AN ELEMENTARY PROOF OF THE POSITIVITY OF THE INTERTWINING OPERATOR IN ONE–DIMENSIONAL TRIGONOMETRIC DUNKL THEORY

Jean-Philippe Anker

AN ELEMENTARY PROOF OF THE POSITIVITY OF THE INTERTWINING OPERATOR IN ONE–DIMENSIONAL TRIGONOMETRIC DUNKL THEORY

JEAN–PHILIPPE ANKER

Abstract. This note is devoted to the intertwining operator in the one–dimensional trigonometric Dunkl setting. We obtain a simple integral expression of this operator and deduce its positivity.

1. Introduction

We use the lecture notes [6] as a general reference about trigonometric Dunkl theory. In dimension 1, this special function theory is a deformation of Fourier analysis on $\mathbb{R}$, depending on two complex parameters k_1 and k_2, where the classical derivative is replaced by the Cherednik operator

$$\begin{aligned} Df(x) &= \big(\tfrac{d}{dx}\big)f(x) + \big\{\tfrac{k_1}{1-e^{-x}} + \tfrac{2\,k_2}{1-e^{-2x}}\big\}\big\{f(x)-f(-x)\big\} - \big(\tfrac{k_1}{2}+k_2\big)f(x) \\ &= \big(\tfrac{d}{dx}\big)f(x) + \big\{\tfrac{k_1+k_2}{2}\coth\tfrac{x}{2} + \tfrac{k_2}{2}\tanh\tfrac{x}{2}\big\}\big\{f(x)-f(-x)\big\} - \big(\tfrac{k_1}{2}+k_2\big)f(-x)\,, \end{aligned}$$

the Lebesgue measure by $A(x)\,dx$, where

$$A(x) = |2\sinh\tfrac{x}{2}|^{2k_1}\,|2\sinh x|^{2k_2}\,,$$

and the exponential function $e^{i\lambda x}$ by the Opdam hypergeometric function

$$G_{i\lambda}(x) = \underbrace{\varphi_{2\lambda}^{k_1+k_2-\frac12,\,k_2-\frac12}\big(\tfrac{x}{2}\big)}_{{}_2\mathrm{F}_1(\frac{k_1}{2}+k_2+i\lambda,\,\frac{k_1}{2}+k_2-i\lambda;\,k_1+k_2+\frac12;\,-\sinh^2\frac{x}{2})} + \frac{\frac{k_1}{2}+k_2+i\lambda}{2k_1+2k_2+1}\,(\sinh x)\,\underbrace{\varphi_{2\lambda}^{k_1+k_2+\frac12,\,k_2+\frac12}\big(\tfrac{x}{2}\big)}_{{}_2\mathrm{F}_1(\frac{k_1}{2}+k_2+1+i\lambda,\,\frac{k_1}{2}+k_2+1-i\lambda;\,k_1+k_2+\frac32;\,-\sinh^2\frac{x}{2})}\,.$$

Here $\varphi_\lambda^{\alpha,\beta}(x)$ denotes the Jacobi function and ${}_2\mathrm{F}_1(a,b;c;Z)$ the classical hypergeometric function.

In a series of papers ([2], [5], [7], [3], [8], [9], ...), Trimèche and his collaborators have studied an interwining operator $\mathcal{V}: C^\infty(\mathbb{R}) \longrightarrow C^\infty(\mathbb{R})$, which is characterized by

$$\mathcal{V}\circ\big(\tfrac{d}{dx}\big) = D\circ\mathcal{V} \quad\text{and}\quad \delta_0\circ\mathcal{V} = \delta_0\,.$$

Let us mention in particular the following facts.

- *Eigenfunctions.* For every $\lambda\in\mathbb{C}$,
$$\mathcal{V}(x\longmapsto e^{i\lambda x}) = G_{i\lambda}\,.$$
- *Explicit expression.* An integral representation of $\mathcal{V}$ was computed in [2] (and independently in [1]), under the assumption that $k_1\geqslant 0$, $k_2\geqslant 0$ with $k_1+k_2>0$.
- *Analytic continuation.* It was shown in [3] that the interwining operator $\mathcal{V}$ extends meromorphically with respect to $k\in\mathbb{C}^2$, with singularities in $\{k\in\mathbb{C}^2\,|\,k_1+k_2+\frac12\in-\mathbb{N}\}$.

2010 *Mathematics Subject Classification.* 33C67.

Key words and phrases. Trigonometric Dunkl theory, intertwining operator.

- *Positivity*. On the one hand, the positivity of $\mathcal{V}$ was disproved in [2], by using the above–mentioned expression of $\mathcal{V}$ in the case $k_1 > 0$, $k_2 > 0$. On the other hand, the positivity of $\mathcal{V}$ was proved in [8], [9] by using the positivity of the heat kernel in the case $k_1 \geqslant 0$, $k_2 \geqslant 0$.

In Section 2, we obtain an integral representation of $\mathcal{V}$ when $\operatorname{Re} k_1 > 0$ and $\operatorname{Re} k_2 > 0$. The expression is simpler and the proof is quicker than the previous ones in [2] or [1]. In Section 3, we deduce the positivity of $\mathcal{V}$ when $k_1 > 0$, $k_2 > 0$, and comment on the positivity issue.

2. Integral representation of the interwining operator

In this section, we resume the computations in [2, Section 2], [1, Ch. 4] and prove the following result.

Theorem 2.1. *Let* $k = (k_1, k_2) \in \mathbb{C}^2$ *with* $\operatorname{Re} k_1 > 0$ *and* $\operatorname{Re} k_2 > 0$. *Then*

$$\mathcal{V}f(x) = \int_{-|x|}^{+|x|} \mathcal{K}(x,y)\, f(y)\, dy\,,$$

where

$$\begin{aligned}\mathcal{K}(x,y) = \tfrac{c}{4}\, A(x)^{-1} \int_{|y|}^{|x|} \sigma(x,y,z)\, (\cosh\tfrac{z}{2} - \cosh\tfrac{y}{2})^{k_1-1}\, (\cosh x - \cosh z)^{k_2-1} \\ \times\, (\sinh\tfrac{z}{2})\, dz\,,\end{aligned} \tag{1}$$

with

$$c = 2^{3k_1+3k_2}\, \frac{\Gamma(k_1+k_2+\frac{1}{2})}{\sqrt{\pi}\,\Gamma(k_1)\,\Gamma(k_2)} \tag{2}$$

and

$$\sigma(x,y,z) = (\operatorname{sign} x)\, \big\{ e^{\frac{x}{2}}\, (2\cosh\tfrac{x}{2}) - e^{-\frac{y}{2}}\, (2\cosh\tfrac{z}{2}) \big\}\,. \tag{3}$$

Proof. As observed in [2] and [5],

$$\mathcal{V}f(x) = \int_{-|x|}^{+|x|} \mathcal{K}(x,y)\, f(y)\, dy$$

is an integral operator, whose kernel

$$\mathcal{K}(x,y) = \tfrac{1}{4}\, K(\tfrac{x}{2}, \tfrac{y}{2}) + (\operatorname{sign} x)\, \big(\tfrac{k_1}{4} + \tfrac{k_2}{2}\big)\, A(x)^{-1}\, \widetilde{K}(\tfrac{x}{2}, \tfrac{y}{2}) - (\operatorname{sign} x)\, \tfrac{1}{2}\, A(x)^{-1}\, \tfrac{\partial}{\partial y}\, \widetilde{K}(\tfrac{x}{2}, \tfrac{y}{2}) \tag{4}$$

can be expressed in terms of the kernel

$$\begin{aligned}K(x,y) = {} & 2\, c\, A(2x)^{-1}\, |\sinh 2x| \\ & \times \int_{|y|}^{|x|} (\cosh z - \cosh y)^{k_1-1}\, (\cosh 2x - \cosh 2z)^{k_2-1}\, (\sinh z)\, dz\end{aligned} \tag{5}$$

of the interwining operator in the Jacobi setting (see [4, Subsection 5.3]) and of its integral

$$\begin{aligned}\widetilde{K}(x,y) &= \int_{|y|}^{|x|} K(w,y)\, A(2w)\, dw \\ &= \tfrac{c}{k_2} \int_{|y|}^{|x|} (\cosh z - \cosh y)^{k_1-1}\, (\cosh 2x - \cosh 2z)^{k_2}\, (\sinh z)\, dz\,.\end{aligned} \tag{6}$$

Let us integrate by parts (6) and differentiate the resulting expression with respect to y. This way, we obtain

$$\widetilde{K}(x,y) = \tfrac{4\,c}{k_1} \int_{|y|}^{|x|} (\cosh z - \cosh y)^{k_1}\, (\cosh 2x - \cosh 2z)^{k_2-1}\, (\cosh z)\, (\sinh z)\, dz\,, \tag{7}$$

and

$$\frac{\partial}{\partial y}\widetilde{K}(x,y) = -4\,c\,(\sinh y)\int_{|y|}^{|x|}(\cosh z-\cosh y)^{k_1-1}\,(\cosh 2x-\cosh 2z)^{k_2-1} \times (\cosh z)\,(\sinh z)\,dz\,. \tag{8}$$

We conclude by substituting (5), (6), (7), (8) in (4) and more precisely (6), respectively (7) in

$$(\operatorname{sign} x)\,\tfrac{k_2}{2}\,A(x)^{-1}\,\widetilde{K}(\tfrac{x}{2},\tfrac{y}{2})\,, \quad \text{respectively} \quad (\operatorname{sign} x)\,\tfrac{k_1}{4}\,A(x)^{-1}\,\widetilde{K}(\tfrac{x}{2},\tfrac{y}{2})\,.$$

□

Remark 2.2. *Let $x,y\in\mathbb{R}$ such that $|x|>|y|$. The expression (1) extends meromorphically with respect to $k\in\mathbb{C}^2$, with singularities in $\{k\in\mathbb{C}^2\,|\,k_1+k_2+\frac{1}{2}\in-\mathbb{N}\}$, produced by the factor $\Gamma(k_1+k_2+\frac{1}{2})$ in (2). In the limit cases where either k_1 or k_2 vanishes, (1) reduces to the following expressions, already obtained in [2] and [1]:*

- *Assume that $k_1=0$ and $\operatorname{Re}k_2>0$. Then*

$$\mathcal{K}(x,y) = 2^{k_2-1}\,\frac{\Gamma(k_2+\frac{1}{2})}{\sqrt{\pi}\,\Gamma(k_2)}\,|\sinh x|^{-2k_2}\,(\cosh x-\cosh y)^{k_2-1}\,(\operatorname{sign} x)\,(e^x-e^{-y})\,. \tag{9}$$

- *Assume that $k_2=0$ and $\operatorname{Re}k_1>0$. Then*

$$\mathcal{K}(x,y) = 2^{k_1-2}\,\frac{\Gamma(k_1+\frac{1}{2})}{\sqrt{\pi}\,\Gamma(k_1)}\,|\sinh \tfrac{x}{2}|^{-2k_1}\,(\cosh \tfrac{x}{2}-\cosh \tfrac{y}{2})^{k_1-1}\,(\operatorname{sign} x)\,(e^{\frac{x}{2}}-e^{-\frac{y}{2}})\,. \tag{10}$$

3. Positivity of the interwining operator

Corollary 3.1. *Assume that $k_1>0$ and $k_2>0$. Then the kernel (1) is stricly positive, for every $x,y\in\mathbb{R}$ such that $|x|>|y|$.*

Proof. It is enough to check that $\sigma(x,y,z)>0$, for every $x,y,z\in\mathbb{R}$ such that $|x|>z>|y|$. On the one hand, if $x>0$, then

$$\begin{aligned}\sigma(x,y,z) &= e^{\frac{x}{2}}\,(2\cosh\tfrac{x}{2}) - e^{-\frac{y}{2}}\,(2\cosh\tfrac{z}{2})\\ &> (e^{\frac{x}{2}}-e^{-\frac{y}{2}})\,(2\cosh\tfrac{x}{2}) > 0\,.\end{aligned}$$

On the other hand, if $x<0$, then

$$\begin{aligned}\sigma(x,y,z) &= e^{-\frac{y}{2}}\,(2\cosh\tfrac{z}{2}) - e^{\frac{x}{2}}\,(2\cosh\tfrac{x}{2})\\ &> e^{-\frac{y}{2}}\,(2\cosh\tfrac{y}{2}) - e^{\frac{x}{2}}\,(2\cosh\tfrac{x}{2}) = e^{-y}-e^{x} > 0\,.\end{aligned}$$

□

Remark 3.2. *As already observed in [2], the positivity of (9), respectively (10) is immediate in the limit case where $k_1=0$ and $k_2>0$, respectively $k_2=0$ and $k_1>0$.*

Remark 3.3. *The positivity of $\mathcal{V}$ was mistakenly disproved in [2, Theorem 2.11] when $k_1>0$ and $k_2>0$. More precisely, by using a more complicated formula than (1), the density $\mathcal{K}(x,y)$ was shown to be negative, when $x>0$ and $y\searrow -x$. The error in the proof lies in the expression A_1, which is equal to $\frac{k}{k'}\,\frac{\sinh(2x)-\sinh(2|y|)}{E}$ and which tends to $+2\,\frac{k}{k'}\,\frac{\cosh(2x)}{\sinh(2x)}>0$.*

Remark 3.4. *A different approach, based on the positivity of the heat kernel, was used in [8] and [9], in order to tackle the positivity of $\mathcal{V}$.*
