**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Computational Anatomy aims to model and analyze the variability of the human anatomy. Given a set of medical images of the same organ, the first step is the estimation of the mean organ's shape. This mean anatomical shape is called the template in Computer vision or Medical imaging. The estimation of a template/atlas is central because it represents the starting point for all further processing or analyses. In view of the medical applications, evaluating the quality of this statistical estimate is crucial. How does the estimated template behave for varying amount of data, for small and large level of noise? We present a geometric Bayesian framework which unifies two estimation problems that are usually considered distinct: the template estimation problem and manifold learning problem - here associated to estimating the template's orbit. We leverage this to evaluate the quality of the template estimator.

# **Template estimation in Computational Anatomy**

Computational Medicine relying on medical images

First step: **template shape** computation

Second step: analysis

**Template shape**

# **Template estimation as a non-linear model of Errors-in-Variables**

### Generative model of organs' shapes

### $X_i = \boldsymbol{\rho}(\boldsymbol{T}, \boldsymbol{g}_i) + \epsilon_i$ where $g_i \sim \mathcal{N}(g_0, \eta)$ i.i.d. and $\epsilon_i \sim \mathcal{N}(0, \sigma)$ i.i.d.

Goal: Estimate the **template** *T* 

## **Unification through Geometric Statistics**

M: space of the images  $X_i$ 's G: Lie group of transformations Action of G on M:  $\rho: M \times G \to M$  denoted:  $(X,g) \to \rho(X,g)$ Q: shape space, quotient of M by G

### Non-linear model of Errors-in-Variables

 $X_i = \boldsymbol{\rho}(\boldsymbol{T}, \boldsymbol{g}_i) + \epsilon_i$ where  $g_i \sim \mathcal{N}(g_0, \eta)$  i.i.d. and  $\epsilon_i \sim \mathcal{N}(0, \sigma)$  i.i.d.

Goal: Estimate the **curve** parameterized by T

# Different estimators of the template's shape

### **Functional model:** $g_i$ 's are parameters

**Structural model**:  $g_i$ 's are random variables

Likelihood: 
$$L = \prod_{i=1}^{n} \exp\left(-\frac{d_{M}^{2}(\rho(X_{i},g_{i}),T)}{2\sigma^{2}}\right)$$
  
• Modal approximation in (1):  $\exp\left(-\frac{d_{C}^{2}(g,g_{0})}{2\eta^{2}}\right) \simeq \delta_{g_{0}}$  i.e.  $\eta \simeq 0$   
• Adding regularization in (1):  $+\frac{\sigma^{2}}{\eta^{2}}d_{G}^{2}(g_{i},g_{0})$   
• Adding regularization in (1):  $+\frac{\sigma^{2}}{\eta^{2}}d_{G}^{2}(g_{i},g_{0})$   
• Adding regularization in (1):  $+\frac{\sigma^{2}}{\eta^{2}}d_{G}^{2}(g_{i},g_{0})$   
• Likelihood:  $L = \prod_{i=1}^{n} \int_{g \in G} \exp\left(-\frac{d_{M}^{2}(\rho(X_{i}g_{i}),T)}{2\sigma^{2}}\right)\exp\left(-\frac{d_{G}^{2}(g,g_{0})}{2\sigma^{2}}\right)dg$   
• Modal approximation in (1):  $+\frac{\sigma^{2}}{\eta^{2}}d_{G}^{2}(g_{i},g_{0})$   
• Adding regularization in (1):  $+\frac{\sigma^{2}}{\eta^{2}}d_{G}^{2}(g_{i},g_{0})$   
• Adding regularization in (1):  $+\frac{\sigma^{2}}{\eta^{2}}d_{G}^{2}(g_{i},g_{0})$   
•  $T = \operatorname{argmin}_{T} \sum_{i=1}^{n} \min_{g \in G} d_{M}^{2}(\rho(T,g_{i}),X_{i})$   
•  $T = \operatorname{argmin}_{T} \sum_{i=1}^{n} \min_{g \in G} d_{M}^{2}(\rho(T,g_{i}),X_{i})$   
•  $T = \operatorname{argmin}_{T} \sum_{i=1}^{n} m_{g \in G} d_{M}^{2}(\rho(T,g_{i}),X_{i})$   
•  $T = \operatorname{argmin}_{T} \sum_{i=1}^{n} m_{g \in G} d_{M}^{2}(\rho(T,g_{i}),X_{i})$   
•  $T = \operatorname{argmin}_{T} \sum_{i=1}^{n} m_{g \in G} d_{M}^{2}(\rho(T,g_{i}),X_{i})$   
•  $T = \operatorname{argmin}_{T} \sum_{i=1}^{n} m_{g \in G} d_{M}^{2}(\rho(T,g_{i}),X_{i})$   
•  $T = \operatorname{argmin}_{T} \sum_{i=1}^{n} m_{g \in G} d_{M}^{2}(\rho(T,g_{i}),X_{i})$   
•  $T = \operatorname{argmin}_{T} \sum_{i=1}^{n} m_{g \in G} d_{M}^{2}(\rho(T,g_{i}),X_{i})$   
•  $T = \operatorname{argmin}_{T} \sum_{i=1}^{n} m_{g \in G} d_{M}^{2}(\rho(T,g_{i}),X_{i})$   
•  $T = \operatorname{argmin}_{T} \sum_{i=1}^{n} m_{g \in G} d_{M}^{2}(\rho(T,g_{i}),X_{i})$   
•  $T = \operatorname{argmin}_{T} \sum_{i=1}^{n} m_{g \in G} d_{M}^{2}(\rho(T,g_{i}),X_{i})$
