**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

# High-order hybrid discontinuous galerkin methods for diffusion-convection equations with evanescent diffusion

Loïc DIJOUX, Vincent FONTAINE

## Physical context

- Diffusion-advection equation

$$\nabla \cdot (-\alpha \nabla u + \beta u) = f \quad \text{in } \Omega$$

where  $\alpha$  : the conductivity tensor,  $u$  : the state variable,  $\beta$  : velocity advection field and  $f$  : source term.

Application field:

- Ground water flow
- Heat and Mass transfert, ...

## A mixed formulation

We introduce an auxiliary variable  $Q_d$  :

$$\begin{cases} Q_d = -\alpha \nabla u \\ \nabla \cdot \mathbf{q}_d + \nabla \cdot \beta u = f \end{cases}$$

where  $\mathbf{q}_d = \alpha \nabla Q_d$ . We introduce two approximate variables  $u_h$  and  $Q_h$  of respectively  $u$  and  $Q_d$  :

$$\begin{aligned} Q_h &= \sum_{i=1}^{n_q} Q_i w_i \\ u_h &= \sum_{j=1}^{n_u} u_j v_j \end{aligned}$$

where  $n_q$  and  $n_u$  are the degrees of freedom of  $Q_h$  and  $u_h$  respectively.  $w_i$  and  $v_j$  are their corresponding interpolations functions.

## Approximation spaces

We define finite element spaces:

$$\mathcal{W}_h^p = \{w \in [L^2(\Omega)]^d : w|_K \in \mathcal{W}^p(K), \quad \forall K \in \mathcal{T}_h\},$$

$$\mathcal{V}_h^p = \{v \in L^2(\Omega) : v|_K \in \mathcal{V}^p(K), \quad \forall K \in \mathcal{T}_h\},$$

and add a traced finite element space:

$$\mathcal{M}_h^p = \{\mu \in L^2(\varepsilon_h) : \mu|_e \in \mathcal{M}^p(e), \quad \forall e \in \varepsilon_h\}$$

## Discrete weak formulation

We impose the continuity of  $\alpha \nabla Q_h + \beta u_h$  on each edge  $e \in \varepsilon_h$  through one more equation and finally write :

Find  $(Q_h, u_h, \lambda_h) \in \mathcal{W}_h^p \times \mathcal{V}_h^p \times \mathcal{M}_h^p$  such that :

$$\begin{aligned} (Q_h, w_h)_{\mathcal{T}_h} - (u_h, \nabla \cdot (\alpha \nabla w_h))_{\mathcal{T}_h} + \langle \lambda_h, \alpha \nabla w_h \cdot \mathbf{n} \rangle_{\partial \mathcal{T}_h} &= -\langle g_D, \alpha \nabla w_h \cdot \mathbf{n} \rangle_{\Gamma_D} \quad \forall w_h \in \mathcal{W}_h^p \\ \langle \alpha \nabla Q_h + \beta u_h, v_h \rangle_{\partial \mathcal{T}_h} - \langle \alpha \nabla Q_h + \beta u_h, \nabla v_h \rangle_{\mathcal{T}_h} &= (f, v_h)_{\mathcal{T}_h} \quad \forall v_h \in \mathcal{V}_h^p \\ \langle [\alpha \nabla Q_h + \beta u_h], \mu_h \rangle_{\varepsilon_h} &= -\langle g_N, \mu_h \rangle_{\Gamma_N} \quad \forall \mu_h \in \mathcal{M}_h^p \end{aligned}$$

Definition of  $\hat{\mathbf{q}}_h$  (see [1, 3]) on each face  $e \in \partial \mathcal{T}_h$  :

$$\hat{\mathbf{q}}_h \cdot \mathbf{n}_e + \beta u_h \cdot \mathbf{n}_e = \mathbf{q}_h \cdot \mathbf{n}_e + \beta \cdot \mathbf{n}_e \lambda_h + \tau_e (P u_h - \lambda_h)$$

where  $\tau_e = \sqrt{\det(\alpha)} h^{-1} + \text{MAX}(\beta \cdot \mathbf{n}_e, 0)$ , see [2] and [1]

Examples of HdG methods:

Methods	$\mathcal{W}_h^p(K)$	$\mathcal{V}_h^p(K)$	$\mathcal{M}_h^p(e)$	$\tau_e$	$\ u - u_h\ _+$	$\ \mathbf{q} - \mathbf{q}_h^*\ _+$
$RT_p$	$(\mathcal{P}^p)^d + x\mathcal{P}^p$	$\mathcal{P}^p$	$\mathcal{P}^p$	0	$p+1$	$p+1$
$HdG_p$	$(\mathcal{P}^p)^d$	$\mathcal{P}^p$	$\mathcal{P}^p$	$kh^{-1} +  \beta \cdot \mathbf{n}_e $	$p+1$	$p+1$
$HdG_p^m$	$(\mathcal{P}^p)^d$	$\mathcal{P}^{p+1}$	$\mathcal{P}^p$	$kh^{-1} +  \beta \cdot \mathbf{n}_e $	$p+2$	$p+1$
$HdG_p^m$	$(\mathcal{P}^p)^d + x\mathcal{P}^p$	$\mathcal{P}^{p+1}$	$\mathcal{P}^p$	$\sqrt{\det(\alpha)} h^{-1} + \text{MAX}(\beta \cdot \mathbf{n}_e, 0)$	$p+2$	$p+1$

+ : for  $\beta = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$

## Numerical results : degenerate case

We propose to study a heterogeneous and anisotropic case with the exact solution defined in  $\Omega \in (0, 1) \times (0, \frac{1}{3})$  as :

$$\begin{cases} u(x, y) = 1 & \text{for } \Omega_1 \in (0, \frac{1}{3}) \times (0, \frac{1}{3}) \\ u(x, y) = 1 & \text{for } \Omega_2 \in (\frac{1}{3}, \frac{2}{3}) \times (0, \frac{1}{3}) \\ u(x, y) = \frac{e-e^x}{e} & \text{for } \Omega_3 \in (\frac{2}{3}, 1) \times (0, \frac{1}{3}) \end{cases}$$

For  $\Omega_1, \Omega_3$  we have the conductivity tensor  $\alpha = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$  and for  $\Omega_2$  we have  $\alpha = \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix}$ . The velocity field is defined in  $\Omega$  and we have  $\beta = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$ .

## Numerical results : degenerate case

Triangular mesh (GMSH : 7547 faces) &  $HdG_p^m$  :

Discrete solution :  $u_h \in \mathcal{W}_h^2$  :
