# BOUNDARY SINGULARITIES OF SOLUTIONS TO SEMILINEAR FRACTIONAL EQUATIONS 

PHUOC-TAI NGUYEN AND LAURENT VÉRON

#### Abstract

We prove the existence of a solution of $(-\Delta)^{s} u+f(u)=0$ in a smooth bounded domain $\Omega$ with a prescribed boundary value $\mu$ in the class of positive Radon measures for a large class of continuous functions $f$ satisfying a weak singularity condition expressed under an integral form. We study the existence of a boundary trace for positive moderate solutions. In the particular case where $f(u)=u^{p}$ and $\mu$ is a Dirac mass, we prove the existence of several critical exponents $p$.

## 1. Introduction

Let $\Omega \subset \mathbb{R}^{N}$ be a bounded domain with $C^{2}$ boundary and $s \in(0,1)$. Define the $s$-fractional Laplacian as

$$
(-\Delta)^{s} u(x):=\lim _{\varepsilon \rightarrow 0}(-\Delta)_{\varepsilon}^{s} u(x)
$$

where

$$
(-\Delta)_{\varepsilon}^{s} u(x):=a_{N, s} \int_{\mathbb{R}^{N} \backslash B_{\varepsilon}(x)} \frac{u(x)-u(y)}{|x-y|^{N+2 s}} d y, \quad a_{N, s}:=\frac{\Gamma(N / 2+s)}{\pi^{N / 2} \Gamma(2-s)} s(1-s) .
$$

We denote by $G_{s}^{\Omega}$ and $M_{s}^{\Omega}$ the Green kernel and the Martin kernel of $(-\Delta)^{s}$ in $\Omega$ respectively. Denote by $\mathbb{G}_{s}^{\Omega}$ and $\mathbb{M}_{s}^{\Omega}$ the Green operator and the Martin operator (see section 2 for more details).

Let $\rho(x)$ be the distance from $x$ to $\partial \Omega$. For $\beta>0$, denote

$$
\Omega_{\beta}:=\{x \in \Omega: \rho(x)<\beta\}, D_{\beta}:=\{x \in \Omega: \rho(x)>\beta\}, \Sigma_{\beta}:=\{x \in \Omega: \rho(x)=\beta\}
$$

Definition 1.1. We say that a function $u \in L_{l o c}^{1}(\Omega)$ possesses a s-boundary trace on $\partial \Omega$ if there exists a measure $\mu \in \mathfrak{M}(\partial \Omega)$ such that

$$
\begin{equation*}
\lim _{\beta \rightarrow 0} \beta^{1-s} \int_{\Sigma_{\beta}}\left|u-\mathbb{M}_{s}^{\Omega}[\mu]\right| d S=0 \tag{1.1}
\end{equation*}
$$

The $s$-boundary trace of $u$ is denoted noted by $\operatorname{tr}_{s}(u)$.
Let $f \in C(\mathbb{R})$ be an increasing function with $f(0)=0, \tau \in \mathfrak{M}\left(\Omega, \rho^{s}\right)$ and $\mu \in \mathfrak{M}(\partial \Omega)$. In this paper, we study nonlinear problem of the form

$$
\left\{\begin{align*}
(-\Delta)^{s} u+f(u) & =\tau  \tag{1.2}\\
& \text { in } \Omega \\
\operatorname{tr}_{s}(u) & =\mu \\
& =0 \\
u & \text { in } \Omega^{c}
\end{align*}\right.
$$

Definition 1.2. Let $\tau \in \mathfrak{M}(\Omega)$ and $\mu \in \mathfrak{M}(\partial \Omega)$. A function $u$ is called a weak solution of (1.2) if $u \in L^{1}(\Omega), f(u) \in L^{1}\left(\Omega, \rho^{s}\right)$ and

$$
\begin{equation*}
\int_{\Omega}\left(u(-\Delta)^{s} \xi+f(u) \xi\right) d x=\int_{\Omega} \xi d \tau+\int_{\Omega} \mathbb{M}_{s}^{\Omega}[\mu](-\Delta)^{s} \xi d x, \quad \forall \xi \in \mathbb{X}_{s}(\Omega) \tag{1.3}
\end{equation*}
$$

The linear problem associated to (1.2) is

$$
\left\{\begin{align*}
(-\Delta)^{s} u & =\tau & & \text { in } \Omega  \tag{1.4}\\
\operatorname{tr}_{s}(u) & =\mu & & \\
u & =0 & & \text { in } \Omega^{c}
\end{align*}\right.
$$

Proposition A. Assume $s \in\left(\frac{1}{2}, 1\right)$. Let $\tau \in \mathfrak{M}\left(\Omega, \rho^{s}\right)$ and $\mu \in \mathfrak{M}(\partial \Omega)$.
(i) Problem (1.4) admits a unique solution. The solution is given by

$$
\begin{equation*}
u=\mathbb{G}_{s}^{\Omega}[\tau]+\mathbb{M}_{s}^{\Omega}[\mu] \tag{1.5}
\end{equation*}
$$

(ii) There exists a positive constant $c=c(N, s, \Omega)$ such that

$$
\begin{equation*}
\|u\|_{L^{1}(\Omega)} \leq c\left(\|\tau\|_{\mathfrak{M}\left(\Omega, \rho^{s}\right)}+\|\mu\|_{\mathfrak{M}(\partial \Omega)}\right) \tag{1.6}
\end{equation*}
$$

Next we deal with (1.2) with $L^{1}$ data.
Theorem B. Assume $s \in\left(\frac{1}{2}, 1\right)$ and $f \in C(\mathbb{R})$ is nondecreasing and $t f(t) \geq 0$ for every $t \in \mathbb{R}$.
I. Existence And uniqueness. For every $\tau \in L^{1}\left(\Omega, \rho^{s}\right)$ and $\mu \in L^{1}(\partial \Omega)$, problem (1.2) admits a unique weak solution $u$. Moreover,

$$
\begin{gather*}
u=\mathbb{G}_{s}^{\Omega}[\tau-f(u)]+\mathbb{M}_{s}^{\Omega}[\mu] \quad \text { in } \Omega  \tag{1.7}\\
-\mathbb{G}_{s}^{\Omega}\left[\tau^{-}\right]-\mathbb{M}_{s}^{\Omega}\left[\mu^{-}\right] \leq u \leq \mathbb{G}_{s}^{\Omega}\left[\tau^{+}\right]+\mathbb{M}_{s}^{\Omega}\left[\mu^{+}\right] \quad \text { in } \Omega . \tag{1.8}
\end{gather*}
$$

II. Monotonicity. Assume $\tau, \tau^{\prime} \in L^{1}(\Omega), \mu, \mu^{\prime} \in L^{1}(\partial \Omega)$ and $u$ and $u^{\prime}$ be the solutions of (1.2) with data $(\tau, \mu)$ and $\left(\tau^{\prime}, \mu^{\prime}\right)$ respectively. If $\tau \leq \tau^{\prime}$ and $\mu \leq \mu^{\prime}$ then $u \leq u^{\prime}$ in $\Omega$.

Put

$$
p_{1}^{*}:=\frac{N+2 s}{N}, \quad p_{2}^{*}:=\frac{N+s}{N-s}, \quad p_{3}^{*}:=\frac{N}{N-2 s} .
$$

Note that $p_{1}^{*}<p_{2}^{*}<p_{3}^{*}$.
An important feature of (1.2) is that this problem does not admit solutions for every measures $\tau$ and $\mu$ and the solvability of (1.2) depends on the properties of the nonlinearity $f$. This is reflected in the following result.

Theorem C. Assume $f$ is a continuous nondecreasing function on $\mathbb{R}$ satisfying $f(0)=0$ and

$$
\begin{equation*}
\int_{1}^{\infty}[f(s)-f(-s)] s^{-1-p_{2}^{*}} d s<\infty . \tag{1.9}
\end{equation*}
$$

Then for every $\tau \in \mathfrak{M}\left(\Omega, \rho^{s}\right)$ and $\mu \in \mathfrak{M}(\partial \Omega)$ there exists a unique solution of (1.2). This solution satisfies

$$
\begin{gather*}
u=\mathbb{G}_{s}^{\Omega}[\tau-f(u)]+\mathbb{M}_{s}^{\Omega}[\mu],  \tag{1.10}\\
-\mathbb{G}_{s}^{\Omega}\left[\tau^{-}\right]-\mathbb{M}_{s}^{\Omega}\left[\mu^{-}\right] \leq u \leq \mathbb{G}_{s}^{\Omega}\left[\tau^{+}\right]+\mathbb{M}_{s}^{\Omega}\left[\mu^{+}\right] . \tag{1.11}
\end{gather*}
$$

Moreover, the mapping $(\tau, \mu) \mapsto u$ is nondecreasing.
Theorem D. Assume $s \in\left(\frac{1}{2}, 1\right)$ and $f$ is a continuous nondecreasing function on $\mathbb{R}$ satisfying $f(0)=0$ and (1.9). Let $z \in \partial \Omega$ and $k>0$. Let $u_{z, k}^{\Omega}$ be the unique solution of

$$
\left\{\begin{align*}
(-\Delta)^{s} u+f(u) & =0 \quad \text { in } \Omega  \tag{1.12}\\
\operatorname{tr}_{s}(u) & =k \delta_{z} \\
u & =0 \quad \text { in } \Omega^{c} .
\end{align*}\right.
$$

Then

$$
\begin{equation*}
\lim _{\Omega \ni x \rightarrow z} \frac{u_{z, k}^{\Omega}(x)}{M_{s}^{\Omega}(x, z)}=k . \tag{1.13}
\end{equation*}
$$

We next assume that $0 \in \partial \Omega$. Let $0<p<p_{2}^{*}$ and denote by $u_{k}^{\Omega}$ the unique solution of

$$
\left\{\begin{align*}
(-\Delta)^{s} u+u^{p} & =0 & & \text { in } \Omega  \tag{1.14}\\
\operatorname{tr}_{s}(u) & =k \delta_{0} & & \\
u & =0 & & \text { in } \Omega^{c} .
\end{align*}\right.
$$

By Theorem C, $u_{k}^{\Omega} \leq k M_{s}^{\Omega}(\cdot, 0)$. Moreover, $k \mapsto u_{k}^{\Omega}$ is increasing. In the Appendix we develop the study of separable solutions of

$$
\left\{\begin{align*}
(-\Delta)^{s} u+u^{p} & =0 & & \text { in } \mathbb{R}_{+}^{N}  \tag{1.15}\\
u & =0 & & \text { in } \overline{\mathbb{R}_{-}^{N}} .
\end{align*}\right.
$$

when $p>1$. Writting such a solution under the form $u(x)=u(r, \sigma)=r^{-\frac{2 s}{p-1}} \omega(\sigma)$, with $r>0$ and $\sigma \in S_{+}^{N-1}$, we obtain that $\omega$ satisfies

$$
\left\{\begin{align*}
\mathcal{A}_{s} \omega-\mathcal{L}_{s, \frac{2 s}{p-1}} \omega+\omega^{p}=0 & \text { in } S_{+}^{N-1}  \tag{1.16}\\
\omega=0 & \text { in } \overline{S_{-}^{N-1}},
\end{align*}\right.
$$

where $\mathcal{A}_{s}$ is a nonlocal operator naturaly associated to the $s$-fractional Laplace-Beltrami operator and $\mathcal{L}_{s, \frac{2 s}{p-1}}$ a linear integral operator with kernel. In analyzing the spectral properties of $\mathcal{A}_{s}$ we prove

Theorem E. Let $N \geq 2, s \in(0,1)$ and $p>p_{1}^{*}$.
I- If $p_{2}^{*} \leq p<p_{3}^{*}$ there exists no positive solution of (3.20) belonging to $W_{0}^{s, 2}\left(S_{+}^{N-1}\right)$.
II- If $p_{1}^{*}<p<p_{2}^{*}$ there exists a unique positive solution $\omega^{*} \in W_{0}^{s, 2}\left(S_{+}^{N-1}\right)$ of (3.20).
As a consequence of this result we obtain the obtain the behaviour of $u_{k}^{\Omega}$ when $k \rightarrow \infty$.
Theorem $\mathbf{F}$ Assume $s \in\left(\frac{1}{2}, 1\right)$. Let $\Omega=\mathbb{R}_{+}^{N}$ or $\Omega$ be a bounded domain with $C^{2}$ boundary containing 0 .
I- If $p \in\left(p_{1}^{*}, p_{2}^{*}\right)$ then $u_{\infty}^{\Omega}:=\lim _{k \rightarrow 0} u_{k}^{\Omega}$ is a positive solution of

$$
\left\{\begin{array}{rll}
(-\Delta)^{s} u+u^{p} & =0 & \text { in } \Omega  \tag{1.17}\\
u & =0 & \text { in } \Omega^{c}
\end{array}\right.
$$

(i) If $\Omega=\mathbb{R}_{+}^{N}$ then

$$
u_{\infty}^{\mathbb{R}_{+}^{N}}(x)=|x|^{-\frac{2 s}{p-1}} \omega^{*}(\sigma), \quad \text { with } \sigma=\frac{x}{|x|}, \quad \forall x \in \mathbb{R}_{+}^{N} .
$$

(ii) If $\Omega$ is a bounded $C^{2}$ domain with $\partial \Omega$ containing 0 then

$$
\begin{equation*}
\lim _{\substack{\Omega \ni x \rightarrow 0 \\ \frac{x}{|x|}=\sigma \in S_{+}^{N-1}}}|x|^{\frac{2 s}{p-1}} u_{\infty}^{\Omega}(x)=\omega^{*}(\sigma), \tag{1.18}
\end{equation*}
$$

locally uniformly on $S_{+}^{N-1}$. In particular, there exists a positive constant $c$ such that

$$
\begin{equation*}
c^{-1} \rho(x)^{s}|x|^{-\frac{(p+1) s}{p-1}} \leq u_{\infty}^{\Omega}(x) \leq c \rho(x)^{s}|x|^{-\frac{(p+1) s}{p-1}}, \quad \forall x \in \Omega . \tag{1.19}
\end{equation*}
$$

II- Assume $p \in\left(0, p_{1}^{*}\right]$. Then $\lim _{k \rightarrow \infty} u_{k}^{\Omega}=\infty$ in $\Omega$.

## 2. Linear problems

Throughout the present paper, we denote by $c, c^{\prime}, c_{1}, c_{2}, C, \ldots$ positive constants that may vary from line to line. If necessary, the dependence of these constants will be made precise.
2.1. $s$-harmonic functions. We first recall the definition of $s$-harmonic functions (see [3, page 46], [4, page 230], [6, page 20]). Denote by ( $X_{t}, P^{x}$ ) the standard rotation invariant $2 s$ stable Lévy process in $\mathbb{R}^{N}$ (i.e. homogeneous with independent increments) with characteristic function

$$
E^{0} e^{i \xi X_{t}}=e^{-t|\xi|^{2 s}}, \quad \xi \in \mathbb{R}^{N}, t \geq 0
$$

Denote by $E^{x}$ the expectation with respect to the distribution $P^{x}$ of the process starting from $x \in \mathbb{R}^{N}$. We assume that sample paths of $X_{t}$ are right-continuous and have left-hand limits a. s. The process $\left(X_{t}\right)$ is Markov with transition probabilities given by

$$
P_{t}(x, A)=P^{x}\left(X_{t} \in A\right)=\mu_{t}(A-x)
$$

where $\mu_{t}$ is the one-dimensional distribution of $X_{t}$ with respect to $P^{0}$. It is well known that process $\left(X_{t}, P^{x}\right)$ has the generator $(-\Delta)^{s}$.

For each Borel set $D \subset \mathbb{R}^{N}$, set $t_{D}:=\inf \left\{t \geq 0: X_{t} \notin D\right\}$, i.e. $t_{D}$ is the first exit time from $D$. If $D$ is bounded then $t_{D}<\infty$ a.s. Moreover, we use the notation

$$
E^{x} u\left(X_{t_{D}}\right)=E^{x}\left\{u\left(X_{t_{D}}\right): t_{D}<\infty\right\} .
$$

Definition 2.1. Let $u$ be a Borel Borel measurable function in $\mathbb{R}^{N}$. We say that $u$ is $s$ harmonic in $\Omega$ if for every bounded open set $D \Subset \Omega$,

$$
u(x)=E^{x} u\left(X_{t_{D}}\right), \quad x \in D
$$

We say that $u$ is singular s-harmonic in $\Omega$ if $u$ is s-harmonic and $u=0$ in $\Omega^{c}$.
Put

$$
\mathcal{D}_{s}:=\left\{u: \mathbb{R}^{N} \mapsto \mathbb{R}: \text { Borel measurable such that } \int_{\mathbb{R}^{N}} \frac{|u(x)|}{(1+|x|)^{N+2 s}}\right\}
$$

The following result follows from [5, Corollary 3.10 and Theorem 3.12] and [6, page 20].
Proposition 2.2. Let $u \in \mathcal{D}_{s}$.
(i) $u$ is s-harmonic in $\Omega$ if and only if $(-\Delta)^{s} u=0$ in $\Omega$ in the sense of distributions.
(ii) $u$ is singular s-harmonic in $\Omega$ if and only if $u$ is s-harmonic in $\Omega$ and $u=0$ in $\Omega^{c}$.
2.2. Green kernel, Poisson kernel and Martin kernel. In what follows the notation $f \sim g$ means: there exists a positive constant $c$ such that $c^{-1} f<g<c f$ in the domain of the two functions or in a specified subset of this domain.

Denote by $G_{s}^{\Omega}$ the Green kernel of $(-\Delta)^{s}$ in $\Omega$. Namely, for every $y \in \Omega$,

$$
\left\{\begin{aligned}
(-\Delta)^{s} G_{s}^{\Omega}(\cdot, y) & =\delta_{y} & & \text { in } \Omega \\
G_{s}^{\Omega}(\cdot, y) & =0 & & \text { in } \Omega^{c}
\end{aligned}\right.
$$

where $\delta_{y}$ is the Dirac mass at $y$. The following properties are well-known (see [1, Lemma 3.2]):
(i) $G_{s}^{\Omega}$ is in continuous, positive in $\{(x, y) \in \Omega \times \Omega: x \neq y\}, G_{s}^{\Omega}(x, y)=G_{s}^{\Omega}(y, x)$ for every $x, y \in \mathbb{R}^{N}, x \neq y$ (symmetric) and $G_{s}^{\Omega}(x, y)=0$ if $x$ or $y$ belongs to $\Omega^{c}$.
(ii) $(-\Delta)^{s} G_{s}^{\Omega}(x, \cdot) \in L^{1}\left(\Omega^{c}\right)$ for every $x \in \Omega$ and $(-\Delta)^{s} G_{s}^{\Omega}(x, y) \leq 0$ for every $x \in \Omega$ and $y \in \Omega^{c}$.

By [13, Corollary 1.3], for every $x, y \in \Omega, x \neq y$,

$$
\begin{equation*}
G_{s}^{\Omega}(x, y) \sim \min \left\{|x-y|^{2 s-N}, \rho(x)^{s} \rho(y)^{s}|x-y|^{-N}\right\} \tag{2.1}
\end{equation*}
$$

The similarity constant in the above estimate depends only on $\Omega$ and $s$. Denote by $\mathbb{G}_{s}^{\Omega}$ the associated Green operator

$$
\mathbb{G}_{s}^{\Omega}[\tau](x)=\int_{\Omega} G_{s}^{\Omega}(x, y) d \tau(y), \quad \tau \in \mathfrak{M}\left(\Omega, \rho^{s}\right)
$$

Put

$$
k_{s, \gamma}:= \begin{cases}p_{3}^{*} & \text { if } \gamma \in\left[0, \frac{N-2 s}{N} s\right)  \tag{2.2}\\ \frac{N+s}{N-2 s+\gamma} & \text { if } \gamma \in\left[\frac{N-2 s}{N} s, s\right]\end{cases}
$$

The following estimate was obtained in [11, Proposition 2.3 and Proposition 2.6].
Lemma 2.3. Assume $\gamma \in[0, s]$ and $k_{s, \gamma}$ be as in (2.2).
(i) There exists a constant $c=c(N, s, \gamma, \Omega)>0$ such that

$$
\begin{equation*}
\left\|\mathbb{G}_{s}^{\Omega}[\tau]\right\|_{M^{k_{s, \gamma}\left(\Omega, \rho^{s}\right)}} \leq c\|\tau\|_{\mathfrak{M}\left(\Omega, \rho^{\gamma}\right)} \quad \forall \tau \in \mathfrak{M}\left(\Omega, \rho^{\gamma}\right) \tag{2.3}
\end{equation*}
$$

(ii) Assume $\left\{\tau_{n}\right\} \subset \mathfrak{M}\left(\Omega, \rho^{\gamma}\right)$ converges weakly to $\tau \in \mathfrak{M}\left(\Omega, \rho^{\gamma}\right)$. Then $\mathbb{G}_{s}^{\Omega}\left[\tau_{n}\right] \rightarrow \mathbb{G}_{s}^{\Omega}[\tau]$ in $L^{p}\left(\Omega, \rho^{s}\right)$ for any $p \in\left[1, k_{s, \gamma}\right)$.

Let $P_{s}^{\Omega}$ be the Poisson kernel of $(-\Delta)^{s}$ defined by (see [7])

$$
P_{s}^{\Omega}(x, y):=-a_{N,-s} \int_{\Omega} \frac{G_{s}^{\Omega}(x, z)}{|z-y|^{N+2 s}} d z, \quad \forall x \in \Omega, y \in \bar{\Omega}^{c}
$$

Then by [1, Proposition 2] (see also [13, Theorem 1.4]), $P_{s}^{\Omega}(x, y)=-(-\Delta)^{s} G_{s}^{\Omega}(x, y)$ for every $x \in \Omega$ and $y \in \bar{\Omega}^{c}$. Moreover, $P_{s}^{\Omega}$ is continuous in $\Omega \times \bar{\Omega}^{c}$ (see [4, Lemma 2]) and there holds (see [13, Theorem 1.5])

$$
\begin{equation*}
P_{s}^{\Omega}(x, y) \sim \frac{\rho(x)^{s}}{\rho(y)^{s}(1+\rho(y))^{s}} \frac{1}{|x-y|^{N}}, \quad \forall x \in \Omega, y \in \bar{\Omega}^{c} \tag{2.4}
\end{equation*}
$$

The similarity constant in the above estimate depends only on $\Omega$ and $s$. Denote by $\mathbb{P}_{s}^{\Omega}$ the corresponding operator defined by

$$
\mathbb{P}_{s}^{\Omega}[\nu](x)=\int_{\bar{\Omega}^{c}} P_{s}^{\Omega}(x, y) d \nu(y), \quad \nu \in \mathfrak{M}\left(\bar{\Omega}^{c}\right)
$$

Fix a reference point $x_{0} \in \Omega$ and denote by $M_{s}^{\Omega}$ the Martin kernel of $(-\Delta)^{s}$ in $\Omega$, i.e.

$$
M_{s}^{\Omega}(x, z)=\lim _{\Omega \ni y \rightarrow z} \frac{G_{s}^{\Omega}(x, y)}{G_{s}^{\Omega}\left(x_{0}, y\right)}, \quad \forall x \in \mathbb{R}^{N}, z \in \partial \Omega
$$

By [14, Theorem 3.6], the Martin boundary of $\Omega$ can be indentified with the Euclidean boundary $\partial \Omega$. Denote by $\mathbb{M}_{s}^{\Omega}$ the associated Martin operator

$$
\mathbb{M}_{s}^{\Omega}[\mu](x)=\int_{\partial \Omega} M_{s}^{\Omega}(x, z) d \mu(z), \quad \mu \in \mathfrak{M}(\partial \Omega)
$$

The following results can be found in $[4,14]$
Proposition 2.4. (i) The mapping $(x, z) \mapsto M_{s}^{\Omega}(x, z)$ is continuous on $\Omega \times \partial \Omega$. For any $z \in \partial \Omega$, the function $M_{s}^{\Omega}(., z)$ is singular s-harmonic in $\Omega$ with $M_{s}^{\Omega}\left(x_{0}, z\right)=1$. Moreover, if $z, z^{\prime} \in \partial \Omega, z \neq z^{\prime}$ then $\lim _{x \rightarrow z^{\prime}} M_{s}^{\Omega}(x, z)=0$.
(ii) There exists a positive constant $c=c(\Omega, s)$ such that for any $x \in \Omega$ and $z \in \partial \Omega$,

$$
\begin{equation*}
c^{-1} \rho(x)^{s}|x-z|^{-N} \leq M_{s}^{\Omega}(x, z) \leq c \rho(x)^{s}|x-z|^{-N} \tag{2.5}
\end{equation*}
$$

(iii) For every finite nonnegative measure $\mu$ on $\partial \Omega$ the function $\mathbb{M}_{s}^{\Omega}[\mu]$ is singular sharmonic in $\Omega$ with $u\left(x_{0}\right)=\mu\left(\mathbb{R}^{N}\right)$. Conversely, if $u$ is a nonnegative singular s-harmonic function in $\Omega$ then there exists a unique finite nonnegative measure $\mu$ on $\partial \Omega$ such that $u=\mathbb{M}_{s}^{\Omega}[\mu]$ in $\mathbb{R}^{N}$.
(iv) If $u$ is a nonnegative $s$-harmonic function in $\Omega$ then there exists a unique finite nonnegative measure $\mu$ on $\partial \Omega$ such that

$$
u(x)=\mathbb{M}_{s}^{\Omega}[\mu](x)+\mathbb{P}_{s}^{\Omega}[u](x) \quad \forall x \in \Omega
$$

Lemma 2.5. (i) There exists a constant $c=c(N, \mu, \gamma, \Omega)$ such that

$$
\begin{equation*}
\left\|\mathbb{M}_{s}^{\Omega}[\mu]\right\|_{M^{\frac{N+\gamma}{N-s}\left(\Omega, \rho^{\gamma}\right)}} \leq c\|\mu\|_{\mathfrak{M}(\partial \Omega)}, \quad \forall \mu \in \mathfrak{M}(\partial \Omega), \gamma>-s \tag{2.6}
\end{equation*}
$$

(ii) If $\left\{\mu_{n}\right\} \subset \mathfrak{M}(\partial \Omega)$ converges weakly to $\mu \in \mathfrak{M}(\partial \Omega)$ then $\mathbb{M}_{s}^{\Omega}\left[\mu_{n}\right] \rightarrow \mathbb{M}_{s}^{\Omega}[\mu]$ in $L^{p}\left(\Omega, \rho^{\gamma}\right)$ for every $1 \leq p<\frac{N+\gamma}{N-s}$.

Proof. (i) By using (2.5) and a similar argument as in the proof of [2, Theorem 2.5], we obtain (2.6).
(ii) By combining the fact that $M_{s}^{\Omega}(x, z)=0$ for every $x \in \Omega^{c}$ and $z \in \partial \Omega$ and Proposition 2.4 (i) we deduce that for every $x \in \mathbb{R}^{N}, M_{s}^{\Omega}(x, \cdot) \in C(\partial \Omega)$. It follows that $\mathbb{M}_{s}^{\Omega}\left[\mu_{n}\right] \rightarrow$ $\mathbb{M}_{s}^{\Omega}[\mu]$ everywhere in $\Omega$. Due to (i) and the Holder inequality, we deduce that, for any $1 \leq p \leq \frac{N+\gamma}{N-s},\left\{\mathbb{M}_{s}^{\Omega}\left[\mu_{n}\right]\right\}$ is uniformly integrable with respect to $\rho^{\gamma} d x$. By invoking Vitali's theorem, we obtain the convergence in $L^{p}\left(\Omega, \rho^{\gamma}\right)$.
2.3. Boundary trace. We recall that, for $\beta>0$,

$$
\Omega_{\beta}:=\{x \in \Omega: \rho(x)<\beta\}, D_{\beta}:=\{x \in \Omega: \rho(x)>\beta\}, \Sigma_{\beta}:=\{x \in \Omega: \rho(x)=\beta\} .
$$

The following geometric property of $C^{2}$ domains can be found in [17]
Proposition 2.6. There exists $\beta_{0}>0$ such that
(i) For every point $x \in \bar{\Omega}_{\beta_{0}}$, there exists a unique point $\sigma_{x} \in \partial \Omega$ such that $\left|x-\sigma_{x}\right|=\delta(x)$. This implies $x=\sigma_{x}-\delta(x) \mathbf{n}_{\sigma_{x}}$.
(ii) The mappings $x \mapsto \delta(x)$ and $x \mapsto \sigma_{x}$ belong to $C^{2}\left(\bar{\Omega}_{\beta_{0}}\right)$ and $C^{1}\left(\bar{\Omega}_{\beta_{0}}\right)$ respectively. Furthermore, $\lim _{x \rightarrow \sigma(x)} \nabla \delta(x)=-\mathbf{n}_{\sigma_{x}}$.
Proposition 2.7. Assume $s \in(0,1)$. Then there exist positive constants $c_{1}=c_{1}(N, \Omega, s)$ such that, for every $\beta \in\left(0, \beta_{0}\right)$,

$$
\begin{equation*}
c_{1}^{-1} \leq \beta^{1-s} \int_{\Sigma_{\beta}} M_{s}^{\Omega}(x, y) d S(x) \leq c_{1} \quad \forall y \in \partial \Omega . \tag{2.7}
\end{equation*}
$$

Proof. For $r_{0}>0$ fixed, by (2.5),

$$
\begin{equation*}
\int_{\Sigma_{\beta} \backslash B_{r_{0}}(y)} M_{s}^{\Omega}(x, y) d S(x) \leq c \beta^{s}, \tag{2.8}
\end{equation*}
$$

which implies

$$
\begin{equation*}
\lim _{\beta \rightarrow 0} \int_{\Sigma_{\beta} \backslash B_{r_{0}}(y)} M_{s}^{\Omega}(x, y) d S(x)=0 \quad \forall y \in \partial \Omega . \tag{2.9}
\end{equation*}
$$

Note that for $r_{0}$ fixed, the rate of convergence is independent of $y$.
In order to prove (2.7) we may assume that the coordinates are placed so that $y=0$ and the tangent hyperplane to $\partial \Omega$ at 0 is $x_{N}=0$ with the $x_{N}$ axis pointing into the domain. For $x \in \mathbb{R}^{N}$ put $x^{\prime}=\left(x_{1}, \cdots, x_{N-1}\right)$. Pick $r_{0} \in\left(0, \beta_{0}\right)$ sufficiently small (depending only on the $C^{2}$ characteristic of $\Omega$ ) so that

$$
\frac{1}{2}\left(\left|x^{\prime}\right|^{2}+\rho(x)^{2}\right) \leq|x|^{2} \quad \forall x \in \Omega \cap B_{r_{0}}(0)
$$

Hence if $x \in \Sigma_{\beta} \cap B_{r_{0}}(0)$ then $\frac{1}{4}\left(\left|x^{\prime}\right|+\beta\right) \leq|x|$. Combining this inequality and (2.5) leads to

$$
\begin{aligned}
\int_{\Sigma_{\beta} \cap B_{r_{0}}(0)} M_{s}^{\Omega}(x, 0) d S(x) & \leq c_{2} \beta^{s} \int_{\Sigma_{\beta, 0}}\left(\left|x^{\prime}\right|+\beta\right)^{-N} d S(x) \\
& \leq c_{2} \beta^{s} \int_{\left|x^{\prime}\right|<r_{0}}\left(\left|x^{\prime}\right|+\beta\right)^{-N} d x^{\prime} \\
& \leq c_{2} \beta^{s} \int_{0}^{r_{0}}(t+\beta)^{-2} d t \\
& =c_{3} \beta^{s-1} .
\end{aligned}
$$

Therefore, for $\beta<r_{0}$,

$$
\begin{equation*}
\beta^{1-s} \int_{\Sigma_{\beta} \cap B_{r_{0}}(0)} M_{s}^{\Omega}(x, 0) d S(x) \leq c_{4} \tag{2.10}
\end{equation*}
$$

By combining estimates (2.8) and (2.10), we obtain the second estimate in (2.7). The first estimate in (2.7) follows from (2.5).

As a consequence, we get the following estimates.
Corollary 2.8. Assume $p \in(0,1)$. For every $\mu \in \mathfrak{M}^{+}(\partial \Omega)$ and $\beta \in\left(0, \beta_{0}\right)$, there holds

$$
\begin{equation*}
c_{1}^{-1}\|\mu\|_{\mathfrak{M}(\partial \Omega)} \leq \beta^{1-s} \int_{\Sigma_{\beta}} \mathbb{M}_{s}^{\Omega}[\mu] d S \leq c_{1}\|\mu\|_{\mathfrak{M}(\partial \Omega)} \tag{2.11}
\end{equation*}
$$

with $c_{1}$ is as in (2.7).
Proposition 2.9. Assume $s \in\left(\frac{1}{2}, 1\right)$. Then there exists a constant $c=c(s, N, \Omega)$ such that for any $\tau \in \mathfrak{M}\left(\Omega, \rho^{s}\right)$ and any $0<\beta<\beta_{0}$,

$$
\begin{equation*}
\beta^{1-s} \int_{\Sigma_{\beta}} \mathbb{G}_{s}^{\Omega}[\tau] d S \leq c \int_{\Omega} \rho^{s} d|\tau| \tag{2.12}
\end{equation*}
$$

Moreover,

$$
\begin{equation*}
\lim _{\beta \rightarrow 0} \beta^{1-s} \int_{\Sigma_{\beta}} \mathbb{G}_{s}^{\Omega}[\tau] d S=0 \tag{2.13}
\end{equation*}
$$

Proof. Without loss of generality, we may assume that $\tau>0$. Denote $v:=\mathbb{G}_{\mu}^{\Omega}[\tau]$. We first prove (2.12). By Fubini's theorem and (2.5),

$$
\begin{aligned}
\int_{\Sigma_{\beta}} v(x) d S(x) & \leq c_{5}\left(\int_{\Omega} \int_{\Sigma_{\beta} \cap B_{\frac{\beta}{2}}(y)}|x-y|^{2 s-N} d S(x) d \tau(y)\right. \\
& \left.+\beta^{s} \int_{\Omega} \int_{\Sigma_{\beta} \backslash B_{\frac{\beta}{2}}(y)}|x-y|^{-N} d S(x) \rho(y)^{s} d \tau(y)\right) \\
& :=I_{1, \beta}+I_{2, \beta}
\end{aligned}
$$

Note that, if $x \in \Sigma_{\beta}$ and $|x-y| \leq \beta / 2$ then $\beta / 2 \leq \rho(y) \leq 3 \beta / 2$. Therefore

$$
\begin{aligned}
\beta^{1-s} I_{1, \beta} & \leq c_{6} \beta^{1-2 s} \int_{\Sigma_{\beta} \cap B_{\frac{\beta}{2}}(y)}|x-y|^{2 s-N} d S(x) \int_{\Omega} \rho(y)^{s} d \tau(y) \\
& \leq c_{6} \beta^{1-2 s} \int_{0}^{\beta / 2} r^{2 s-N} r^{N-2} d r \int_{\Omega} \rho(y)^{s} d \tau(y) \\
& \leq c_{7} \int_{\Omega} \rho(y)^{s} d \tau(y)
\end{aligned}
$$

We have

$$
I_{2, \beta} \leq c_{7} \beta^{s} \int_{\beta / 2}^{\infty} r^{-N} r^{N-2} d r \int_{\Omega} \rho(y)^{s} d \tau(y)=c_{8} \beta^{s-1} \int_{\Omega} \rho(y)^{s} d \tau(y)
$$

Combining the above estimates, we obtain (2.12).

Next we demonstrate (2.13). Given $\epsilon \in\left(0,\|\tau\|_{\mathfrak{M}\left(\Omega, \rho^{s}\right)}\right)$ and $\beta_{1} \in\left(0, \beta_{0}\right)$ put $\tau_{1}=\tau \chi_{\bar{D}_{\beta_{1}}}$ and $\tau_{2}=\tau \chi_{\Omega_{\beta_{1}}}$. We can choose $\beta_{1}=\beta_{1}(\epsilon)$ such that

$$
\begin{equation*}
\int_{\Omega_{\beta_{1}}} \rho(y)^{s} d \tau(y) \leq \epsilon \tag{2.14}
\end{equation*}
$$

Thus the choice of $\beta_{1}$ depends on the rate at which $\int_{\Omega_{\beta}} \rho^{s} d \tau$ tends to zero as $\beta \rightarrow 0$.
Put $v_{i}=\mathbb{G}_{s}^{\Omega}\left[\tau_{i}\right]$. Then, for $0<\beta<\beta_{1} / 2$,

$$
\int_{\Sigma_{\beta}} v_{1}(x) d S(x) \leq c_{9} \beta^{s} \beta_{1}^{-N} \int_{\Omega} \rho(y)^{s} d \tau_{1}(y)
$$

which yields

$$
\begin{equation*}
\lim _{\beta \rightarrow 0} \beta^{1-s} \int_{\Sigma_{\beta}} v_{1}(x) d S(x)=0 \tag{2.15}
\end{equation*}
$$

On the other hand, due to (2.12),

$$
\begin{equation*}
\beta^{1-s} \int_{\Sigma_{\beta}} v_{2} d S \leq c_{10} \int_{\Omega} \rho^{s} d \tau_{2} \leq c_{11} \epsilon \quad \forall \beta<\beta_{0} \tag{2.16}
\end{equation*}
$$

From (2.15) and (2.16), we obtain (2.13).
Define

$$
\begin{equation*}
\tilde{M}_{s}^{\Omega}(x, z):=\lim _{\Omega \ni y \rightarrow z} \frac{G_{s}^{\Omega}(x, y)}{\rho(y)^{s}} \tag{2.17}
\end{equation*}
$$

By [1, page 5547], there is a positive constant $c=c(\Omega, s)$ such that

$$
\begin{equation*}
c^{-1} \rho(x)^{s}|x-z|^{-N} \leq \tilde{M}_{s}^{\Omega}(x, z) \leq c \rho(x)^{s}|x-z|^{-N}, \quad \forall x \in \Omega, z \in \partial \Omega \tag{2.18}
\end{equation*}
$$

This follows

$$
\begin{align*}
c_{12}^{-1}<c_{13}^{-1} \int_{\partial \Omega} \rho(x)|x-z|^{-N} d S(z) & \\
\leq \rho(x)^{1-s} & \int_{\partial \Omega} \tilde{M}_{s}^{\Omega}(x, z) d S(z)  \tag{2.19}\\
& \leq c_{13} \int_{\partial \Omega} \rho(x)|x-z|^{-N} d S(z)<c_{12} \quad \forall x \in \Omega
\end{align*}
$$

Following [1], we define, for any $z \in \partial \Omega$,

$$
\mathbb{E}_{s}^{\Omega}[u](z):=\lim _{\Omega \ni x \rightarrow z} \frac{u(x)}{\int_{\partial \Omega} \tilde{M}_{s}^{\Omega}(x, y) d S(y)}
$$

Lemma 2.10. Assume $s \in\left(\frac{1}{2}, 1\right)$. Let $u, w \in \mathcal{D}_{s}$ be two nonnegative functions satisfying

$$
\left\{\begin{align*}
(-\Delta)^{s} u & \leq 0 \leq(-\Delta)^{s} w & & \text { in } \Omega  \tag{2.20}\\
u & =0 & & \text { in } \Omega^{c}
\end{align*}\right.
$$

If $u \leq w$ in $\mathbb{R}^{N}$ then $(-\Delta)^{s} u \in \mathfrak{M}^{+}\left(\Omega, \rho^{s}\right)$ and there exists a measure $\mu \in \mathfrak{M}^{+}(\partial \Omega)$ such that

$$
\begin{equation*}
\lim _{\beta \rightarrow 0} \beta^{1-s} \int_{\Sigma_{\beta}}\left|u-\mathbb{M}_{s}^{\Omega}[\mu]\right| d S=0 \tag{2.21}
\end{equation*}
$$

Moreover, if $\mu=0$ then $u=0$.

Proof. By the assumption, there exists a nonnegative Radon measure $\tau$ on $\Omega$ such that $(-\Delta)^{s} u=-\tau$.

We first prove that $\tau \in \mathfrak{M}^{+}\left(\Omega, \rho^{s}\right)$. For any $\beta \in\left(0, \beta_{0}\right)$, denote by $\tau_{\beta}$ the restriction of $\tau$ to $D_{\beta}$ and by $v_{\beta}$ the restriction of $u$ on $\Sigma_{\beta}$. From [1, Theorem 1.4], there exists a unique solution $v_{\beta}$ of

$$
\left\{\begin{aligned}
(-\Delta)^{s} v_{\beta} & =-\tau_{\beta} & & \text { in } D_{\beta} \\
\mathbb{E}_{s}^{D_{\beta}}\left[v_{\beta}\right] & =0 & & \text { on } \Sigma_{\beta} \\
v_{\beta} & =\left.u\right|_{D_{\beta}^{c}} & & \text { in } D_{\beta}^{c} .
\end{aligned}\right.
$$

Moreover, the solution can be written as

$$
\begin{equation*}
v_{\beta}+\mathbb{G}_{s}^{D_{\beta}}\left[\tau_{\beta}\right]=\mathbb{P}_{s}^{D_{\beta}}\left[\left.u\right|_{D_{\beta}^{c}}\right] \quad \text { in } D_{\beta} \tag{2.22}
\end{equation*}
$$

By the maximum principle [1, Lemma 3.9], $v_{\beta}=u$ and $\mathbb{P}_{s}^{D_{\beta}}\left[\left.u\right|_{D_{\beta}^{c}}\right] \leq w$ a.e. in $\mathbb{R}^{N}$. This, together with $(2.22)$, implies that $\mathbb{G}_{s}^{D_{\beta}}\left[\tau_{\beta}\right] \leq w$ in $D_{\beta}$. Letting $\beta \rightarrow 0$ yields $\mathbb{G}_{s}^{\Omega}[\tau]<\infty$. For fixed $x_{0} \in \Omega$, by $(2.1), G_{s}^{\Omega}\left(x_{0}, y\right)>c \rho(y)^{s}$ for every $y \in \Omega$. Hence the finiteness of $\mathbb{G}_{s}^{\Omega}[\tau]$ implies that $\tau \in \mathfrak{M}^{+}\left(\Omega, \rho^{s}\right)$.

We next show that there exists a measure $\mu \in \mathfrak{M}^{+}(\partial \Omega)$ such that (2.21) holds. Put $v=u+\mathbb{G}_{s}^{\Omega}[\tau]$ then $v$ is a nonnegative singular $s$-harmonic in $\Omega$ due to the fact that $\mathbb{G}_{s}^{\Omega}[\tau]=0$ in $\Omega^{c}$. By Proposition 2.2 and Proposition 2.4 (iii), there exists a finite measure $\mu$ on $\partial \Omega$ such that $v=\mathbb{M}_{s}^{\Omega}[\mu]$ in $\mathbb{R}^{N}$. By Proposition 2.9, we obtain (2.21). If $\mu=0$ then $v=0$ and thus $u=0$.

Definition 2.11. A function $u$ possesses a s-boundary trace on $\partial \Omega$ if there exists a measure $\mu \in \mathfrak{M}^{+}(\partial \Omega)$ such that

$$
\begin{equation*}
\lim _{\beta \rightarrow 0} \beta^{1-s} \int_{\Sigma_{\beta}}\left|u-\mathbb{M}_{s}^{\Omega}[\mu]\right| d S=0 \tag{2.23}
\end{equation*}
$$

The s-boundary trace of $u$ is denoted noted by $\operatorname{tr}_{s}(u)$.
Remark. (i) The notation of s-boundary trace is well defined. Indeed, suppose that $\mu$ and $\mu^{\prime}$ satisfy (2.23). Put $v=\left(\mathbb{M}_{s}^{\Omega}\left[\mu-\mu^{\prime}\right]\right)_{+}$. Clearly $v \leq \mathbb{M}_{s}^{\Omega}\left[|\mu|+\left|\mu^{\prime}\right|\right], v=0$ in $\Omega^{c}$ and $\lim _{\beta \rightarrow 0} \beta^{1-s} \int_{\Sigma_{\beta}}|v| d S=0$. By Kato's inequality [8, Theorem 1.2], $(-\Delta)^{s} v \leq 0$ in $\Omega$. Therefore, we deduce $v \equiv 0$ from (2.20). This implies $\mathbb{M}_{s}^{\Omega}\left[\mu-\mu^{\prime}\right] \leq 0$. By permuting the role of $\mu$ and $\mu^{\prime}$, we obtain $\mathbb{M}_{s}^{\Omega}\left[\mu-\mu^{\prime}\right] \geq 0$. Thus $\mu=\mu^{\prime}$.
(ii) It is clear that for every $\mu \in \mathfrak{M}(\partial \Omega), \operatorname{tr}_{s}\left(\mathbb{M}_{s}^{\Omega}[\mu]\right)=\mu$. I f $s>\frac{1}{2}$, by Proposition 2.9, for every $\tau \in \mathfrak{M}\left(\Omega, \rho^{s}\right), \operatorname{tr}_{s}\left(\mathbb{G}_{s}^{\Omega}[\tau]\right)=0$.

### 2.4. Weak solutions of linear problems.

Definition 2.12. Let $\tau \in \mathfrak{M}(\Omega)$ and $\mu \in \mathfrak{M}(\partial \Omega)$. A function $u$ is called a weak solution of (1.4) if $u \in L^{1}(\Omega)$ and

$$
\begin{equation*}
\int_{\Omega} u(-\Delta)^{s} \xi d x=\int_{\Omega} \xi d \tau+\int_{\Omega} \mathbb{M}_{s}^{\Omega}[\mu](-\Delta)^{s} \xi d x, \quad \forall \xi \in \mathbb{X}_{s}(\Omega) \tag{2.24}
\end{equation*}
$$

Proof Proposition A. The uniqueness follows from [11, Proposition 2.4]. Let $u$ be as in (1.5). By [11],

$$
\int_{\Omega}\left(u-\mathbb{M}_{s}^{\Omega}[\mu]\right)(-\Delta)^{s} \xi d x=\int_{\Omega} \mathbb{G}_{s}^{\Omega}[\tau](-\Delta)^{s} \xi d x=\int_{\Omega} \xi d \tau \quad \forall \xi \in \mathbb{X}_{s}(\Omega)
$$

This implies (2.24) and therefore $u$ is the unique solution of (1.4). Since $s \in\left(\frac{1}{2}, 1\right)$. By Proposition 2.9, $\operatorname{tr}_{s}(u)=\operatorname{tr}_{s}\left(\mathbb{M}_{s}^{\Omega}[\mu]\right)=\mu$. Finally, estimate (1.6) follows from Lemma 2.3 and Lemma 2.5.

## 3. Nonlinear problems

In this section, we consider the nonlinear problem (1.2). The definition of weak solutions of (1.2) is given in Definition 1.2.

### 3.1. Subcritical absorption. Proof of Theorem B.

Monotonicity. Let $\tau, \tau^{\prime} \in L^{1}(\Omega), \mu, \mu^{\prime} \in L^{1}(\partial \Omega)$ and $u$ and $u^{\prime}$ be the solutions of (1.2) with data $(\tau, \mu)$ and $\left(\tau^{\prime}, \mu^{\prime}\right)$ respectively. We will show that if $\tau \leq \tau^{\prime}$ and $\mu \leq \mu^{\prime}$ then $u \leq u^{\prime}$ in $\Omega$. Indeed, put $v:=\left(u-u^{\prime}\right)_{+}$, it is sufficient to prove that $v \equiv 0$. Since (1.10) holds, it follows

$$
|u| \leq \mathbb{G}_{s}^{\Omega}[|\tau|+|f(u)|]+\mathbb{M}_{s}^{\Omega}[|\mu|] \quad \text { in } \Omega
$$

Similarly

$$
\left|u^{\prime}\right| \leq \mathbb{G}_{s}^{\Omega}\left[\left|\tau^{\prime}\right|+\left|f\left(u^{\prime}\right)\right|\right]+\mathbb{M}_{s}^{\Omega}\left[\left|\mu^{\prime}\right|\right] \quad \text { in } \Omega
$$

Therefore

$$
0 \leq v \leq|u|+\left|u^{\prime}\right| \leq \mathbb{G}_{s}^{\Omega}\left[|\tau|+\left|\tau^{\prime}\right|+|f(u)|+\left|f\left(u^{\prime}\right)\right|\right]+\mathbb{M}_{s}^{\Omega}\left[|\mu|+\left|\mu^{\prime}\right|\right]:=w
$$

By Kato inequality, the assumption $\tau \leq \tau^{\prime}$ and the monotonicity of $f$, we obtain

$$
(-\Delta)^{s} v \leq \operatorname{sign}_{+}\left(u-u^{\prime}\right)\left(\tau-\tau^{\prime}\right)-\operatorname{sign}_{+}\left(u-u^{\prime}\right)\left(f(u)-f\left(u^{\prime}\right)\right) \leq 0
$$

Therefore

$$
(-\Delta)^{s} v \leq 0 \leq(-\Delta)^{s} w \quad \text { in } \Omega
$$

Since $\mu \leq \mu^{\prime}$, it follows that $\operatorname{tr}_{s}(v)=0$. By Lemma 2.10, $v=0$ and thus $u \leq u^{\prime}$.
Existence.
Step 1: Assume that $\tau \in L^{\infty}(\Omega)$ and $\mu \in L^{\infty}(\partial \Omega)$.
Put $\hat{f}(t):=f\left(t+\mathbb{M}_{s}^{\Omega}[\mu]\right)-f\left(\mathbb{M}_{s}^{\Omega}[\mu]\right)$ and $\hat{\tau}:=\tau-f\left(\mathbb{M}_{s}^{\Omega}[\mu]\right)$. Then $\hat{f}$ is nondecreasing and $t \hat{f}(t) \geq 0$ for every $t \in \mathbb{R}$ and $\hat{\tau} \in L^{1}\left(\Omega, \rho^{s}\right)$. Consider the problem

$$
\left\{\begin{align*}
(-\Delta)^{s} v+\hat{f}(v) & =\hat{\tau} & & \text { in } \Omega  \tag{3.1}\\
v & =0 & & \text { in } \Omega^{c}
\end{align*}\right.
$$

By [10, Proposition 3.1] there exists a unique weak solution $v$ of (3.1). It means that $v \in$ $L^{1}(\Omega), \hat{f}(v) \in L^{1}\left(\Omega, \rho^{s}\right)$ and

$$
\begin{equation*}
\int_{\Omega}\left(v(-\Delta)^{s} \xi+\hat{f}(v) \xi\right) d x=\int_{\Omega} \xi \hat{\tau} d x, \quad \forall \xi \in \mathbb{X}_{s}(\Omega) \tag{3.2}
\end{equation*}
$$

Put $u:=v+\mathbb{M}_{s}^{\Omega}[\mu]$ then $u \in L^{1}(\Omega)$ and $f(u) \in L^{1}\left(\Omega, \rho^{s}\right)$. By (3.2) $u$ satisfies (1.3).
Step 2: Assume that $0 \leq \tau \in L^{1}\left(\Omega, \rho^{s}\right)$ and $0 \leq \mu \in L^{1}(\partial \Omega)$.
Let $\left\{\tau_{n}\right\} \subset C^{1}(\bar{\Omega})$ be a nondecreasing sequence convering to $\tau$ in $L^{1}\left(\Omega, \rho^{s}\right)$ and $\left\{\mu_{n}\right\} \subset$ $C^{1}(\partial \Omega)$ be a nondecreasing sequence convering to $\mu$ in $L^{1}(\partial \Omega)$. Then $\left\{\mathbb{M}_{s}^{\Omega}\left[\mu_{n}\right]\right\}$ is increasing and by Lemma 2.5 (ii) it converges to $\mathbb{M}_{s}^{\Omega}[\mu]$ a.e. in $\Omega$ and in $L^{p}\left(\Omega, \rho^{s}\right)$ for every $1 \leq p<p_{2}^{*}$. Let $u_{n}$ be the unique solution of (1.2) with $\tau$ and $\mu$ replaced by $\tau_{n}$ and $\mu_{n}$ respectively.

By step 1 and the monotonicity of $f$, we derive that $\left\{u_{n}\right\}$ and $\left\{f\left(u_{n}\right)\right\}$ are nondecreasing. Moreover

$$
\begin{equation*}
\int_{\Omega}\left(u_{n}(-\Delta)^{s} \xi+f\left(u_{n}\right) \xi\right) d x=\int_{\Omega} \xi d \tau_{n}+\int_{\Omega} \mathbb{M}_{s}^{\Omega}\left[\mu_{n}\right](-\Delta)^{s} \xi d x \quad \forall \xi \in \mathbb{X}_{s}(\Omega) \tag{3.3}
\end{equation*}
$$

Let $\eta \in C(\bar{\Omega})$ be the solution of

$$
\left\{\begin{align*}
(-\Delta)^{s} \eta=1 & \text { in } \Omega  \tag{3.4}\\
\eta=0 & \text { in } \Omega^{c}
\end{align*}\right.
$$

then $c^{-1} \rho^{s}<\eta<c \rho^{s}$ in $\Omega$ for some $c>1$. By choosing $\xi=\eta$ in (3.3), we get

$$
\begin{align*}
\left\|u_{n}\right\|_{L^{1}(\Omega)}+\left\|f\left(u_{n}\right)\right\|_{L^{1}\left(\Omega, \rho^{s}\right)} & \leq c\left(\left\|\tau_{n}\right\|_{L^{1}\left(\Omega, \rho^{s}\right)}+\left\|\mu_{n}\right\|_{L^{1}(\partial \Omega)}\right) \\
& \leq c^{\prime}\left(\|\tau\|_{L^{1}\left(\Omega, \rho^{s}\right)}+\|\mu\|_{L^{1}(\partial \Omega)}\right) \tag{3.5}
\end{align*}
$$

Then $\left\{u_{n}\right\}$ and $\left\{f\left(u_{n}\right)\right\}$ are uniformly bounded in $L^{1}(\Omega)$ and $L^{1}\left(\Omega, \rho^{s}\right)$ respectively. By the monotone convergence theorem, there exists $u \in L^{1}(\Omega)$ such that $u_{n} \rightarrow u$ in $L^{1}(\Omega)$ and $f\left(u_{n}\right) \rightarrow f(u)$ in $L^{1}\left(\Omega, \rho^{s}\right)$. By letting $n \rightarrow \infty$ in (3.3), we deduce that $u$ satisfies (1.3), namely $u$ is a weak solution of (1.2).

The uniqueness follows from the monotonicity.
Step 3: Assume that $\tau \in L^{1}\left(\Omega, \rho^{s}\right)$ and $\mu \in L^{1}(\partial \Omega)$.
Let $\left\{\tau_{n}\right\} \subset C^{1}(\bar{\Omega})$ be a sequence such that $\left\{\tau_{n}^{+}\right\}$and $\left\{\tau_{n}^{-}\right\}$are nondecreasing and $\tau_{n}^{ \pm} \rightarrow \tau^{ \pm}$ in $L^{1}\left(\Omega, \rho^{s}\right)$. Let $\left\{\mu_{n}\right\} \subset C^{1}(\partial \Omega)$ be a sequence such that $\left\{\mu_{n}^{+}\right\}$and $\left\{\mu_{n}^{-}\right\}$are nondecreasing and $\mu_{n}^{ \pm} \rightarrow \mu^{ \pm}$in $L^{1}(\partial \Omega)$. Let $u_{n}$ be the unique solutions of (1.2) with data $\left(\tau_{n}, \mu_{n}\right)$. Put $v_{n}:=u_{n}-\mathbb{M}_{s}^{\Omega}\left[\mu_{n}\right]$. For any $m, n \in \mathbb{N}$, we have

$$
\left\{\begin{aligned}
(-\Delta)^{s}\left(v_{m}-v_{n}\right)+f\left(u_{m}\right)-f\left(u_{n}\right) & =\tau_{m}-\tau_{n} & & \text { in } \Omega \\
v_{m}-v_{n} & =0 & & \text { in } \Omega^{c}
\end{aligned}\right.
$$

By $[10$, Proposition 2.4$]$, for any $\xi \in \mathbb{X}_{s}(\Omega)$,
$\int_{\Omega}\left|v_{m}-v_{n}\right|(-\Delta)^{s} \xi d x+\int_{\Omega} \xi \operatorname{sign}\left(v_{m}-v_{n}\right)\left(f\left(u_{m}\right)-f\left(u_{n}\right)\right) d x \leq \int_{\Omega} \xi \operatorname{sign}\left(v_{m}-v_{n}\right)\left(\tau_{m}-\tau_{n}\right) d x$.
By choosing $\xi=\eta$ and Lemma 2.5 (i), we obtain

$$
\begin{aligned}
\int_{\Omega}\left|v_{m}-v_{n}\right| d x+\int_{\Omega} \Phi_{m, n} \eta\left|v_{m}-v_{n}\right| d x & \leq \int_{\Omega} \eta\left|\tau_{m}-\tau_{n}\right| d x+\int_{\Omega} \eta\left|\mathbb{M}_{s}^{\Omega}\left[\mu_{m}-\mu_{n}\right]\right| d x \\
& \leq c\left(\left\|\tau_{m}-\tau_{n}\right\|_{L^{1}\left(\Omega, \rho^{s}\right)}+\left\|\mu_{m}-\mu_{n}\right\|_{L^{1}(\partial \Omega)}\right)
\end{aligned}
$$

where

$$
\Phi_{m, n}(x):= \begin{cases}\frac{f\left(u_{m}\right)(x)-f\left(u_{n}\right)(x)}{u_{m}(x)-u_{n}(x)} & \text { if } u_{m}(x) \neq u_{n}(x) \\ 0 & \text { if } u_{m}(x)=u_{n}(x)\end{cases}
$$

This imples that $\left\{v_{n}\right\}$ is a Cauchy sequence in $L^{1}(\Omega)$ and hence converges in $L^{1}(\Omega)$ and (up to a subsequence) a.e. to a function $v$. Therefore $\left\{u_{n}\right\}$ and $\left\{f\left(u_{n}\right)\right\}$ converge a.e. to $u$ and $f(u)$ respectively with $u=v+\mathbb{M}_{s}^{\Omega}[\mu]$.

Let $w_{1, n}$ and $w_{2, n}$ be the unique solutions of (1.2) with data $\left(\tau_{n}^{+}, \mu_{n}^{+}\right)$and $\left(-\tau_{n}^{-},-\mu_{n}^{-}\right)$ respectively. By (i), for any $n \in \mathbb{N}, w_{2, n} \leq 0 \leq w_{1, n}$ and

$$
\begin{equation*}
-\mathbb{G}_{s}^{\Omega}\left[\tau_{n}^{-}\right]-\mathbb{M}_{s}^{\Omega}\left[\mu_{n}^{-}\right] \leq w_{2, n} \leq u_{n} \leq w_{1, n} \leq \mathbb{G}_{s}^{\Omega}\left[\tau_{n}^{+}\right]+\mathbb{M}_{s}^{\Omega}\left[\mu_{n}^{+}\right] \tag{3.6}
\end{equation*}
$$

By step 2, the sequences $\left\{w_{1, n}\right\},\left\{f\left(w_{1, n}\right)\right\},\left\{-w_{2, n}\right\}$ and $\left\{-f\left(w_{2, n}\right)\right\}$ are increasing and converge to $w_{1}$ in $L^{1}(\Omega), f\left(w_{1}\right)$ in $L^{1}\left(\Omega, \rho^{s}\right),-w_{2}$ in $L^{1}(\Omega)$ and $-f\left(w_{2}\right)$ in $L^{1}\left(\Omega, \rho^{s}\right)$ respectively. Since $\left|u_{n}\right| \leq w_{1, n}-w_{2, n},\left|f\left(u_{n}\right)\right| \leq f\left(w_{1, n}\right)-f\left(w_{2, n}\right)$, due to generalized dominated convergence theorem, $\left\{u_{n}\right\}$ and $\left\{f\left(u_{n}\right)\right\}$ converge to $u$ and $f(u)$ in $L^{1}(\Omega)$ and $L^{1}\left(\Omega, \rho^{s}\right)$ respectively. By passing to the limit in (3.3), we derive that $u$ satisfies (1.3).

The uniqness follows from the monotonicity.
Define

$$
C\left(\bar{\Omega}, \rho^{-s}\right):=\left\{\zeta \in C(\bar{\Omega}): \rho^{-s} \zeta \in C(\bar{\Omega})\right\} .
$$

This space is endowed with the norm

$$
\|\zeta\|_{C\left(\bar{\Omega}, \rho^{-s}\right)}=\left\|\rho^{-s} \zeta\right\|_{C(\bar{\Omega})} .
$$

We say that a sequence $\left\{\tau_{n}\right\} \subset \mathfrak{M}\left(\Omega, \rho^{s}\right)$ converges weakly to a measure $\tau \in \mathfrak{M}\left(\Omega, \rho^{s}\right)$ if

$$
\lim _{n \rightarrow \infty} \int_{\Omega} \zeta d \tau_{n}=\int_{\Omega} \zeta d \tau \quad \forall \zeta \in C\left(\bar{\Omega}, \rho^{-s}\right) .
$$

## Proof of Theorem C.

Monotonicity. The monotonicity can be proved by using the same argument as in the proof of Theorem B.
Existence. Let $\left\{\tau_{n}\right\} \subset C^{1}(\Omega)$ and $\left\{\mu_{n}\right\} \subset C^{1}(\partial \Omega)$ such that $\tau_{n}^{ \pm} \rightarrow \tau^{ \pm}$weakly and $\mu_{n}^{ \pm} \rightarrow \mu^{ \pm}$ weakly. Then there is a positive constant $c$ independent of $n$ such that

$$
\left\|\tau_{n}\right\|_{\mathfrak{M}\left(\Omega, \rho^{s}\right)} \leq c\|\tau\|_{\mathfrak{M}\left(\Omega, \rho^{s}\right)} \quad \text { and } \quad\left\|\mu_{n}\right\|_{\mathfrak{M}(\partial \Omega)} \leq c\|\mu\|_{\mathfrak{M}(\partial \Omega)} .
$$

Let $u_{n}, w_{1, n}$ and $w_{2, n}$ as in the proof of Theorem B. Then

$$
\begin{equation*}
\left|u_{n}\right| \leq \max \left(w_{1, n},-w_{2, n}\right) \leq \mathbb{G}_{s}^{\Omega}\left[\left|\tau_{n}\right|\right]+\mathbb{M}_{s}^{\Omega}\left[\left|\mu_{n}\right|\right] . \tag{3.7}
\end{equation*}
$$

This, together with (2.3), (2.6) and (3.8), implies that

$$
\begin{equation*}
\left\|u_{n}\right\|_{M^{p_{2}^{*}\left(\Omega, \rho^{s}\right)}} \leq c\left(\left\|\tau_{n}\right\|_{\mathfrak{M}\left(\Omega, \rho^{s}\right)}+\left\|\mu_{n}\right\|_{\mathfrak{M}(\partial \Omega)}\right) \leq c^{\prime}\left(\|\tau\|_{\mathfrak{M}\left(\Omega, \rho^{s}\right)}+\|\mu\|_{\mathfrak{M}(\partial \Omega)}\right) . \tag{3.8}
\end{equation*}
$$

We have

$$
\begin{align*}
\int_{\Omega}\left(w_{1, n}(-\Delta)^{s} \xi+f\left(w_{1, n}\right) \xi\right) d x & =\int_{\Omega} \xi d \tau_{n}^{+}+\int_{\Omega} \mathbb{M}_{s}^{\Omega}\left[\mu_{n}^{+}\right](-\Delta)^{s} \xi d x \\
\int_{\Omega}\left(w_{2, n}(-\Delta)^{s} \xi+f\left(w_{2, n}\right) \xi\right) d x & =-\int_{\Omega} \xi d \tau_{n}^{-}-\int_{\Omega} \mathbb{M}_{s}^{\Omega}\left[\mu_{n}^{-}\right](-\Delta)^{s} \xi d x, \quad \forall \xi \in \mathbb{X}_{s}(\Omega) \tag{3.9}
\end{align*}
$$

and subtracting the first estimate by the second one in (3.4), we obtain

$$
\begin{equation*}
\int_{\Omega}\left[\left(w_{1, n}-w_{2, n}\right)+\left(f\left(w_{1, n}\right)-f\left(w_{2, n}\right) \eta\right] d x=\int_{\Omega} \eta d\left|\tau_{n}\right|+\int_{\Omega} \mathbb{M}_{s}^{\Omega}\left[\left|\mu_{n}\right|\right] d x\right. \tag{3.10}
\end{equation*}
$$

By taking into account that $\left|u_{n}\right| \leq w_{1, n}-w_{2, n},\left|f\left(u_{n}\right)\right| \leq f\left(w_{1, n}\right)-f\left(w_{2, n}\right)$ and $c^{-1} \rho^{s} \leq \eta \leq$ $c \rho^{s}$ for some positive constant $c$, we infer

$$
\begin{align*}
\left\|u_{n}\right\|_{L^{1}(\Omega)}+\left\|f\left(u_{n}\right)\right\|_{L^{1}\left(\Omega ; \rho^{s}\right)} & \leq c\left(\left\|\tau_{n}\right\|_{L^{1}\left(\Omega, \rho^{s}\right)}+\left\|\mu_{n}\right\|_{\mathfrak{M}(\partial \Omega)}\right) \\
& \leq c^{\prime}\left(\|\tau\|_{\mathfrak{M}\left(\Omega, \rho^{s}\right)}+\|\mu\|_{\mathfrak{M}(\partial \Omega)}\right) \tag{3.11}
\end{align*}
$$

This implies that $\left\{u_{n}\right\}$ and $\left\{f\left(u_{n}\right)\right\}$ are uniformly bounded in $L^{1}(\Omega)$ and $L^{1}\left(\Omega, \rho^{s}\right)$ respectively.

Since $\left\{\tau_{n}-f\left(u_{n}\right)\right\}$ is uniformly bounded in $L^{1}\left(\Omega, \rho^{s}\right)$ and the mapping $\phi \mapsto \mathbb{G}_{s}^{\Omega}[\phi]$ is compact from $L^{1}\left(\Omega, \rho^{s}\right)$ into $L^{p}(\Omega)$ for any $p \in\left[1, \frac{N}{N-s}\right)$ (see [11, Proposition 2.6]), we derive
that there is a subsequence, still denoted by $\left\{u_{n}\right\}$, and a function $u$ such that $u_{n} \rightarrow u$ in $L^{p}(\Omega)$ and a.e. in $\Omega$. It follows from the continuity of $f$ that $f\left(u_{n}\right) \rightarrow f(u)$ a.e. in $\Omega$.

By Hölder inequality, we infer that $\left\{u_{n}\right\}$ is uniformly integrable in $L^{1}(\Omega)$.
We next prove that $\left\{f \circ u_{n}\right\}$ is uniformly integrable in $L^{1}\left(\Omega, \rho^{s}\right)$. Define $\tilde{f}(s):=f(|s|)-$ $f(-|s|), s \in \mathbb{R}$. Then $\tilde{f}$ is nondecreasing in $\mathbb{R}$ and $|f(s)| \leq \tilde{f}(s)$ for every $s \in \mathbb{R}$. For $\ell>0$ and $n \in \mathbb{N}$, set

$$
A_{n}(\ell):=\left\{x \in \Omega:\left|u_{n}(x)\right|>\ell\right\}, \quad a_{n}(\ell):=\int_{A_{n}(\ell)} \rho^{s} d x
$$

We take an arbitrary Borel set $D \subset \Omega$ and estimate

$$
\begin{align*}
\int_{D}\left|f\left(u_{n}\right)\right| \rho^{s} d x & =\int_{D \cap A_{n}(\ell)}\left|f\left(u_{n}\right)\right| \rho^{s} d x+\int_{D \backslash A_{n}(\ell)}\left|f\left(u_{n}\right)\right| \rho^{s} d x  \tag{3.12}\\
& \leq \int_{A_{n}(\ell)} \tilde{f}\left(u_{n}\right) \rho^{s} d x+\tilde{f}(\ell) \int_{\Omega} \rho^{s} d x
\end{align*}
$$

On one hand, we have

$$
\int_{A_{n}(\ell)} \tilde{f}\left(u_{n}\right) \rho^{s} d x=a_{n}(\ell) \tilde{f}(\ell)+\int_{\ell}^{\infty} a_{n}(s) d \tilde{f}(s) d s
$$

From (3.8), we infer $a_{n}(s) \leq \tilde{c} s^{-p_{2}^{*}}$ where $\tilde{c}$ is a positive constant independent of $n$. Hence, for any $l>\ell$,

$$
\begin{align*}
a_{n}(\ell) \tilde{f}(\ell)+\int_{\ell}^{l} a_{n}(s) d \tilde{f}(s) d s & \leq \tilde{c} \ell^{-p_{2}^{*}} \tilde{f}(\ell)+\tilde{c} \int_{\ell}^{l} s^{-p_{2}^{*}} d \tilde{f}(s) \\
& \leq \tilde{c} l^{-p_{2}^{*}} \tilde{f}(l)+\frac{\tilde{c}}{p_{2}^{*}+1} \int_{\ell}^{l} s^{-1-p_{2}^{*}} \tilde{f}(s) d s \tag{3.13}
\end{align*}
$$

By assumption (1.9), there exists a sequence $\left\{l_{k}\right\}$ such that $l_{k} \rightarrow \infty$ and $l_{k}^{-p_{2}^{*}} \tilde{f}\left(l_{k}\right) \rightarrow 0$ as $k \rightarrow \infty$. Taking $l=l_{k}$ in (3.13) and then letting $k \rightarrow \infty$, we obtain

$$
\begin{equation*}
a_{n}(\ell) \tilde{f}(\ell)+\int_{\ell}^{\infty} a_{n}(s) d \tilde{f}(s) d s \leq \frac{\tilde{c}}{p_{2}^{*}+1} \int_{\ell}^{\infty} s^{-1-p_{2}^{*}} \tilde{f}(s) d s \tag{3.14}
\end{equation*}
$$

From assumption (1.9), we see that the right hand-side of (3.14) tends to 0 as $\ell \rightarrow \infty$. Therefore, for any $\epsilon>0$, one can choose $\ell>0$ such that the right hand-side of (3.14) is smaller than $\epsilon / 2$. Fix such $\ell$, one then can choose $\delta>0$ small such that if $\int_{D} \rho^{s} d x<\delta$ then $\tilde{f}(\ell) \int_{D} \rho^{s} d x<\epsilon / 2$. Therefore, from (3.12), we derive

$$
\int_{D} \rho^{s} d x<\delta \Longrightarrow \int_{D}\left|f\left(u_{n}\right)\right| \rho^{s} d x<\epsilon
$$

This means $\left\{f \circ u_{n}\right\}$ is uniformly integrable in $L^{1}\left(\Omega, \rho^{s}\right)$.
By Vitali convergence theorem, we deduce that up to a subsequence, still denoted by $\left\{u_{n}\right\}$, such that $u_{n} \rightarrow u$ in $L^{1}(\Omega)$ and $f \circ u_{n} \rightarrow f \circ u$ in $L^{1}\left(\Omega, \rho^{s}\right)$. We have

$$
\begin{equation*}
\int_{\Omega}\left(u_{n}(-\Delta)^{s} \xi+f\left(u_{n}\right) \xi\right) d x=\int_{\Omega} \xi d \tau_{n}+\int_{\Omega} \mathbb{M}_{s}^{\Omega}\left[\mu_{n}\right](-\Delta)^{s} \xi d x, \quad \forall \xi \in \mathbb{X}_{s}(\Omega) \tag{3.15}
\end{equation*}
$$

By letting $n \rightarrow \infty$ we obtain (1.3), i.e. $u$ is a solution of (1.2).

Proposition 3.1. Assume $f$ is a continuous nondecreasing function on $\mathbb{R}$ satisfying $f(0)=0$ and (1.9). Then for every $z \in \partial \Omega$,

$$
\begin{equation*}
\lim _{\Omega \ni x \rightarrow z} \frac{\mathbb{G}_{s}^{\Omega}\left[f\left(M_{s}^{\Omega}(\cdot, z)\right)\right](x)}{M_{s}^{\Omega}(x, z)}=0 \tag{3.16}
\end{equation*}
$$

Proof. By (2.1),

$$
G_{s}^{\Omega}(x, y) \leq c_{14} \rho(x)^{s}|x-y|^{-N} \min \left\{\rho(y)^{s},|x-y|^{s}\right\}, \quad \forall x \neq y
$$

Hence

$$
\begin{equation*}
\frac{\mathbb{G}_{s}^{\Omega}\left[f\left(M_{s}^{\Omega}(\cdot, z)\right)\right](x)}{M_{s}^{\Omega}(x, z)} \leq c_{15}|x-z|^{N} \int_{\Omega}|x-y|^{-N} \min \left\{|x-y|^{s},|y-z|^{s}\right\} f\left(|y-z|^{s-N}\right) d y \tag{3.17}
\end{equation*}
$$

Put

$$
\begin{align*}
\mathcal{D}_{1} & :=\Omega \cap B(x,|x-z| / 2), \quad \mathcal{D}_{2}:=\Omega \cap B(z,|x-z| / 2), \quad \mathcal{D}_{3}:=\Omega \backslash\left(\mathcal{D}_{1} \cup \mathcal{D}_{2}\right)  \tag{3.18}\\
I_{i} & :=|x-z|^{N} \int_{\mathcal{D}_{i}}|x-y|^{-N} \min \left\{|x-y|^{s},|y-z|^{s}\right\} f\left(|y-z|^{s-N}\right) d y, \quad i=1,2,3
\end{align*}
$$

For every $y \in \mathcal{D}_{1},|x-z| \leq 2|y-z|$, therefore

$$
I_{1} \leq c_{16}|x-z|^{N} f\left(|x-z|^{s-N}\right) \int_{\mathcal{D}_{1}}|x-y|^{s-N} d y \leq c_{17}|x-z|^{N+s} f\left(|x-z|^{s-N}\right)
$$

Hence

$$
\begin{equation*}
\lim _{x \rightarrow z} I_{1} \leq c_{17} \lim _{x \rightarrow z}|x-z|^{N+s} f\left(|x-z|^{s-N}\right)=0 \tag{3.19}
\end{equation*}
$$

We next estimate $I_{2}$. For every $y \in \mathcal{D}_{2},|x-z| \leq 2|x-y|$, hence

$$
I_{2} \leq c_{18} \int_{\mathcal{D}_{2}}|y-z|^{s} f\left(|y-z|^{s-N}\right) d y \leq c_{37} \int_{|x-z|^{s-N}}^{\infty} t^{-1-p_{2}^{*}} f(t) d t
$$

Therefore, by (1.9),

$$
\begin{equation*}
\lim _{x \rightarrow z} I_{2} \leq c_{19} \lim _{x \rightarrow z} \int_{|x-z|^{s-N}}^{\infty} t^{-1-p_{2}^{*}} f(s) d s=0 \tag{3.20}
\end{equation*}
$$

Finally, we estimate $I_{3}$. For every $y \in \mathcal{D}_{3},|y-z| \leq 3|x-y|$, therefore

$$
\begin{equation*}
I_{3} \leq c_{20}|x-z|^{N} \int_{\mathcal{D}_{3}}|y-z|^{s-N} f\left(|y-z|^{s-N}\right) d y \leq c_{21}|x-z|^{N} \int_{0}^{|x-z|^{s-N}} t^{-\frac{N}{N-s}} f(t) d t \tag{3.21}
\end{equation*}
$$

Put

$$
g_{1}(r)=\int_{0}^{r^{s-N}} t^{-\frac{N}{N-s}} f(t) d t, \quad g_{2}(r)=r^{-N}
$$

If $\lim _{r \rightarrow 0} g_{1}(r)<\infty$ then by (3.21), $\lim _{x \rightarrow z} I_{3}=0$. Otherwise, $\lim _{r \rightarrow 0} g_{1}(r)=\infty=$ $\lim _{r \rightarrow 0} g_{2}(r)$. Therefore, by L' hopital's rule,

$$
\begin{equation*}
\lim _{r \rightarrow 0} \frac{g_{1}(r)}{g_{2}(r)}=\lim _{r \rightarrow 0} \frac{g_{1}^{\prime}(r)}{g_{2}^{\prime}(r)}=\lim _{r \rightarrow 0} \frac{N-s}{N} r^{N+s} f\left(r^{s-N}\right)=0 \tag{3.22}
\end{equation*}
$$

By combining (3.21) and (3.22) we obtain

$$
\begin{equation*}
\lim _{x \rightarrow z} I_{3} \leq c_{22} \lim _{x \rightarrow z}|x-z|^{N} \int_{0}^{|x-z|^{s-N}} t^{-\frac{N}{N-s}} f(t) d t=0 \tag{3.23}
\end{equation*}
$$

We deduce (3.17) by gathering (3.19), (3.20) and (3.23).

Proof of Theorem D. From Theorem C we get

$$
\begin{equation*}
k M_{s}^{\Omega}(x, z)-\mathbb{G}_{s}^{\Omega}\left[f\left(M_{s}^{\Omega}(\cdot, z)\right)\right](x) \leq u_{k, z}^{\Omega}(x) \leq k M_{s}^{\Omega}(x, z) \tag{3.24}
\end{equation*}
$$

which implies

$$
k-\frac{\mathbb{G}_{s}^{\Omega}\left[f\left(M_{s}^{\Omega}(\cdot, z)\right)\right](x)}{M_{s}^{\Omega}(x, z)} \leq \frac{u_{k, z}^{\Omega}(x)}{M_{s}^{\Omega}(x, z)} \leq k
$$

We derive (1.13) due to Proposition 3.1.

### 3.2. Power absorption.

Lemma 3.2. Let $p \in\left(0, p_{2}^{*}\right)$. There exists a constant $c=c(N, s, p, \Omega)>0$ such that for any $x \in \Omega$ and $z \in \partial \Omega$, there holds

$$
\mathbb{G}_{s}^{\Omega}\left[M_{s}^{\Omega}(\cdot, z)^{p}\right](x) \leq \begin{cases}c \rho(x)^{s}|x-z|^{s-(N-s) p} & \text { if } \frac{s}{N-s}<p<p_{2}^{*}  \tag{3.25}\\ -c \rho(x)^{s} \ln |x-z| & \text { if } p=\frac{s}{N-s} \\ c \rho(x)^{s} & \text { if } 0<p<\frac{s}{N-s}\end{cases}
$$

Proof. We use a similar argument as in the proof of Proposition 3.1. It is easy to see that for every $x \in \Omega$ and $z \in \partial \Omega$,

$$
\begin{equation*}
\mathbb{G}_{s}^{\Omega}\left[M_{s}^{\Omega}(\cdot, z)^{p}\right](x) \leq c_{23} \rho(x)^{s} \int_{\Omega}|x-y|^{-N}|y-z|^{(s-N) p} \min \left\{|x-y|^{s},|y-z|^{s}\right\} d y \tag{3.26}
\end{equation*}
$$

Let $\mathcal{D}_{i}, i=1,2,3$ be as in (3.18) and put

$$
J_{i}:=\rho(x)^{s} \int_{\mathcal{D}_{i}}|x-y|^{-N}|y-z|^{(s-N) p} \min \left\{|x-y|^{s},|y-z|^{s}\right\} d y
$$

By proceeding as in the proof of Proposition 3.1 we deduce easily that there is positive constants $c_{24}=c_{24}(N, s, p, \Omega)$ such that

$$
\begin{equation*}
J_{i} \leq c_{24} \rho(x)^{s}|x-z|^{s-(N-s) p}, \quad i=1,2 \tag{3.27}
\end{equation*}
$$

and

$$
J_{3} \leq c_{24} \rho(x)^{s} \int_{|x-z| / 2}^{\operatorname{diam}(\Omega)} r^{s-1-(N-s) p} d r \leq \begin{cases}c_{25} \rho(x)^{s}|x-z|^{s-(N-s) p} & \text { if } \frac{s}{N-s}<p<p_{2}^{*}  \tag{3.28}\\ -c_{25} \rho(x)^{s} \ln |x-z| & \text { if } p=\frac{s}{N-s} \\ c_{25} \rho(x)^{s} & \text { if } 0<p<\frac{s}{N-s}\end{cases}
$$

Combining (3.27) and (3.28) implies (3.25).
Next we assume that $0 \in \partial \Omega$. Let $0<p<p_{2}^{*}$ and denote by $u_{k}^{\Omega}$ the unique solution of (1.14). By Theorem C, $u_{k}^{\Omega} \leq k M_{s}^{\Omega}(\cdot, 0)$ and $k \mapsto u_{k}^{\Omega}$ is increasing.

For any $\ell>0$, put

$$
T_{\ell}[u](y):=\ell^{\frac{2 s}{p-1}} u(\ell y), \quad \forall y \in \Omega_{\ell}:=\ell^{-1} \Omega
$$

If $u$ is a solution of (1.17) in $\Omega$ then $T_{\ell}[u]$ is a solution of (1.17) with $\Omega$ replaced by $\Omega_{\ell}$.
By Corollary A.9, the function

$$
\begin{equation*}
x \mapsto U(x)=\ell_{s, p}|x|^{-\frac{2 s}{p-1}}, \quad x \neq 0 \tag{3.29}
\end{equation*}
$$

where $\ell_{s, p}$ is a positive constant, is a radial singular solution of

$$
\begin{equation*}
(-\Delta)^{s} u+u^{p}=0 \quad \text { in } \mathbb{R}^{N} \backslash\{0\} \tag{3.30}
\end{equation*}
$$

Lemma 3.3. Assume $p \in\left(p_{1}^{*}, p_{2}^{*}\right)$. Then there exists a positive constant $C$ depending on $N$, $s, p$ and the $C^{2}$ characteristic of $\Omega$ such that the following holds. If $u$ is a positive solution of (1.17) vanishing on $\partial \Omega \backslash\{0\}$ and $u \leq U$ in $\Omega$ then there holds

$$
\begin{equation*}
u(x) \leq C \rho(x)^{s}|x|^{-\frac{(p+1) s}{p-1}} \quad \forall x \in \Omega \tag{3.31}
\end{equation*}
$$

Proof. Let $P \in(\partial \Omega \backslash\{0\}) \cap B_{1}(0)$ and put

$$
d=d(P):=\frac{1}{2}|P|<\frac{1}{2}
$$

Let $\beta_{0}$ be the positive constant in Proposition 2.6. Put

$$
u_{d}(y)=T_{d}[u](y) \quad y \in \Omega_{d}:=d^{-1} \Omega
$$

Then $u_{d}$ is a solution of

$$
\left\{\begin{array}{rll}
(-\Delta)^{s} u+u^{p} & =0 & \text { in } \Omega_{d}  \tag{3.32}\\
u=0 & & \text { in }\left(\Omega_{d}\right)^{c} .
\end{array}\right.
$$

and $u_{d}$ vanishes on $\partial \Omega_{d} \backslash\{0\}$. Moreover

$$
u_{d}(y) \leq T_{d}[U](y)=d^{\frac{2 s}{p-1}} U(d y)=\ell_{s, p}|y|^{-\frac{2 s}{p-1}}=U(y)
$$

Put $P_{d}=d^{-1} P$ and let $\beta_{0}$ be the constant in Proposition 2.6. We may assume $\beta_{0} \leq \frac{1}{4}$. Let $\zeta_{P} \in C^{\infty}\left(\mathbb{R}^{N}\right)$ such that $0 \leq \zeta \leq 1$ in $\mathbb{R}^{N}, \zeta=0$ in $B_{\beta_{0}}\left(P_{d}\right)$ and $\zeta=1$ in $\mathbb{R}^{N} \backslash B_{2 \beta_{0}}\left(P_{d}\right)$. Let $\eta_{d} \in C\left(\bar{\Omega}_{d}\right)$ be the solution of (3.4) with $\Omega$ replaced by $\Omega_{d}$. For $l>0$, denote

$$
V_{d, l}:=\zeta_{P} U+l \eta_{d}
$$

We will compare $u_{d}$ with $V_{d, l}$.
Step 1: We show that $V_{d, l}$ is a super solution of (3.32) for l large enough.
For $y \in \Omega_{d} \backslash B_{4 \beta_{0}}\left(P_{d}\right), \zeta_{P}(y)=1$ and hence

$$
\begin{aligned}
(-\Delta)^{s}\left(\zeta_{P} U\right)(y) & =\lim _{\epsilon \rightarrow 0} \int_{\mathbb{R}^{N} \backslash B_{\epsilon}(y)} \frac{U(y)-\zeta_{P}(z) U(z)}{|y-z|^{N+2 s}} d z \\
& =(-\Delta)^{s} U(y)+\lim _{\epsilon \rightarrow 0} \int_{\mathbb{R}^{N} \backslash B_{\epsilon}(y)} \frac{U(z)-\zeta_{P}(z) U(z)}{|y-z|^{N+2 s}} d z \\
& \geq(-\Delta)^{s} U(y)-\int_{B_{\frac{1}{2}}\left(P_{d}\right)} \frac{U(z)}{|y-z|^{N+2 s}} d z \\
& \geq(-\Delta)^{s} U(y)-c_{26}
\end{aligned}
$$

where $c_{44}=c_{44}\left(N, s, p, \beta_{0}\right)$. Since $\left(\Omega_{d} \cap B_{2 \beta_{0}}(0)\right) \subset\left(\Omega_{d} \backslash B_{4 \beta_{0}}\left(P_{d}\right)\right)$, it follows that, for any $y \in \Omega_{d} \cap B_{2 \beta_{0}}(0) \backslash\{0\}$,

$$
\begin{aligned}
(-\Delta)^{s} V_{d, l}(y)+\left(V_{d, l}(y)\right)^{p} & =(-\Delta)^{s}\left(\zeta_{P} U\right)(y)+l(-\Delta)^{s} \eta_{d}(y)+\left(\zeta_{P}(y) U(y)+l \eta_{d}(y)\right)^{p} \\
& \geq(-\Delta)^{s} U(y)-c_{26}+l+U(y)^{p}
\end{aligned}
$$

Therefore if we choose $l \geq c_{26}$ then

$$
\begin{equation*}
(-\Delta)^{s} V_{d, l}+\left(V_{d, l}\right)^{p} \geq 0 \quad \text { in } \Omega_{d} \cap B_{2 \beta_{0}}(0) \backslash\{0\} \tag{3.33}
\end{equation*}
$$

Next we see that there exists $c_{27}>0$ such that

$$
\left|(-\Delta)^{s}\left(\zeta_{P} U\right)\right| \leq c_{27} \quad \text { in } \Omega_{d} \backslash B_{2 \beta_{0}}(0)
$$

Consequently,

$$
\begin{aligned}
(-\Delta)^{s} V_{d, l} & =(-\Delta)^{s}\left(\zeta_{P} U\right)+l(-\Delta)^{s} \eta_{d} \\
& \geq-c_{27}+l
\end{aligned}
$$

Therefore if we choose $l \geq c_{27}$ then

$$
\begin{equation*}
(-\Delta)^{s} V_{d, l} \geq 0 \quad \text { in } \Omega_{d} \backslash B_{2 \beta_{0}}(0) \tag{3.34}
\end{equation*}
$$

By combining (3.33) and (3.34), for $l \geq \max \left\{c_{26}, c_{27}\right\}$, we deduce that $V_{d, l}$ is a super solution of (3.32).
Step 2: We show that $u_{d} \leq V_{d, l}$ in $\Omega_{d}$. By contradiction, we assume that there exists $x_{0} \in \Omega_{d}$ such that

$$
\left(u_{d}-V_{d, l}\right)\left(x_{0}\right)=\max _{x \in \Omega_{d}}\left(u_{d}-V_{d, l}\right)>0
$$

Then $(-\Delta)^{s}\left(u_{d}-V_{d, l}\right)\left(x_{0}\right) \geq 0$. It follows that

$$
0 \leq(-\Delta)^{s}\left(u_{d}-V_{d, l}\right)\left(x_{0}\right) \leq-\left(u_{d}\left(x_{0}\right)^{p}-V_{d, l}\left(x_{0}\right)^{p}\right)<0
$$

This contradiction implies that $u_{d} \leq V_{d, l}$ in $\Omega_{d}$.
Step 3: End of proof. From step 2, we deduce that

$$
u_{d} \leq l \eta_{d} \quad \text { in } \Omega_{d} \cap B_{\beta_{0}}\left(P_{d}\right)
$$

We note that $\eta_{d}(y) \leq c \operatorname{dist}\left(y, \partial \Omega_{d}\right)^{s}$ for every $y \in \Omega_{d}$. Here the constant $c$ depends on $N, s$ and the $C^{2}$ characteristic of $\Omega_{d}$. Since $d<1$, a $C^{2}$ characteristic of $\Omega_{d}$ can be taken as a $C^{2}$ characteristic of $\Omega$. Therefore the constant $c$ can be taken independently of $P$. Consequently,

$$
u_{d}(y) \leq l c \operatorname{dist}\left(y, \partial \Omega_{d}\right)^{s} \quad \forall y \in \Omega_{d} \cap B_{\beta_{0}}\left(P_{d}\right)
$$

This implies

$$
\begin{equation*}
u(x) \leq c^{\prime} \rho(x)^{s} d^{-\frac{(p+1) s}{p-1}} \quad \forall x \in \Omega \cap B_{d \beta_{0}}(P) \tag{3.35}
\end{equation*}
$$

Put

$$
\mathcal{F}_{1}:=\Omega_{\beta_{0}} \cap B_{\frac{1}{1+\beta_{0}}}(0) \cap\left\{x: \rho(x) \leq \beta_{0}|x|\right\}, \quad \mathcal{F}_{2}:=\Omega_{\beta_{0}} \cap B_{\frac{1}{1+\beta_{0}}}(0) \cap\left\{x: \rho(x)>\beta_{0}|x|\right\}
$$

If $x \in \mathcal{F}_{1}$ then let $P \in \partial \Omega \backslash\{0\}$ such that $\rho(x)=|x-P|$. It follows that

$$
\begin{equation*}
\frac{1}{2}\left(1-\beta_{0}\right)|x|<d=\frac{1}{2}|P| \leq \frac{1}{2}\left(1+\beta_{0}\right)|x|<1 . \tag{3.36}
\end{equation*}
$$

By combining (3.35) and (3.36), we get

$$
u(x) \leq c^{\prime}\left(1-\beta_{0}\right)^{-\frac{(p+1) s}{p-1}} \rho(x)^{s}|x|^{-\frac{(p+1) s}{p-1}}
$$

If $x \in \mathcal{F}_{2}$ then (3.31) follows from the assumption $u \leq U$. Thus (3.31) holds for every $x \in \Omega_{\beta_{0}} \cap B_{\frac{1}{1+\beta_{0}}}(0)$. If $x \in \Omega \backslash B_{\frac{1}{1+\beta_{0}}}(0)$ then by a similar argument as in Step 1 and Step 2 without simlarity transformation, we deduce that there exist constants $c$ and $\tilde{\beta} \in\left(0, \frac{1}{2\left(1+\beta_{0}\right)}\right)$ depending on $N, s, p$ and the $C^{2}$ characteristic of $\Omega$ such that (3.31) holds in $B_{\tilde{\beta}}(P) \cap \Omega$ for every $P \in \partial \Omega \backslash B_{\frac{1}{1+\beta_{0}}}(0)$. Finally, since $u \leq U$, estimate (3.31) holds in $D_{\frac{\tilde{\beta}}{2}}$. Thus (3.31) holds in $\Omega$.

Proposition 3.4. Assume $p \in\left(p_{1}^{*}, p_{2}^{*}\right)$. Then $u_{\infty}^{\Omega}:=\lim _{k \rightarrow 0} u_{k}^{\Omega}$ is a classical solution of (1.17). Moreover, there exists $c=c(N, s, p, \Omega)>0$ such that

$$
\begin{equation*}
c^{-1} \rho(x)^{s}|x|^{-\frac{(p+1) s}{p-1}} \leq u_{\infty}^{\Omega}(x) \leq c \rho(x)^{s}|x|^{-\frac{(p+1) s}{p-1}} \quad \forall x \in \Omega \tag{3.37}
\end{equation*}
$$

Proof. We first claim that for any $k>0$,

$$
\begin{equation*}
u_{k}^{\Omega} \leq U \quad \text { in } \Omega \tag{3.38}
\end{equation*}
$$

Indeed, by (2.5),

$$
u_{k}^{\Omega}(x) \leq k M_{s}^{\Omega}(x, 0) \leq c_{28} k \rho(x)^{s}|x|^{-N} \leq c_{28} k|x|^{s-N} \quad \forall x \in \Omega
$$

Since $p<p_{2}^{*}$, it follows that

$$
\lim _{\Omega \ni x \rightarrow 0} \frac{u_{k}^{\Omega}(x)}{U(x)}=0
$$

By proceeding as in Step 2 of the proof of Lemma 3.3, we deduce that $u_{k}^{\Omega} \leq U$ in $\Omega$.
Consequently, $u_{\infty}^{\Omega}:=\lim _{k \rightarrow \infty} u_{k}^{\Omega}$ is a solution of (1.17) vanishing on $\partial \Omega \backslash\{0\}$ and satisfying $u_{\infty}^{\Omega} \leq U$ in $\Omega$. In light of Lemma 3.3, we obtain the upper bound in (3.37).

Next we prove the lower bound in (3.37). For any $k>0$ and $x \in \Omega$, we have

$$
\begin{aligned}
u_{k}^{\Omega}(x) & \geq k M_{s}^{\Omega}(x, 0)-k^{p} \mathbb{G}_{s}^{\Omega}\left[M_{s}^{\Omega}(\cdot, 0)^{p}\right](x) \\
& \geq c_{29}^{-1} k \rho(x)^{s}|x|^{-N}\left(1-c_{29} c_{30} k^{p-1}|x|^{N+s-(N-s) p}\right)
\end{aligned}
$$

One can choose $r>0$ such that $x \in \Omega \cap\left(B_{2 r}(0) \backslash B_{r}(0)\right)$. Put $k=a r^{-\frac{N+s-(N-s) p}{p-1}}$, where $a>0$ will be made precise later on, then

$$
u_{k}^{\Omega}(x) \geq c_{31} a \rho(x)^{s}|x|^{-\frac{(p+1) s}{p-1}}\left(1-c_{29} c_{30} a^{p-1}\right)
$$

By choosing $a=\left(2 c_{29} c_{30}\right)^{-\frac{1}{p-1}}$, we deduce for any $x \in \Omega$ there exists $k>0$ depending on $|x|$ such that

$$
u_{k}^{\Omega}(x) \geq c_{32} \rho(x)^{s}|x|^{-\frac{(p+1) s}{p-1}}
$$

Since $u_{\infty}^{\Omega} \geq u_{k}^{\Omega}$ in $\Omega$ we obtain the first inequality in (3.37).
Proposition 3.5. Assume $0<p \leq p_{1}^{*}$. There exist $k_{0}=k_{0}(N, s, p)$ and $c=c(N, s, p, \Omega)$ such that the following holds. There exists a decreasing sequence of positive numbers $\left\{r_{k}\right\}$ such that $\lim _{k \rightarrow \infty} r_{k}=0$ and for any $k>k_{0}$,

$$
u_{k}^{\Omega}(x) \geq\left\{\begin{array}{ll}
c \rho(x)^{s}|x|^{-N-s} & \text { if } 0<p<p_{1}^{*},  \tag{3.39}\\
c \rho(x)^{s}|x|^{-N-s}(-\ln |x|)^{-1} & \text { if } p=p_{1}^{*},
\end{array}, \quad \forall x \in \Omega \backslash B_{r_{k}}(0)\right.
$$

Proof. For any $\ell>0$, we have

$$
\begin{equation*}
u_{\ell}^{\Omega}(x) \geq \ell M_{s}^{\Omega}(x, 0)-\ell^{p} \mathbb{G}_{s}^{\Omega}\left[M_{s}^{\Omega}(\cdot, 0)^{p}\right](x) \quad \forall x \in \Omega \tag{3.40}
\end{equation*}
$$

Case 1: $p \in\left(\frac{s}{N-s}, p_{1}^{*}\right)$. Put $k_{1}:=\left(2 c_{29} c_{30}\right)^{\frac{s}{N+2 s-N p}}$ and take $k>k_{1}$. For $\ell>0$, put $r_{\ell}=\ell^{-\frac{1}{s}}$, then $\ell=r_{\ell}^{-s}$. Take arbitrarily $x \in \Omega \backslash B_{r_{k}}(0)$ then one can choose $\ell \in\left(\max \left(2^{-s} k, k_{1}\right), k\right)$ such
that $x \in \Omega \cap\left(B_{r_{\ell}}(0) \backslash B_{\frac{r_{\ell}}{2}}(0)\right)$. From (3.40), (2.5) and (3.25), we get

$$
\begin{aligned}
u_{\ell}^{\Omega}(x) & \geq c_{29}^{-1} \ell \rho(x)^{s}|x|^{-N}\left(1-c_{29} c_{30} \ell^{p-1}|x|^{N+s-(N-s) p}\right) \\
& \geq c_{29}^{-1} \rho(x)^{s}|x|^{-N} r_{\ell}^{-s}\left(1-c_{29} c_{30} r_{\ell}^{N+2 s-N p}\right) \\
& \geq\left(2 c_{29}\right)^{-1} \rho(x)^{s}|x|^{-N} r_{\ell}^{-s} \\
& \geq c_{33} \rho(x)^{s}|x|^{-N-s} .
\end{aligned}
$$

Here the second estimate holds since $p<p_{2}^{*}$ and the third estimate holds since $N>N p-2 s$ and $\ell>k_{1}$. Since $k>\ell$, we deduce that

$$
\begin{equation*}
u_{k}^{\Omega}(x) \geq c_{33} \rho(x)^{s}|x|^{-N-s}, \quad \forall x \in \Omega \backslash B_{r_{k}}(0) \tag{3.41}
\end{equation*}
$$

Case 2: $p=\frac{s}{N-s}$. Put $k_{2}=\left(\frac{2 c_{29} c_{30}(1+s)}{s}\right)^{\frac{s}{N-s p}}$ and take $k>k_{2}$. For $\ell>0$, put $r_{\ell}=\ell^{-\frac{1}{s}}$, then $\ell=r_{\ell}^{-s}$. Take arbitrarily $x \in \Omega \backslash B_{r_{k}}(0)$ then one can choose $\ell \in\left(\max \left(2^{-s} k, k_{2}\right), k\right)$ such that $x \in \Omega \cap\left(B_{r_{\ell}}(0) \backslash B_{\frac{r_{\ell}}{2}}(0)\right)$. From (3.40), (2.5) and (3.25), we get

$$
\begin{aligned}
u_{\ell}^{\Omega}(x) & \geq c_{29}^{-1} \ell \rho(x)^{s}|x|^{-N}\left(1+c_{29} c_{30} \ell^{p-1}|x|^{N} \ln |x|\right) \\
& \geq c_{29}^{-1} \rho(x)^{s}|x|^{-N} r_{\ell}^{-s}\left(1+c_{29} c_{30} r_{\ell}^{N+s-s p} \ln \left(\frac{r_{\ell}}{2}\right)\right) \\
& \geq\left(2 c_{29}\right)^{-1} \rho(x)^{s}|x|^{-N} r_{\ell}^{-s} \\
& \geq c_{33} \rho(x)^{s}|x|^{-N-s} .
\end{aligned}
$$

Here the third estimate holds since $\ell>k_{2}$ and $N-s p>0$. Therefore (3.41) holds.
Case 3: $p \in\left(0, \frac{s}{N-s}\right)$. Put $k_{3}=\left(2 c_{29} c_{30}\right)^{\frac{s}{N+s-s p}}$ and take $k>k_{3}$. For $\ell>0$, put $r_{\ell}=\ell^{-\frac{1}{s}}$, then $\ell=r_{\ell}^{-s}$. Take arbitrarily $x \in \Omega \backslash B_{r_{k}}(0)$ then one can choose $\ell \in\left(\max \left(2^{-s} k, k_{3}\right), k\right)$ such that $x \in \Omega \cap\left(B_{r_{\ell}}(0) \backslash B_{\frac{r_{\ell}}{2}}(0)\right)$. From (3.40), (2.5) and (3.25), we get

$$
\begin{aligned}
u_{\ell}^{\Omega}(x) & \geq c_{29}^{-1} \ell \rho(x)^{s}|x|^{-N}\left(1-c_{29} c_{30} \ell^{p-1}|x|^{N}\right) \\
& \geq c_{29}^{-1} \rho(x)^{s}|x|^{-N} r_{\ell}^{-s}\left(1-c_{29} c_{30} r_{\ell}^{N+s-s p}\right) \\
& \geq\left(2 c_{29}\right)^{-1} \rho(x)^{s}|x|^{-N} r_{\ell}^{-s} \\
& \geq c_{33} \rho(x)^{s}|x|^{-N-s} .
\end{aligned}
$$

Here the third estimate holds since $\ell>k_{3}$ and $N+s-s p>0$. Therefore (3.41) holds.
Case 4: $p=p_{1}^{*}$. Put $k_{4}=\exp \left(\left(2 c_{29} c_{30}\right)^{\frac{s}{N+s-(N-s) p}}\right)$ and take $k>k_{4}$. For $\ell>0$, put $r_{\ell}=(\ell \ln (\ell))^{-\frac{1}{s}}$, then $\ell \ln (\ell)=r_{\ell}^{-s}$ and $\ell<r_{\ell}^{-s}$ when $\ell>3$. Take arbitrarily $x \in \Omega \backslash B_{r_{k}}(0)$ then one can choose $\ell \in\left(\max \left(2^{-s} k, k_{4}\right), k\right)$ such that $x \in \Omega \cap\left(B_{r_{\ell}}(0) \backslash B_{\frac{r_{\ell}}{2}}(0)\right)$. From (3.40), (2.5) and (3.25), we get

$$
\begin{aligned}
u_{\ell}^{\Omega}(x) & \geq c_{29}^{-1} \ell \rho(x)^{s}|x|^{-N}\left(1-c_{29} c_{30} \ell^{p-1}|x|^{N+s-(N-s) p}\right) \\
& \geq c_{29}^{-1} \ell \rho(x)^{s}|x|^{-N}\left(1-c_{29} c_{30} \ell^{p-1}(\ell \ln (\ell))^{-\frac{N+s-(N-s) p}{s}}\right) \\
& =c_{29}^{-1} \ell \rho(x)^{s}|x|^{-N}\left(1-c_{29} c_{30} \ln (\ell)^{-\frac{N+s-(N-s) p}{s}}\right) \\
& \geq\left(2 c_{29}\right)^{-1} \ell \rho(x)^{s}|x|^{-N} \\
& \geq c_{34} \rho(x)^{s}|x|^{-N-s}(-\ln |x|)^{-1}
\end{aligned}
$$

Here the last estimate follows from the following estimate

$$
\ell=\frac{r_{\ell}^{-s}}{\ln (\ell)}>\frac{|x|^{-s}}{-s 2^{s} \ln |x|} .
$$

Since $u_{k}(x) \geq u_{\ell}(x)$, we derive

$$
u_{k}^{\Omega}(x) \geq c_{34} \rho(x)^{s}|x|^{-N-s}(-\ln |x|)^{-1}
$$

By putting $k_{0}:=\max \left(k_{1}, k_{2}, k_{3}, k_{4}\right)$, we obtain (3.39).
Proposition 3.6. Assume $0<p \leq p_{1}^{*}$. Then $\lim _{k \rightarrow \infty} u_{k}^{\Omega}(x)=\infty$ for every $x \in \Omega$.
Proof. The proposition can be obtained by adapting the argument in the proof of [9, Theorem 1.2]. Let $r_{0}>0$ and put

$$
\theta_{k}:=\int_{B_{r_{0}}(0)} u_{k}^{\Omega}(x) d x .
$$

Then

$$
\theta_{k} \geq c \int_{\left(B_{r_{0}} \cap \Omega\right) \backslash B_{r_{k}}(0)} \rho(x)^{s}|x|^{N-s}(-\ln |x|)^{-1} d x,
$$

which implies

$$
\begin{equation*}
\lim _{k \rightarrow \infty} \theta_{k}=\infty \tag{3.42}
\end{equation*}
$$

Fix $y_{0} \in \Omega \backslash \bar{B}_{r_{0}}(0)$ and set $\delta:=\frac{1}{2} \min \left\{\rho\left(y_{0}\right),\left|y_{0}\right|-r_{0}\right\}$. By [12, Lemma 2.4] there exists a unique classical solution $w_{k}$ of the following problem

$$
\left\{\begin{align*}
(-\Delta)^{s} w_{k}+w_{k}^{p} & =0  \tag{3.43}\\
& \text { in } B_{\delta}\left(y_{0}\right), \\
w_{k} & =0 \quad \text { in } \mathbb{R}^{N} \backslash\left(B_{\delta}\left(y_{0}\right) \cup B_{r_{0}}(0)\right), \\
w_{k} & =u_{k}^{\Omega} \text { in } B_{r_{0}}(0) .
\end{align*}\right.
$$

By [12, Lemma 2.2],

$$
\begin{equation*}
u_{k}^{\Omega} \geq w_{k} \quad \text { in } B_{\delta}\left(y_{0}\right) . \tag{3.44}
\end{equation*}
$$

Next put $\tilde{w}_{k}:=w_{k}-\chi_{B_{r_{0}}(0)} u_{k}$ then $\tilde{w}_{k}=w_{k}$ in $B_{\delta}\left(y_{0}\right)$. Moreover, for $x \in B_{\delta}\left(y_{0}\right)$

$$
\begin{align*}
(-\Delta)^{s} \tilde{w}_{k}(x) & =-\lim _{\epsilon \rightarrow 0} \int_{B_{\delta}\left(y_{0}\right) \backslash B_{\epsilon}(x)} \frac{w_{k}(z)-w_{k}(x)}{|z-x|^{N+2 s}} d z+\lim _{\epsilon \rightarrow 0} \int_{B_{\delta}^{c}\left(y_{0}\right) \backslash B_{\epsilon}(x)} \frac{w_{k}(x)}{|z-x|^{N+2 s}} d z \\
& =-\lim _{\epsilon \rightarrow 0} \int_{\mathbb{R}^{N} \backslash B_{\epsilon}(x)} \frac{w_{k}(z)-w_{k}(x)}{|z-x|^{N+2 s}} d z+\int_{B_{r_{0}}(0)} \frac{u_{k}^{\Omega}(z)}{|z-x|^{N+2 s}} d z  \tag{3.45}\\
& \geq(-\Delta)^{s} w_{k}(x)+A \theta_{k}
\end{align*}
$$

where $A=\left(\left|y_{0}\right|+r_{0}\right)^{-N-2 s}$. It follows that, for $x \in B_{\delta}\left(y_{0}\right)$,

$$
\begin{equation*}
(-\Delta)^{s} \tilde{w}_{k}(x)+\tilde{w}_{k}^{p}(x) \geq(-\Delta)^{s} w_{k}(x)+w_{k}^{p}(x)+A \theta_{k}=A \theta_{k}, \tag{3.46}
\end{equation*}
$$

Therefore $\tilde{w}_{k} \in C\left(\overline{B_{\delta}\left(y_{0}\right)}\right)$ is a supersolution of

$$
\left\{\begin{align*}
(-\Delta)^{s} w+w^{p}=A \theta_{k} & \text { in } B_{\delta}\left(y_{0}\right),  \tag{3.47}\\
w=0 & \text { in } \mathbb{R}^{N} \backslash B_{\delta}\left(y_{0}\right) .
\end{align*}\right.
$$

Let $\eta_{0} \in C\left(\overline{B_{\delta}\left(y_{0}\right)}\right)$ be the unique solution of

$$
\left\{\begin{align*}
(-\Delta)^{s} \eta_{0}=1 & \text { in } B_{\delta}\left(y_{0}\right)  \tag{3.48}\\
\eta_{0}=0 & \text { in } \mathbb{R}^{N} \backslash B_{\delta}\left(y_{0}\right)
\end{align*}\right.
$$

We can choose $k$ large enough so that the function

$$
\frac{\eta_{0}\left(A \theta_{k}\right)^{\frac{1}{p}}}{2 \max _{\mathbb{R}^{N}} \eta_{0}}
$$

is a subsolution of (3.47). By [12, Lemma 2.2] we obtain

$$
\begin{equation*}
\tilde{w}_{k}(x) \geq \frac{\eta_{0}\left(A \theta_{k}\right)^{\frac{1}{p}}}{2 \max _{\mathbb{R}^{N}} \eta_{0}} \quad \forall x \in B_{\delta}\left(y_{0}\right) \tag{3.49}
\end{equation*}
$$

Put

$$
\underline{c}:=\min _{x \in B_{\delta}\left(y_{0}\right)} \frac{\eta_{0}}{2 \max _{\mathbb{R}^{N}} \eta_{0}}
$$

then we derive from (3.49) that

$$
\begin{equation*}
w_{k}(x) \geq \underline{c}\left(A \theta_{k}\right)^{\frac{1}{p}} \tag{3.50}
\end{equation*}
$$

By combining $(3.42),(3.44)$ and $(3.50)$, we deduce that

$$
\lim _{k \rightarrow \infty} u_{k}^{\Omega}(x)=\infty \quad \forall x \in B_{\frac{\delta}{2}}\left(y_{0}\right)
$$

This implies

$$
\lim _{k \rightarrow \infty} u_{k}^{\Omega}(x)=\infty \quad \forall x \in \Omega
$$

Theorem 3.7. Assume $p \in\left(1, p_{2}^{*}\right)$ and either $\Omega=\mathbb{R}_{+}^{N}:=\left\{x=\left(x^{\prime}, x_{N}\right): x_{N}>0\right\}$ or $\partial \Omega$ is compact with $0 \in \partial \Omega$. Then, for any $k>0$, there exists a unique solution solution $u_{k}^{\Omega}$ of problem (1.14) satisfying $u_{k}^{\Omega} \leq k M_{s}^{\Omega}(\cdot, 0)$ in $\Omega$ and

$$
\begin{equation*}
\lim _{|x| \rightarrow 0} \frac{u_{k}^{\Omega}(x)}{M_{s}^{\Omega}(x, 0)}=k \tag{3.51}
\end{equation*}
$$

Moreover, the map $k \mapsto u_{k}^{\Omega}$ is increasing.
Proof. Step 1: Existence. For $R>0$ we set $\Omega_{R}=\Omega \cap B_{R}$ and let $u:=u_{k}^{\Omega_{R}}$ be the unique solution of

$$
\left\{\begin{align*}
(-\Delta)^{s} u+u^{p} & =0 \quad \text { in } \Omega_{R}  \tag{3.52}\\
\operatorname{tr}_{s}(u) & =k \delta_{0} \\
u & =0 \quad \text { on } \Omega_{R}^{c}
\end{align*}\right.
$$

Then

$$
\begin{equation*}
u_{k}^{\Omega_{R}}(x) \leq k M_{s}^{\Omega_{R}}(x, 0) \quad \forall x \in \Omega_{R} \tag{3.53}
\end{equation*}
$$

Since $R \mapsto M_{s}^{\Omega_{R}}(., 0)$ is increasing, it follows from (1.13) that $R \mapsto u_{k}^{\Omega_{R}}$ is increasing too with the limit $u^{*}$ and there holds

$$
\begin{equation*}
u^{*}(x) \leq k M_{s}^{\Omega}(x, 0) \quad \forall x \in \Omega \tag{3.54}
\end{equation*}
$$

From (3.53), we deduce that

$$
u_{k}^{\Omega_{R}}(x) \leq c k|x|^{s-N} \quad \forall x \in \Omega_{R}
$$

where $c$ depends only on $N, s$ and the $C^{2}$ charateristic of $\Omega$. Hence by the regularity up to the boundary [19], $\left\{u_{k}^{\Omega_{R}}\right\}$ is uniformly bounded in $C_{l o c}^{s}\left(\bar{\Omega} \backslash B_{\epsilon}\right)$ and in $C_{l o c}^{2 s+\alpha}\left(\Omega \backslash B_{\epsilon}\right)$ for any $\epsilon>0$. Therefore, $\left\{u_{k}^{\Omega_{R}}\right\}$ converges locally uniformly, as $R \rightarrow \infty$, to $u^{*} \in C(\bar{\Omega} \backslash\{0\}) \cap C^{2 s+\alpha}(\Omega)$. Thus $u^{*}$ is a positive solution of (1.14). Moreover by combining (1.13), (3.53), the fact that $M_{s}^{\Omega_{R}} \uparrow M_{s}^{\Omega}$ and $u_{k}^{\Omega_{R}} \uparrow u_{k}^{\Omega}$, we deduce that $\operatorname{tr}_{s}\left(u^{*}\right)=k \delta_{0}$ and

$$
\lim _{\Omega \ni x \rightarrow 0} \frac{u^{*}(x)}{M_{s}^{\Omega}(x, 0)}=k
$$

Step 2: Uniqueness. Suppose $u$ and $u^{\prime}$ are two weak solutions of (1.17) satisfying $\max \left\{u, u^{\prime}\right\} \leq$ $k M_{s}^{\Omega}(\cdot, 0)$ in $\Omega$ and

$$
\begin{equation*}
\lim _{\Omega \ni x \rightarrow 0} \frac{u(x)}{M_{s}^{\Omega}(x, 0)}=\lim _{\Omega \ni x \rightarrow 0} \frac{u^{\prime}(x)}{M_{s}^{\Omega}(x, 0)}=k \tag{3.55}
\end{equation*}
$$

Take $\epsilon>0$ and put $u_{\epsilon}:=(1+\epsilon) u^{\prime}+\epsilon, v:=\left(u-u_{\epsilon}\right)_{+}$. Then by (3.55) there exists a smooth bounded domain $G \subset \Omega$ such that $v=0$ in $G^{c}$. In light of Kato's inequality, we derive $(-\Delta)^{s} v \leq 0$ in $G$. Moreover, $v \leq k M_{s}^{\Omega}(\cdot, 0)$ in $G$. By (2.20) we obtain $v=0$ in $G$ and therefore $u \leq(1+\epsilon) u^{\prime}+\epsilon$ in $\Omega$. Letting $\epsilon \rightarrow 0$ yields $u \leq u^{\prime}$ in $\Omega$. By permuting the role of $u$ and $u^{\prime}$, we derive $u=u^{\prime}$ in $\Omega$.

By a similar argument as in step 2, we can show that $k \mapsto u_{k}^{\Omega}$ is increasing.
Proof of Theorem F. (i) Case 1: $p_{1}^{*}<p<p_{2}^{*}$.
Since $\partial \Omega \in C^{2}$, there exist two open balls $B$ and $B^{\prime}$ such that $B \subset \Omega \subset B^{\prime c}$ and $\partial B \cap \partial B^{\prime}=$ $\{0\}$. Since $M_{s}^{B}(x, 0) \leq M_{s}^{\Omega}(x, 0) \leq M_{s}^{B^{\prime c}}(x, 0)$ it follows from Theorem 3.7 that

$$
\begin{equation*}
u_{k}^{B} \leq u_{k}^{\Omega} \leq u_{k}^{B^{\prime c}} \tag{3.56}
\end{equation*}
$$

where the first inequality holds in $B$ and the second inequality holds in $\Omega$.
Let $\mathcal{O}$ be $B, \Omega$ or $B^{\prime c}$. Because of uniqueness, we have

$$
\begin{equation*}
T_{\ell}\left[u_{k}^{\mathcal{O}}\right]=u_{k \ell}^{\frac{\mathcal{O}_{\ell}}{p-1}+1-N} \quad \forall \ell>0 \tag{3.57}
\end{equation*}
$$

with $\mathcal{O}_{\ell}=\ell^{-1} \mathcal{O}$. By Theorem 3.7, the sequence $\left\{u_{k}^{\mathcal{O}}\right\}$ is increasing and by $(3.38), u_{k}^{\mathcal{O}} \leq U$. It follows that $\left\{u_{k}^{\mathcal{O}}\right\}$ converges to a function $u_{\infty}^{\mathcal{O}}$ which is a positive solution of (1.17) with $\Omega$ replaced by $\mathcal{O}$ and vanishes on $\partial \mathcal{O} \backslash\{0\}$.
Step 1: $\mathcal{O}:=\mathbb{R}_{+}^{N}$. Then $\mathcal{O}_{\ell}=\mathbb{R}_{+}^{N}$. Letting $k \rightarrow \infty$ in (3.57) yields to

$$
\begin{equation*}
T_{\ell}\left[u_{\infty}^{\mathbb{R}_{+}^{N}}\right]=u_{\infty}^{\mathbb{R}_{+}^{N}} \quad \forall \ell>0 \tag{3.58}
\end{equation*}
$$

Therefore $u_{\infty}^{\mathbb{R}_{+}^{N}}$ is self-similar and thus it can be written in the separable form

$$
u_{\infty}^{\mathbb{R}_{+}^{N}}(x)=u_{\infty}^{\mathbb{R}_{+}^{N}}(r, \sigma)=r^{-\frac{2 s}{p-1}} \omega(\sigma)
$$

where $r=|x|, \sigma=\frac{x}{|x|} \in S^{N-1}$ and $\omega$ satisfies (3.20). Since $p_{1}^{*}<p<p_{2}^{*}$, it follows from Theorem E that $\omega=\omega^{*}$, the unique positive solution of (3.20). This means

$$
\begin{equation*}
u_{\infty}^{\mathbb{R}_{+}^{N}}(x)=r^{-\frac{2 s}{p-1}} \omega^{*}(\sigma) \tag{3.59}
\end{equation*}
$$

This implies (3.37).
Step 2: $\mathcal{O}:=B$ or $B^{\prime c}$. In accordance with our previous notations, we set $B_{\ell}=\ell^{-1} B$ and $\left(B^{c}\right)_{\ell}=\ell^{-1} B^{c}$ for any $\ell>0$ and we have,

$$
\begin{equation*}
T_{\ell}\left[u_{\infty}^{B}\right]=u_{\infty}^{B_{\ell}} \text { and } T_{\ell}\left[u_{\infty}^{B^{\prime c}}\right]=u_{\infty}^{\left(B^{\prime c}\right)_{\ell}} \tag{3.60}
\end{equation*}
$$

and

$$
\begin{equation*}
u_{\infty}^{B_{\ell^{\prime}}} \leq u_{\infty}^{B_{\ell}} \leq u_{\infty}^{\mathbb{R}_{+}^{N}} \leq u_{\infty}^{\left(B^{\prime c}\right)_{\ell}} \leq u_{\infty}^{\left(B^{\prime c}\right)_{\ell^{\prime \prime}}} \quad 0<\ell \leq \ell^{\prime}, \ell^{\prime \prime} \leq 1 . \tag{3.61}
\end{equation*}
$$

When $\ell \rightarrow 0, u_{\infty}^{B_{\ell}} \uparrow \underline{u}_{\infty}^{\mathbb{R}_{+}^{N}}$ and $u_{\infty}^{\left(B^{\prime c}\right) \ell} \downarrow \bar{u}_{\infty}^{\mathbb{R}_{+}^{N}}$ where $\underline{u}_{\infty}^{\mathbb{R}_{+}^{N}}$ and $\bar{u}_{\infty}^{\mathbb{R}_{+}^{N}}$ are positive solutions of (3.38) in $\mathbb{R}_{+}^{N}$ such that

$$
\begin{equation*}
u_{\infty}^{B_{\ell}} \leq \underline{u}_{\infty}^{\mathbb{R}_{+}^{N}} \leq u_{\infty}^{\mathbb{R}_{+}^{N}} \leq \bar{u}_{\infty}^{\mathbb{R}_{+}^{N}} \leq u_{\infty}^{\left(B^{\prime c}\right) \ell} \quad 0<\ell \leq 1 \tag{3.62}
\end{equation*}
$$

This combined with the monotonicity of $u_{\infty}^{B_{\ell}}$ and $u_{\infty}^{\left(B^{\prime c}\right) \ell}$ implies that $\underline{u}_{\infty}^{\mathbb{R}_{+}^{N}}$ and $\bar{u}_{\infty}^{\mathbb{R}_{+}^{N}}$ vanish on $\partial \mathbb{R}_{+}^{N} \backslash\{0\}$ and are continuous in $\overline{\mathbb{R}_{+}^{N}} \backslash\{0\}$. Furthermore there also holds for $\ell, \ell^{\prime}>0$,

$$
\begin{equation*}
T_{\ell^{\prime} \ell}\left[u_{\infty}^{B}\right]=T_{\ell^{\prime}}\left[T_{\ell}\left[u_{\infty}^{B}\right]\right]=u_{\infty}^{B_{\ell \ell^{\prime}}} \text { and } T_{\ell^{\prime} \ell}\left[u_{\infty}^{B^{\prime c}}\right]=T_{\ell^{\prime}}\left[T_{\ell}\left[u_{\infty}^{B^{\prime c}}\right]\right]=u_{\infty}^{\left(B_{c}^{\prime}\right)_{\ell \ell^{\prime}}} \tag{3.63}
\end{equation*}
$$

Letting $\ell \rightarrow 0$ and using (3.60) and the above convergence, we obtain

$$
\begin{equation*}
\underline{u}_{\infty}^{\mathbb{R}_{+}^{N}}=T_{\ell^{\prime}}\left[\underline{u}_{\infty}^{\mathbb{R}_{+}^{N}}\right] \text { and } \bar{u}_{\infty}^{\mathbb{R}_{+}^{N}}=T_{\ell^{\prime}}\left[\bar{u}_{\infty}^{\mathbb{R}_{+}^{N}}\right] \quad \ell^{\prime}>0 \tag{3.64}
\end{equation*}
$$

Again this implies that $\underline{u}_{\infty}^{\mathbb{R}_{+}^{N}}$ and $\bar{u}_{\infty}^{\mathbb{R}_{+}^{N}}$ are separable solutions of (3.19) in $\mathbb{R}_{+}^{N}$ vanishing on $\partial \mathbb{R}_{+}^{N} \backslash\{0\}$. Since $p_{1}^{*}<p<p_{2}^{*}$, by Theorem E,

$$
\underline{u}_{\infty}^{\mathbb{R}_{+}^{N}}(x)=\bar{u}_{\infty}^{\mathbb{R}_{+}^{N}}(x)=u_{\infty}^{\mathbb{R}_{+}^{N}}(x)=r^{-\frac{2 s}{p-1}} \omega^{*}(\sigma)
$$

Step 3: End of the proof. From (3.56) and (3.60) there holds

$$
\begin{equation*}
u_{\infty}^{B_{\ell}} \leq T_{\ell}\left[u_{\infty}^{\Omega}\right] \leq u_{\infty}^{\left(B^{\prime c}\right)_{\ell}} \quad 0<\ell \leq 1 \tag{3.65}
\end{equation*}
$$

Since the left-hand side and the right-hand side of (3.65) converge to the same function $u_{\infty}^{\mathbb{R}_{+}^{N}}$, we obtain

$$
\begin{equation*}
\lim _{\ell \rightarrow 0} \ell^{\frac{2 s}{p-1}} u_{\infty}^{\Omega}(\ell x)=|x|^{-\frac{2 s}{p-1}} \omega^{*}\left(\frac{x}{|x|}\right) \tag{3.66}
\end{equation*}
$$

and this convergence holds in any compact subset of $\Omega$. Take $|x|=1$, we derive (1.18). Estimate (3.37) follows from Proposition 3.4.
(ii) Case 2: $0<p \leq p_{1}^{*}$. Then by Proposition 3.6, $\lim _{k \rightarrow \infty} u_{k}^{\Omega}(x)=\infty$ for every $x \in \Omega$.

## Appendix A. Appendix - Separable solutions

A.1. Separable $s$-harmonic functions. We denote by $(r, \sigma) \in \mathbb{R}_{+} \times S^{N-1}$ the spherical coordinates in $\mathbb{R}^{N}$, consider the follonwing parametric representation of the unit sphere

$$
\begin{equation*}
S^{N-1}=\left\{\sigma=\left(\cos \phi \sigma^{\prime}, \sin \phi\right): \sigma^{\prime} \in S^{N-2},-\frac{\pi}{2} \leq \phi \leq \frac{\pi}{2}\right\} \tag{A.1}
\end{equation*}
$$

hence $x_{N}=r \sin \phi$. We define the spherical fractional Laplace-Beltrami operator $\mathcal{A}_{s}$ by

$$
\begin{equation*}
\mathcal{A}_{s} \omega(\sigma):=\lim _{\epsilon \rightarrow 0} \mathcal{A}_{s, \epsilon} \omega(\sigma) \tag{A.2}
\end{equation*}
$$

with

$$
\begin{equation*}
\mathcal{A}_{s, \epsilon} \omega(\sigma):=a_{N, s} \iint_{\mathbb{R}_{+} \times S^{N-1} \backslash B_{\epsilon}(\vec{\sigma})} \frac{(\omega(\sigma)-\omega(\eta)) \tau^{N-1}}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} d S(\eta) d \tau \tag{A.3}
\end{equation*}
$$

where $\vec{\sigma}=(1, \sigma)$. If $u:(r, \sigma) \mapsto u(r, \sigma)=r^{-\beta} \omega(\sigma)$ is $s$-harmonic in $\mathbb{R}^{N} \backslash\{0\}$, it satisfies, at least formally,

$$
\begin{equation*}
\mathcal{A}_{s} \omega-\mathcal{L}_{s, \beta} \omega=0 \quad \text { on } \quad S^{N-1} \tag{A.4}
\end{equation*}
$$

where $\mathcal{L}_{s, \beta}$ is the integral operator

$$
\begin{equation*}
\mathcal{L}_{s, \beta} \omega(\sigma):=a_{N, s} \int_{0}^{\infty} \int_{S^{N-1}} \frac{\left(\tau^{-\beta}-1\right) \tau^{N-1}}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} \omega(\eta) d S(\eta) d \tau \tag{A.5}
\end{equation*}
$$

whenever this integral is defined. We will see in the next two lemmas that the role of the exponent $\beta_{0}=N$ is fundamental for the definition of $\mathcal{L}_{s, \beta} \omega$ since we have
Lemma A.1. If $N \geq 2, s \in(0,1), \beta<N$ and $(\sigma, \eta) \in \mathbb{R}^{N-1} \times \mathbb{R}^{N-1}$ such that $\langle\sigma, \eta\rangle \neq 1$, we define

$$
\begin{equation*}
B_{s, \beta}(\sigma, \eta):=\int_{0}^{\infty} \frac{\left(\tau^{-\beta}-1\right) \tau^{N-1}}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} d \tau \tag{A.6}
\end{equation*}
$$

Then
(i) $B_{s, \beta}(\sigma, \eta)<0 \Longleftrightarrow \beta<N-2 s$,
(ii) $B_{s, \beta}(\sigma, \eta)=0 \Longleftrightarrow \beta=N-2 s$,
(iii) $B_{s, \beta}(\sigma, \eta)>0 \Longleftrightarrow \beta>N-2 s$.

Proof. Since $\beta<N$, the integral in (A.7) is absolutely convergent. We write

$$
\begin{aligned}
B_{s, \beta}(\sigma, \eta) & =\int_{0}^{1} \frac{\left(\tau^{-\beta}-1\right) \tau^{N-1}}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} d \tau+\int_{1}^{\infty} \frac{\left(\tau^{-\beta}-1\right) \tau^{N-1}}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} d \tau \\
& =: I+I I
\end{aligned}
$$

By the change of variable $\tau \mapsto \tau^{-1}$

$$
I I=-\int_{0}^{1} \frac{\left(\tau^{-\beta}-1\right) \tau^{N-1+c_{s}}}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} d \tau
$$

where $c_{s}=\beta+2 s-N$. Since

$$
\begin{equation*}
B_{s, \beta}(\sigma, \eta)=\int_{0}^{1} \frac{\left(\tau^{-\beta}-1\right)\left(\tau^{N-1}-\tau^{N-1+c_{s}}\right)}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} d \tau \tag{A.7}
\end{equation*}
$$

the claim follows.
As a byproduct of (A.7) we have the following monotonicity formula
Lemma A.2. If $N \geq 2$ and $s \in(0,1)$, then for any $(\sigma, \eta) \in S^{N-1} \times S^{N-1}$ the mapping $\beta \mapsto B_{s, \beta}(\sigma, \eta)$ is continuous and increasing from $(N-2 s, N)$ onto $(0, \infty)$.

In the next result we analyze the behaviour of $B_{s, \beta}(\sigma, \eta)$ when $\sigma-\eta \rightarrow 0$ on $S^{N-1}$.
Lemma A.3. Assume $N \geq 2$, $s \in(0,1)$ and $\beta<N$ with $\beta \neq N-2 s$, then
I- If $N \geq 3$, there exists $c=c(N, \beta, s)>0$ such that

$$
\begin{equation*}
\left|B_{s, \beta}(\sigma, \eta)\right| \leq c|\sigma-\eta|^{3-N-2 s} \quad \forall(\sigma, \eta) \in S^{N-1} \times S^{N-1} \tag{A.8}
\end{equation*}
$$

II- If $N=2$,
(i) either $s>\frac{1}{2}$ and (A.8) holds with $N=2$,
(ii) either $s=\frac{1}{2}$ and

$$
\begin{equation*}
\left|B_{s, \beta}(\sigma, \eta)\right| \leq c(-\ln |\sigma-\eta|+1) \quad \forall(\sigma, \eta) \in S^{1} \times S^{1} \tag{A.9}
\end{equation*}
$$

(iii) or $0<s<\frac{1}{2}$ and

$$
\begin{equation*}
\left|B_{s, \beta}(\sigma, \eta)\right| \leq c \quad \forall(\sigma, \eta) \in S^{1} \times S^{1} \tag{A.10}
\end{equation*}
$$

Proof. First, notice that the quantity

$$
\int_{0}^{\frac{1}{2}} \frac{\left(\tau^{-\beta}-1\right)\left(\tau^{N-1}-\tau^{N-1+c_{s}}\right)}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} d \tau
$$

is uniformly bounded with respect to $(\sigma, \eta)$. The only possible singularity in the expression given in (A.7) occurs when $\langle\sigma, \eta\rangle=1$ and $\tau=1$. We write $\langle\sigma, \eta\rangle=1-\frac{1}{2} \kappa^{2}$ and $t=1-\tau$, hence

$$
\begin{aligned}
\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s} & =\left(t^{2}+(1-t) \kappa^{2}\right)^{\frac{N}{2}+s} \\
& \approx \kappa^{N+2 s}\left(1+\left(\frac{t}{\kappa}\right)^{2}\right)^{\frac{N}{2}+s}
\end{aligned}
$$

as $t \rightarrow 0$. Moreover

$$
\begin{aligned}
\left(\tau^{-\beta}-1\right)\left(\tau^{N-1}-\tau^{N-1+c_{s}}\right) & =\left((1-t)^{-\beta}-1\right)\left((1-t)^{N-1}-(1-t)^{N-1+c_{s}}\right) \\
& =c_{s} \beta t^{2}+O\left(t^{3}\right) \quad \text { as } t \rightarrow 0
\end{aligned}
$$

Hence

$$
\begin{aligned}
\int_{\frac{1}{2}}^{1} \frac{\left(\tau^{-\beta}-1\right)\left(\tau^{N-1}-\tau^{N-1+c_{s}}\right)}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} d \tau & =\int_{0}^{\frac{1}{2}} \frac{\left((1-t)^{-\beta}-1\right)\left((1-t)^{N-1}-(1-t)^{N-1+c_{s}}\right)}{\left(t^{2}+(1-t) \kappa^{2}\right)^{\frac{N}{2}+s}} d t \\
& \approx c_{s} \kappa^{3-N-2 s} \int_{0}^{\frac{1}{2 \kappa}} \frac{x^{2}}{\left(1+x^{2}\right)^{\frac{N}{2}+s}} d x
\end{aligned}
$$

If $N=2$ and $s<\frac{1}{2}$,

$$
\left|\kappa^{1-2 s} \int_{0}^{\frac{1}{2 \kappa}} \frac{x^{2}}{\left(1+x^{2}\right)^{1+s}} d x\right| \leq M
$$

for some $M>0$ independent of $\kappa$. If $N=2$ and $s=\frac{1}{2}$

$$
\int_{0}^{\frac{1}{2 \kappa}} \frac{x^{2}}{\left(1+x^{2}\right)^{1+\frac{1}{2}}} d x=\ln \left(\frac{1}{\kappa}\right)(1+o(1))
$$

and if $N=3$ or $N=2$ and $s>\frac{1}{2}$,

$$
\int_{0}^{\frac{1}{2 \kappa}} \frac{x^{2}}{\left(1+x^{2}\right)^{\frac{N}{2}+s}} d x \rightarrow \int_{0}^{\infty} \frac{x^{2}}{\left(1+x^{2}\right)^{\frac{N}{2}+s}} d x
$$

as $\kappa \rightarrow 0$. Since $\sigma, \eta \in S^{N-1}$ there holds $\kappa^{2}=2(1-\langle\sigma, \eta\rangle)=|\sigma-\eta|^{2}$. Thus the claim follows.

Proposition A.4. Assume $N \geq 2$, $s \in(0,1)$ and $\beta<N$ with $\beta \neq N-2 s$. Then $\omega \mapsto \mathcal{L}_{s, \beta} \omega$ is a continuous linear operator from $L^{q}\left(S^{N-1}\right)$ into $L^{r}\left(S^{N-1}\right)$ for any $1 \leq q, r \leq \infty$ such that

$$
\begin{equation*}
\frac{1}{r}>\frac{1}{q}-\frac{2(1-s)}{N-1} \tag{A.11}
\end{equation*}
$$

Furthermore, $\mathcal{L}_{s, \beta}$ is positive (resp. negative) operator if $\beta<N-2 s($ resp. $N-2 s<\beta<N)$.

Proof. By Lemma A.3, for any $\eta \in S^{N-1}, B_{s, \beta}(., \eta) \in L^{a}\left(S^{N-1}\right)$ for all $1<a<\frac{N-1}{N+2 s-3}$ if $N \geq 3$ or $N=2$ and $s>\frac{1}{2} ; B_{s, \beta}(., \eta) \in \bigcap_{1 \leq a<\infty} L^{a}\left(S^{1}\right)$ if $N=2$ and $s=\frac{1}{2}$ and $B_{s, \beta}(., \eta)$ is uniformly bounded on $S^{1}$ if $N=2$ and $0<s<\frac{1}{2}$. The continuity result follows from Young's inequality and the sign assertion from Lemma A.1.

The above calculations justifies the name of fractional Laplace-Beltrami operator given to $\mathcal{A}_{s}$ since we have the following relation.

Lemma A.5. Assume $N \geq 2$ and $s \in(0,1)$, then

$$
\begin{equation*}
\mathcal{A}_{s} \omega(\sigma)=b_{N, s} C P V \int_{S^{N-1}} \frac{(\omega(\sigma)-\omega(\eta))}{|\sigma-\eta|^{N-1+2 s}} d S(\eta)+\mathcal{B}_{s} \omega(\sigma) \tag{A.12}
\end{equation*}
$$

where $\mathcal{B}_{s}$ is a bounded linear operator from $L^{q}\left(S^{N-1}\right)$ into $L^{r}\left(S^{N-1}\right)$ for $q$, $r$ satisfying (A.11) and

$$
\begin{equation*}
b_{N, s}:=2 a_{N, s} \int_{0}^{\infty} \frac{d x}{\left(x^{2}+1\right)^{\frac{N}{2}+s}} \tag{A.13}
\end{equation*}
$$

Proof. If $(\sigma, \eta) \in S^{N-1} \times S^{N-1}$, we set $\langle\sigma, \eta\rangle=1-\frac{1}{2} \kappa^{2}$. Then

$$
\int_{0}^{\infty} \frac{\tau^{N-1} d \tau}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}}=\int_{0}^{1} \frac{\left(\tau^{N-1}+\tau^{2 s-1}\right) d \tau}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}}
$$

Then we put $t=1-\tau$, hence, when $t \rightarrow 0$, we have after some straightforward computation

$$
\begin{aligned}
\frac{\left(\tau^{N-1}+\tau^{2 s-1}\right)}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} & =\frac{\left(2-(N+2 s-2) t+O\left(t^{2}\right)\right)\left(1+\frac{(N+2 s) t \kappa^{2}}{2\left(t^{2}+\kappa^{2}\right)}+O\left(\left(\frac{t \kappa^{2}}{t^{2}+2 \kappa^{2}}\right)^{2}\right)\right)}{\left(t^{2}+\kappa^{2}\right)^{\frac{N}{2}+s}} \\
& =\frac{2+2 t+O\left(t^{2}\right)}{\left(t^{2}+\kappa^{2}\right)^{\frac{N}{2}+s}} .
\end{aligned}
$$

This implies

$$
\begin{align*}
& \int_{0}^{1} \frac{\left(\tau^{N-1}+\tau^{2 s-1}\right) d \tau}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} \\
& =2 \kappa^{1-N-2 s} \int_{0}^{\frac{1}{\kappa}} \frac{d x}{\left(x^{2}+1\right)^{\frac{N}{2}+s}}+2 \kappa^{2-N-2 s} \int_{0}^{\frac{1}{\kappa}} \frac{x d x}{\left(x^{2}+1\right)^{\frac{N}{2}+s}}+O\left(\kappa^{3-N-s}\right) \int_{0}^{\frac{1}{\kappa}} \frac{x^{2} d x}{\left(x^{2}+1\right)^{\frac{N}{2}+s}} \\
& =2 \kappa^{1-N-2 s} \int_{0}^{\infty} \frac{d x}{\left(x^{2}+1\right)^{\frac{N}{2}+s}}+O(1)+O\left(\kappa^{3-N-s}\right) \int_{0}^{\frac{1}{\kappa}} \frac{x^{2} d x}{\left(x^{2}+1\right)^{\frac{N}{2}+s}} \tag{A.14}
\end{align*}
$$

Since $\kappa=|\sigma-\eta|$, the claim follows from Proposition A. 4 and the kernel estimate in Lemma A.3.

Lemma A.6. Under the assumption of Lemma A. 5 there holds

$$
\begin{equation*}
\left|\int_{S^{N-1}} \omega \mathcal{L}_{s, \beta} \omega d S\right| \leq c_{35} \int_{S^{N-1}} \omega^{2} d S \quad \forall \omega \in L^{2}\left(S^{N-1}\right) \tag{A.15}
\end{equation*}
$$

where

$$
c_{35}=\int_{0}^{1}\left(\int_{S^{N-1}} \frac{d S(\eta)}{\left(1+\tau^{2}-2 \tau\left\langle\mathbf{e}_{N}, \eta\right\rangle\right)^{\frac{N}{2}+s}}\right)\left(\tau^{-\beta}-1\right)\left|\tau^{N-1}-\tau^{N-1+c_{s}}\right| d \tau .
$$

Proof. There holds by Cauchy-Schwarz inequality

$$
\begin{aligned}
& \left|\int_{S^{N-1}} \omega \mathcal{L}_{s, \beta} \omega d S\right| \\
& \leq \int_{0}^{1}\left(\int_{S^{N-1}} \int_{S^{N-1}} \frac{|\omega(\eta)||\omega(\sigma)| d S(\eta) d S(\sigma)}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}}\right)\left(\tau^{-\beta}-1\right)\left|\tau^{N-1}-\tau^{N-1+c_{s}}\right| d \tau \\
& \leq \int_{0}^{1}\left(\int_{S^{N-1}} \int_{S^{N-1}} \frac{\omega^{2}(\eta)}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} d S(\eta) d S(\sigma)\right) \times\left(\tau^{-\beta}-1\right)\left|\tau^{N-1}-\tau^{N-1+c_{s}}\right| d \tau \\
& \leq \int_{S^{N-1}}\left(\int_{0}^{1}\left(\int_{S^{N-1}} \frac{d S(\sigma)}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}}\right)\left(\tau^{-\beta}-1\right)\left|\tau^{N-1}-\tau^{N-1+c_{s}}\right| d \tau\right) \omega^{2}(\eta) d S(\eta) .
\end{aligned}
$$

Since, by invariance by rotation, we have

$$
\int_{S^{N-1}} \frac{d S(\sigma)}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}}=\int_{S^{N-1}} \frac{d S(\sigma)}{\left(1+\tau^{2}-2 \tau\left\langle\mathbf{e}_{N}, \sigma\right\rangle\right)^{\frac{N}{2}+s}},
$$

we derive (A.15).
Proposition A.7. Let $N \geq 2, s \in(0,1)$ and $N-2 s<\beta<N$. Then there exist a unique $\lambda_{s, \beta}>0$ and a unique (up to an homothety) positive $\psi_{1} \in W_{0}^{s, 2}\left(S_{+}^{N-1}\right)$, such that

$$
\begin{equation*}
\mathcal{A}_{s} \psi_{1}=\lambda_{s, \beta} \mathcal{L}_{s, \beta} \psi_{1} \quad \text { in } S_{+}^{N-1} . \tag{A.16}
\end{equation*}
$$

Furthermore the mapping $\beta \mapsto \lambda_{s, \beta}$ is continuous and decreasing from $(N-2 s, N)$ onto $(0, \infty)$. Finally $\lambda_{s, \beta}=1$ if and only if $\beta=N-s$ and $\psi_{1}(\sigma)=(\sin \phi)^{s}$.

Proof. We first notice that

$$
\begin{equation*}
\int_{S_{+}^{N-1}} \omega \mathcal{A}_{s} \omega d S=\frac{1}{2} \int_{S_{+}^{N-1}} \int_{0}^{\infty} \int_{S_{+}^{N-1}} \frac{(\omega(\sigma)-\omega(\eta))^{2}}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} \tau^{N-1} d S(\eta) d \tau d S(\sigma), \tag{A.17}
\end{equation*}
$$

for any $\omega \in C_{0}^{1}\left(S_{+}^{N-1}\right)$. By Lemma A. 5 and (A.11) with $r=q=2$,

$$
\begin{aligned}
& \int_{S_{+}^{N-1}} \int_{0}^{\infty} \int_{S_{+}^{N-1}} \frac{(\omega(\sigma)-\omega(\eta))^{2}}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} \tau^{N-1} d S(\eta) d \tau d S(\sigma) \\
& \leq c_{36}\|\omega\|_{W_{0}^{s, 2}\left(S_{+}^{N-1}\right)}^{2}+c_{37}\|\omega\|_{L^{2}\left(S_{+}^{N-1}\right)}^{2},
\end{aligned}
$$

where

$$
\|\omega\|_{W_{0}^{s, 2}\left(S_{+}^{N-1}\right)}^{2}=\int_{S_{+}^{N-1}} \int_{S_{+}^{N-1}} \frac{(\omega(\sigma)-\omega(\eta))^{2}}{|\eta-\sigma|^{N-1+2 s}} d S(\eta) d S(\sigma) .
$$

Since, by Poincaré inequality [18], there holds

$$
\|\omega\|_{W_{0}^{s, 2}\left(S_{+}^{N-1}\right)}^{2} \geq c_{38}\|\omega\|_{L^{2}\left(S_{+}^{N-1}\right)}^{2} .
$$

we obtain that the right-hand side of (A.17) is bounded from above by $\left(\frac{1}{2} c_{36}+\frac{c_{37}}{2 c_{38}}\right)\|\omega\|_{W_{0}^{s, 2}\left(S_{+}^{N-1}\right)}^{2}$. Next we use the expansion estimates in Lemma A. 5 to obtain that

$$
\frac{\tau^{N-1}+\tau^{2 s-1}}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} \geq \frac{1}{\left(t^{2}+\kappa^{2}\right)^{\frac{N}{2}+s}} \quad \forall t=1-\tau \in\left(0, \epsilon_{0}\right), \forall(\sigma, \eta) \in S_{+}^{N-1} \times S_{+}^{N-1}
$$

where $\kappa=|\sigma-\eta| \leq 2$. Hence

$$
\int_{0}^{\infty} \frac{\tau^{N-1} d \tau}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} \geq \int_{0}^{\epsilon_{0}} \frac{d t}{\left(t^{2}+\kappa^{2}\right)^{\frac{N}{2}+s}}=\kappa^{1-N-2 s} \int_{0}^{\frac{\epsilon_{0}}{2}} \frac{d t}{\left(t^{2}+1\right)^{\frac{N}{2}+s}}
$$

Therefore,

$$
\int_{S_{+}^{N-1}} \omega \mathcal{A}_{s} \omega d S \geq \int_{0}^{\frac{\epsilon_{0}}{2}} \frac{d t}{2\left(t^{2}+1\right)^{\frac{N}{2}+s}}\|\omega\|_{W_{0}^{s, 2}\left(S_{+}^{N-1}\right)}^{2}
$$

Finally we obtain

$$
\begin{align*}
& \frac{1}{c_{39}}\|\omega\|_{W_{0}^{s, 2}\left(S_{+}^{N-1}\right)}^{2} \\
& \leq \int_{S_{+}^{N-1}} \int_{0}^{\infty} \int_{S_{+}^{N-1}} \frac{(\omega(\sigma)-\omega(\eta))^{2}}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} \tau^{N-1} d S(\eta) d \tau d S(\sigma)  \tag{A.18}\\
& \leq c_{39}\|\omega\|_{W_{0}^{s, 2}\left(S_{+}^{N-1}\right)}^{2}
\end{align*}
$$

We consider the bilinear form in $W_{0}^{s, 2}\left(S_{+}^{N-1}\right)$

$$
\mathbb{A}(\omega, \zeta):=\int_{S_{+}^{N-1}} \int_{0}^{\infty} \int_{S_{+}^{N-1}} \frac{(\omega(\sigma)-\omega(\eta)) \zeta(\sigma)}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} \tau^{N-1} d S(\eta) d \tau d S(\sigma)
$$

Then $\mathbb{A}$ is symmetric,

$$
\mathbb{A}(\omega, \omega)=\int_{S_{+}^{N-1}} \omega \mathcal{A}_{s} \omega d S \geq \frac{1}{2 c_{52}}\|\omega\|_{W_{0}^{s, 2}\left(S_{+}^{N-1}\right)}^{2}
$$

and

$$
|\mathbb{A}(\omega, \zeta)| \leq\left(\int_{S_{+}^{N-1}} \omega \mathcal{A}_{s} \omega d S\right)^{\frac{1}{2}}\left(\int_{S_{+}^{N-1}} \zeta \mathcal{A}_{s} \zeta d S\right)^{\frac{1}{2}} \leq \frac{c_{52}}{2}\|\omega\|_{W_{0}^{s, 2}\left(S_{+}^{N-1}\right)}\|\zeta\|_{W_{0}^{s, 2}\left(S_{+}^{N-1}\right)}
$$

By Riesz theorem, for any $L \in W^{-s, 2}\left(S_{+}^{N-1}\right)$ there exists $\omega_{L} \in W_{0}^{s, 2}\left(S_{+}^{N-1}\right)$ such that

$$
\mathbb{A}\left(\omega_{L}, \zeta\right)=L(\zeta) \quad \forall \zeta \in W_{0}^{s, 2}\left(S_{+}^{N-1}\right)
$$

We denote $\omega_{L}=\mathcal{A}_{s}^{-1}(L)$. It is clear that $\mathcal{A}_{s}^{-1}$ is positive and since the the imbedding of $W_{0}^{s, 2}\left(S_{+}^{N-1}\right)$ into $L^{2}\left(S_{+}^{N-1}\right)$ is compact by Rellich-Kondrachov theorem [18], $\mathcal{A}_{s}^{-1}$ is a compact operator. Hence the operator

$$
\omega \mapsto \mathcal{A}_{s}^{-1} \circ \mathcal{L}_{s, \beta} \omega
$$

is a compact positive operator (here we use the fact that $\beta>N-2 s$ which makes $\mathcal{B}_{s, \beta}$ positive). By the Krein-Rutman theorem there exists $\mu>0$ and $\psi_{1} \in W_{0}^{s, 2}\left(S_{+}^{N-1}\right), \psi_{1} \geq 0$ such that

$$
\mathcal{A}_{s}^{-1} \circ \mathcal{L}_{s, \beta} \psi_{1}=\mu \psi_{1}
$$

The function $\psi_{1}$ is the unique positive eigenfunction and $\mu$ the only positive eigenvalue with positive eigenfunctions. Furthermore $\mu$ is the spectral radius of $\mathcal{A}_{s}^{-1} \circ \mathcal{B}_{s, \beta}$. If we set $\lambda_{s, \beta}=$ $\mu^{-1}$, we obtain (A.16). It is also classical that $\lambda_{s, \beta}$ can be defined by

$$
\begin{equation*}
\lambda_{s, \beta}:=\inf \left\{\int_{S_{+}^{N-1}} \omega \mathcal{A}_{s} \omega d S: \omega \in W_{0}^{s, 2}\left(S_{+}^{N-1}\right), \omega \geq 0, \int_{S_{+}^{N-1}} \omega \mathcal{L}_{s, \beta} \omega d S=1\right\} \tag{A.19}
\end{equation*}
$$

Using (A.7), Lemma A. 2 and monotone convergence theorem, we derive that the mapping

$$
\beta \mapsto \int_{S_{+}^{N-1}} \omega \mathcal{L}_{s, \beta} \omega d S
$$

is increasing and continuous. This implies that $\beta \mapsto \lambda_{s, \beta}$ is decreasing and continuous. Since $\int_{S_{+}^{N-1}} \omega \mathcal{L}_{s, \beta} \omega d S \rightarrow \infty$ when $\beta \uparrow N$, the expression (A.19) implies that $\lambda_{s, \beta} \rightarrow 0$ when $\beta \uparrow N$. Next, if $\omega \geq 0$ is an element of $W_{0}^{s, 2}\left(S_{+}^{N-1}\right)$ such that $\int_{S_{+}^{N-1}} \omega \mathcal{L}_{s, \beta} \omega d S=1$, we derive from Poincaré inequality [18] and (A.15),

$$
\|\omega\|_{W_{0}^{s, 2}\left(S_{+}^{N-1}\right)}^{2} \geq c_{53}\|\omega\|_{L^{2}\left(S_{+}^{N-1}\right)}^{2} \geq \frac{c_{53}}{c_{51}}
$$

Since $c_{51} \rightarrow 0$ when $\beta \downarrow N-2 s$, we infer that $\lim _{\beta \rightarrow N-2 s} \lambda_{s, \beta}=\infty$. Consequently the mapping $\beta \mapsto \lambda_{s, \beta}$ is a decreasing homeomorphism from $(N-2 s, N)$ onto $(0, \infty)$ and there exists a unique $\beta_{s} \in(N-2 s, N)$ such that $\lambda_{s, \beta_{s}}=1$. By (??), the Martin kernel in $\mathbb{R}_{+}^{N}$ taken at $(x, 0)$ is a separable singular $s$-harmonic function. It is expressed by

$$
M_{s}^{\mathbb{R}_{+}^{N}}((r, \sigma), 0)=c_{N, s} r^{s-N}(\sin \phi)^{s}
$$

This means that the function $\sigma \mapsto \omega(\sigma)=(\sin \phi)^{s}$, which vanishes on $\overline{S_{-}^{N-1}}$ and belongs to $W_{0}^{s, 2}\left(S_{+}^{N-1}\right) \cap L^{\infty}\left(S_{+}^{N-1}\right)$ satisfies

$$
\mathcal{A}_{s} \omega-\mathcal{L}_{s, N-s} \omega=0
$$

The uniqueness of the positive eigenfunction implies that this function is $\psi_{1}$ and $\beta=N-s$.

## A.2. The nonlinear problem.

A.2.1. Separable solutions in $\mathbb{R}^{N}$. If we look for separable positive solutions of

$$
\begin{equation*}
(-\Delta)^{s} u+u^{p}=0 \quad \text { in } \mathbb{R}^{N} \tag{A.20}
\end{equation*}
$$

under the form $u_{\infty}(x)=r^{-\frac{2 s}{p-1}} \omega(\sigma)$ where $x=(r, \sigma) \in \mathbb{R}_{+} \times S^{N-1}$, then $\omega$ satisfies

$$
\begin{equation*}
\mathcal{A}_{s} \omega-\mathcal{L}_{s, \frac{2 s}{p-1}} \omega+\omega^{p}=0 \quad \text { in } S^{N-1} \tag{A.21}
\end{equation*}
$$

Proposition A.8. Assume $N \geq 2$ and $s \in(0,1)$.
(i) If $p \geq p_{3}^{*}$ then there exists no positive solution of (A.21).
(ii) If $p_{1}^{*}<p<p_{3}^{*}$ then the unique positive solution of (A.21) is a constant function with value

$$
\begin{equation*}
\ell_{s, p}=\left(c_{35}\right)^{\frac{1}{p-1}} \tag{A.22}
\end{equation*}
$$

where $c_{51}$ is the constant defined in Lemma A.6.

Proof. From (A.21) we get

$$
\int_{S^{N-1}} \omega \mathcal{A}_{s} \omega d S-\int_{S^{N-1}} \omega \mathcal{L}_{s, \frac{2 s}{p-1}} \omega d S+\int_{S^{N-1}} \omega^{p+1} d S=0
$$

Assuming that $\omega \geq 0$, then if $p \geq p_{3}^{*}$, we have $c_{s} \leq 0$ which implies $\int_{S^{N-1}} \omega \mathcal{L}_{s, \frac{2 s}{p-1}} \omega d S \leq 0$. Then $\omega=0$ since the two other integrals are nonnegative. Next, if we assume $p_{1}^{*}<p<p_{3}^{*}$ it is clear that if $\omega$ is a constant nonnegative solution of (A.16) we have from

$$
\omega \int_{0}^{1} \int_{S^{N-1}} \frac{\left(\tau^{-\frac{2 s}{p-1}-1}\right)\left(\tau^{N-1}-\tau^{N-1+c_{s}}\right)}{\left(1+\tau^{2}-2 \tau\langle\sigma, \eta\rangle\right)^{\frac{N}{2}+s}} d S(\eta) d \tau=\omega^{p} \quad \forall \sigma \in S^{N-1} .
$$

Using invariance by rotation of the integral term on $S^{N-1}$, we derive the claim. Conversely, assume $\omega$ is any bounded nonconstant positive solution, then it belongs to $C^{2}\left(S^{N-1}\right)$ by [19]. Let $\sigma_{0} \in S^{N-1}$ where $\omega$ is maximal, then $\mathcal{A}_{s} \omega\left(\sigma_{0}\right) \geq 0$ thus

$$
\omega^{p}\left(\sigma_{0}\right) \leq \mathcal{L}_{s, \frac{2 s}{p-1}} \omega\left(\sigma_{0}\right) \leq \omega\left(\sigma_{0}\right) \int_{0}^{1} \int_{S^{N-1}} \frac{\left(\tau^{-\frac{2 s}{p-1}}-1\right)\left(\tau^{N-1}-\tau^{N-1+c_{s}}\right)}{\left(1+\tau^{2}-2\left\langle\sigma_{0}, \eta\right)^{\frac{N}{2}+s}\right.} d S\left(\eta d \tau=c_{51} \omega\left(\sigma_{0}\right)\right.
$$

Hence $\omega\left(\sigma_{0}\right)<\ell_{s, p}$. Similarly $\min _{S^{N-1}} \omega>\ell_{s, p}$, contradiction.
Corollary A.9. Assume $N \geq 2, s \in(0,1)$ and $p_{1}^{*}<p<p_{3}^{*}$. Then the only positive separable solution $u$ of (A.20) in $\mathbb{R}^{N} \backslash\{0\}$ is

$$
\begin{equation*}
x \mapsto U(x)=\ell_{s, p}|x|^{-\frac{2 s}{p-1}} . \tag{A.23}
\end{equation*}
$$

A.2.2. Separable solutions in $\mathbb{R}_{+}^{N}$. If we consider separable solutions $x \mapsto u(x)=r^{-\frac{2 s}{p-1}} \omega(\sigma)$ of problem (3.19) then $\omega$ satisfies (3.20).
Proof of Theorem E.
Step 1: Non-existence. Assume that such a solution $\omega \geq 0$ exists, then

$$
\int_{S_{+}^{N-1}} \omega \mathcal{A}_{s} \omega d S-\int_{S_{+}^{N-1}} \omega \mathcal{L}_{s, \frac{2 s}{p-1}} \omega d S+\int_{S_{+}^{N-1}} \omega^{p} d S=0 .
$$

Hence

$$
\begin{equation*}
\left(\lambda_{s, \frac{2 s}{p-1}}-1\right) \int_{S_{+}^{N-1}} \omega \mathcal{L}_{s, \frac{2 s}{p-1}} \omega d S+\int_{S_{+}^{N-1}} \omega^{p} d S \leq 0 \tag{S1}
\end{equation*}
$$

If $\lambda_{s, \frac{2 s}{p-1}} \geq 1$, equivalently $p \geq p_{2}^{*}$, the only nonnegative solution is the trivial one.
Step 2: Existence. Consider the following functional with domain $W_{0}^{s, 2}\left(S_{+}^{N-1}\right) \cap L^{p+1}\left(S_{+}^{N-1}\right)$,

$$
\begin{equation*}
\omega \mapsto \mathcal{J}(\omega):=\int_{S_{+}^{N-1}} \omega \mathcal{A}_{s} \omega d S+\frac{1}{p+1} \int_{S_{+}^{N-1}}|\omega|^{p+1} d S-\int_{S_{+}^{N-1}} \omega \mathcal{L}_{s, \frac{2 s}{p-1}} \omega d S . \tag{S2}
\end{equation*}
$$

Because of Lemma A.6, $\mathcal{J}(\omega) \rightarrow \infty$ when $\|\omega\|_{W_{0}^{s, 2}\left(S_{+}^{N-1}\right)}+\|\omega\|_{L^{p+1}\left(S_{+}^{N-1}\right)} \rightarrow \infty$. Furthermore, for $\epsilon>0$, we have

$$
\mathcal{J}\left(\epsilon \psi_{1}\right)=\epsilon^{2}\left(\lambda_{s, \frac{2 s}{p-1}}-1\right) \int_{S_{+}^{N-1}} \psi_{1} \mathcal{L}_{s, \frac{2 s}{p-1}} \psi_{1} d S+\frac{\epsilon^{p+1}}{p+1} \int_{S_{+}^{N-1}}\left|\psi_{1}\right|^{p+1} d S
$$

This implies that $\inf \mathcal{J}(\omega)<0$ if $\lambda_{s, \frac{2 s}{p-1}}<1$, and thus the infimum of $\mathcal{J}$ in $W_{0}^{s, 2}\left(S_{+}^{N-1}\right) \cap$ $L_{+}^{p+1}\left(S_{+}^{N-1}\right)$ is achieved by a nontrivial nonnegative solution of (3.20).

Step 3: Uniqueness.
(i) Existence of a maximal solution. By [19] any solution $\omega$ is smooth. Hence, at its maximum $\sigma_{0}$, it satisfies $\mathcal{A}_{s} \omega\left(\sigma_{0}\right) \geq 0$, thus

$$
\omega\left(\sigma_{0}\right)^{p} \leq \mathcal{L}_{s, \frac{2 s}{p-1}} \omega\left(\sigma_{0}\right) \leq \omega\left(\sigma_{0}\right) c_{35}
$$

This implies that $\sup \omega \leq \ell_{s, p}$. From the equation the set $\mathcal{E} \subset W_{0}^{s, 2}\left(S_{+}^{N-1}\right)$ of positive solutions of (3.20) is bounded in $W_{0}^{s, 2}\left(S_{+}^{N-1}\right) \cap L^{\infty}\left(S_{+}^{N-1}\right)$ and thus in $C^{s}\left(S^{N-1}\right) \cap C^{2}\left(S_{+}^{N-1}\right)$ by [19]. We put $\bar{\omega}(\sigma)=\sup \{\omega(\sigma): \omega \in \mathcal{E}\}$. There exists a countable dense set $\mathcal{S}:=\left\{\sigma_{n}\right\} \subset S_{+}^{N-1}$ and a sequence of function $\left\{\omega_{n}\right\} \subset \mathcal{E}$ such that

$$
\lim _{n \rightarrow \infty} \omega_{n}\left(\sigma_{k}\right)=\bar{\omega}\left(\sigma_{k}\right)
$$

Furthermore, this sequence $\left\{\omega_{n}\right\}$ can be constructed such that $\left\{\omega_{n}\left(\sigma_{k}\right)\right\}$ is nondecreasing for any $k$. Finally by local compactnes estimate, $\left\{\omega_{n}\right\}$ converges to $\bar{\omega}$ in $C^{s-\delta}\left(S^{N-1}\right) \cap C^{2}\left(S_{+}^{N-1}\right)$ for any $\delta \in(0, s)$ and weakly in $W_{0}^{s, 2}\left(S_{+}^{N-1}\right)$. This implies that $\bar{\omega}$ belongs to $\mathcal{E}$. It follows from [19, Th 1.2] that any $\omega \in \mathcal{E}$ satisfies

$$
\begin{equation*}
\omega(\sigma) \leq c_{54}\left(\operatorname{dist}\left(\sigma, \partial S_{+}^{N-1}\right)\right)^{s}=c_{40} \phi^{s} \quad \forall \sigma \in S_{+}^{N-1} \tag{A.24}
\end{equation*}
$$

(ii) Existence of a minimal solution. This follows from the first part of the proof of Theorem 1.5 which asserts that $u_{k}^{\Omega} \uparrow u_{\infty}^{\Omega}$ and $u_{\infty}^{\Omega}$ is self-similar and it is the minimal solution of (1.17) in $\mathbb{R}_{+}^{N}$ which satisfies

$$
\begin{equation*}
\lim _{x \rightarrow 0} \frac{u_{\infty}^{\Omega}(x)}{M_{s}^{\mathbb{R}_{+}^{N}}(x, 0)}=\infty \tag{A.25}
\end{equation*}
$$

Thus $u_{\infty}(r, \sigma)=r^{-\frac{2 s}{p-1}} \underline{\omega}(\sigma)$ and $\underline{\omega}$ is the minimal positive solution of (3.20). Furthermore it follows from (3.37) that

$$
\begin{equation*}
\underline{\omega}(\sigma) \geq c_{55}\left(\operatorname{dist}\left(\sigma, \partial S_{+}^{N-1}\right)\right)^{s}=c_{55} \phi^{s} \quad \forall \sigma \in S_{+}^{N-1} \tag{A.26}
\end{equation*}
$$

if $\phi=\phi(\sigma)$ is the latitude of $\sigma$.
(iii) End of the uniqueness proof. By combining (A.24) and (A.26) we infer that there exists $K>1$ such that

$$
\begin{equation*}
\bar{\omega} \leq K \underline{\omega} \quad \text { in } S_{+}^{N-1} \tag{A.27}
\end{equation*}
$$

Assume $\bar{\omega} \neq \underline{\omega}$, then

$$
\omega_{1}:=\underline{\omega}-\frac{1}{2 K}(\bar{\omega}-\underline{\omega})
$$

is a positive supersolution (by convexity) of (3.20). Moreover

$$
\omega_{2}:=\left(\frac{1}{2}+\frac{1}{2 K}\right) \underline{\omega}
$$

is a positive subsolution of (3.20) smaller than $\omega_{1}$ hence also than $\underline{\omega}$. It follows by classical construction that there exists a solution $\tilde{\omega}$ of (3.20) which satisfies $\omega_{2} \leq \tilde{\omega} \leq \omega_{1}$, which contradicts the minimality of $\underline{\omega}$.
