# A uniform cube-free morphism is $k$-power-free for all integers $k \geq 4$ 

Francis Wlazinski *

December 15, 2016

#### Abstract

The fact that the image of a word by a morphism contains a cube implies some relations. Under some assumptions, we show that these relations lead to more precise results. This allows us to establish that a cube-free uniform morphism is a $k$-power-free morphism for all integers $k \geq 4$.

## 1 Introduction

For all integers $k \geq 2$, a $k$-power is a repetition of $k$ consecutive and identical sequences. A square and a cube respectively correspond to the special cases of $k=2$ and $k=3$. An overlap is a word of the form $x u x u x$ where $x$ is a letter and $u$ is a word. An infinite word without squares over a three-symbol alphabet and an infinite word without overlaps over a two-symbol alphabet were given by Thue [16, 17] (see also the translation of Berstel [3]). These words are obtained by iterating morphisms.

To find morphisms that generate $k$-power-free words, a method is to consider $k$-power-free morphisms. By definition, a $k$-power-free morphism maps a $k$-power-free word to a $k$-power-free word. Starting with a letter (so $k$-power-free), the word generated by the iteration of a $k$-power-free morphism is thus $k$-power-free. But non- $k$-power-free morphisms can generate $k$-power-free words. For instance, the Fibonacci morphism $\varphi:\{a, b\} \rightarrow$ $\{a, b\} ; a \mapsto a b ; b \mapsto a$ generates the word abaababaabaababaababa..., which is 4 -power-free [7]. But $\varphi$ is not 4 -power-free since $\varphi\left(b^{3} a\right)=a^{4} b$.

Even if we know different ways to verify whether a morphism generates a $k$-power-free word $[2,6,7,14]$ but also whether a morphism is $k$-power-free [5, $9,8,15,18]$, a simple question remains unanswered; is a $k$-power-free morphism also a ( $k+1$ )-power-free morphism?

In [1], Bean, Ehrenfeucht, and McNulty gave a partial result; the morphism $h$ defined by $h(a)=a b a c b a b$, $h(b)=c d a b c a b d, h(c)=c d a c a b c b d$ and $h(d)=c d a c b c a c b d$ is square-free but not cube-free. Another partial result exists for the Thue-Morse morphism $\mu:\{a, b\} \rightarrow\{a, b\} ; a \mapsto a b ; b \mapsto b a$. It is $k$-power-free for every integer $k>2$ [4].

When $k \geq 4$, we proved in [19] that a $k$-power-free uniform morphism is $(k+1)$-power-free. But one of the properties required to prove this result (Lemma 3.1 in [19]) does not hold for $k=3$. We give a new one (Lemma 3.4) that allows us to conclude for cube-free uniform morphisms (Theorem 4.1 and Proposition 4.2).

## 2 Preliminaries

We assume the reader is familiar (if not, see for instance $[12,13]$ ) with basic notions on words and morphisms. We use notations that largely come from [19].

[^0]
### 2.1 Words

Let $w$ be a non-empty word and let $i, j$ be two integers such that $0 \leq i-1 \leq j \leq|w|$. We denote by $w[i . . j]$ the factor of $w$ such that $|w[i . . j]|=j-i+1$ and $w=p w[i . . j] s$ for two words $s$ and $p$ verifying $|p|=i-1$. When $i=j$, we also denote by $w[i]$ the factor $w[i . . i]$, which is the $i^{\text {th }}$ letter of $w$. In particular, $w[1]$ and $w[|w|]$ are respectively the first and the last letter of $w$. We denote Fcts $(w)$ the set of all factors of the word $w$.

Powers of a word $u$ are defined inductively by $u^{0}=\varepsilon$ and $u^{n}=u u^{n-1}$ for all integers $n \geq 1$. Given an integer $k \geq 2$, since the case $\varepsilon^{k}$ is of little interest, we called a $k$-power any word $u^{k}$ with $u \neq \varepsilon$. Given an integer $k \geq 2$, a word is $k$-power-free if it does not contain any $k$-power as factor. A primitive word is a word that is not a $k$-power of an another word whatever the integer $k \geq 2$. A (non-empty) $k$-power $v^{k}$ is called pure if any proper factor of $v^{k}$ is $k$-power-free.

The following proposition gives the well-known solutions (see [11]) to an elementary equation in words and will be widely used in the following sections:

Proposition 2.1 Let $A$ be an alphabet and $u, v, w$ three words over $A$.

1. If $v u=u w$ and $v \neq \varepsilon$ then there exist two words $r$ and $s$ over $A$, and an integer $n$ such that $u=r(s r)^{n}$, $v=r s$ and $w=s r$.
2. If $v u=u v$, then there exist $a$ word $w$ over $A$ and two integers $n$ and $p$ such that $u=w^{n}$ and $v=w^{p}$.

We also need a property on words that is an immediate consequence of Proposition 2.1(2).
Lemma $2.2[8,10]$ If a non-empty word $v$ is an internal factor of $v v$, i.e., if there exist two non-empty words $x$ and $y$ such that $v v=x v y$ then there exist a non-empty word $t$ and two integers $i, j \geq 1$ such that $x=t^{i}, y=t^{j}$, and $v=t^{i+j}$.

We also use the following result which is a corollary of a result of Fine and Wilf [11, 12].
Corollary 2.3 (Keränen) [8] Let $x$ and $y$ be two words. If a power of $x$ and a power of $y$ have a common factor of length at least equal to $|x|+|y|-g c d(|x|,|y|)$ then there exist two words $t_{1}$ and $t_{2}$ such that $x$ is a power of $t_{1} t_{2}$ and $y$ is a power of $t_{2} t_{1}$ with $t_{1} t_{2}$ and $t_{2} t_{1}$ primitive words. Furthermore, if $|x|>|y|$ then $x$ is not primitive.

### 2.2 Morphisms

Let $A$ and $B$ be two alphabets. A morphism $f$ from $A^{*}$ to $B^{*}$ is a mapping from $A^{*}$ to $B^{*}$ such that $f(u v)=$ $f(u) f(v)$ for all words $u, v$ over $A$.

Let $k \geq 2$ be an integer. A morphism $f$ on $A$ is $k$-power-free if and only if $f(w)$ is $k$-power-free for all $k$-power-free words $w$ over $A$.

A morphism $f$ on $A$ is called prefix (resp. suffix) if, for all letters $a$ and $b$ in $A$, the word $f(a)$ is not a prefix (resp. not a suffix) of $f(b)$. A prefix (resp. suffix) morphism $f$ is non-erasing that is $f(a) \neq \varepsilon$ for all letters $a$. A morphism is bifix if it is prefix and suffix.

A morphism $f$ from $A^{*}$ to $B^{*}$ is a ps-morphism if and only if the equalities $f(a)=p s, f(b)=p s^{\prime}$, and $f(c)=p^{\prime} s$ with $a, b, c \in A$ (possibly $c=b$ ) and $p, s, p^{\prime}$, and $s^{\prime} \in B^{*}$ imply $b=a$ or $c=a$.

Let us recall some definitions and properties that will be used in the sequel. Lemma 2.4 derives directly from the definitions of a prefix or a suffix morphism. A detailed proof is left to the reader.

Lemma 2.4 Let $f$ be a bifix morphism on an alphabet $A$ and let $u, v$, $w$, and $t$ be words over $A$.
The equality $f(u)=f(v) p$ with $p$ be a prefix of $f(w)$ implies $u=v w^{\prime}$ for a prefix $w^{\prime}$ of $w$ such that $f\left(w^{\prime}\right)=p$. And the equality $f(u)=s f(v)$ with $s$ a suffix of $f(t)$ implies $u=t^{\prime} v$ for a suffix $t^{\prime}$ of $t$ such that $f\left(t^{\prime}\right)=s$.

Lemma 2.5 $[8,10]$ If $f$ is not a ps-morphism then $f$ is not a $k$-power-free morphism for all integers $k \geq 2$.

Lemma 2.6 [19] Let $f$ be a ps-morphism from $A^{*}$ to $B^{*}$ and let $u$, $v$ and $w$ be words over $A$ such that $f(u)=\delta \beta$, $f(v)=\alpha \beta$, and $f(w)=\alpha \gamma$ for some non-empty words $\alpha, \beta, \gamma$, and $\delta$ over $B$. Then it implies $v=v_{1} a v_{2}$, $u=u_{1} b v_{2}$, and $w=v_{1} c w_{2}$ for some words $v_{1}, v_{2}, u_{1}$, and $w_{2}$, and some letters $a, b$, and $c$. Moreover, we have either $b=a$ or $c=a$.

Furthermore, if $|\delta|<|f(u[1])|$ then $u_{1}=\varepsilon$ and if $|\gamma|<|f(w[|w|])|$ then $w_{2}=\varepsilon$.
Assuming that $f(\bar{w})=p u^{k} s$ for a factor $\bar{w}$ of a word $w$ and a non-empty word $u$, and assuming that $\bar{w}$ contains a factor $w_{0}$ such that $\left|f\left(w_{0}\right)\right|=|u|$, Lemma 2.8 states that $\bar{w}$ necessarily contains a $k$-power $w^{\prime k}$ such that $f\left(w^{\prime}\right)$ is a conjugate of $u$. We will say that $f(w)$ contains a synchronised $k$-power $u^{k}$. More precisely:

Definition 2.7 Let $k \geq 2$ be an integer. Let $f$ be a morphism from $A^{*}$ to $B^{*}$, $w$ be a word over $A$, and $u$ be a non-empty word over $B$ such that $f(w)$ contains the $k$-power $u^{k}$. Let $\bar{w}$ be a shortest factor of $w$ whose image by $f$ contains $u^{k}$, i.e., $f(\bar{w})=p u^{k} s$ with $|p|<|f(\bar{w}[1])|$ and $|s|<|f(\bar{w}[|\bar{w}|])|$.

We say that $f(w)$ and $u^{k}$ are synchronised if there exist three words $w_{0}, w_{1}$, and $w_{2}$ such that $\left|f\left(w_{0}\right)\right|=|u|$ and $\bar{w}=w_{1} w_{0} w_{2}$ with $p=\varepsilon$ if $w_{1}=\varepsilon$, and $s=\varepsilon$ if $w_{2}=\varepsilon$.

The three following results, which will be used in this paper, were proved in [19].
Lemma 2.8 Let $k \geq 2$ be an integer, let $f$ be a ps-morphism, and let $w$ be a word such that $f(w)=p u^{k} s$ with $|p|<|f(w[1])|$ and $|p|<|f(w[1])|$. If $f(w)$ contains a synchronised $k$-power then $w$ starts or ends with a $k$-power $w_{0}^{k}$ such that $f\left(w_{0}\right)$ and $u$ are conjugated.

Lemma 2.9 Let $k \geq 3$ be an integer and let $\kappa \in\{k ; k+1\}$. Let $f$ be a morphism from $A^{*}$ to $B^{*}$ and let $\omega$ be a word over $A$ such that $f(\omega)=p U^{\kappa} S$ for some words $p, S$ and $U \neq \varepsilon$ over $B$ such that $|p|<|f(\omega[1])|$. Moreover, we assume that $|S|<|f(\omega[|\omega|])|$ when $\kappa=k+1$ and $v^{3}$ is a chosen factor of a pure $k$-power $v^{k}$.

When one of the four following situations holds, there exist a word $\check{\omega}$ such that $f(\check{\omega})=p^{\prime}\left(U^{\prime}\right)^{\kappa} S^{\prime}$ for some words $p^{\prime}$, $S^{\prime}$, and $U^{\prime} \neq \varepsilon$ over $B$ satisfying $\left|p^{\prime}\right|<|f(\check{\omega}[1])|, 0<\left|U^{\prime}\right|<|U|$, and $f(\check{\omega})$ and $\left(U^{\prime}\right)^{\kappa}$ are synchronised only if $f(\omega)$ and $U^{\kappa}$ are synchronised.

1. $d_{\mathrm{v}}=1,\left|D_{\mathrm{v}} f(v)^{2}\right|<|U|$, and $L_{j, v} \cup R_{j, v} \neq \emptyset$ for every integer $j \in[2, \kappa]$.
2. $d_{\mathrm{v}}=1, L_{j, v} \cup R_{j, v} \neq \emptyset$ for every integer $j \in[2, \kappa-1]$, and there exists a positive integer $\phi$ such that $\omega\left[n_{\mathrm{v}} . .|\omega|\right]$ starts with $v^{\phi+2}$ and $\sup \left\{2|f(v)| ;\left|D_{\mathrm{v}} f(v)^{\phi}\right|\right\} \leq|U|<\left|D_{\mathrm{v}} f(v)^{\phi+1}\right|$.
3. $d_{\mathrm{v}}=0,\left|D_{\mathrm{v}} f(v)^{2}\right| \leq|U|$, and $L_{j, v} \cup R_{j, v} \neq \emptyset$ for every integer $j \in[1, \kappa]$.
4. $d_{\mathrm{v}}=0,|U|<\left|D_{\mathrm{v}} f(v)^{2}\right|<\left|D_{\mathrm{v}} U\right|$, and $L_{j, v} \cup R_{j, v} \neq \emptyset$ for every integer $j \in[1, \kappa-1]$.

Proposition 2.10 Let $A$ and $B$ be two alphabets and let $k \geq 4$ be an integer. A $k$-power-free uniform morphism is a $(k+1)$-power-free morphism.

## 3 About cube-free-morphisms

As mentioned in the introduction, Lemma 3.1 in [19] is no longer valid for $k=3$. Even if parts of its proof can be extended to this case, some new problems appear. The following lemma is one of the situations we can obtain:

Lemma 3.1 Let $f$ be a ps-morphism from $A^{*}$ to $B^{*}$. Let us assume that there exist $\rho, \mu, \alpha, \beta$, and $\theta$ words over $B$ and $q_{1}, q_{2}$, and $q$ words over $A$ such that $q \neq \varepsilon, \rho=\alpha \beta$ is not the image of a word by $f, \theta=\mu \rho \rho \mu \rho \mu$, $f(q)=\rho \mu \rho, f\left(q_{1}\right)$ ends with $\beta \theta, f\left(q_{2}\right)$ starts with $\theta \alpha$, and the words $q_{1}\left[2 . .\left|q_{1}\right|\right] q$ and $q q_{2}\left[1 . .\left|q_{2}\right|-1\right]$ are cube-free. Then $f$ is not cube-free.

Proof of Lemma 3.1 is simply done using iteratively Lemma 3.2. By induction, if $f$ was not cube-free, we could find an infinite sequence $\left(\chi_{i}\right)_{i \geq 0}$ of non-empty words starting with $\chi_{0}=q$ such that $\left|f\left(\chi_{i}\right)\right|>\left|f\left(\chi_{i+1}\right)\right|>0$; it is impossible.

Lemma 3.2 Let $f$ be a ps-morphism from $A^{*}$ to $B^{*}$. Let us assume that there exist $\rho, \mu, \alpha$, $\beta$, and $\theta$ words over $B$ and $q_{1}, q_{2}$, and $q$ words over $A$ such that $q \neq \varepsilon, \rho=\alpha \beta$ is not the image of a word by $f, \theta=\mu \rho \rho \mu \rho \rho \mu$, $f(q)=\rho \mu \rho, f\left(q_{1}\right)$ ends with $\beta \theta, f\left(q_{2}\right)$ starts with $\theta \alpha$, and the words $q_{1}\left[2 . .\left|q_{1}\right|\right] q$ and $q q_{2}\left[1 . .\left|q_{2}\right|-1\right]$ are cube-free.

Then either $f$ is not cube-free or there exist $\rho^{\prime}, \mu^{\prime}, \alpha^{\prime}, \beta^{\prime}$, and $\theta^{\prime}$ words over $B$ and $q_{1}^{\prime}, q_{2}^{\prime}$, and $q^{\prime}$ words over A such that $q^{\prime} \neq \varepsilon, \rho^{\prime}=\alpha^{\prime} \beta^{\prime}$ is not the image of a word by $f, \theta^{\prime}=\mu^{\prime} \rho^{\prime} \rho^{\prime} \mu^{\prime} \rho^{\prime} \rho^{\prime} \mu^{\prime}, f\left(q^{\prime}\right)=\rho^{\prime} \mu^{\prime} \rho^{\prime}, f\left(q_{1}^{\prime}\right)$ ends with $\beta^{\prime} \theta^{\prime}, f\left(q_{2}^{\prime}\right)$ starts with $\theta^{\prime} \alpha^{\prime}$, and the words $q_{1}^{\prime}\left[2 . .\left|q_{1}^{\prime}\right|\right] q^{\prime}$ and $q^{\prime} q_{2}^{\prime}\left[1 . .\left|q_{2}^{\prime}\right|-1\right]$ are cube-free.

And more particularly, we have $\left|f\left(q^{\prime}\right)\right|<|f(q)|$.

## Proof.

Let us first remark that the condition $q \neq \varepsilon$ is simply a consequence that $\rho$ is not the image of a word by $f$. Indeed, it implies $\rho \neq f(\varepsilon)=\varepsilon$. Therefore, $f(q)=\rho \mu \rho \neq \varepsilon$ and so $q \neq \varepsilon$. Moreover, the fact that $f$ is a ps-morphism implies that $f$ is bifix and non-erasing.

We can write $f\left(q_{1}\right)=\pi_{1} \beta \theta$ and $f\left(q_{2}\right)=\theta \alpha \sigma_{2}$ for two words $\pi_{1}$ and $\sigma_{2}$ over $B$. Let us denote $\varphi=\mu \rho$ and $\psi=\rho \mu$ so $\theta=\varphi f(q) \psi$.

Let $Q_{1}$ be the smallest suffix of $q_{1}$ whose image by $f$ ends with $\psi$ and $Q_{2}$ be the smallest prefix of $q_{2}$ whose image by $f$ starts with $\varphi$. Since $\rho \neq \varepsilon$, it implies that $Q_{1}$ and $Q_{2}$ are not empty. There exist two words $\Pi_{1}$ and $\Sigma_{2}$ such that $f\left(Q_{1}\right)=\Pi_{1} \psi, f\left(Q_{2}\right)=\varphi \Sigma_{2},\left|\Pi_{1}\right|<\left|f\left(Q_{1}[1]\right)\right|$ and $\left|\Sigma_{2}\right|<\left|f\left(Q_{2}\left[\left|Q_{2}\right|\right]\right)\right|$.

We have $Q_{1} q Q_{2}$ factor of $q_{1} q q_{2}$ and $f\left(Q_{1} q Q_{2}\right)=\Pi_{1} \psi f(q) \varphi \Sigma_{2}=\Pi_{1}(\rho \mu)^{3} \rho \Sigma_{2}$.
If $Q_{1} q Q_{2}$ is cube-free, it ends the proof; $f$ is not cube-free. Hence, $Q_{1} q Q_{2}$ contains a shortest cube $q^{\prime 3}$; any proper factor of $q^{\prime 3}$ is cube-free, i.e., $q^{\prime 3}$ is a pure cube. So we can write $Q_{1} q Q_{2}=q_{1}^{\prime} q^{\prime 3} q_{2}^{\prime}$ for some words $q_{1}^{\prime}$ and $q_{2}^{\prime}$.

Let us remark that $Q_{1} q$ is necessarily cube-free. Indeed, if $Q_{1} \neq q_{1}$ then $Q_{1} q$ is a suffix of $q_{1}\left[2 . .\left|q_{1}\right|\right] q$ which is cube-free by assumption. If $Q_{1}=q_{1}$, by definition of $Q_{1}$, it means that $\psi$ is not a suffix of $f\left(q_{1}\left[2 .\left|q_{1}\right|\right]\right)$ and so $\left|f\left(q_{1}\left[2 . .\left|q_{1}\right|\right]\right)\right|<|\rho \mu|$. It implies that $\left|f\left(Q_{1}[1]\right)\right|=\left|f\left(q_{1}[1]\right)\right|>\left|\pi_{1} \beta \varphi f(q)\right| \geq\left|f\left(q_{1}\left[2 . .\left|q_{1}\right|\right] q\right)\right|$. In particular, it means that the first letter of $q_{1}$, i.e., $q_{1}[1]=Q_{1}[1]$ is not a letter of $q_{1}\left[2 . .\left|q_{1}\right|\right] q$. Since no cube appears in $q_{1}\left[2 . .\left|q_{1}\right|\right] q$, it follows that $q_{1} q=Q_{1} q$ is cube-free.

In the same way, we obtain that $q Q_{2}$ is cube-free.
So $q^{\prime 3}$ is neither a factor of $Q_{1} q$ nor a factor of $q Q_{2}$. It follows that $\left|q_{1}^{\prime} q^{\prime 3}\right|>\left|Q_{1} q\right|$ and $\left|q^{\prime 3} q_{2}^{\prime}\right|>\left|q Q_{2}\right|$ that is $\left|q_{2}^{\prime}\right|<\left|Q_{2}\right|$ and $\left|q_{1}^{\prime}\right|<\left|Q_{1}\right|$.

Let $\varphi^{\prime}$ be the greatest prefix of $\varphi=\mu \rho$ such that $f\left(Q_{1} q\right) \varphi^{\prime}$ is a prefix of $f\left(q_{1}^{\prime} q^{\prime 3}\right)$. Let $\psi^{\prime}$ be the greatest suffix of $\psi=\rho \mu$ such that $\psi^{\prime} f\left(q Q_{2}\right)$ is a suffix of $f\left(q^{\prime 3} q_{2}^{\prime}\right)$.

By these definitions, the word $\psi^{\prime} f(q) \varphi^{\prime}=\psi^{\prime} \rho \mu \rho \varphi^{\prime}$ is a common factor (not necessarily the greatest) of $f\left(q^{\prime}\right)^{3}$ and $(\rho \mu)^{4}$.

Note that the inequality $\left|\psi^{\prime} f(q) \varphi^{\prime}\right| \geq\left|f\left(q^{\prime}\right)\right|+|\rho \mu|$ is equivalent to $\left|f\left(q^{\prime}\right)\right| \leq\left|\psi^{\prime}\right|+\left|\varphi^{\prime}\right|+|\rho|$.
Case 1: $\left|f\left(q^{\prime}\right)\right| \leq\left|\psi^{\prime}\right|+\left|\varphi^{\prime}\right|+|\rho|$.
By Corollary 2.3, there exist two words $t_{1}$ and $t_{2}$, and two integers $i$ and $j$ such that $f\left(q^{\prime}\right)=\left(t_{1} t_{2}\right)^{i}$ and $\psi=\rho \mu=\left(t_{2} t_{1}\right)^{j}$ with $t_{1} t_{2}$ and $t_{2} t_{1}$ primitive words. If $j \geq 2, f\left(Q_{1} q\right)$ ends with $\psi f(q)=(\rho \mu)^{2} \rho=\left(t_{2} t_{1}\right)^{2 j} \rho$ where $2 j>3$. If $i \geq 2, f\left(q^{\prime 2}\right)=\left(t_{1} t_{2}\right)^{2 i}$ with $q^{\prime 2}$ a proper prefix of $q^{\prime 3}$ and $2 i>3$. In this two cases, the image by $f$ of a cube-free word contains a cube; $f$ is not cube-free. So $i=j=1$.

We have $f\left(Q_{1} q Q_{2}\right)=\Pi_{1}\left(t_{2} t_{1}\right)^{3} \rho \Sigma_{2}=f\left(q_{1}^{\prime} q^{\prime 3} q_{2}^{\prime}\right)=f\left(q_{1}^{\prime}\right)\left(t_{1} t_{2}\right)^{3} f\left(q_{2}^{\prime}\right)$. Since $t_{1} t_{2}$ is not an internal factor of $\left(t_{1} t_{2}\right)^{2}$ (otherwise, by Lemma 2.2, $t_{1} t_{2}$ would not be primitive), $\left|f\left(q_{1}^{\prime}\right)\right|<\left|f\left(Q_{1}\right)\right|=\left|\Pi_{1} t_{2} t_{1}\right|$ and $\left|f\left(q_{2}^{\prime}\right)\right|<$ $\left|f\left(Q_{2}\right)\right|=\left|t_{2} t_{1} \Sigma_{2}\right|$, we have either $\Pi_{1}=f\left(q_{1}^{\prime}\right) t_{1}$ and $f\left(q_{2}^{\prime}\right)=t_{1} \rho \Sigma_{2}$, or $\Pi_{1} t_{2}=f\left(q_{1}^{\prime}\right)$ and $t_{2} f\left(q_{2}^{\prime}\right)=\rho \Sigma_{2}$.

Case 1.1: $\Pi_{1}=f\left(q_{1}^{\prime}\right) t_{1}$.

Since $\left|\Pi_{1}\right|<\left|f\left(Q_{1}[1]\right)\right|=\left|f\left(\left(q_{1}^{\prime} q\right)[1]\right)\right|$ and $f$ bifix, it means that $q_{1}^{\prime}=\varepsilon, \Pi_{1}=t_{1}$, and $f\left(Q_{1}\right)=\Pi_{1} \psi=t_{1} t_{2} t_{1}=$ $f\left(q^{\prime}\right) t_{1}$ with $t_{1}$ a prefix of $f\left(q^{\prime}\right)$. Since $f$ is a ps-morphism so a bifix morphism, by Lemma 2.4, we obtain that there exists a prefix $x$ (possibly empty) of $q^{\prime}$ such that $f(x)=t_{1}$. From $f\left(q^{\prime}\right)=t_{1} t_{2}=f(x) t_{2}$ with $t_{2}$ a prefix of $f(q)$ and $f$ bifix, we obtain that there exists a prefix $y$ of $q$ such that $f(y)=t_{2}$.

From $f(q)=\rho \mu \rho=f(y x) \rho$ and $f$ bifix, we obtain that $\rho$ is the image of a word; a contradiction with the definition of $\rho$ in the hypotheses of this lemma.

Case 1.2: $\Pi_{1} t_{2}=f\left(q_{1}^{\prime}\right)$.
This case is solved in the same way as Case 1.1,
From $f\left(Q_{1}\right)=\Pi_{1} t_{2} t_{1}=f\left(q_{1}^{\prime}\right) t_{1}$, we obtain that $t_{1}$ is the image of a word. From $f\left(q^{\prime}\right)=t_{1} t_{2}$, we obtain that $t_{2}$ is the image of a word. It follows that $\rho$ is the image of a word; a contradiction with the definition of $\rho$.

Case 2: $\left|f\left(q^{\prime}\right)\right|>\left|\psi^{\prime}\right|+\left|\varphi^{\prime}\right|+|\rho|$.
If $q_{1}^{\prime}=\varepsilon$, i.e., $Q_{1} q Q_{2}=q^{\prime 3} q_{2}^{\prime}$ then, by definition of $\psi^{\prime}$, it means that $\psi^{\prime}=\psi=\rho \mu$. It follows that $\left|f\left(q^{\prime}\right)\right|>\left|\psi^{\prime}\right|+\left|\varphi^{\prime}\right|+|\rho|=|f(q)|+\left|\varphi^{\prime}\right|$. Furthermore, $\left|f\left(q^{\prime}\right)^{3}\right|>\left|\Pi_{1}\right|+2|f(q)|+2\left|\varphi^{\prime}\right|=\left|\Pi_{1} \varphi\right|+|f(q)|+$ $|\rho|+2\left|\varphi^{\prime}\right|=\left|f\left(Q_{1} q\right)\right|+|\rho|+2\left|\varphi^{\prime}\right|$. Since $|\rho| \neq 0$, we have $|\rho|+2\left|\varphi^{\prime}\right|>\left|\varphi^{\prime}\right|$. If $q_{2}^{\prime} \neq \varepsilon$ then $\left|f\left(q_{2}^{\prime}\right)\right|>\left|\Sigma_{2}\right|$ and, by definition of $\varphi^{\prime}$, we obtain $\left|f\left(q^{\prime}\right)^{3}\right|=\left|f\left(Q_{1} q\right) \varphi^{\prime}\right|$; this is impossible. Hence, $q_{2}^{\prime}=\varepsilon$ and $\varphi^{\prime}=\varphi=$ $\mu \rho$. It follows that $\left|f\left(q^{\prime}\right)^{2}\right|=\left|f\left(Q_{1} q Q_{2}\right)\right|-\left|f\left(q^{\prime}\right)\right|=\left|\Pi_{1} \rho \mu f(q) \mu \rho \Sigma_{2}\right|-\left|f\left(q^{\prime}\right)\right|<\left|\Pi_{1} \rho \mu \Sigma_{2}\right|$. If $\left|q^{\prime}\right| \geq 2$ then $\left|f\left(q^{\prime}\right) f\left(q^{\prime}\right)\right|>\left|\Pi_{1} \Sigma_{2}\right|+\left|f\left(q^{\prime}\right)\right|>\left|\Pi_{1} \Sigma_{2}\right|+|\psi|+|\varphi|+|\rho|=\left|\Pi_{1} \Sigma_{2}\right|+|\rho \mu \rho \mu \rho|$ with $|\rho| \neq 0$; this conflicts with previous inequality. Consequently, we have $\left|q^{\prime}\right|=1$ and $q^{\prime 3}=Q_{1} q Q_{2}$ with $Q_{1}, q$, and $Q_{2}$ non-empty words. Therefore, $Q_{1}=q=Q_{2}=q^{\prime}$ with $\rho \mu \rho=f(q)=f\left(Q_{1}\right)=\Pi_{1} \rho \mu$, i.e., $\mu \rho=\rho \mu$. By Proposition 2.1(2), there exist a non-empty word $\omega$ over $A$ and two integers $n$, and $p$ such that $\rho=\omega^{n}$ and $\mu=\omega^{p}$. Since $\rho \neq \varepsilon$, we obtain that $n \geq 1$. It follows that $f\left(Q_{1} q\right)$ contains $\omega^{3 n+2 p}$ with $Q_{1} q$ cube-free and $3 n+2 p \geq 3 ; f$ is not cube-free.

In the same way, we obtain that $q_{2}^{\prime} \neq \varepsilon$.
Since $Q_{1} q Q_{2}=q_{1}^{\prime} q^{\prime 3} q_{2}^{\prime}$, we have $\left|f\left(q_{1}^{\prime}[1]\right)\right|=\left|f\left(Q_{1}[1]\right)\right|>\left|\Pi_{1}\right|$ and $\left|f\left(q_{2}^{\prime}\left[\left|q_{2}^{\prime}\right|\right]\right)\right|=\left|f\left(Q_{2}\left[\left|Q_{2}\right|\right]\right)\right|>\left|\Sigma_{2}\right|$. Hence, $\left|\psi^{\prime}\right|<|\psi|$ and $\left|\varphi^{\prime}\right|<|\varphi|$. By definition of $\psi^{\prime}$ and $\varphi^{\prime}$, it implies that $f\left(q^{\prime}\right)^{3}=\psi^{\prime} f(q) \varphi^{\prime}$.

We have $\left|\psi^{\prime}\right|+2|\rho|+|\mu|+\left|\varphi^{\prime}\right|=\left|\psi^{\prime} f(q) \varphi^{\prime}\right|=\left|f\left(q^{\prime}\right)^{3}\right|>3\left(\left|\psi^{\prime}\right|+\left|\varphi^{\prime}\right|+|\rho|\right)$ that is $|\mu|>2\left|\psi^{\prime}\right|+2\left|\varphi^{\prime}\right|+|\rho|$. It means that $\mu$ starts with $\varphi^{\prime}$ and ends with $\psi^{\prime}$.

The word $f\left(q^{\prime}\right)$ starts with $\psi^{\prime} \rho$ and ends with $\rho \varphi^{\prime}$. There exist two words $X$ and $Y$ such that $f\left(q^{\prime}\right)=\psi^{\prime} \rho X=$ $Y \rho \varphi^{\prime}$. Since $\left|f\left(q^{\prime}\right)\right|>\left|\psi^{\prime}\right|+\left|\varphi^{\prime}\right|+|\rho|$, we have $|X|>\left|\varphi^{\prime}\right|$ and $|Y|>\left|\psi^{\prime}\right|$. Therefore, there exist two non-empty words $X^{\prime}$ and $Y^{\prime}$ such that $X=X^{\prime} \varphi^{\prime}, Y=\psi^{\prime} Y^{\prime}$, and $f\left(q^{\prime}\right)=\psi^{\prime} \rho X^{\prime} \varphi^{\prime}=\psi^{\prime} Y^{\prime} \rho \varphi^{\prime}$. It follows that $\rho X^{\prime}=Y^{\prime} \rho$. By proposition 2.1(1), there exist two words $r$ and $s$ and an integer $i$ such that $\rho=r(s r)^{i}, X^{\prime}=s r$, and $Y^{\prime}=r s$. Let us also note that $\mu$ ends with $Y^{\prime}$ and starts with $X^{\prime}$.

If $i \geq 1$ then $f\left(Q_{1} q\right)$ contains $\mu \rho \mu$ that itself contains $Y^{\prime} \rho X^{\prime}=(r s)^{2+i} r$ with $Q_{1} q$ cube-free and $2+i \geq 3 ; f$ is not cube-free.

Let us now consider the case $i=0$. We have $\rho=r, Y^{\prime}=\rho s, X^{\prime}=s \rho$, and $f\left(q^{\prime}\right)=\psi^{\prime} \rho s \rho \varphi^{\prime}$. From $f\left(q^{\prime}\right)^{3}=\psi^{\prime} f(q) \varphi^{\prime}=\psi^{\prime} \rho \mu \rho \varphi^{\prime}$, we also obtain that $\mu=s \rho \varphi^{\prime} f\left(q^{\prime}\right) \psi^{\prime} \rho s$. Let us remark that $\mu$ starts and ends with $s$. But the word $\mu$ also starts with $\varphi^{\prime}$ and also ends with $\psi^{\prime}$.

In particular, the word $f\left(Q_{1} q\right)$ contains $\mu(\rho) \mu$ that itself contains $\psi^{\prime} \rho s(\rho) s \rho \varphi^{\prime}$.
If $|s| \leq\left|\varphi^{\prime}\right|$ then $s$ is a prefix of $\varphi^{\prime}$ and $\psi^{\prime} \rho s \rho s \rho \varphi^{\prime}$ contains the cube $(\rho s)^{3}$. If $|s| \leq\left|\psi^{\prime}\right|$ then $s$ is a suffix of $\psi^{\prime}$ and $\psi^{\prime} \rho s \rho s \rho \varphi^{\prime}$ contains the cube $(s \rho)^{3}$. If $|s|>\left|\varphi^{\prime}\right|,|s|>\left|\psi^{\prime}\right|$, and $|s| \leq\left|\varphi^{\prime}\right|+\left|\psi^{\prime}\right|$ then there exist three words $a, b$, and $c$ such that $s=a b c, \varphi^{\prime}=a b$, and $\psi^{\prime}=b c$. It follows that $\psi^{\prime} \rho s \rho s \rho \varphi^{\prime}$ contains the cube $(b c \rho a)^{3}$. In these three cases, $f\left(Q_{1} q\right)$ contains a cube with $Q_{1} q$ cube-free; $f$ is not cube-free.

The remaining case is $|s|>\left|\varphi^{\prime}\right|,|s|>\left|\psi^{\prime}\right|$, and $|s|>\left|\varphi^{\prime}\right|+\left|\psi^{\prime}\right|$; there exists a non-empty word $\mu^{\prime}$ such that $s=\varphi^{\prime} \mu^{\prime} \psi^{\prime}$ and we have $f\left(q^{\prime}\right)=\psi^{\prime} \rho \varphi^{\prime} \mu^{\prime} \psi^{\prime} \rho \varphi^{\prime}$.

Let us denote $\alpha^{\prime}=\psi^{\prime} \rho, \beta^{\prime}=\varphi^{\prime}, \rho^{\prime}=\psi^{\prime} \rho \varphi^{\prime}=\alpha^{\prime} \beta^{\prime}$, and $\theta^{\prime}=\mu^{\prime} \rho^{\prime} \rho^{\prime} \mu^{\prime} \rho^{\prime} \rho^{\prime} \mu^{\prime}$. We have $f\left(q^{\prime}\right)=\rho^{\prime} \mu^{\prime} \rho^{\prime}$ and $\mu=s \rho \varphi^{\prime} f\left(q^{\prime}\right) \psi^{\prime} \rho s=\varphi^{\prime} \mu^{\prime} \rho^{\prime} f\left(q^{\prime}\right) \rho^{\prime} \mu^{\prime} \psi^{\prime}=\varphi^{\prime} \theta^{\prime} \psi^{\prime}$.

Since $f\left(Q_{1}\right)=f\left(q_{1}^{\prime}\right) \psi^{\prime}$ ends with $\mu$, we obtain that $f\left(q_{1}^{\prime}\right)$ ends with $\varphi^{\prime} \theta^{\prime}=\beta^{\prime} \theta^{\prime}$. And, since $f\left(Q_{2}\right)=\varphi^{\prime} f\left(q_{2}^{\prime}\right)$ starts with $\mu \rho$, we obtain that $f\left(q_{2}^{\prime}\right)$ starts with $\theta^{\prime} \psi^{\prime} \rho=\theta^{\prime} \alpha^{\prime}$. Moreover, by Lemma 2.4, it means that $\psi^{\prime}$ and $\varphi^{\prime}$
are images of words by $f$.
Since $f$ is bifix, if $\rho^{\prime}=\psi^{\prime} \rho \varphi^{\prime}$ is the image of a word by $f$, it is the same for $\rho$; a contradiction with the hypotheses. So $\rho^{\prime}$ is not the image of a word by $f$.

Since $q_{1}^{\prime} q^{\prime}$ is a prefix of $Q_{1} q$ and $q^{\prime} q_{2}^{\prime}$ is a suffix of $q Q_{2}$, the words $q_{1}^{\prime} q^{\prime}$ and $q^{\prime} q_{2}^{\prime}$ are cube-free.
Finally, since $3\left|f\left(q^{\prime}\right)\right|=\left|\psi^{\prime} f(q) \varphi^{\prime}\right|<|\psi f(q) \varphi| \leq 3|f(q)|$, we have $\left|f\left(q^{\prime}\right)\right|<|f(q)|$.

Lemma 3.3 Let $f$ be a ps-morphism from $A^{*}$ to $B^{*}$. Let $q_{1}, q_{2}$, and $q$ be non-empty words over $A$ and let $w=q_{1} q^{3} q_{2}$. Let us assume that $f(w)=\pi_{1} f(z)^{3} \sigma_{2},\left|\pi_{1}\right|<\left|f\left(q_{1}[1]\right)\right|,\left|\sigma_{2}\right|<\left|f\left(q_{2}\left[\left|q_{2}\right|\right]\right)\right|$, and $z$ is a non-empty word over $A$ such that $z^{3}$ is a pure cube.

If $|q| \leq 2$, if $|z| \geq 2$, or if $2|f(q)| \geq|f(z)|$ then $f$ is not cube-free.
Otherwise, either $f$ is not cube-free or there exist two words $X$ and $Y$ such that $|Y| \leq 1,2|f(q)|<|f(X)|=$ $|f(z)|<3|f(q)|$, and $q_{1} q^{3} q_{2}=X^{3} Y$ with $q_{1}$ a prefix of $X$, $q_{2}$ a suffix of $X Y$, and $|f(Y)|<\left|\sigma_{2} f(z)\right|$ or $q_{1} q^{3} q_{2}=$ $Y X^{3}$ with $q_{1}$ a prefix of $Y X, q_{2}$ a suffix of $X$, and $|f(Y)|<\left|\pi_{1} f(z)\right|$.

## Proof.

Let us first remark that we can assume that the image by $f$ of any proper factor of $z^{3}$ is cube-free. Otherwise, it ends the proof; $f$ is not cube-free.

The hypotheses imply $|f(z)|>|f(q)|$. Furthermore, there exist a suffix $\sigma_{1}$ of $f\left(q_{1}\right)$ and a prefix $\pi_{2}$ of $f\left(q_{2}\right)$ such that $f\left(q_{1}\right)=\pi_{1} \sigma_{1}$ and $f\left(q_{2}\right)=\pi_{2} \sigma_{2}$. It means that $f(z)^{3}=\sigma_{1} f(q)^{3} \pi_{2}$.

If $\left|\sigma_{1} f\left(q^{3}\right)\right| \leq\left|f(z)^{2} f(z[1 . .|z|-1])\right|$ then $f(z)^{2} f(z[1 . .|z|-1])$ contains the cube $f(q)^{3}$ with $z^{2}(z[1 . .|z|-1])$ a proper factor of $z^{3}$ and so cube-free. It ends the proof; $f$ is not cube-free. Identically, if $\left|f\left(q^{3}\right) \pi_{2}\right| \leq$ $\left|f(z[2 . .|z|]) f(z)^{2}\right|$ then $f$ is not cube-free. Consequently, we obtain that $\left|\pi_{2}\right|<|f(z[|z|])|$ and $\left|\sigma_{1}\right|<|f(z[1])|$; there exist two non-empty words $\alpha$ and $\beta$ such that $f(z)=\sigma_{1} \alpha=\beta \pi_{2}$ and $f(q)^{3}=\alpha f(z) \beta$.

Let us note that $\alpha \neq \varepsilon$ or $\beta \neq \varepsilon$. Otherwise, $f\left(z^{2}\right)$ contains $f(q)^{3}$. It ends the proof; $f$ is not cube-free.
If $\left|f\left(q^{2}\right)\right| \geq|f(z)|$ then $|\alpha|+|\beta|=\left|f\left(q^{3}\right)\right|-|f(z)| \geq|f(q)|$ and the length of $\alpha f(z) \beta \in \operatorname{Fcts}\left(f(z)^{3}\right) \cap \operatorname{Fcts}\left(f(q)^{3}\right)$ is at least $|f(z)|+|f(q)|$. Let us note that this situation particularly happens when $|z| \geq 2$ because in this case $|\alpha|+|\beta| \geq|f(z[2 . .|z|])|+|f(z[1 . .|z|-1])| \geq|f(z)|>|f(q)|$. By Corollary 2.3, there exist two words $z_{1}$ and $z_{2}$, and two integers $i$ and $j$ such that $f(z)=\left(z_{1} z_{2}\right)^{i}$ and $f(q)=\left(z_{2} z_{1}\right)^{j}$. The inequality $|f(z)|>|f(q)|(>0)$ implies $i>j \geq 1$. It follows that $f(z)^{2}=\left(z_{1} z_{2}\right)^{2 i}$ with $2 i>3$ that is $f(z)^{2}$ contains a cube; $f$ is not cube-free.

From now on, $z$ is a letter and $\left|f\left(q^{2}\right)\right|<|f(z)|$, i.e., $0<|\alpha|+|\beta|<|f(q)|$. We obtain that $f(q)^{3}=\alpha f(z) \beta$ starts and ends with $\alpha \beta$, i.e., $\alpha \beta$ is a prefix and a suffix of $f(q)$. There exist two non-empty words $\varphi$ and $\psi$ such that $f(q)=(\alpha \beta) \varphi=\psi(\alpha \beta)$ and $f(z)=\beta \varphi f(q) \psi \alpha$. By Proposition 2.1(1), there exist two words $\rho$ and $\mu$, and an integer $j$ such that $\alpha \beta=\rho(\mu \rho)^{j}, \varphi=\mu \rho$, and $\psi=\rho \mu$.

Since $f(z)^{2}$ contains $(\psi \alpha)(\beta \varphi)=\rho \mu \rho(\mu \rho)^{j} \mu \rho=\rho(\mu \rho)^{j+2}$ and $f(z)^{2}$ cube-free, we necessarily have $j=0$.
In this case, if we denote $\theta=\varphi f(q) \psi$, we have $\alpha \beta=\rho, f(q)=\rho \mu \rho, f(z)=\beta \mu \rho f(q) \rho \mu \alpha . \quad \theta=\mu \rho \rho \mu \rho \rho \mu$, $f(z)=\beta \theta \alpha, f\left(q_{1}\right)=\pi_{1} \beta \theta$ and $f\left(q_{2}\right)=\theta \alpha \sigma_{2}$.

Since $f$ is a $p s$-morphism so is non-erasing and since $q \neq \varepsilon$, we have $\rho \mu \neq \varepsilon$. Since $f(z)$ is cube-free, we necessarily have $\mu \neq \varepsilon$ and $\rho \neq \varepsilon$. Otherwise, the factor $\theta=\mu \rho \rho \mu \rho \rho \mu$ of $f(z)$ would be equal to $\rho^{4}$ or $\mu^{3}$.

We also necessarily have $q_{1}\left[2 . .\left|q_{1}\right|\right] q$ and $q q_{2}\left[1 . .\left|q_{2}\right|-1\right]$ cube-free. Otherwise, $f\left(q_{1}\left[2 . .\left|q_{1}\right|\right] q\right)$ or $f\left(q q_{2}\left[1 . .\left|q_{2}\right|-1\right]\right)$ both factors of $f(z)^{2}$ would contain a cube.

By Lemma 3.1, if $\rho$ is not the image of a word by $f$ then $f$ is not cube-free; it ends the proof.
Let us now assume that $\rho$ is the image of a word and let $\dot{q}$ be the non-empty word such that $f(\dot{q})=\rho=\alpha \beta(\neq \varepsilon)$. Since $f$ is bifix, $f(q)=\rho \mu \rho$ and $\mu \neq \varepsilon$, there exist a non-empty word $\bar{q}$ such that $f(\bar{q})=\mu$. It follows that $q=\dot{q} \bar{q} \dot{q}$ and necessarily $|q| \geq 3$. In particular, $|f(q q \dot{q} \bar{q})|=|f(z)|$ and $q q \dot{q} \bar{q}$ is an internal factor of $w ; f(w)$ and $f(z)^{3}$ are synchronised.

Furthermore, if we denote $x=\bar{q} \dot{q} q \dot{q} \bar{q}$, we obtain that $f(x)=\theta, f\left(q_{1}\right)=\pi_{1} \beta f(x)$, and $f\left(q_{2}\right)=f(x) \alpha \sigma_{2}$. Since $f$ is bifix and by Lemma 2.4, it follows that $q_{1}=W_{1} x$ for a non-empty word $W_{1}$ verifying $f\left(W_{1}\right)=\pi_{1} \beta(\neq \varepsilon)$ and $q_{2}=x W_{2}$ for a non-empty word $W_{2}$ verifying $f\left(W_{2}\right)=\alpha \sigma_{2}(\neq \varepsilon)$.

Since $f(\dot{q})=\rho=\alpha \beta,\left|\pi_{1}\right|<\left|f\left(q_{1}[1]\right)\right|=\left|f\left(W_{1}[1]\right)\right|$, and $\left|\sigma_{2}\right|<\left|f\left(q_{2}\left[\left|q_{2}\right|\right]\right)\right|=\left|f\left(W_{2}\left[\left|W_{2}\right|\right]\right)\right|$, by Lemma 2.6, we obtain that $\dot{q}=a, W_{1}=b, W_{2}=c$ for some letters $a, b, c$. Moreover, we have $b=a$ or $c=a$. It means that $q_{1} q^{3} q_{2}=b x(\dot{q} \bar{q} \dot{q})^{3} x c=$ bxaxaxc.

If $b=a$, let $X=a x$. It follows that $q_{1} q^{3} q_{2}=X^{3} c$ with $|f(X)|=|f(a x)|=|f(\dot{q} x)|=|\beta f(x) \alpha|=|f(z)|=$ $3|f(q)|-|\rho|$ and $|f(c)|-\left|\sigma_{2}\right|=|\alpha|<|f(q)|<|f(z)|$.

In the same way, if $c=a$, let $X=x a$. We have $q_{1} q^{3} q_{2}=b X^{3}$ with $|f(x a)|=|f(z)|$ and $|f(b)|<\left|\pi_{1} f(z)\right|$.
Lemma 3.4 Let $f$ be a ps-morphism from $A^{*}$ to $B^{*}$. Let $v$ and $T$ be non-empty words over $A$ such that $v^{3}$ is a pure cube. Let us assume that $f(T)=\pi_{1} f(v)^{3} \sigma_{2}$ with $\left|\pi_{1}\right|<|f(T[1])|,\left|\sigma_{2}\right|<|f(T[|T|])|, \pi_{1}$ a suffix of the image by $f$ of a shortest word $v_{1}$ and $\sigma_{2}$ a prefix of the image by $f$ of a shortest word $v_{2}$.
Then one of the following holds:

- (P.1): There exist a cube $x^{3}$, a word $y$ over $A$, and a word $Z$ over $B$ such that
(P.1.1): $T=x^{3} y,|y| \leq 1, f(y)=\pi_{1} \sigma_{2}, f(x)=\pi_{1} Z$, and $f(v)=Z \pi_{1}$
(P.1.2): or $T=y x^{3},|y|=1, f(y)=\pi_{1} \sigma_{2}, f(x)=Z \sigma_{2}$, and $f(v)=\sigma_{2} Z$.
- (P.2): There exist a pure cube $x^{3}$ and a non-empty word $y$ over $A$ such that
(P.2.1): $T=x^{3} y$ with $\left|f\left(x^{2}\right)\right|<\left|\pi_{1} f(v)\right|$
(P.2.2): or $T=y x^{3}$ with $\left|f\left(x^{2}\right)\right|<\left|f(v) \sigma_{2}\right|$.
- (P.3): $T=t^{3},|v| \geq 3,|t|=1$ (i.e., $t$ is a letter), $2|f(v)|<|f(t)|<3|f(v)|$, and there exist two words $x \neq \varepsilon$ and $y$ such that $|f(x)|=|f(t)|$ and
(P.3.1): $v_{1} v^{3} v_{2}=x^{3} y$ with $v_{1}$ a prefix of $x, v_{2}$ a suffix of $x y$, and $|f(y)|<\left|f(t) \sigma_{2}^{\prime}\right|$
(P.3.2): or $v_{1} v^{3} v_{2}=y x^{3}$ with $v_{1}$ a prefix of $y x$, $v_{2}$ a suffix of $x$, and $|f(y)|<\left|\pi_{1}^{\prime} f(t)\right|$
where $\pi_{1}^{\prime}$ and $\sigma_{2}^{\prime}$ are the words such that $f\left(v_{1}[1]\right)=\pi_{1}^{\prime} \pi_{1}$ and $f\left(v_{2}\left[\left|v_{2}\right|\right]\right)=\sigma_{2} \sigma_{2}^{\prime}$.
- (P.4): $f$ is not cube-free.

## Proof.

If $T$ is cube-free, it ends the proof; $f$ is not cube-free.
So $T$ contains at least one cube. Among the cubes of $T$, we choose one whose image by $f$ is a shortest; we can write $T=t_{1} t^{3} t_{2}$ where $|f(t)|=\min \left\{\left|f\left(t^{\prime}\right)\right|\right.$ where $\left.t^{\prime 3} \in \operatorname{Fcts}(T)\right\}$. By this definition, since $f$ is bifix (as any ps-morphism) and so non-erasing, $t^{3}$ is a pure cube.

If $t_{1} \neq \varepsilon$ and $t_{2} \neq \varepsilon$ then, by Lemma 3.3, $T$ verify (P.1) or (P.4).
As in the proof of Lemma 3.1 done in [19], if a power of $f(t)$ and a power of $f(v)$ have a common factor of length at least $|f(t)|+|f(v)|$, we obtain that $T$ verify (P.1).

From now, let us assume the converse holds, i.e., any common factor of $f(t)^{3}$ and $f(v)^{3}$ is of length at most $|f(t)|+|f(v)|$. It means that $\left|f(t)^{3}\right|-\left|\sigma_{2}\right|<|f(t)|+|f(v)|$ when $t_{1} \neq \varepsilon$ and $t_{2}=\varepsilon$, and that $\left|f(t)^{3}\right|-\left|\pi_{1}\right|<$ $|f(t)|+|f(v)|$ when $t_{1}=\varepsilon$ and $t_{2} \neq \varepsilon$. That is $T$ verify (P.2) with $x=t$.

Let us now treat the case where $t_{1}=t_{2}=\varepsilon$. In this case, $f(v)^{3}$ is factor of $f\left(t^{3}\right)=f(T)$. Hence, $2|f(v)|<|f(t)|$ and $\left|\pi_{1}\right|+\left|\sigma_{2}\right|=3|f(t)|-3|f(v)|>3|f(v)|$. If $\pi_{1}=\varepsilon$ then $f\left(t^{2}\right)$ contains the cube $f(v)^{3}$ with $t^{2}$ cube-free; $f$ is not cube-free. In the same way, if $\sigma_{2}=\varepsilon$ then $f$ is not cube-free. It follows that $v_{1} \neq \varepsilon$ and $v_{2} \neq \varepsilon$; there exist a prefix $\pi_{1}^{\prime}$ of $f\left(v_{1}[1]\right)$ and a suffix $\sigma_{2}^{\prime}$ of $f\left(v_{2}\left[\left|v_{2}\right|\right]\right)$ such that $f\left(v_{1} v^{3} v_{2}\right)=\pi_{1}^{\prime} \pi_{1} f(v)^{3} \sigma_{2} \sigma_{2}^{\prime}=\pi_{1}^{\prime} f(t)^{3} \sigma_{2}^{\prime}$. By Lemma 3.3 with $q=v$, we obtain that either $f$ is not cube-free (for instance if $|v| \leq 2$ or if $|t| \geq 2$ ) or $T$ verify (P.3).

By Lemma 2.8, we immediately obtain:
Corollary 3.5 With hypotheses and notations of Lemma 3.4, if $f(T)$ and $f(v)^{3}$ are synchronised then either $f$ is not cube-free or $T$ verifies (P.1).

## 4 Special case of uniform morphisms

As a consequence of Lemma 3.4 and using Lemma 2.9, we can reduce a word whose image by a uniform morphism contains a cube. We can now state our main result.

Theorem 4.1 Let $A$ and $B$ be two alphabets. A cube-free uniform morphism is $k$-power-free for all integers $k \geq 4$.

It is a consequence of Proposition 2.10 and Proposition 4.2:
Proposition 4.2 Let $A$ and $B$ be two alphabets. A cube-free uniform morphism is 4-power-free.

## Proof.

We follow the approach of the proof of Lemma 4.1 in [19]. We have to verify that all the steps are checked for $k=3$.

Let $f$ be uniform morphism from $A^{*}$ to $B^{*}$. We assume that $f$ is not 4 -power-free and we want to show that $f$ is not cube-free. The morphism $f$ must be a ps-morphism. Otherwise, by Lemma 2.5, $f$ is not cube-free; it ends the proof.

Let $w$ a shortest 4-power-free word whose image by $f$ contains a 4-power. That is $f(w)=p u^{4} s$ for a non-empty word $u$ and two words $p$ and $s$ over $B$. If $f(w)$ and $u^{4}$ are synchronised, by Lemma $2.8, w$ contains a 4 -power; a contradiction with the definition of $w$.

Now, let us assume that $f$ is a ps-morphism and that $f(w)$ and $u^{4}$ are not synchronised. In particular, it implies that $f$ is bifix and injective.

The central point of this proof is that, starting with $w$ and $u$, we use iteratively reduction of Lemma 2.6 in [19] on the word whose image contains a 4 -power in such a way that there is no reduction left. That is, no situation of the hypotheses of this lemma can be founded after this procedure; we obtain new words $W$ et $U$ such that $f(W)=p U^{4} s$ with $p$ a proper prefix of $W[1], s$ a proper suffix of $W[|W|]$, and $f(W)$ and $U^{4}$ are not synchronised.

We will show that either $f$ is not cube-free, or $f(W)$ and $U$ can again be reduced using Lemma 2.6 in [19]; a contradiction with their definitions.

Step 1: For any pure cube $v^{3}$ of $W$, the words $U^{4}$ and $f(v)^{3}$ do not have any common factor of length at least $|U|+|f(v)|$.

By contradiction, let us assume that $U^{4}$ and $f(v)^{3}$ have a common factor of length at least $|U|+|f(v)|$. By Corollary 2.3, there exist two words $t_{1}$ and $t_{2}$, and two integers $r$ and $q$ such that $f(v)=\left(t_{1} t_{2}\right)^{r}$ and $U=\left(t_{2} t_{1}\right)^{q}$ with $t_{1} t_{2}$ and $t_{2} t_{1}$ primitive words.

If $r \geq 2$ then $f\left(v^{2}\right)=\left(t_{1} t_{2}\right)^{2 r}$ with $2 r>3$ that is $f\left(v^{2}\right)$ contains a cube with $v^{2}$ cube-free by definition of $v$; $f$ is not cube-free.

If $r=1$ then it implies $q \geq 2$. Otherwise, $v^{q}$ would be an internal factor of $v^{3}$ that is of $W$ with $\left|f(v)^{q}\right|=|U|$; $f(W)$ and $U^{3}$ would be synchronised. Consequently, if $W=v_{1} v^{3} v_{2}$ for some words $v_{1}$ and $v_{2}$ then $f(W)=$ $f\left(v_{1}\right)\left(t_{1} t_{2}\right)^{3} f\left(v_{2}\right)=p U^{4} s=p\left(t_{2} t_{1}\right)^{4 q} s$ with $q \geq 2$.

Let $x$ be the greatest integer such that $p\left(t_{2} t_{1}\right)^{x}$ is a prefix of $f\left(v_{1} v\right)$ and let $y$ be the greatest integer such that $\left(t_{2} t_{1}\right)^{y} s$ is a suffix of $f\left(v v_{2}\right)$. There exist four words $t_{p}^{\prime}, t_{p}^{\prime \prime}, t_{s}^{\prime}$, and $t_{s}^{\prime \prime}$ such that $t_{2} t_{1}=t_{p}^{\prime} t_{p}^{\prime \prime}=t_{s}^{\prime} t_{s}^{\prime \prime}$, $f\left(v_{1} v\right)=p\left(t_{2} t_{1}\right)^{x} t_{p}^{\prime}, f\left(v v_{2}\right)=t_{s}^{\prime \prime}\left(t_{2} t_{1}\right)^{y} s$, and $f(v)=t_{p}^{\prime \prime}\left(t_{2} t_{1}\right)^{4 q-x-y-2} t_{s}^{\prime}$.

If $x=0$ then $\left|f\left(v_{1}\right)\right|<p$. It implies that $v_{1}=\varepsilon$. Therefore, we obtain that $f\left(v_{1} v^{2}\right)=p t_{p}^{\prime} f(v)=\left(t_{1} t_{2}\right)^{2}$ starts with a prefix of $p\left(t_{2} t_{1}\right)^{2}$. Since $t_{2} t_{1}$ is not a primitive word, by Lemma $2.2,\left(t_{2} t_{1}\right)$ is not an internal factor of $\left(t_{2} t_{1}\right)^{2}$. It implies that $p=t_{1}$ and $t_{p}^{\prime}=t_{2}$. In the same way, if $y=0$, we obtain that $s=t_{2}$ and $t_{s}^{\prime \prime}=t_{1}$.

Since $f\left(v_{1} v\right)$ ends with $t_{1} t_{2}$, since $f\left(v v_{2}\right)$ starts with $t_{1} t_{2}$, if $x \geq 1$ and $t_{p}^{\prime} \neq t_{2}$, or if $y \geq 1$ and $t_{s}^{\prime \prime} \neq t_{1}$ then $\left(t_{2} t_{1}\right)$ is an internal factor of $\left(t_{2} t_{1}\right)^{2}$. By Lemma 2.2, we obtain that $t_{2} t_{1}$ is not a primitive word; a contradiction with the definition of $t_{2} t_{1}$.

Therefore, $t_{p}^{\prime}=t_{2}=t_{s}^{\prime}, t_{p}^{\prime \prime}=t_{1}=t_{s}^{\prime \prime}, f\left(v_{1} v\right)=p t_{2} f(v)^{x}, f\left(v v_{2}\right)=f(v)^{y} t_{1} s$, and $x+y+1=4 q-1$. Since $f$ is bifix, it follows that $f\left(v_{1} v\right)$ ends with $f(v)^{x}$ and $f\left(v v_{2}\right)$ starts with $f(v)^{y}$. Consequently, we obtain that $v^{4 q-1}$
is an internal factor $W$ with $4 q-1 \geq q$. It implies that $v^{q}$ is an internal factor $W$ with $\left|f(v)^{q}\right|=|U|$, i.e., $f(W)$ and $u^{3}$ are synchronised; a contradiction with the hypotheses.

Step 2: $W[2 . .|W|-1]$ contains a cube and so a pure-cube.
By contradiction, let us assume that $W[2 .|W|-1]$ is cube-free. It implies that $W$ starts or ends with a pure cube. Let $s_{1}$ and $p_{5}$ be the words such that $f(W[1])=p s_{1}$ and $f(W[|W|])=p_{5} s$ that is $U^{4}=$ $s_{1} f(W[2 . .|W|-1]) p_{5}$.

If $\left|s_{1}\right| \leq\left|U^{3}\right|$ then there exists a word $U_{c}$ such that $s_{1} U_{c}$ is the prefix of $U^{4}=s_{1} f(W[2 . .|W|-1]) p_{5}$ of length $\left|s_{1} U\right|$. Trivially, the word $U_{c}$ is a conjugated of $U$ (and $\left|U_{c}\right|=|U|$ ).

If $\left|s_{1}\right|+\left|p_{5}\right| \leq|U|$, we naturally have $\left|s_{1}\right| \leq\left|U^{3}\right|$. Moreover $\left|s_{1}\right|+\left|U_{c}^{3}\right|+\left|p_{5}\right| \leq\left|U^{4}\right|$. It means that $f(W[2 .|W|-1])$ starts with $U_{c}^{3}$. Since $W[2 .|W|-1]$ is a cube-free word, it ends the proof; $f$ is not cube-free.

Let us now study the case where $\left|s_{1}\right|+\left|p_{5}\right|>|U|$.
Let us recall that, since we assume that $W[2 .|W|-1]$ is cube-free, any pure cube of $W=W[1 . .|W|]$ is necessarily a prefix or a suffix of it.

If $W$ starts with a pure cube $v^{3}$, let $W_{\text {com }}$ be the greatest prefix of $s_{1} f(v[2 . .|v|]) f\left(v^{2}\right)$ that is factor of $U^{4}$ so a common factor of a power of $f(v)$ and a power of $U$. Let us remark that, if $W=v^{3}$ then $W_{c o m}=U^{4}$ else $W_{\text {com }}=s_{1} f(v[2 . .|v|]) f\left(v^{2}\right)$.

By Step 1, we have $\left|W_{\text {com }}\right|<|U|+|f(v)|$. By definition of $W_{\text {com }}$, if $W=v^{3}$ then $W_{\text {com }}=U^{4}=$ $s_{1} f(v[2 . .|v|]) f(v) f(v[1 . .|v|-1]) p_{5}$ would be a common factor of $f(v)^{3}$ and $U^{3}$ with $\left|W_{c o m}\right| \geq\left|s_{1}\right|+|f(v)|+\left|p_{5}\right|>$ $|f(v)|+|U|$; a contradiction. Hence, $W \neq v^{3}$ and $\left|W_{\text {com }}\right|=|f(v)|+\left|s_{1} f(v[2 . .|v|]) f(v)\right|>|f(v)|+2\left|s_{1}\right|$. It implies that $\left|s_{1}\right|<|U| / 2$.

In the case where $W$ ends with a cube $v^{\prime 3}$, we similarly obtain that $\left|p_{5}\right|<|U| / 2$.
If $W$ starts with a cube then $\left|s_{1}\right|<|U| / 2$. Since $\left|s_{1}\right|+\left|p_{5}\right|>|U|$, we obtain that $\left|p_{5}\right|>|U| / 2$. It implies that $W[2 . .|W|]$ is cube-free. But $f(W[1 . .|W|])$ starts with $p s_{1} U_{c}^{3}$, i.e., $f(W[2 . .|W|])$ contains the cube $U_{c}^{3} ; f$ is not cube-free.

In the same way, if $W$ ends with a cube, we also obtain either a contradiction with the assumptions or that $f$ is not cube-free.

Step 3: For any pure cube $v^{3} \in \operatorname{Fcts}(W[2 .|W|-1])$, the word $f(v)^{3}$ is an internal factor of $U^{3}$ and $\left|f\left(v^{2}\right)\right|<|U|$.

For any pure cube $v^{3} \in \operatorname{Fcts}(W[2 . .|W|-1])$, the word $f(v)^{3}$ is an internal factor of $U^{4}$. So $\left|f(v)^{3}\right|<$ $|U|+|f(v)|$, i.e., $\left|f(v)^{2}\right|<|U|$ and $\left|f(v)^{3}\right|<\frac{3}{2}|U|$. That is $f(v)^{3}$ is an internal factor of $U^{3}$. It implies that $c_{\mathrm{v}}=1,2$ or 3 .

Let us recall that, for all integers $j \in\left[1 ; 5-c_{\mathrm{v}}\right], f(v)^{3}$ is an internal factor of $p_{j} U^{c_{\mathrm{v}}} s_{j+c_{\mathrm{v}}}$. Consequently, if $\widehat{v}_{j}$ is the shortest factor of $W\left[i_{j} . . i_{j+c_{v}}\right]$ such that $f\left(\widehat{v}_{j}\right)$ contains $f(v)^{3}$ then, by Corollary 3.5, $\widehat{v}_{j}$ verifies Property (P.1) for all integers $j \in\left[1 ; 5-c_{\mathrm{V}}\right]$.

We are going to see that it implies that $W$ can be reduced; a final contradiction.
Case 3.1: $c_{\mathrm{v}}=3$
We necessarily have $d_{\mathrm{v}}=1$ and $\left|D_{\mathrm{v}} f(v)\right|\left(\leq\left|f\left(v^{2}\right)\right|\right)<|U| \leq\left|D_{\mathrm{v}} f\left(v^{2}\right)\right|$. For all integers $j \in[1 ; 2]$, if $\widehat{v}_{j}$ verifies (P.1.1) then $x_{j}{ }^{3} \in L_{j+1, v}$. And if $\widehat{v}_{j}$ verifies (P.1.2) then $x_{j}{ }^{3} \in R_{j+1, v}$. In other words, we have $L_{j+1, v} \cup R_{j+1, v} \neq \emptyset$ with $j+1 \in[2 ; 3]$; by Lemma 2.9(2), we can reduce $W$.

Case 3.2: $c_{\mathrm{v}} \neq 3$ and $d_{\mathrm{v}}=1$
We necessarily have $c_{\mathrm{v}}=2$, i.e, $5-c_{\mathrm{v}}=3$. For all integers $j \in[1 ; 3]$, if $\widehat{v}_{j}$ verifies (P.1.1) then $x_{j}{ }^{3} \in L_{j+1, v}$. And if $\widehat{v}_{j}$ verifies (P.1.2) then $x_{j}{ }^{3} \in R_{j+1, v}$. That is $L_{j, v} \cup R_{j, v} \neq \emptyset$ for all integers $j \in[2 ; 4]$; by Lemma 2.9(1), a reduction can be done.

Case 3.3: $c_{\mathrm{v}} \neq 3$ and $d_{\mathrm{v}}=0$
If $c_{\mathrm{v}}=1$ then $\left|D_{\mathrm{v}} f(v)^{2}\right| \leq|U|$ and $L_{j, v} \cup R_{j, v} \neq \emptyset$ for all integers $j \in[1 ; 4]$. By Lemma 2.9(3), a reduction can be done.

If $c_{\mathrm{v}}=2$ then $|U|<\left|D_{\mathrm{v}} f(v)^{2}\right|$ and $L_{j, v} \cup R_{j, v} \neq \emptyset$ for all integers $j \in[1 ; 3]$; by Lemma 2.9(4), a reduction can be done.
