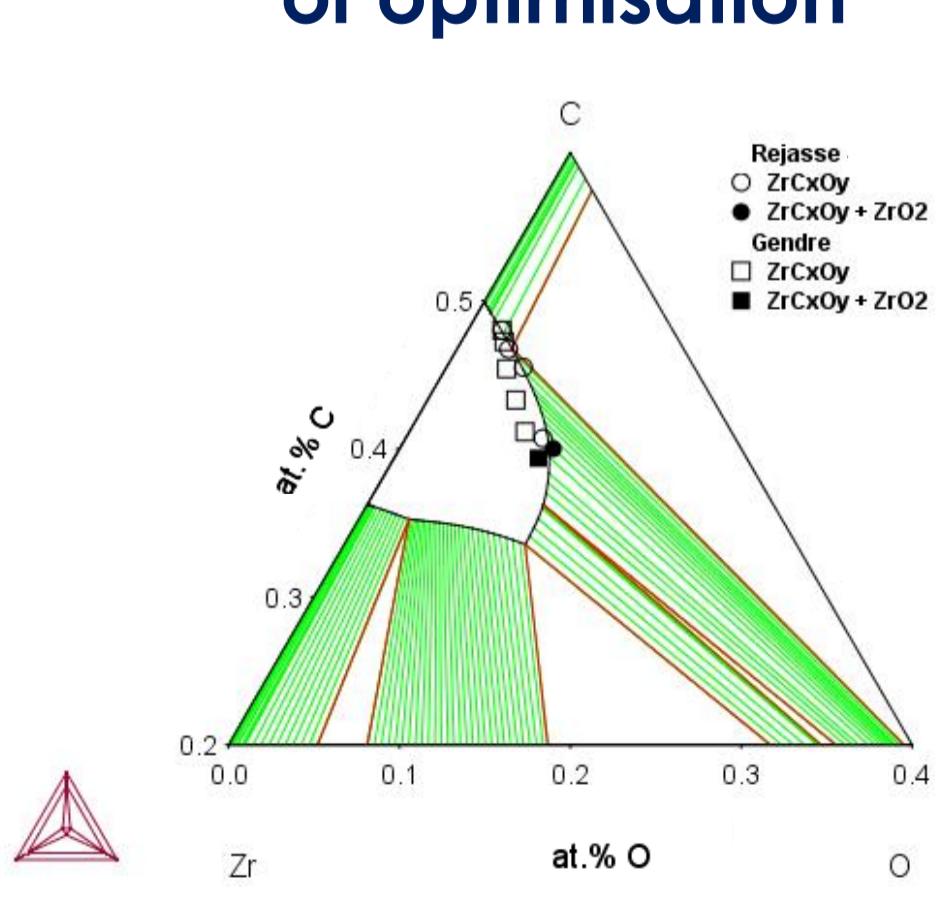

Thermodynamic Modeling

Binary diagram Zr-C c

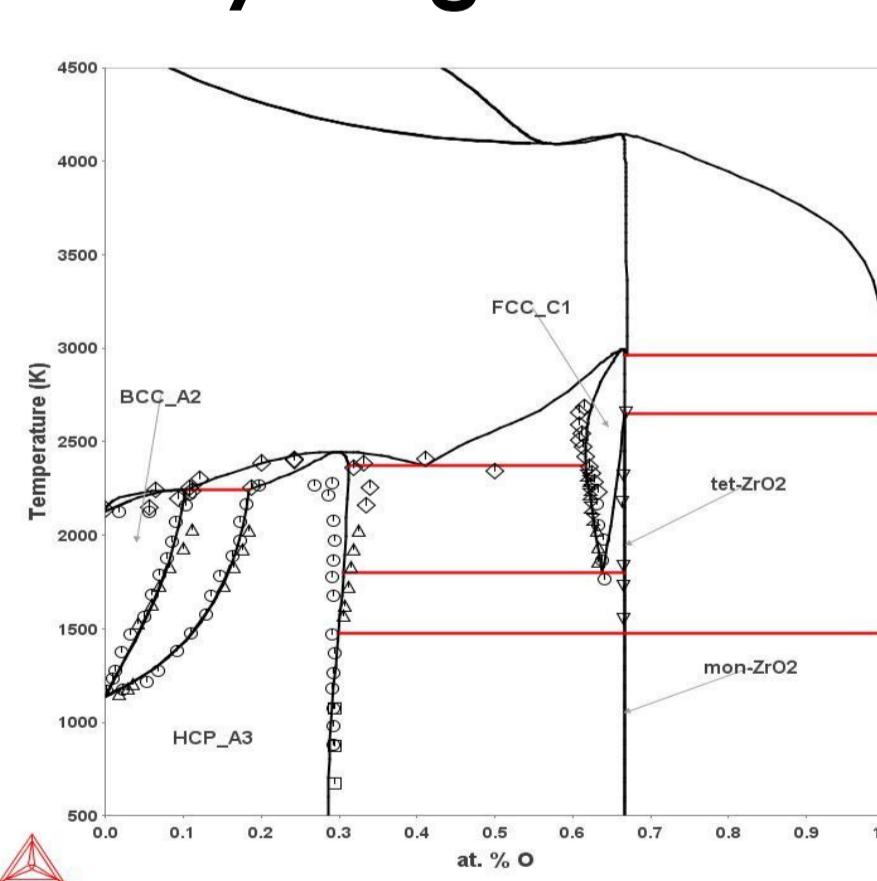

- FCC-A1 : $(\text{Zr})_1(\text{C}, \text{Va})_1 / \text{L}^0, \text{L}^1$
- C Graphite
- BCC_A2 : $(\text{Zr})_1(\text{C}, \text{Va})_3 / \text{L}^0$
- HCP_A3 : $(\text{Zr})_1(\text{C}, \text{Va})_{0.5} / \text{L}^0$
- Liquid : $(\text{Zr}, \text{C})_1 / \text{L}^0, \text{L}^1, \text{L}^2$

Extrapolation in the ternary system and result of optimisation

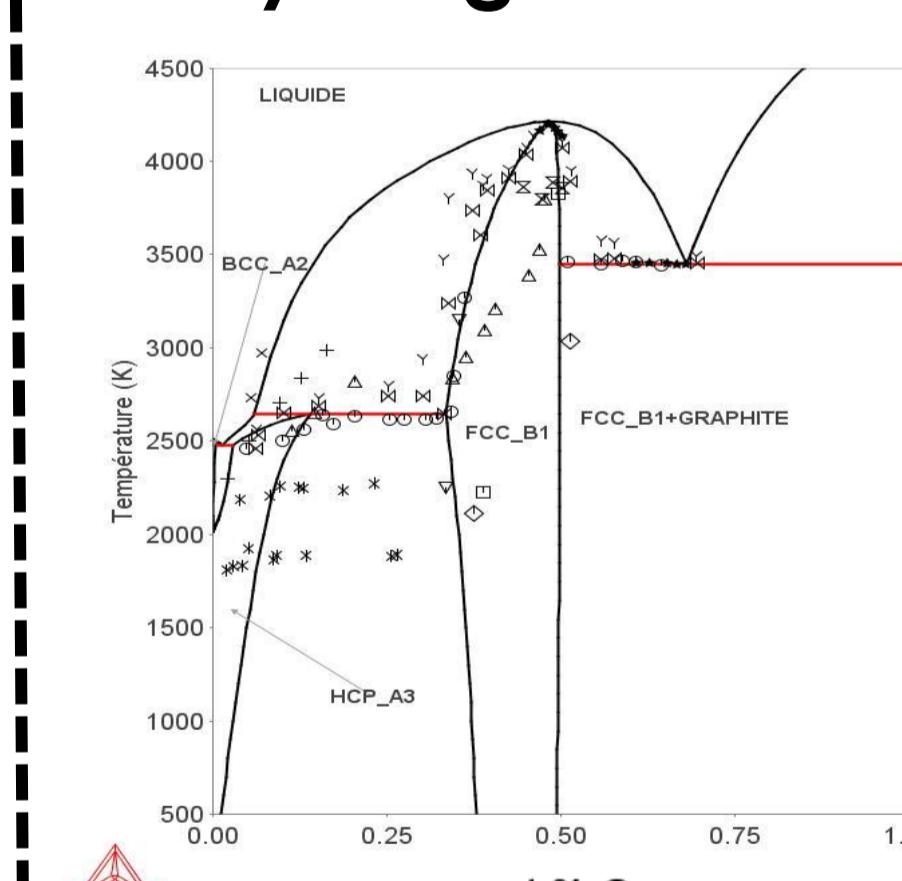

Binary diagram Zr-O d

- FCC-C1 : $(\text{Zr})_1(\text{O}, \text{Va})_2 / \text{L}^0, \text{L}^1, \text{L}^2$
- BCC_A2 : $(\text{Zr})_1(\text{O}, \text{Va})_3 / \text{L}^0$
- HCP_A3 : $(\text{Zr})_1(\text{O}, \text{Va})_{0.5} / \text{L}^0$
- Liquid : $(\text{O}, \text{ZrO}_2, \text{Zr})_1 / \text{L}^0, \text{L}^1, \text{L}^2, \text{L}^3$

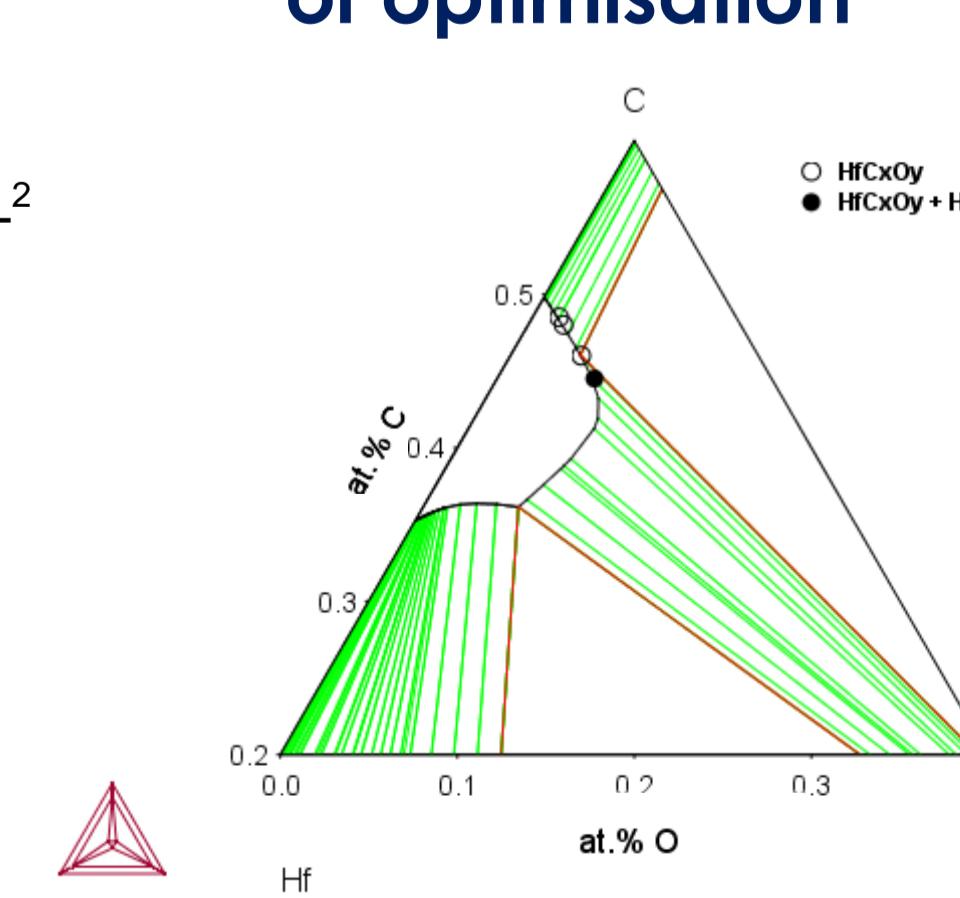

At 1750°C

Binary diagram Hf-C e

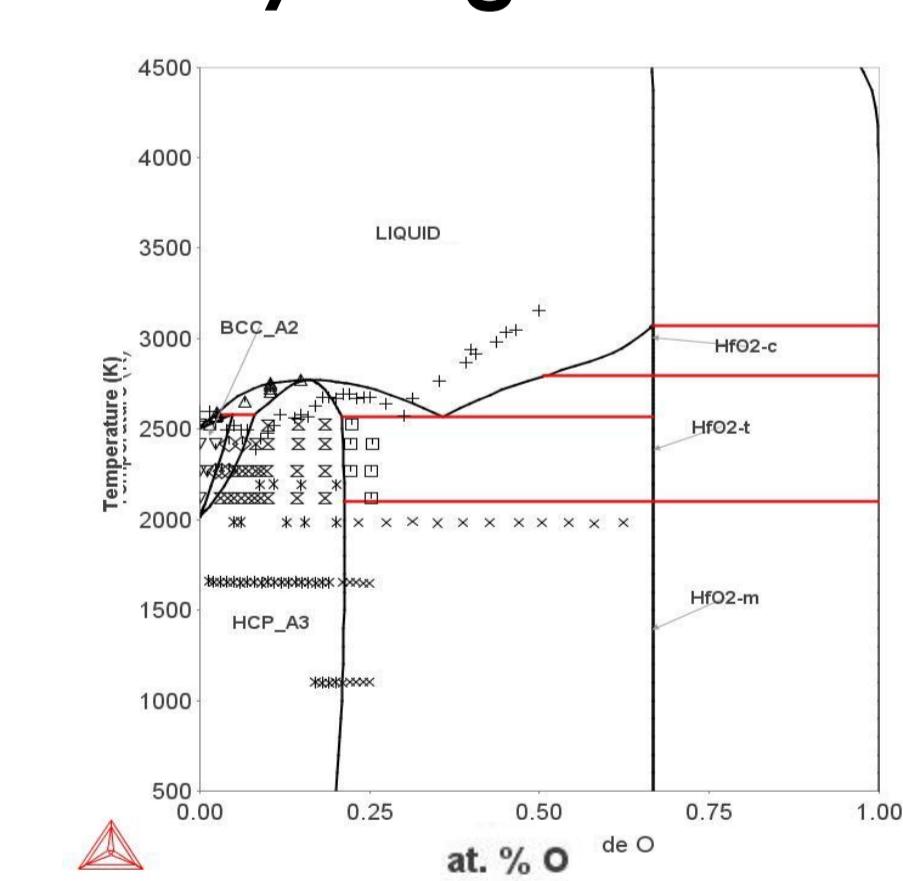

- FCC-B1 : $(\text{Hf})_1(\text{C}, \text{Va})_2 / \text{L}^0, \text{L}^1$
- C Graphite
- BCC_A2 : $(\text{Hf})_1(\text{C}, \text{Va})_3 / \text{L}^0$
- HCP_A3 : $(\text{Hf})_1(\text{C}, \text{Va})_{0.5} / \text{L}^0, \text{L}^1, \text{L}^2$
- Liquid : $(\text{Hf}, \text{C})_1 / \text{L}^0, \text{L}^1, \text{L}^2, \text{L}^3$

Extrapolation in the ternary system and result of optimisation

Binary diagram Hf-O f

- BCC_A2 : $(\text{Hf})_1(\text{O}, \text{Va})_3 / \text{L}^0$
- HCP_A3 : $(\text{Hf})_1(\text{O}, \text{Va})_{0.5} / \text{L}^0, \text{L}^1$
- Liquid : Ionic / $\text{L}^0, \text{L}^1, \text{L}^2$

Summary

- The carbothermal reaction is a purely reconstructive reaction which operates through solid-gas equilibria.
- This reaction allowed to determine the stability domains of $\text{MeC}_{x}\text{O}_{y}$ solid solutions. On the Zr-C-O system, the extent of the domain increases with the temperature. At the same temperature, the domain of $\text{HfC}_{x}\text{O}_{y}$ is narrower than $\text{ZrC}_{x}\text{O}_{y}$.
- These experimental data were used to assess the two ternary phase diagrams and to describe the evolution of the solid solutions with the temperature
