**Abstract** We report herein the synthesis of 5-(substituted)quinolino[3,4-*b*]quinoxalin-6(5*H*)-one derivatives from methyl 3-(2-bromophenyl)quinoxaline-2-carboxylate under one-pot Buchwald-Hartwig coupling/lactamization reaction.

**Quinoline, Aromatic anilines, Buchwald-Hartwig reaction**

**Key words** quinoxaline, aromatic anilines, Buchwald-Hartwig reaction, lactamization reaction

## Introduction

Quinoxalines are common structural motifs in many natural and synthetic compounds with interesting biological activities. Many quinoxaline derivatives show a wide range of biological activities, making them potential antitumor,<sup>1</sup> antibiotic,<sup>2</sup> antiviral,<sup>3</sup> anti-HIV<sup>4</sup> and anti-inflammatory agents.<sup>5</sup> The list of their uses in medicinal chemistry is long.<sup>6</sup> The olaquindox (OLA), 2-[(2-hydroxyethyl)carbamoyl]-3-methylquinoxaline 1,4-dioxide, presents strong antimicrobial activities and is used in subtherapeutics (animal feed) to promote animal growth.<sup>7</sup> Quinacillin is significantly active (0.15–0.62 µg/mL, 0.32–1.35 µM) against *Staphylococcus aureus*.<sup>8</sup>

The phenanthridin group is present in many bioactive natural and pharmaceutical products.<sup>9</sup> They show particularly interesting biological activity as anticancer agents.<sup>10</sup> In order to synthesize structures with high biological activity potential, we combined the quinoxaline moiety with the phenanthridin moiety. Furthermore, to the best of our knowledge, few syntheses of quinolino[3,4-*b*]quinoxalin-6(5*H*)-one derivatives have been reported<sup>11</sup> and none used coupling reactions.

Palladium-catalyzed coupling reactions have been extensively used in medicinal chemistry. The synthesis process is not expensive and possesses a wide compatibility with many functional groups. This approach is an effective way of functionalizing the quinoxaline derivatives as Suzuki-Miyaura,<sup>12</sup> Sonogashira<sup>13</sup> or Buchwald-Hartwig<sup>14</sup> reactions, and the 2-bromophenylboronic acid (2) proved promising as a substrate for coupling/lactamization reaction.<sup>15</sup>

As part of our research program to develop new bioactive compounds,<sup>16</sup> we report herein the first one-pot Buchwald-Hartwig coupling/lactamization reaction in a quinoxaline series for the synthesis of 5-(substituted)quinolino[3,4-*b*]quinoxalin-6(5*H*)-ones.

The starting product for one-pot coupling/lactamization reaction, ethyl 3-(2-bromophenyl)quinoxaline-2-carboxylate (3), was synthesized by Suzuki-Miyaura reaction between ethyl 3-chloroquinoxaline-2-carboxylate (1) and 2-bromophenylboronic acid (2) using 0.02 equiv of  $\text{Pd}(\text{PPh}_3)_4$  as a palladium source and 5 equiv of  $\text{Na}_2\text{CO}_3$  as a base in an acetonitrile–water mixture (3/1) at 100 °C for 5 h (Scheme 1). The key product (3) was obtained in good yields (73%).<sup>17</sup>

## Scheme 1 Preparation of ethyl 3-(2-bromophenyl)quinoxaline-2-carboxylate (3)

Our initial strategy consisted in the introduction of the amide group from ester, first replacing the ethoxy group, which was followed by an intramolecular Buchwald-Hartwig reaction/cyclization. The amidation reaction was tested with starting product (3) and aniline in the presence of  $t\text{-BuOK}$  at room temperature in toluene for 30 min. The formation of intermediate 3-(2-bromophenyl)-*N*-phenylquinoxaline-2-carboxamide was confirmed by TLC and LCMS. Then, we applied the coupling reaction conditions with different catalysts ( $\text{Pd}(\text{OAc})_2$ ,  $\text{Pd}(\text{PPh}_3)_4$ ) in the presence of bases ( $\text{K}_2\text{CO}_3$ ,  $\text{Cs}_2\text{CO}_3$ ,  $t\text{-BuOK}$ ) at 110 °C. The best yield (44%) of 5-phenylquinolino[3,4-*b*]quinoxalin-6(5*H*)-one (5a) was obtained with palladium acetate, BINAP as supporting ligand and  $\text{Cs}_2\text{CO}_3$  at 110 °C for 12 h.

In view of these last poor yields, a simpler strategy was developed, only involving coupling reaction conditions with ethyl 3-

(2-bromophenyl)quinoxaline-2-carboxylate (**3**). Preliminary tests were conducted with ethyl 3-(2-bromophenyl)quinoxaline-2-carboxylate (**3**) and aniline with different catalysts [Pd(OAc)<sub>2</sub>, Pd(PPh<sub>3</sub>)<sub>4</sub>], in the presence of base (K<sub>2</sub>CO<sub>3</sub>, Cs<sub>2</sub>CO<sub>3</sub>, *t*-BuOK) at 110°C in toluene (Table 1).

A better yield was obtained with palladium acetate as catalyst and BINAP as ligand in presence of Cs<sub>2</sub>CO<sub>3</sub> in toluene at 110°C for 5h (97% yield).

**Scheme 2** Reaction of ethyl 3-(2-bromophenyl)quinoxaline-2-carboxylate (**3**) and aniline (**4a**)

**Table 1** Optimization reaction between ethyl 3-(2-bromophenyl)quinoxaline-2-carboxylate and aniline<sup>a</sup>

Entry	Catalyst <sup>a</sup>	Ligand <sup>a</sup>	Base <sup>a</sup>	Time (h)	Yield <sup>b</sup> (%)
<b>1</b>	Pd(OAc) <sub>2</sub>	BINAP	K <sub>2</sub> CO <sub>3</sub>	15	78
<b>2</b>	Pd(OAc) <sub>2</sub>	BINAP	<i>t</i> -BuOK	15	Complex mixture
<b>3</b>	Pd(OAc) <sub>2</sub>	BINAP	Cs <sub>2</sub> CO <sub>3</sub>	5	97
<b>4</b>	Pd(PPh <sub>3</sub> ) <sub>4</sub>	-	K <sub>2</sub> CO <sub>3</sub>	10	Starting material

<sup>a</sup> All reactions are performed using 1.5 equiv of aniline, 20 mol% of Pd, 15 mol% of ligand, and 2.2 equiv of base. <sup>b</sup> All yields refer to chromatographically pure products based on substrate **3**.

Aromatic amine	Product <sup>a</sup>	Yield <sup>b</sup> (%)
Aniline	<b>5a</b>	97
2-Chloroaniline	<b>5b</b>	63
3-Chloroaniline	<b>5c</b>	80

<i>p</i> -Toluidine	<b>5l</b>	90

**Scheme 3** Synthesis of 5-(substituted)quinolino[3,4-*b*]quinoxalin-6(5*H*)-ones **5a–l**

After optimization of the conditions (Table 1, entry 3) we generalized the coupling/lactamization reaction with different aniline derivatives and the corresponding 5-(substituted)quinolino[3,4-*b*]quinoxalin-6(5*H*)-one derivatives were obtained in good yields (50–97% Scheme 3, Table 2). Very good yields were obtained with no substituted aniline (**5a** 97%) and *p*-toluidine (**5l** 90%). Good yields were obtained with anilines substituted by halogen atom in *ortho*, *meta* or *para* position (63–88%). A yield of 82% was obtained with anilines substituted by CN or 65% yield with CF<sub>3</sub> group in *meta* position. With dichlorinated anilines, moderate to good yields (**5j** 60% and **5k** 76%) were obtained. No reaction was observed with anilines substituted by nitro or cyano group in *para* position. Finally, a low yield was obtained with 4-methoxyaniline (**5i** 17% with Cs<sub>2</sub>CO<sub>3</sub> for 5h and 50% with K<sub>2</sub>CO<sub>3</sub> for 24h).

In conclusion, we developed a very efficient one-pot reaction combining Buchwald-Hartwig and lactamization reactions for the synthesis of quinolino[3,4-*b*]quinoxalin-6(5*H*)-one derivatives. Starting material ethyl 3-(2-bromophenyl)quinoxaline-2-carboxylate (**3**) was prepared by Suzuki–Miyaura reaction from ethyl 3-chloroquinoxaline-2-carboxylate and 2-bromophenylboronic acid. The pharmacological evaluation of these highly potential bioactive compounds is under active investigation.

**Table 2** Generalization of one-pot coupling/lactamization reactions

<sup>a</sup> All the reactions are performed using 1.5 equiv of aniline, 20 mol% of Pd(OAc)<sub>2</sub>, 15 mol% of BINAP, 2.2 equiv of Cs<sub>2</sub>CO<sub>3</sub> in toluene for 5h at 110°C. <sup>b</sup> All yields refer to chromatographically isolated pure products based
