HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destin  e au d  p  t et    la diffusion de documents scientifiques de niveau recherche, publi  s ou non,   manant des   tablissements d'enseignement et de recherche fran  ais ou   trangers, des laboratoires publics ou priv  s.

Cadmium (Cd)

Very toxic (carcinogenic) - Accumulated by crops due to root uptake from soil - European regulatory limits for contents in some foodstuffs (EC 1881/2006) - Dietary exposure to Cd too high in Europe (Efsa, 2009) - Wheat = major contributor to dietary exposure to Cd
Project of lowering regulatory limit for Cd in wheat (DGSanco, 2011)

Cd in French durum wheat compared to current and possible new regulatory limits

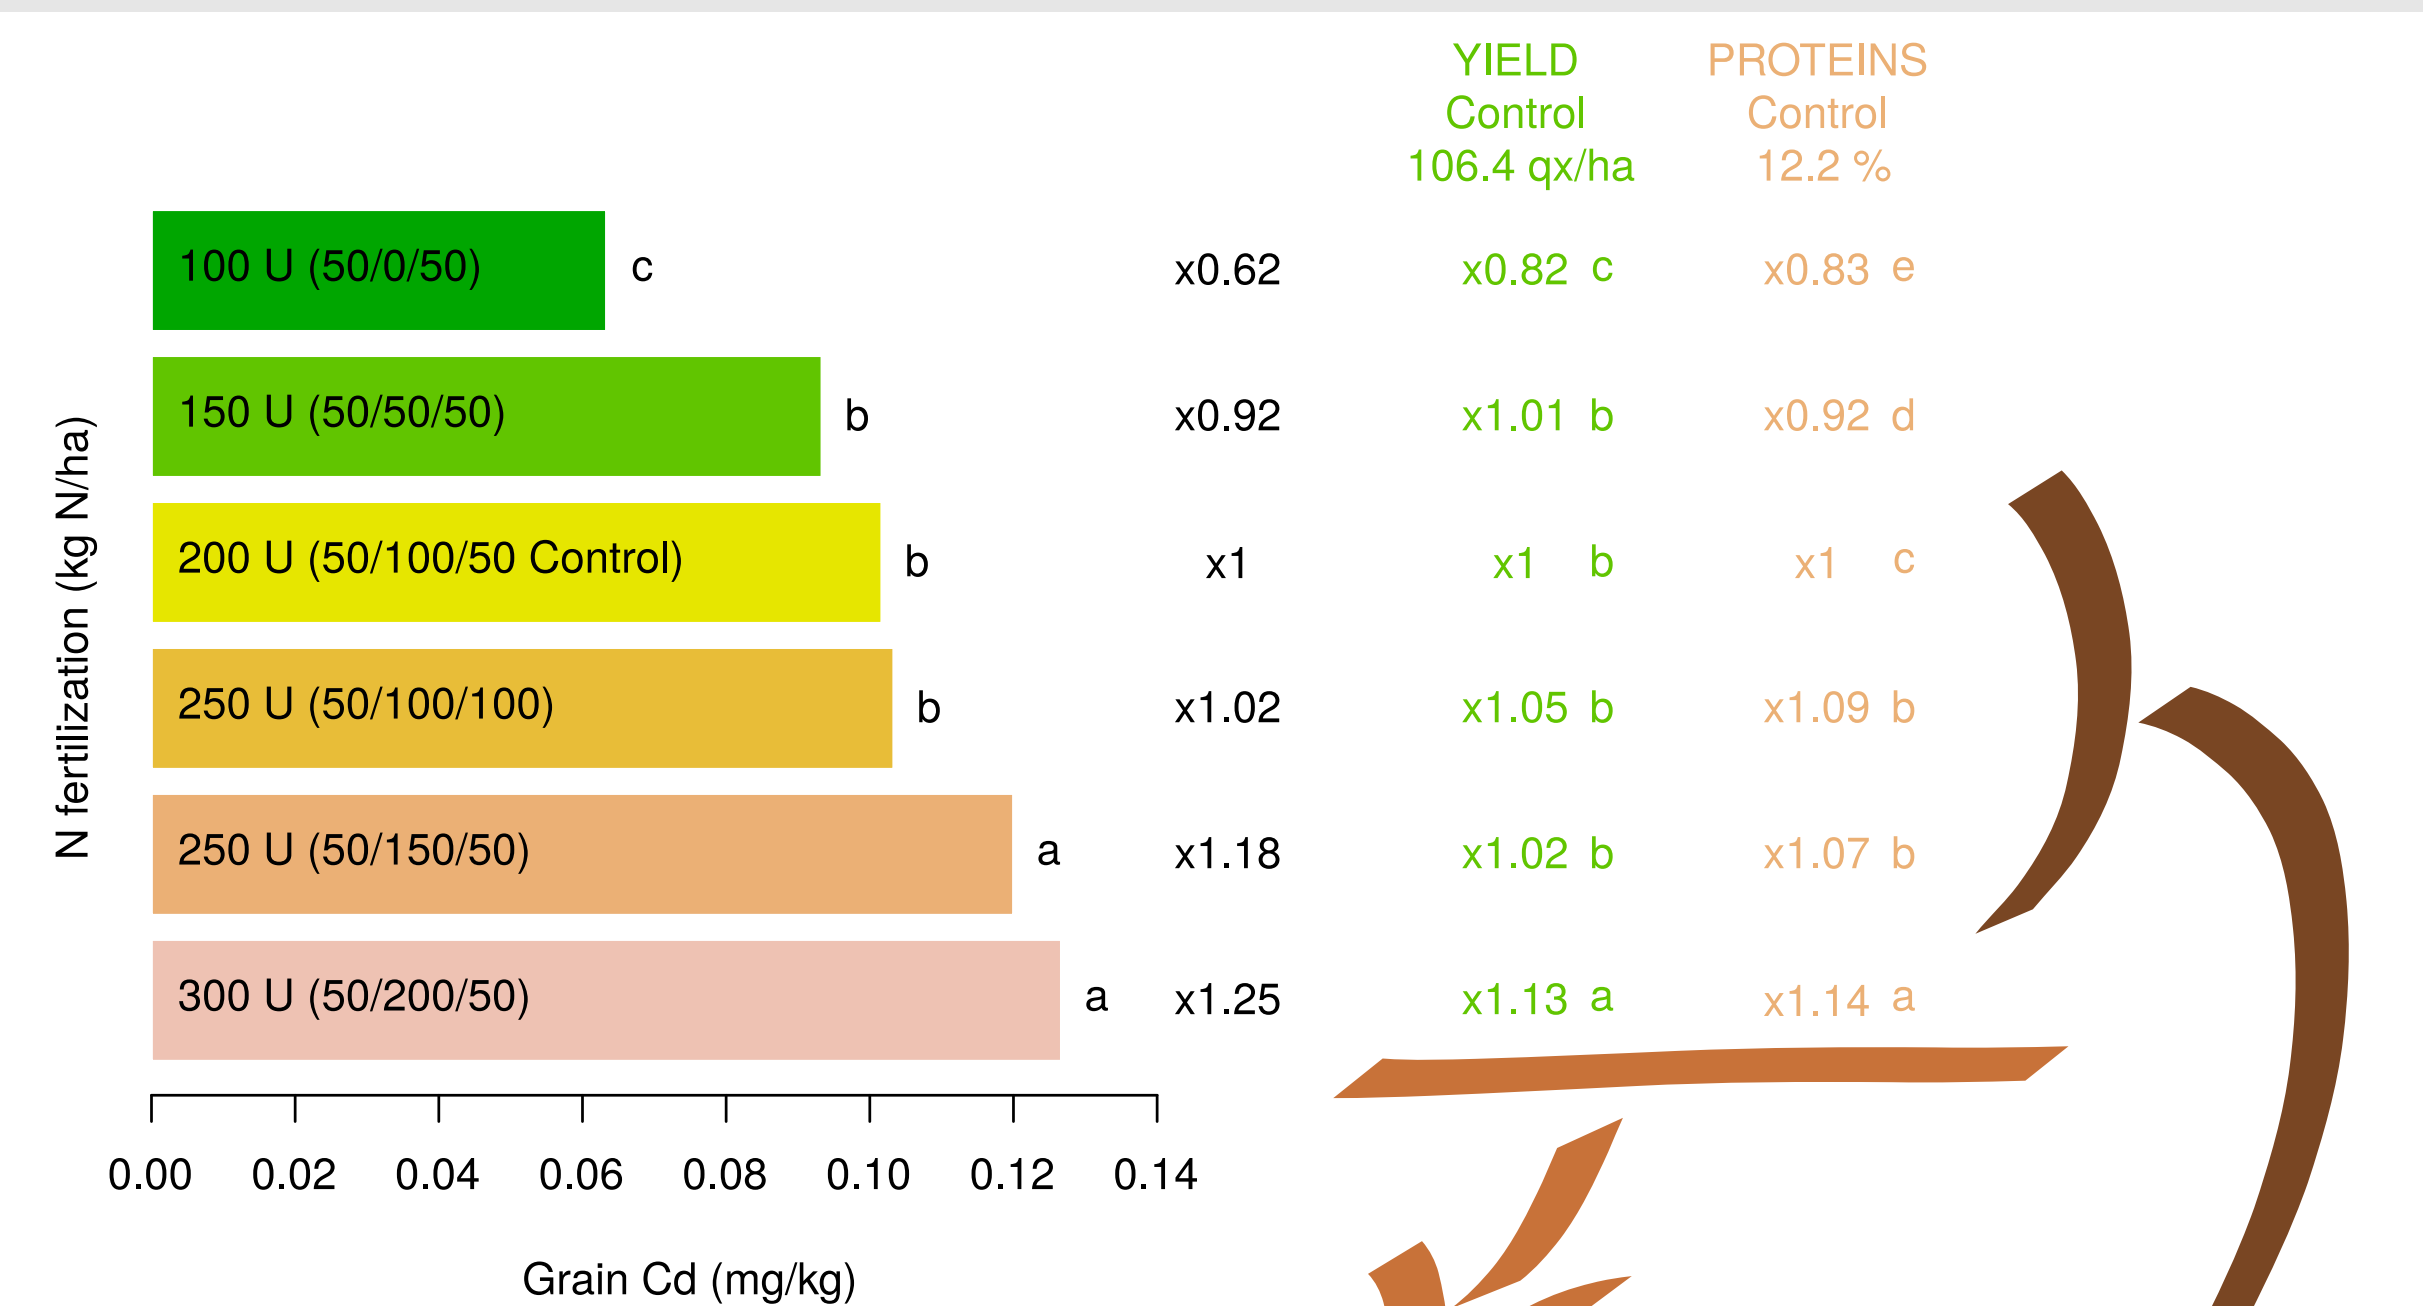

Cd in durum wheat grain : Phytoavailability of Cd in soil > cultivar differences

Field factorial trials comparing cultivars for different soils

Contrary to Canada, in France, cultivars are not yet selected for the low Cd accumulation allele (Zimmerl et al., 2014)

N fertilization increases Cd in durum wheat grain Splitting N dose can help limiting contamination

NH₄NO₃ fertilization increased more importantly grain Cd than yield and protein content

Increase proteins but not Cd in grains = Split N quantity NH₄⁺ assumed to desorb Cd and/or acidify soil solution

Risk assessment for the contamination of durum wheat grain by Cd

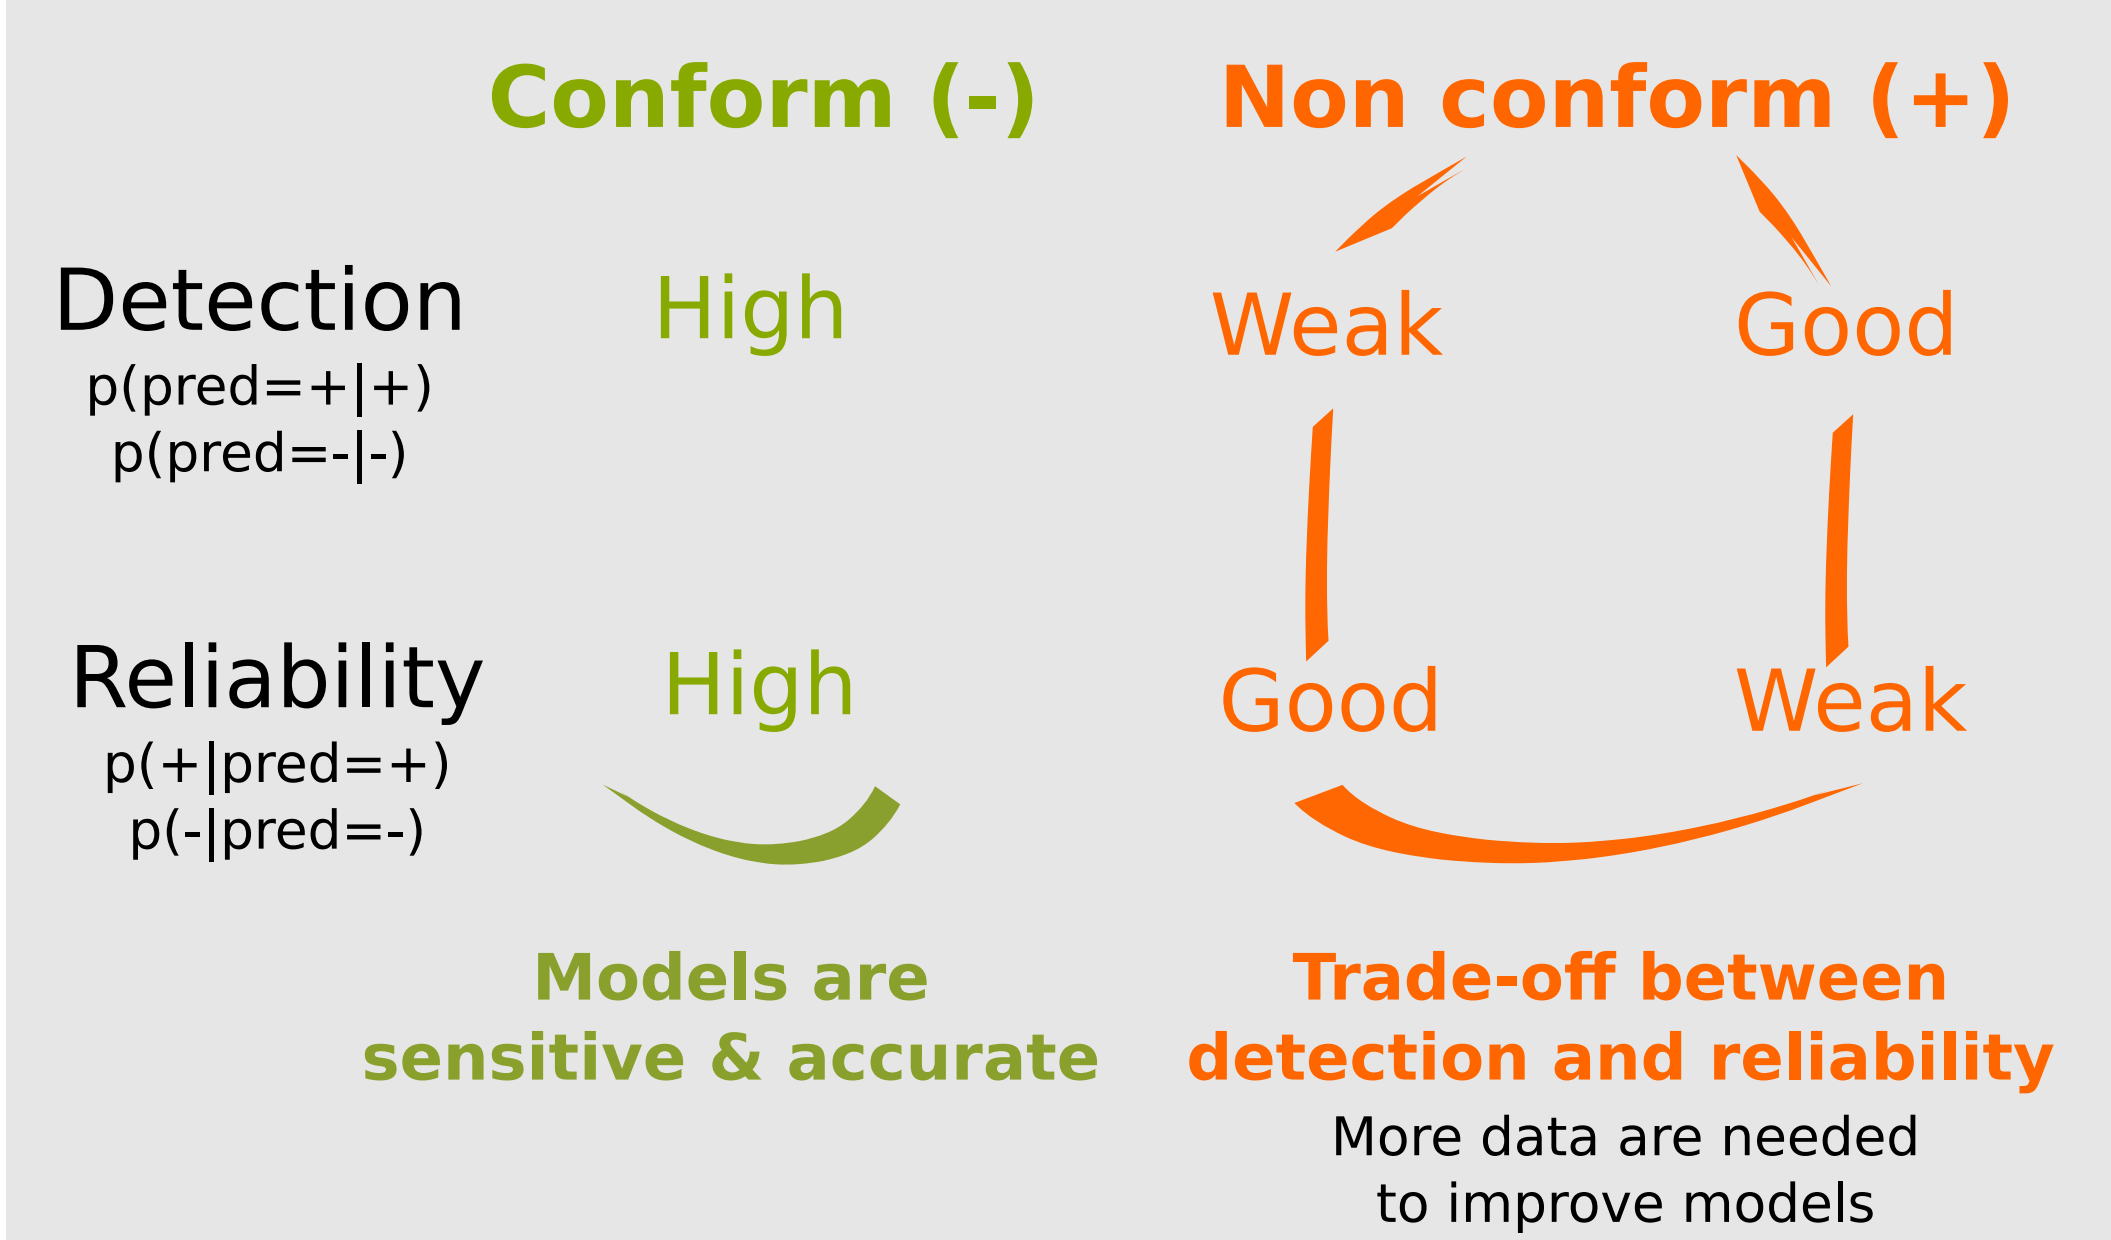

Logistic models

Probability (grain Cd > limit) = f(Cdtot : total soil Cd, pH : soil pH, Corg : soil organic carbon, Calc : soil calcareous, Clay : soil clay, Silk_C, Silk_F : coarse & fine silk)
Field data : n=408
(2008-2016, French production of durum wheat)

Model performances for field applications

The models predict correctly more than **91%** of the cases

Which model(s) ?

- 1 Cdtot
- 2 Cdtot + pHeau
- 3 Cdtot + pHeau + Clay
- 4 Cdtot + pHeau + Silt_F
- 5 Cdtot + pHeau + Silt_C
- 6 Cdtot + pHeau + Corg
- 7 Cdtot + pHeau + Calc
- 8 Cdtot + pHeau + Clay + Silt_F
- 9 Cdtot + pHeau + Clay + Silt_C
- 10 Cdtot + pHeau + Clay + Corg
- 11 Cdtot + pHeau + Clay + Calc
- 12 Cdtot + pHeau + Silt_F + Silt_C
- 13 Cdtot + pHeau + Silt_F + Corg
- 14 Cdtot + pHeau + Silt_F + Calc
- 15 Cdtot + pHeau + Silt_C + Corg
- 16 Cdtot + pHeau + Silt_C + Calc
- 17 Cdtot + pHeau + Corg + Calc
- 18 Cdtot + pHeau + Clay + Silt_F + Silt_C
- 19 Cdtot + pHeau + Clay + Silt_F + Corg
- 20 Cdtot + pHeau + Clay + Silt_F + Calc
- 21 Cdtot + pHeau + Clay + Silt_C + Corg
- 22 Cdtot + pHeau + Clay + Silt_C + Calc
- 23 Cdtot + pHeau + Clay + Corg + Calc
- 24 Cdtot + pHeau + Clay + Silt_F + Silt_C + Corg
- 25 Cdtot + pHeau + Clay + Silt_F + Silt_C + Calc
- 26 Cdtot + pHeau + Clay + Silt_F + Silt_C + Corg + Calc

Increase grain Cd : Cdtot, Clay and Silk (buffer power)
Decrease grain Cd : pH (solubility, speciation), Corg (sorption), Calc (sorption, precipitation)
