#### Comment

The unit cell contains four molecules of toluene and four molecules of the compound **1**. The latter is a diborazine displaying a linked ring structure. The *endo*-rings B-N distances are between 1.388(7) and 1.46(1)  $\text{\AA}$  falling within the range of the distances found in other borazines [1, 2]. It should be noted that this large range is also observed in the other previously described diborazine  $1,2'-(\text{B}_3\text{N}_3\text{H}_5)_2$  [3]. As expected, the *exo*-rings B-N<sub>(amino)</sub> bond lengths [av. 1.42(1)  $\text{\AA}$ ] are consistent with a B-N double-bond character [4]. The B – Cl bond lengths [1.782(6)  $\text{\AA}$ ] agree within experimental error with the values reported for 2,4,6-trichloroborazine, 1.76(2)  $\text{\AA}$  [2] and for boron trichloride, ~1.73–1.76  $\text{\AA}$  [4]. The significant feature of this structure is the orthogonal arrangement of the borazine rings planes unlike in the diborazine  $1,2'-(\text{B}_3\text{N}_3\text{H}_5)_2$  [3]. In the latter, the two rings are coplanar, as biphenyl in the solid state, and the inter-ring B-N bond is short [1.464(7)  $\text{\AA}$ ] mirroring its double-bond character. By contrast, in **1** the relative twist of the  $\text{B}_3\text{N}_3$  planes

[90.00(1) $^{\circ}$ ] precludes any interaction between the lone pair of the N(4) nitrogen atom and the vacant *p*-orbital of the B(2) boron atom. Thus, this distance [1.502(8) Å] is longer than in 1,2'-(B<sub>3</sub>N<sub>3</sub>H<sub>5</sub>)<sub>2</sub> and resembles B-N single-bonds [ $\sim$ 1.58 Å] rather B-N double-bond distances [ $\sim$ 1.41 Å]. This phenomenon is presumably related to the steric bulk of the borazine substituents in ortho and meta positions of both rings which precludes their coplanarity.

## Experimental

**Preparation.** All experiments were performed under atmosphere of pure argon and anhydrous conditions using vacuum line and schlenk techniques with solvents purified by standard techniques. 2,4,6-trichloroborazine [5] and chloro(diisopropylamino)borane [6] were prepared as previously described and purified by vacuum sublimation and distillation, respectively. Triethylamine (17.8 mmol) was added to a solution of 2,4,6-trichloroborazine (5.94 mmol) and chloro(diisopropylamino)borane (17.8 mmol) in toluene (20 mL). The mixture was stirred for 24h at room temperature then heated under reflux conditions for 2h. Under cooling, suitable crystals for X-ray analysis were obtained. <sup>11</sup>B NMR (C<sub>6</sub>D<sub>6</sub>): δ 30.1 (2B), 24.6 (3B). <sup>1</sup>H NMR (CDCl<sub>3</sub>): δ 1.12, 1.13 (CH<sub>3</sub>); 3.05 (NH); 3.32, 3.39 (CH).

**Table 1.** Crystal data for 1,2'-[{(2,6-Cl<sub>2</sub>-4-(Pr<sub>2</sub>N)B<sub>3</sub>N<sub>3</sub>H<sub>2</sub>)(4',6'-(Pr<sub>2</sub>N)<sub>2</sub>B<sub>3</sub>N<sub>3</sub>H<sub>3</sub>)}.(C<sub>6</sub>H<sub>5</sub>)CH<sub>3</sub>
