#### Abstract

In this report, the fundamental limits of simultaneous information and energy transmission in the two-user Gaussian interference channel (G-IC) with and without feedback are fully characterized. More specifically, an achievable and converse region in terms of information and energy transmission rates (in bits per channel use and energy-units per channel use, respectively) are identified. In both cases, with and without feedback, an achievability scheme based on powersplitting, common randomness, rate splitting, block-Markov superposition coding, and backward decoding is presented. Finally, converse regions for both cases are obtained using some of the existing outer bounds for information transmission rates, as well as a new outer bound for the energy transmission rate.

Key-words: Two-user Gaussian interference channel, simultaneous information and energy transmission, feedback, information-energy capacity region, achievability, converse.

Résumé : Dans ce rapport, les limites fondamentales de la transmission simultanée d'information et d'énergie dans le canal Gaussien à interférence (G-IC) avec et sans voie de retour sont déterminées. L'ensemble des débits atteignables de transmission d'information d'énergie (en bits par utilisation du canal et en unités d'énergie par utilisation du canal respectivement) est identifié. Pour les deux cas, un schéma d'atteignabilité est basé sur power-splitting, common randomness, rate splitting, block-Markov superposition coding, et backward decoding est présenté. Finalement, la région converse pour les deux cas est obtenu en utilisant des techniques de majoration dans la littérature pour les débits d'information et aussi un majorant pour le débit d'énergie en utilisant la loi des grands nombres.

Mots-clés : Canal à interference, voie de retour, transmission simultanée d'information et d'énergie

## 1 Notation

Throughout this research report, sets are denoted with uppercase calligraphic letters, i.e., $\mathcal{X}$. Random variables are denoted by uppercase letters, e.g., $X$. The realization and the set of events from which the random variable X takes values are respectively denoted by $x$ and $\mathcal{X}$. The probability distribution of $X$ over the set $\mathcal{X}$ is denoted $P_{X}$. Whenever a second random variable $Y$ is involved, $P_{X Y}$ and $P_{Y \mid X}$ denote respectively the joint probability distribution of $(X, Y)$ and the conditional probability distribution of $Y$ given $X$. Let $N$ be a fixed natural number. An $N$-dimensional vector of random variables is denoted by $\boldsymbol{X}=\left(X_{1}, X_{2}, \ldots, X_{N}\right)^{\top}$ and a corresponding realization is denoted by $\boldsymbol{x}=\left(x_{1}, x_{2}, \ldots, x_{N}\right)^{\top} \in \mathcal{X}^{N}$. Given $\boldsymbol{X}=$ $\left(X_{1}, X_{2}, \ldots, X_{N}\right)^{\top}$ and $(a, b) \in \mathbb{N}^{2}$, with $a<b \leq N$, the $(b-a+1)$-dimensional vector of random variables formed by the components $a$ to $b$ of $X$ is denoted by $\boldsymbol{X}_{(a, b)}=\left(X_{a}, X_{a+1}, \ldots, X_{b}\right)^{\top}$. The notation $(\cdot)^{+}$denotes the positive part operator, i.e., $(\cdot)^{+}=\max (\cdot, 0)$ and $\mathbb{E}_{X}[\cdot]$ denotes the expectation with respect to the distribution of the random variable $X$. The logarithm function is assumed to be base 2 .

## 2 Gaussian Interference Channel with Energy Harvesting

Consider the Gaussian interference channel (G-IC) with a non-colocated energy harvester depicted in figure 1 without feedback and in figure 2 with perfect channel-output feedback. Transmitter $i$, with $i \in\{1,2\}$, aims to execute two tasks: (a) an information transmission task and (b) an energy transmission task.

### 2.1 Information Transmission Task

From the information transmission standpoint, the goal of transmitter $i$ is to convey an independent message index $W_{i} \in \mathcal{W}_{i}=\left\{1,2, \ldots, 2^{N R_{i}}\right\}$ to receiver $i$ using $N$ channel input symbols $X_{i, 1}, X_{i, 2}, \ldots, X_{i, N}$. The channel coefficient from transmitter $k$ to receiver $i$, with $k \in\{1,2\}$, is denoted by $h_{i k} \in \mathbb{R}_{+}$. At receiver $i$, during channel use $n$, input symbol $X_{i, n}$ is observed at receiver $i$ subject to the interference produced by the symbol $X_{j, n}$ sent by transmitter $j$, with $j \in\{1,2\} \backslash\{i\}$, and a real additive Gaussian noise $Z_{i, n}$ with zero mean and variance $\sigma_{i}^{2}$. Hence, the channel output at receiver $i$ during channel use $n$, denoted by $Y_{i, n}$, is:

$$
\begin{equation*}
Y_{i, n}=h_{i i} X_{i, n}+h_{i j} X_{j, n}+Z_{i, n} \tag{1}
\end{equation*}
$$

In the case without feedback, at each channel use $n$, the symbol $X_{i, n}$ sent by transmitter $i$ depends upon the message index $W_{i}$ and a randomly generated index $\Omega \in \mathbb{N}$. Let $f_{i, n}^{(N)}: \mathcal{W}_{i} \times \mathbb{N} \rightarrow \mathbb{R}$ be the encoding function at channel use $n$, such that for all $n \in\{1,2, \ldots, N\}$, the following holds:

$$
\begin{equation*}
X_{i, n}=f_{i, n}^{(N)}\left(W_{i}, \Omega\right) \tag{2}
\end{equation*}
$$

In the case with feedback, the symbol $X_{i, n}$ sent by transmitter $i$ depends upon the indices $W_{i}$ and $\Omega$, but also upon all previous channel-outputs $Y_{i, 1}, Y_{i, 2}, \ldots, Y_{i, n-d}$, with $d \in \mathbb{N}$ the feedback delay. In the following, it is assumed that $d$ is equal to one channel use, without any loss of generality. The first channel input symbol $X_{i, 1}$ depends only on the message index $W_{i}$ and $\Omega$. More specifically, $f_{i, 1}^{(N)}: \mathcal{W}_{i} \times \mathbb{N} \rightarrow \mathbb{R}$ and for all $n \in\{2,3, \ldots, N\}, f_{i, n}^{(N)}: \mathcal{W}_{i} \times \mathbb{N} \times \mathbb{R}^{n-1} \rightarrow \mathbb{R}$ are the encoding functions such that:

$$
\begin{align*}
& X_{i, 1}=f_{i, 1}^{(N)}\left(W_{i}, \Omega\right) \text { and }  \tag{3a}\\
& X_{i, n}=f_{i, n}^{(N)}\left(W_{i}, \Omega, Y_{i, 1}, Y_{i, 2}, \ldots, Y_{i, n-1}\right) \text { for all } n>1 \tag{3b}
\end{align*}
$$

In both cases, the random index $\Omega$ is assumed to be independent of both $W_{1}$ and $W_{2}$ and known by all transmitters and receivers. Moreover, channel input symbols $X_{i, 1}, X_{i, 2}, \ldots, X_{i, N}$ are subject to an average power constraint of the form

$$
\begin{equation*}
\frac{1}{N} \sum_{n=1}^{N} \mathrm{E}\left[X_{i, n}^{2}\right] \leq P_{i} \tag{4}
\end{equation*}
$$

where $P_{i}$ denotes the average transmit power of transmitter $i$ in energy units per channel use. The expectation in (4) is taken with respect to $W_{i}$ and $\Omega$ in the case without feedback. In the case with feedback, the expectation is taken over the joint distribution of the message indices $W_{1}$ and $W_{2}$, the random index $\Omega$, and the noise terms, i.e., $Z_{1}$ and $Z_{2}$. The dependence of $X_{i, n}$ on $W_{1}, W_{2}, \Omega$, and the previously observed noise realizations is due to the effect of feedback as shown in (3). Note that $W_{i}$ and $\Omega$ are assumed to be independent and uniformly distributed over their corresponding sets.
Let $T \in \mathbb{N}$ be fixed and assume that during a given communication, $T$ blocks of $N$ channel uses

Figure 1: Two-user Gaussian interference channel with a non-colocated energy harvester at channel use $n$.
are transmitted. The decoder of receiver $i$ observes the channel outputs $Y_{i, 1}, Y_{i, 2}, \ldots, Y_{i, N T}$ and uses a decoding function $\phi_{i}: \mathbb{N} \times \mathbb{R}^{N T} \rightarrow \mathcal{W}_{i}^{T}$, to get an estimate of the message indices:

$$
\begin{equation*}
\left(\widehat{W}_{i}^{(1)}, \widehat{W}_{i}^{(2)}, \ldots, \widehat{W}_{i}^{(T)}\right)=\phi_{i}\left(\Omega, Y_{i, 1}, Y_{i, 2}, \ldots, Y_{i, N T}\right), \tag{5}
\end{equation*}
$$

where $\widehat{W}_{i}^{(t)}$ is an estimate of the message index $W_{i}^{(t)}$ sent during block $t \in\{1,2, \ldots, T\}$. The decoding error probability during block $t$ of a codebook of block-length $N$, denoted by $P_{\mathrm{e}}^{(t)}(N)$, is given by

$$
\begin{equation*}
P_{\mathrm{e}}^{(t)}(N)=\max \left(\operatorname{Pr}\left[\widehat{W}_{1}^{(t)} \neq W_{1}^{(t)}\right], \operatorname{Pr}\left[\widehat{W}_{2}^{(t)} \neq W_{2}^{(t)}\right]\right) . \tag{6}
\end{equation*}
$$

The signal to noise ratio (SNR) at receiver $i$ is denoted by

$$
\begin{equation*}
\mathrm{SNR}_{i}=\frac{\left|h_{i i}\right|^{2} P_{i}}{\sigma_{i}^{2}} \tag{7a}
\end{equation*}
$$

The interference to noise ratio (INR) at receiver $i$ is denoted by

$$
\begin{equation*}
\mathrm{INR}_{i}=\frac{\left|h_{i j}\right|^{2} P_{j}}{\sigma_{i}^{2}}, \text { with } j \neq i \tag{7b}
\end{equation*}
$$

### 2.2 Energy Transmission Task

Let $h_{3 i} \in \mathbb{R}_{+}$be the channel coefficient from transmitter $i$ to the energy harvester (EH). The symbols sent by the transmitters during channel use $n$ are observed by the EH subject to an

Figure 2: Two-user Gaussian interference channel with channel-output feedback and a noncollocated energy harvester during channel use $n$.
additive Gaussian noise $Z_{3, n}$ with zero mean and variance $\sigma_{3}^{2}$. More specifically, the channel output at the EH during channel use $n$, denoted by $Y_{3, n}$, is:

$$
\begin{equation*}
Y_{3, n}=h_{31} X_{1, n}+h_{32} X_{2, n}+Z_{3, n} \tag{8}
\end{equation*}
$$

From the energy transmission standpoint, the goal of both transmitters is to jointly guarantee an average energy rate at the EH . Let $b \geqslant 0$ denote the minimum average energy rate that must be guaranteed at the input of the EH. Let also $B^{(N)}$ be the average energy rate (in energy-units per channel use) at the end of $N$ channel uses. That is,

$$
\begin{equation*}
B^{(N)} \triangleq \frac{1}{N} \sum_{n=1}^{N} Y_{3, n}^{2} \tag{9}
\end{equation*}
$$

The SNR of transmitter $i$ at the EH is denoted by

$$
\begin{equation*}
\mathrm{SNR}_{3 i}=\frac{\left|h_{3 i}\right|^{2} P_{i}}{\sigma_{3}^{2}} \tag{10}
\end{equation*}
$$

Note that the maximum average energy rate, denoted by $B_{\max }$, is:

$$
\begin{equation*}
B_{\max }=\sigma_{3}^{2}\left(1+\mathrm{SNR}_{31}+\mathrm{SNR}_{32}+2 \sqrt{\mathrm{SNR}_{31} \mathrm{SNR}_{32}}\right) \tag{11}
\end{equation*}
$$

The probability of energy outage, given an average energy rate $B$, is defined as follows:

$$
\begin{equation*}
P_{\text {outage }}^{(N, \epsilon)}(B) \triangleq \operatorname{Pr}\left[B^{(N)}<B-\epsilon\right] \tag{12}
\end{equation*}
$$

for all $B>b$ and some $\epsilon>0$.

### 2.3 Simultaneous Information and Energy Transmission

Given a minimum energy rate $b$ to be satisfied at the EH , the system is said to be operating at the information-energy rate triplet $\left(R_{1}, R_{2}, B\right) \in \mathbb{R}_{+}^{3}$ when both transmitter-receiver pairs use a transmit-receive configurations such that: (i) reliable communication at information rates $R_{1}$ and $R_{2}$ is ensured; and (ii) reliable energy transmission at energy rate $B$ is ensured. A formal definition is given below.

Definition 1 (Achievable Rates) The triplet $\left(R_{1}, R_{2}, B\right) \in \mathbb{R}_{+}^{3}$ is achievable if for all $i \in$ $\{1,2\}$, there exists a sequence of encoding functions $f_{i, 1}^{(N)}, f_{i, 2}^{(N)}, \ldots, f_{i, N}^{(N)}$ and a decoding function $\phi_{i}$ such that both the average error probability $P_{\mathrm{e}}^{(t)}(N)$, for all $t \in\{1,2, \ldots, T\}$, and the energyoutage probability $P_{\text {outage }}^{(N, \epsilon)}(B)$ tend to zero as the block-length $N$ tends to infinity. That is,

$$
\begin{align*}
& \limsup _{N \rightarrow \infty} P_{\mathrm{e}}^{(t)}(N)=0 \text { and }  \tag{13a}\\
& \limsup _{N \rightarrow \infty} P_{\text {outage }}^{(N, \epsilon)}=0 . \tag{13b}
\end{align*}
$$

Using Definition 1 the fundamental limits of simultaneous information and energy transmission in the Gaussian interference channel can be described by the information-energy capacity region, defined as follows.

Definition 2 (Information-Energy Capacity Region) The information-energy capacity region given a minimum energy rate $b$, denoted by $\mathcal{E}_{b}^{\mathrm{F}}$ in the case with feedback and $\mathcal{E}_{b}$ in the case without feedback, corresponds to the closure of all achievable information-energy rate triplets $\left(R_{1}, R_{2}, B\right)$.

## 3 Main result

The main result consists of a description of the information-energy capacity regions with feedback $\mathcal{E}_{b}^{\mathrm{F}}$ and without feedback $\mathcal{E}_{b}$, for a given $b \geqslant 0$. Such a description is presented in the form of an approximation in the sense of the definition hereunder.

Definition 3 (Approximation of a Set) Let $n \in \mathbb{N}$ be fixed. A closed and convex region $\mathcal{X} \subset \mathbb{R}_{+}^{n}$ is approximated by the sets $\underline{\mathcal{X}}$ and $\overline{\mathcal{X}}$ if $\underline{\mathcal{X}} \subseteq \mathcal{X} \subseteq \overline{\mathcal{X}}$ and $\forall \boldsymbol{x}=\left(x_{1}, \ldots, x_{n}\right) \in \overline{\mathcal{X}}$ then $\left(\left(x_{1}-\xi_{1}\right)^{+},\left(x_{1}-\xi_{2}\right)^{+}, \ldots,\left(x_{n}-\xi_{n}\right)^{+}\right) \in \underline{\mathcal{X}}$, for some $\left(\xi_{1}, \xi_{2}, \ldots, \xi_{n}\right) \in \mathbb{R}_{+}^{n}$.

### 3.1 Case without Channel-Output Feedback

The information-energy capacity region $\mathcal{E}_{b}$, with $b$ any positive real number, is approximated by the regions $\underline{\mathcal{E}}_{b}$ (Theorem 11), which represents an information-energy achievable region, and $\overline{\mathcal{E}}_{b}$ (Theorem 2], which represents an information-energy converse region.

### 3.1.1 An Achievable Region

The following theorem introduces an achievable information-energy region.

Theorem 1 Let b be a fixed positive real. Then, the information-energy capacity region $\mathcal{E}_{b}$ contains all the rate tuples $\left(R_{1}, R_{2}, B\right)$ that satisfy:

$$
\begin{align*}
& R_{1} \leq \frac{1}{2} \log \left(1+\frac{\left(1-\lambda_{1 e}\right) \mathrm{SNR}_{1}}{1+\lambda_{2 p} \mathrm{INR}_{1}}\right),  \tag{14a}\\
& R_{2} \leq \frac{1}{2} \log \left(1+\frac{\left(1-\lambda_{2 e}\right) \mathrm{SNR}_{2}}{1+\lambda_{1 p} \mathrm{INR}_{2}}\right),  \tag{14b}\\
& R_{1}+R_{2} \leq \frac{1}{2} \log \left(\frac{1+\left(1-\lambda_{1 e}\right) \mathrm{SNR}_{1}+\left(1-\lambda_{2 e}\right) \mathrm{INR}_{1}}{1+\lambda_{2 p} \mathrm{INR}_{1}}\right)+\frac{1}{2} \log \left(1+\frac{\lambda_{2 p} \mathrm{SNR}_{2}}{1+\lambda_{1 p} \mathrm{INR}_{2}}\right),  \tag{14c}\\
& R_{1}+R_{2} \leq \frac{1}{2} \log \left(\frac{1+\left(1-\lambda_{2 e}\right) \mathrm{SNR}_{2}+\left(1-\lambda_{1 e}\right) \mathrm{INR}_{2}}{1+\lambda_{1 p} \mathrm{INR}_{2}}\right)+\frac{1}{2} \log \left(1+\frac{\lambda_{1 p} \mathrm{SNR}_{1}}{1+\lambda_{2 p} \mathrm{INR}_{1}}\right),  \tag{14d}\\
& R_{1}+R_{2} \leq \frac{1}{2} \log \left(\frac{1+\lambda_{1 p} \mathrm{SNR}_{1}+\left(1-\lambda_{2 e}\right) \mathrm{INR}_{1}}{1+\lambda_{2 p} \mathrm{INR}_{1}}\right)+\frac{1}{2} \log \left(\frac{1+\lambda_{2 p} \mathrm{SNR}_{2}+\left(1-\lambda_{1 e}\right) \mathrm{INR}_{2}}{1+\lambda_{1 p} \mathrm{INR}_{2}}\right)(14 \mathrm{c}) \\
& 2 R_{1}+R_{2} \leq \frac{1}{2} \log \left(\frac{1+\left(1-\lambda_{1 e}\right) \mathrm{SNR}_{1}+\left(1-\lambda_{2 e}\right) \mathrm{INR}_{1}}{1+\lambda_{2 p} \mathrm{INR}_{1}}\right)+\frac{1}{2} \log \left(\frac{1+\lambda_{2 p} \mathrm{SNR}_{2}+\left(1-\lambda_{1 e}\right) \mathrm{INR}_{2}}{1+\lambda_{1 p} \mathrm{INR}_{2}}\right) \\
&+\frac{1}{2} \log \left(1+\frac{\lambda_{1 p} \mathrm{SNR}_{1}}{1+\lambda_{2 p} \mathrm{INR}_{1}}\right),  \tag{14f}\\
& R_{1}+2 R_{2} \leq \frac{1}{2} \log \left(\frac{1+\left(1-\lambda_{2 e}\right) \mathrm{SNR}_{2}+\left(1-\lambda_{1 e}\right) \mathrm{INR}_{2}}{1+\lambda_{1 p} \mathrm{INR}_{2}}\right)+\frac{1}{2} \log \left(\frac{1+\lambda_{1 p} \mathrm{SNR}_{1}+\left(1-\lambda_{2 e}\right) \mathrm{INR}_{1}}{1+\lambda_{2 p} \mathrm{INR}_{1}}\right) \\
&+\frac{1}{2} \log \left(1+\frac{\lambda_{2 p} \mathrm{SNR}_{2}}{1+\lambda_{1 p} \mathrm{INR}_{2}}\right),  \tag{14g}\\
& b \leq B \leq  \tag{14h}\\
& \sigma_{3}^{2}\left(1+\mathrm{SNR}_{31}+\mathrm{SNR}_{32}+2 \sqrt{\mathrm{SNR}_{31} \mathrm{SNR}_{32}} \sqrt{\lambda_{1 e} \lambda_{2 e}}\right), \\
& \text { with }\left(\lambda_{i p},\right.\left.\lambda_{i e}\right) \in[0,1]^{2} \text { such that } \lambda_{i p}+\lambda_{i e} \leq 1, \text { for all } i \in\{1,2\} .
\end{align*}
$$

Proof: The proof of Theorem 1 is presented in Appendix $A$.
The achievability scheme used to obtain Theorem11 is built upon random coding arguments using rate-splitting [1], superposition coding [2], common randomness, and power-spliting [3]. Following a rate-splitting argument, the index $W_{i}$ is divided into two sub-indices $W_{i, P} \in\left\{1,2 \ldots, 2^{N R_{i, P}}\right\}$ and $W_{i, C} \in\left\{1,2 \ldots, 2^{N R_{i, C}}\right\}$, where $R_{i, C}+R_{i, P}=R_{i}$. Note that the block index $(t)$ in $W_{i}^{(t)}$ and $\Omega^{(t)}$ are dropped as the encoding and decoding are identical at each block. The message index $W_{i, C}$ must be decoded at both receivers, whereas the index $W_{i, P}$ must be decoded only at the intended receiver. This rate-splitting is reminiscent of the Han-Kobayashi scheme in 11.

The codebook generation at transmitter $i$ follows a three-level superposition coding scheme. The first code-layer is a sub-codebook of $2^{N R_{E}}$ codewords. Denote by $\boldsymbol{v}(\Omega)$ the corresponding codeword of the first code-layer. Note that both transmitters know $\Omega$, hence they are able to choose the same codeword $\boldsymbol{v}(\Omega)$ from the first-layer codebook. The index $\Omega$ as well as the codeword $\boldsymbol{v}(\Omega)$ are also known at the receivers, which highlights that the role of this codebook is not information transmission but energy transmission. The second codeword used by transmitter $i$ is selected using $W_{i, C}$ from the second code-layer, which is a sub-codebook of $2^{N R_{i, C}}$ codewords associated to $\boldsymbol{v}(\Omega)$. Denote by $\boldsymbol{u}_{i}\left(\Omega, W_{i, C}\right)$ the corresponding codeword in the second code-layer. The third codeword used by transmitter $i$ is selected using $W_{i, P}^{(t)}$ from the second code-layer, which is a sub-codebook of $2^{N R_{i, P}}$ codewords associated to $\boldsymbol{u}_{i}\left(\Omega, W_{i, C}\right)$. Denote by $s_{i}\left(\Omega, W_{i, C}, W_{i, P}\right)$ the corresponding codeword in the third code-layer. Finally, for transmitting the triplet $\left(\Omega, W_{i, C}, W_{i, P}\right)$, the channel input symbol $X_{i, n}$ at channel use $n \in\{1,2, \ldots, N\}$ is a deterministic function of the $n$-th components of the codewords $\boldsymbol{v}(\Omega), \boldsymbol{u}_{i}\left(\Omega, W_{i, C}\right)$ and $s_{i}\left(\Omega, W_{i, C}, W_{i, P}\right)$.

### 3.1.2 A Converse Region

The following Theorem introduces an information-energy converse region.
Theorem 2 Let b be a fixed positive real. Then, the information-energy capacity region $\mathcal{E}_{b}$ is contained into the set of all the rate tuples $\left(R_{1}, R_{2}, B\right)$ that satisfy:

$$
\begin{align*}
R_{1} \leq & \frac{1}{2} \log \left(1+\beta_{1} \mathrm{SNR}_{1}\right),  \tag{15a}\\
R_{2} \quad \leq & \frac{1}{2} \log \left(1+\beta_{2} \mathrm{SNR}_{2}\right),  \tag{15b}\\
R_{1}+R_{2} \leq & \frac{1}{2} \log \left(1+\beta_{1} \mathrm{SNR}_{1}+\beta_{2} \mathrm{INR}_{1}\right)+\frac{1}{2} \log \left(1+\frac{\beta_{2} \mathrm{SNR}_{2}}{1+\beta_{2} \mathrm{INR}_{1}}\right)  \tag{15c}\\
R_{1}+R_{2} \leq & \frac{1}{2} \log \left(1+\beta_{2} \mathrm{SNR}_{2}+\beta_{1} \mathrm{INR}_{2}\right)+\frac{1}{2} \log \left(1+\frac{\beta_{1} \mathrm{SNR}_{1}}{1+\beta_{1} \mathrm{INR}_{2}}\right)  \tag{15d}\\
R_{1}+R_{2} \leq & \frac{1}{2} \log \left(1+\frac{\beta_{1} \mathrm{SNR}_{1}+\beta_{2} \mathrm{INR}_{1}+\beta_{1} \beta_{2} \mathrm{INR}_{1} \mathrm{INR}_{2}}{1+\beta_{1} \mathrm{INR}_{2}}\right) \\
+ & \frac{1}{2} \log \left(1+\frac{\beta_{2} \mathrm{SNR}_{2}+\beta_{1} \mathrm{INR}_{2}+\beta_{1} \beta_{2} \mathrm{INR}_{1} \mathrm{INR}_{2}}{1+\beta_{2} \mathrm{INR}_{1}}\right)  \tag{15e}\\
2 R_{1}+R_{2} \leq & \frac{1}{2} \log \left(1+\frac{\beta_{1} \mathrm{SNR}_{1}}{1+\beta_{1} \mathrm{INR}_{2}}\right)+\frac{1}{2} \log \left(1+\beta_{1} \mathrm{SNR}_{1}+\beta_{2} \mathrm{INR}_{1}\right) \\
& +\frac{1}{2} \log \left(1+\frac{\beta_{2} \mathrm{SNR}_{2}+\beta_{1} \mathrm{INR}_{2}+\beta_{1} \beta_{2} \mathrm{INR}_{1} \mathrm{INR}_{2}}{1+\beta_{2} \mathrm{INR}_{1}}\right)  \tag{15f}\\
R_{1}+2 R_{2} \leq & \frac{1}{2} \log \left(1+\frac{\beta_{2} \mathrm{SNR}_{2}}{1+\beta_{2} \mathrm{INR}_{1}}\right)+\frac{1}{2} \log \left(1+\beta_{2} \mathrm{SNR}_{2}+\beta_{1} \mathrm{INR}_{2}\right) \\
& +\frac{1}{2} \log \left(1+\frac{\beta_{1} \mathrm{SNR}_{1}+\beta_{2} \mathrm{INR}_{1}+\beta_{1} \beta_{2} \mathrm{INR}_{1} \mathrm{INR}_{2}}{1+\beta_{1} \mathrm{INR}_{2}}\right)  \tag{15~g}\\
b \leq B \leq & \sigma_{3}^{2}\left(1+\mathrm{SNR}_{31}+\mathrm{SNR}_{32}+2 \sqrt{\mathrm{SNR}_{31} \mathrm{SNR}_{32}} \sqrt{\left(1-\beta_{1}\right)\left(1-\beta_{2}\right)}\right) \tag{15~h}
\end{align*}
$$

with $\left(\beta_{1}, \beta_{2}\right) \in[0,1]^{2}$.
Proof: The proof of Theorem 2 is presented in Appendix B

### 3.1.3 An Approximation to the Information-Energy Capacity Region

Using the inner region $\underline{\mathcal{E}}_{b}$ and the outer region $\overline{\mathcal{E}}_{b}$, described respectively by Theorem 1 and Theorem 2, the information-energy capacity region $\mathcal{E}_{b}$ can be approximated in the sense of Definition 3

Theorem 3 (Approximation of $\mathcal{E}_{b}$ ) Let $\underline{\mathcal{E}}_{b} \subset \mathbb{R}_{+}^{3}$ and $\overline{\mathcal{E}}_{b} \subset \mathbb{R}_{+}^{3}$ be the sets of tuples $\left(R_{1}, R_{2}, B\right)$ described by Theorem 1 and Theorem 2 respectively. Then,

$$
\begin{equation*}
\underline{\mathcal{E}}_{b} \subset \mathcal{E}_{b} \subset \overline{\mathcal{E}}_{b} \tag{16}
\end{equation*}
$$

and for all $\left(R_{1}, R_{2}, B\right) \in \overline{\mathcal{E}}_{b}$ it follows that $\left(\left(R_{1}-1 / 2\right)^{+},\left(R_{2}-1 / 2\right)^{+},\left(B-\frac{B_{\max }}{2}\right)^{+}\right) \in \underline{\mathcal{E}}_{b}$.
Proof: Following similar steps as in 4, it can be shown that for all $\left(R_{1}, R_{2}, 0\right) \in \overline{\mathcal{E}}_{b}$ it follows that $\left(\left(R_{1}-1 / 2\right)^{+},\left(R_{2}-1 / 2\right)^{+}, 0\right) \in \underline{\mathcal{E}}_{b}$. Note also that for all $\left(R_{1}, R_{2}, B\right) \in \overline{\mathcal{E}}_{b}$ and for all $\left(R_{1}, R_{2}, B^{\prime}\right) \in \underline{\mathcal{E}}_{b}$, there always exists a tuple $\left(\beta_{1}, \beta_{2}, \lambda_{1 e}, \lambda_{2 e}\right)$ such that:

Figure 3: 3-D representation of $\underline{\mathcal{E}}_{b}$, with parameters $\mathrm{SNR}_{1}=\mathrm{SNR}_{2}=20 \mathrm{~dB}, \mathrm{INR}_{1}=\mathrm{INR}_{2}=$ $\mathrm{SNR}_{31}=\mathrm{SNR}_{32}=10 \mathrm{~dB}, \sigma_{3}^{2}=1$, and $b=0$.

$$
\begin{aligned}
\frac{B-B^{\prime}}{B_{\max }} & =\frac{2 h_{31} h_{32} \sqrt{P_{1} P_{2}}\left(\sqrt{\left(1-\beta_{1}\right)\left(1-\beta_{2}\right)}-\sqrt{\lambda_{1 e} \lambda_{2 e}}\right)}{\sigma_{3}^{2}+h_{31}^{2} P_{1}+h_{32}^{2} P_{2}+2\left|h_{31}\right|\left|h_{32}\right| \sqrt{P_{1} P_{2}}} \\
& \leq \frac{2 \sqrt{\mathrm{SNR}_{31} \mathrm{SNR}_{32}}}{1+\mathrm{SNR}_{31}+\mathrm{SNR}_{32}+2 \sqrt{\mathrm{SNR}_{31} \mathrm{SNR}_{32}}} \\
& \leq \frac{2 \sqrt{\mathrm{SNR}_{31} \mathrm{SNR}_{32}}}{1+4 \sqrt{\mathrm{SNR}_{31} \mathrm{SNR}_{32}}} \\
& \leq \frac{1}{2}
\end{aligned}
$$

which completes the proof.

### 3.1.4 Examples

Consider a Gaussian interference channel with an external EH with parameters $\mathrm{SNR}_{1}=\mathrm{SNR}_{2}=$ $20 \mathrm{~dB}, \mathrm{INR}_{1}=\mathrm{INR}_{2}=\mathrm{SNR}_{31}=\mathrm{SNR}_{32}=10 \mathrm{~dB}$ and $\sigma_{3}^{2}=1$. Figure 3 and Figure 4 show $\underline{\mathcal{E}}_{b}$ and $\overline{\mathcal{E}}_{b}$, respectively, with $b=0$. Figure 5 shows both $\underline{\mathcal{E}}_{b}$ and $\overline{\mathcal{E}}_{b}$ in the same axes.

Note that for all $B \in\left[0,1+\mathrm{SNR}_{31}+\mathrm{SNR}_{32}\right]$, transmitting information with independent codewords is enough to satisfy the energy rate constraints. This implies that $\beta_{1}=\beta_{2}=1$ is optimal in this regime. Alternatively, for all $B \in\left[1+\mathrm{SNR}_{31}+\mathrm{SNR}_{32}, B_{\text {max }}\right]$, transmitters deal with trade-off between the information and energy rate. Increasing $B$ reduces the information region and and shrinks the information-energy capacity region.

Figure 4: 3-D representation of $\overline{\mathcal{E}}_{b}$, with parameters $\mathrm{SNR}_{1}=\mathrm{SNR}_{2}=20 \mathrm{~dB}, \mathrm{INR}_{1}=\mathrm{INR}_{2}=$ $\mathrm{SNR}_{31}=\mathrm{SNR}_{32}=10 \mathrm{~dB}, \sigma_{3}^{2}=1$, and $b=0$.

Figure 5: 3-D superposition of $\mathcal{E}_{b}$ and $\overline{\mathcal{E}}_{b}$, with parameters $\mathrm{SNR}_{1}=\mathrm{SNR}_{2}=20 \mathrm{~dB}, \mathrm{INR}_{1}=$ $\mathrm{INR}_{2}=\mathrm{SNR}_{31}=\mathrm{SNR}_{32}=10 \mathrm{~dB}, \sigma_{3}^{2}=1$, and $b=0$.

### 3.2 Case with Perfect Channel-Output Feedback

The information-energy capacity region $\mathcal{E}_{b}^{\mathrm{F}}$, with $b$ any positive real number, is approximated by the regions $\underline{\mathcal{E}}_{b}^{\mathrm{F}}$ (Theorem 4) and $\overline{\mathcal{E}}_{b}^{\mathrm{F}}$ (Theorem 5).

### 3.2.1 An Achievable Region

The following theorem introduces an achievable information-energy region.
Theorem 4 Let b be a fixed positive real. Then, the information-energy capacity region $\mathcal{E}_{b}^{\mathrm{F}}$ contains all the rate tuples $\left(R_{1}, R_{2}, B\right)$ that satisfy:

$$
\begin{align*}
R_{1} \leq & \frac{1}{2} \log \left(\frac{1+\left(1-\lambda_{1 e}\right) \mathrm{SNR}_{1}+\left(1-\lambda_{2 e}\right) \mathrm{INR}_{1}+2 \rho \sqrt{\mathrm{SNR}_{1} \mathrm{INR}_{1}}}{1+\lambda_{2 p} \mathrm{INR}_{1}}\right)  \tag{17a}\\
R_{1} \quad \leq & \frac{1}{2} \log \left(\frac{1+\left(1-\left(\rho+\lambda_{1 e}\right)\right) \mathrm{INR}_{2}}{1+\lambda_{1 p} \mathrm{INR}_{2}}\right)+\frac{1}{2} \log \left(\frac{1+\lambda_{1 p} \mathrm{SNR}_{1}+\lambda_{2 p} \mathrm{INR}_{1}}{1+\lambda_{2 p} \mathrm{INR}_{1}}\right),  \tag{17b}\\
R_{2} \quad \leq & \frac{1}{2} \log \left(\frac{1+\left(1-\lambda_{2 e}\right) \mathrm{SNR}_{2}+\left(1-\lambda_{1 e}\right) \mathrm{INR}_{2}+2 \rho \sqrt{\mathrm{SNR}_{2} \mathrm{INR}_{2}}}{1+\lambda_{1 p} \mathrm{INR}_{2}}\right),  \tag{17c}\\
R_{2} \leq \leq & \frac{1}{2} \log \left(\frac{1+\left(1-\left(\rho+\lambda_{2 e}\right)\right) \mathrm{INR}_{1}}{1+\lambda_{2 p} \mathrm{INR}_{1}}\right)+\frac{1}{2} \log \left(\frac{1+\lambda_{2 p} \mathrm{SNR}_{1}+\lambda_{1 p} \mathrm{INR}_{1}}{1+\lambda_{1 p} \mathrm{INR}_{1}}\right),  \tag{17d}\\
R_{1}+R_{2} \leq & \frac{1}{2} \log \left(\frac{1+\lambda_{1 p} \mathrm{SNR}_{1}+\lambda_{2 p} \mathrm{INR}_{1}}{1+\lambda_{2 p} \mathrm{INR}_{1}}\right) \\
& +\frac{1}{2} \log \left(\frac{1+\left(1-\lambda_{2 e}\right) \mathrm{SNR}_{2}+\left(1-\lambda_{1 e}\right) \mathrm{INR}_{2}+2 \rho \sqrt{\mathrm{SNR}_{2} \mathrm{INR}_{2}}}{1+\lambda_{1 p} \mathrm{INR}_{2}}\right),  \tag{17e}\\
R_{1}+R_{2} \leq & \frac{1}{2} \log \left(\frac{1+\lambda_{2 p} \mathrm{SNR}_{1}+\lambda_{1 p} \mathrm{INR}_{1}}{1+\lambda_{1 p} \mathrm{INR}_{1}}\right) \\
& +\frac{1}{2} \log \left(\frac{1+\left(1-\lambda_{1 e}\right) \mathrm{SNR}_{1}+\left(1-\lambda_{2 e}\right) \mathrm{INR}_{1}+2 \rho \sqrt{\mathrm{SNR}_{1} \mathrm{INR}_{1}}}{1+\lambda_{2 p} \mathrm{INR}_{1}}\right),  \tag{17f}\\
b \leq B \leq & \sigma_{3}^{2}\left(1+\mathrm{SNR}_{31}+\mathrm{SNR}_{32}+2 \sqrt{\mathrm{SNR}_{31} \mathrm{SNR}_{32}}\left(\rho+\sqrt{\lambda_{1 e} \lambda_{2 e}}\right)\right), \tag{17~g}
\end{align*}
$$

where $\left(\rho, \lambda_{i p}, \lambda_{i e}\right) \in[0,1]^{3}$ and $\rho+\lambda_{i p}+\lambda_{i e} \leq 1$, for all $i \in\{1,2\}$.
Proof: The proof of Theorem 4 is presented in Appendix C,
The achievability scheme used to obtain Theorem 4 is built upon random coding arguments using rate-splitting [1, block-Markov superposition coding, backward decoding 5], common randomness, and power-spliting [3]. Let $W_{i}^{(t)} \in\left\{1,2 \ldots, 2^{N R_{i}}\right\}$ and $\Omega \in\left\{1,2 \ldots, 2^{N R_{E}}\right\}$ be the message index and the common random index at transmitter $i$ during the $t$-th block. Following a ratesplitting argument, the index $W_{i}^{(t)}$ is divided into two sub-indices $W_{i, P}^{(t)} \in\left\{1,2 \ldots, 2^{N R_{i, P}}\right\}$ and $W_{i, C}^{(t)} \in\left\{1,2 \ldots, 2^{N R_{i, C}}\right\}$, where $R_{i, C}+R_{i, P}=R_{i}$. At the end of block $t$, the message indices $W_{i, C}^{(t)}$ and $W_{i, P}^{(t)}$ must be decoded by receiver $i$, whereas $W_{i, C}^{(t)}$ must be decoded by receiver $j$, and by transmitter $j$ via feedback. Therefore at the beginning of block $t$, each transmitter possesses the knowledge of the indices $W_{1, C}^{(t-1)}$ and $W_{2, C}^{(t-1)}$. In the case of the first block $t=1$, the indices $W_{1, C}^{(0)}$ and $W_{2, C}^{(0)}$ correspond to two indices assumed to be known by all transmitters and receivers. The codebook generation at transmitter $i$ follows a four-level superposition coding scheme. The first code-layer is a sub-codebook of $2^{N R_{E}}$ codewords. Denote by $\boldsymbol{v}(\Omega)$ the corresponding codeword of the first code-layer. Note that both transmitters know $\Omega$, hence they are able to choose the same codeword $\boldsymbol{v}(\Omega)$ from the first-layer codebook. The index $\Omega$ as well as the codeword $\boldsymbol{v}(\Omega)$ are also known at the receivers, which highlights that the role of this codebook is not information transmission but energy transmission. The second code-layer is a sub-codebook of $2^{N\left(R_{1, C}+R_{2, C}\right)}$ codewords. Denote by $\boldsymbol{u}\left(\Omega, W_{1, C}^{(t-1)}, W_{2, C}^{(t-1)}\right)$ the corresponding codeword in the second codelayer. The third codeword used by transmitter $i$ is selected using $W_{i, C}^{(t)}$ from the third code-layer,
which is a sub-codebook of $2^{N R_{i, C}}$ codewords associated to $\boldsymbol{u}\left(\Omega, W_{1, C}^{(t-1)}, W_{2, C}^{(t-1)}\right)$. Denote by $\boldsymbol{u}_{i}\left(\Omega, W_{1, C}^{(t-1)}, W_{2, C}^{(t-1)}, W_{i, C}^{(t)}\right)$ the corresponding codeword in the third code-layer. The fourth codeword used by transmitter $i$ is selected using $W_{i, P}^{(t)}$ from the fourth code-layer, which is a subcodebook of $2^{N R_{i, P}}$ codewords associated to $s_{i}\left(\Omega, W_{1, C}^{(t-1)}, W_{2, C}^{(t-1)}, W_{i, C}^{(t)}, W_{i, P}^{(t)}\right)$ the corresponding in the fourth code-layer. Finally, For transmitting the triplet $\left(\Omega, W_{1, C}^{(t-1)}, W_{2, C}^{(t-1)}, W_{i, C}^{(t)}, W_{i, P}^{(t)}\right)$, the channel input-symbol $X_{i, n}$ at channel use $n \in\{1,2, \ldots, N\}$ is a deterministic function of the $n$-th components of the codewords $\boldsymbol{v}(\Omega), \boldsymbol{u}\left(\Omega, W_{1, C}^{(t-1)}, W_{2, C}^{(t-1)}\right), \boldsymbol{u}_{i}\left(\Omega, W_{1, C}^{(t-1)}, W_{2, C}^{(t-1)}, W_{i, C}^{(t)}\right)$ and $s_{i}\left(\Omega, W_{1, C}^{(t-1)}, W_{2, C}^{(t-1)}, W_{i, C}^{(t)}, W_{i, P}^{(t)}\right)$.

### 3.2.2 A Converse Region

The following theorem describes a converse region denoted by $\overline{\mathcal{E}}_{b}^{\mathrm{F}}$.
Theorem 5 Let b be a fixed positive real. Then, the information-energy capacity region $\mathcal{E}_{b}^{\mathrm{F}}$ is contained into the set of all the rate tuples $\left(R_{1}, R_{2}, B\right)$ that satisfy:

$$
\begin{align*}
R_{1} \quad \leq & \frac{1}{2} \log \left(1+\beta_{1} \mathrm{SNR}_{1}+\beta_{2} \mathrm{INR}_{1}+2 \rho \sqrt{\beta_{1} \mathrm{SNR}_{1} \beta_{2} \mathrm{INR}_{1}}\right)  \tag{18a}\\
R_{1} \quad \leq & \frac{1}{2} \log \left(1+\frac{\beta_{1}\left(1-\rho^{2}\right) \mathrm{SNR}_{1}}{1+\beta_{1}\left(1-\rho^{2}\right) \mathrm{INR}_{2}}\right)+\frac{1}{2} \log \left(1+\beta_{1}\left(1-\rho^{2}\right) \mathrm{INR}_{2}\right),  \tag{18b}\\
R_{2} \quad \leq & \frac{1}{2} \log \left(1+\beta_{2} \mathrm{SNR}_{2}+\beta_{1} \mathrm{INR}_{2}+2 \rho \sqrt{\beta_{2} \mathrm{SNR}_{2} \beta_{1} \mathrm{INR}_{2}}\right)  \tag{18c}\\
R_{2} \quad \leq & \frac{1}{2} \log \left(1+\frac{\beta_{2}\left(1-\rho^{2}\right) \mathrm{SNR}_{2}}{1+\beta_{2}\left(1-\rho^{2}\right) \mathrm{INR}_{1}}\right)+\frac{1}{2} \log \left(1+\beta_{2}\left(1-\rho^{2}\right) \mathrm{INR}_{1}\right),  \tag{18d}\\
R_{1}+R_{2} \leq & \frac{1}{2} \log \left(1+\frac{\beta_{1}\left(1-\rho^{2}\right) \mathrm{SNR}_{1}}{1+\beta_{1}\left(1-\rho^{2}\right) \mathrm{INR}_{2}}\right) \\
& +\frac{1}{2} \log \left(1+\beta_{2} \mathrm{SNR}_{2}+\beta_{1} \mathrm{INR}_{2}+2 \rho \sqrt{\beta_{2} \mathrm{SNR}_{2} \beta_{1} \mathrm{INR}_{2}}\right)  \tag{18e}\\
R_{1}+R_{2} \leq & \frac{1}{2} \log \left(1+\frac{\beta_{2}\left(1-\rho^{2}\right) \mathrm{SNR}_{2}}{1+\beta_{2}\left(1-\rho^{2}\right) \mathrm{INR}_{1}}\right) \\
& +\frac{1}{2} \log \left(1+\beta_{1} \mathrm{SNR}_{1}+\beta_{2} \mathrm{INR}_{1}+2 \rho \sqrt{\beta_{1} \mathrm{SNR}_{1} \beta_{2} \mathrm{INR}_{1}}\right)  \tag{18f}\\
b \leq B \leq & \sigma_{3}^{2}\left(1+\mathrm{SNR}_{31}+\mathrm{SNR}_{32}+2 \rho \sqrt{\mathrm{SNR}_{31} \mathrm{SNR}_{32}}\left(\rho \sqrt{\beta_{1} \beta_{2}}\right.\right. \\
& \left.+2 \sqrt{\left.\left(1-\beta_{1}\right)\left(1-\beta_{2}\right)\right)}\right) \tag{18g}
\end{align*}
$$

with $\left(\beta_{1}, \beta_{2}, \rho\right) \in[0,1]^{3}$.
Proof: The proof of Theorem 5 is presented in Appendix $D$.

### 3.2.3 An Approximation to the Information-Energy Capacity Region

Using the inner region $\underline{\mathcal{E}}_{b}^{\mathrm{F}}$ and the outer region $\overline{\mathcal{E}}_{b}^{\mathrm{F}}$, described respectively by Theorem 4 and Theorem 5 the information-energy capacity region $\mathcal{E}_{b}^{\mathrm{F}}$ can be approximated in the sense of Definition 3 ,

Figure 6: 3-D representation of $\underline{\mathcal{E}}_{b}^{\mathrm{F}}$, with parameters $\mathrm{SNR}_{1}=\mathrm{SNR}_{2}=20 \mathrm{~dB}, \mathrm{INR}_{1}=\mathrm{INR}_{2}=$ $\mathrm{SNR}_{31}=\mathrm{SNR}_{32}=10 \mathrm{~dB}, \sigma_{3}^{2}=1$, and $b=0$.

Theorem 6 (Approximation of $\mathcal{E}_{b}^{\mathrm{F}}$ ) Let $\underline{\mathcal{E}}_{b}^{\mathrm{F}} \subset \mathbb{R}_{+}^{3}$ and $\overline{\mathcal{E}}_{b}^{\mathrm{F}} \subset \mathbb{R}_{+}^{3}$ be the sets of tuples ( $R_{1}, R_{2}, B$ ) described by Theorem 4 and Theorem 5 respectively. Then,

$$
\begin{equation*}
\underline{\mathcal{E}}_{b}^{\mathrm{F}} \subset \mathcal{E}_{b}^{\mathrm{F}} \subset \overline{\mathcal{E}}_{b}^{\mathrm{F}} \tag{19}
\end{equation*}
$$

and for all $\left(R_{1}, R_{2}, B\right) \in \overline{\mathcal{E}}_{b}^{\mathrm{F}}$ it follows that $\left(\left(R_{1}-1\right)^{+},\left(R_{2}-1\right)^{+},\left(B-\frac{B_{\max }}{2}\right)^{+}\right) \in \underline{\mathcal{E}}_{b}^{\mathrm{F}}$.
Proof: Following similar steps as in [5], it can be shown that for all $\left(R_{1}, R_{2}, 0\right) \in \overline{\mathcal{E}}_{b}^{\mathrm{F}}$ it follows that $\left(\left(R_{1}-1\right)^{+},\left(R_{2}-1\right)^{+}, 0\right) \in \underline{\mathcal{E}}_{b}^{\mathrm{F}}$. Note also that for all $\left(R_{1}, R_{2}, B\right) \in \overline{\mathcal{E}}_{b}^{\mathrm{F}}$ and for all $\left(R_{1}, R_{2}, B^{\prime}\right) \in \underline{\mathcal{E}}_{b}^{\mathrm{F}}$, there always exists a tuple $\left(\beta_{1}, \beta_{2}, \lambda_{1 e}, \lambda_{2 e}, \rho\right)$ such that:

$$
\begin{aligned}
\frac{B-B^{\prime}}{B_{\max }} & \leq \frac{2 h_{31} h_{32} \sqrt{P_{1} P_{2}}\left(\sqrt{\left(1-\beta_{1}\right)\left(1-\beta_{2}\right)}+\rho \sqrt{\beta_{1} \beta_{2}}\right)}{\sigma_{3}^{2}+h_{31}^{2} P_{1}+h_{32}^{2} P_{2}+2 h_{31} h_{32} \sqrt{P_{1} P_{2}}} \\
& \leq \frac{2 \sqrt{\mathrm{SNR}_{31} \mathrm{SNR}_{32}}}{1+\mathrm{SNR}_{31}+\mathrm{SNR}_{32}+2 \sqrt{\mathrm{SNR}_{31} \mathrm{SNR}_{32}}} \\
& \leq \frac{2 \sqrt{\mathrm{SNR}_{31} \mathrm{SNR}_{32}}}{1+4 \sqrt{\mathrm{SNR}_{31} \mathrm{SNR}_{32}}} \\
& \leq \frac{1}{2}
\end{aligned}
$$

which completes the proof.

### 3.2.4 Example

Consider a Gaussian interference channel with feedback and an external EH with parameters $\mathrm{SNR}_{1}=\mathrm{SNR}_{2}=20 \mathrm{~dB}, \mathrm{INR}_{1}=\mathrm{INR}_{2}=\mathrm{SNR}_{31}=\mathrm{SNR}_{32}=10 \mathrm{~dB}$ and $\sigma_{3}^{2}=1$. Figure 6 and

Figure 7: 3-D representation of $\overline{\mathcal{E}}_{b}^{\mathrm{F}}$, with parameters $\mathrm{SNR}_{1}=\mathrm{SNR}_{2}=20 \mathrm{~dB}, \mathrm{INR}_{1}=\mathrm{INR}_{2}=$ $\mathrm{SNR}_{31}=\mathrm{SNR}_{32}=10 \mathrm{~dB}, \sigma_{3}^{2}=1$, and $b=0$

Figure 8: 3-D superposition of $\underline{\mathcal{E}}_{b}^{\mathrm{F}}$ and $\overline{\mathcal{E}}_{b}^{\mathrm{F}}$, with parameters $\mathrm{SNR}_{1}=\mathrm{SNR}_{2}=20 \mathrm{~dB}, \mathrm{INR}_{1}=$ $\mathrm{INR}_{2}=\mathrm{SNR}_{31}=\mathrm{SNR}_{32}=10 \mathrm{~dB}$ and $\sigma_{3}^{2}=1$.

Figure 7 show $\underline{\mathcal{E}}_{b}$ and $\overline{\mathcal{E}}_{b}$, respectively, with $b=0$. Figure 8 shows both $\underline{\mathcal{E}}_{b}$ and $\overline{\mathcal{E}}_{b}$ in the same axes. Note that for all $B \in\left[0,1+\mathrm{SNR}_{31}+\mathrm{SNR}_{32}\right]$, transmitting information with independent codewords is enough to satisfy the energy rate constraints. This implies that $\beta_{1}=\beta_{2}=1$ is optimal in this regime. Alternatively, for all $B \in\left[1+\mathrm{SNR}_{31}+\mathrm{SNR}_{32}, B_{\text {max }}\right]$, transmitters deal with a trade-off between the information and energy rate. More specifically, increasing $B$ reduces

Figure 9: Energy rate $B$ of the symmetric two-user Gaussian interference channel with feedback (dashed line) and without feedback (solid line), with co-located receiver EH, as a function of $R_{2}$ with two different values of $R_{1}$ and parameters $\mathrm{SNR}_{1}=\mathrm{SNR}_{2}=20 \mathrm{~dB}, \mathrm{INR}_{1}=\mathrm{INR}_{2}=$ $\mathrm{SNR}_{31}=\mathrm{SNR}_{32}=10 \mathrm{~dB}, \sigma_{3}^{2}=1$, and $b=0$.
the information region and shrinks the information-energy capacity region.

### 3.2.5 Comparison with the Case of no Feedback

In this section, the impact of the feedback in terms of information and energy transmission under the assumption of the symmetric interference channel is quantified through an example. From the energy transmission standpoint, figure 9 shows the enhancement of the energy transmission due to the use of feedback when the information rate $R_{1}$ corresponding to transmitter-receiver pair 1 is fixed.

Figure 10: The Information capacity region of the symmetric two-user Gaussian interference channel with feedback (dashed line) and without feedback (solid line), with co-located receiver EH, with two different values of $B$ and parameters $\mathrm{SNR}_{1}=\mathrm{SNR}_{2}=20 \mathrm{~dB}, \mathrm{INR}_{1}=\mathrm{INR}_{2}=$ $\mathrm{SNR}_{31}=\mathrm{SNR}_{32}=10 \mathrm{~dB}, \sigma_{3}^{2}=1$, and $b=0$

## Appendices

## A Proof of Theorem 1

This proof is divided into two parts. The first part consists of the proof of $14 \mathrm{a}-14 \mathrm{~g}$. The second part consists of the proof of 14 h .

## A. 1 Proof of (14a)-14g

Lemma 1 Let $B \in \mathbb{R}^{+}$be fixed, then for all $\left(R_{1}, R_{2}, B\right) \in \underline{\mathcal{E}}_{b}$, the following holds:

$$
\begin{align*}
& R_{1} \leq I\left(X_{1} ; Y_{1} \mid U_{2}, V\right)  \tag{20a}\\
& R_{2} \leq I\left(X_{2} ; Y_{2} \mid U_{1}, V\right)  \tag{20b}\\
R_{1}+ & R_{2} \leq I\left(X_{1}, U_{2} ; Y_{1} \mid V\right)+I\left(X_{2} ; Y_{2} \mid U_{1}, U_{2}, V\right)  \tag{20c}\\
R_{1}+ & R_{2} \leq I\left(X_{2}, U_{1} ; Y_{2} \mid V\right)+I\left(X_{1} ; Y_{1} \mid U_{1}, U_{2}, V\right)  \tag{20d}\\
R_{1}+ & R_{2} \leq I\left(X_{1}, U_{2} ; Y_{1} \mid U_{1}, V\right)+I\left(X_{2}, U_{1} ; Y_{2} \mid U_{2}, V\right)  \tag{20e}\\
2 R_{1}+ & R_{2} \leq I\left(X_{1}, U_{2} ; Y_{1} \mid V\right)+I\left(X_{1} ; Y_{1} \mid U_{1}, U_{2}, V\right)+\left(X_{2} U_{1} ; Y_{2} \mid U_{2} V\right), \text { and }  \tag{20f}\\
R_{1}+ & 2 R_{2} \leq I\left(X_{1}, U_{2} ; Y_{1} \mid V\right)+I\left(X_{1} ; Y_{1} \mid U_{1}, U_{2}, V\right)+I\left(X_{2}, U_{1} ; Y_{2} \mid U_{2}, V\right), \tag{20~g}
\end{align*}
$$

for all joint distributions

$$
\begin{equation*}
P_{V U_{1} U_{2} S_{1} S_{2}}\left(v, u_{1}, u_{2}, s_{1}, s_{2}\right)=P_{V}(v) P_{U_{1} \mid V}\left(u_{1} \mid v\right) P_{U_{2} \mid V}\left(u_{2} \mid v\right) P_{S_{1} \mid U_{1} V}\left(s_{1} \mid u_{1}, v\right) P_{S_{2} \mid U_{2} V}\left(s_{2} \mid u_{2}, v\right) . \tag{21}
\end{equation*}
$$

Proof: Codebook Generation: Fix a strictly positive joint probability distribution:
$P_{V U_{1} U_{2} S_{1} S_{2}}\left(v, u_{1}, u_{2}, s_{1}, s_{2}\right)=P_{V}(v) P_{U_{1} \mid V}\left(u_{1} \mid v\right) P_{U_{2} \mid V}\left(u_{2} \mid v\right) P_{S_{1} \mid U_{1} V}\left(s_{1} \mid u_{1}, v\right) P_{S_{2} \mid U_{2} V}\left(s_{2} \mid u_{2}, v\right)$, for all $\left(v, u_{1}, u_{2}, s_{1}, s_{2}\right) \in \mathcal{X}_{1} \cap \mathcal{X}_{2} \times \mathcal{X}_{1} \times \mathcal{X}_{2} \times \mathcal{X}_{1} \times \mathcal{X}_{2}$. Let $R_{E}, R_{1, C}, R_{2, C}, R_{1, P}$ and $R_{2, P}$ be non negative real numbers. Generate $2^{N R_{E}}$ i.i.d N-length codewords $\boldsymbol{v}(\omega)=\left(v_{1}(\omega), \ldots, v_{N}(\omega)\right)$ according to

$$
\begin{equation*}
P_{\boldsymbol{V}}(\boldsymbol{v}(\omega))=\prod_{m=1}^{N} P_{V}\left(v_{m}(\omega)\right), \tag{22}
\end{equation*}
$$

with $\omega \in\left\{1,2, \ldots, 2^{N R_{E}}\right\}$. For encoder 1 , for each codeword $\boldsymbol{v}(\omega)$, generate $2^{N R_{1, C}}$ i.i.d. $N$ length codewords $\boldsymbol{u}_{1}(\omega, i)=\left(u_{1,1}(\omega, i), \ldots, u_{1, N}(\omega, i)\right)$ according to

$$
\begin{equation*}
P_{\boldsymbol{U}_{\mathbf{1}} \mid \boldsymbol{V}}\left(\boldsymbol{u}_{1}(\omega, i) \mid \boldsymbol{v}(\omega)\right)=\prod_{m=1}^{N} P_{U_{1} \mid V}\left(u_{1, m}(\omega, i) \mid v_{m}(\omega)\right), \tag{23}
\end{equation*}

\end{equation*}
$$

with $l \in\left\{1, \ldots, 2^{N R_{2, P}}\right\}$.
Encoding: Denote by $\left(W_{i}, \Omega\right) \in\left\{1,2, \ldots, 2^{N\left(R_{i, C}+R_{i, P}\right.}\right\} \times\left\{1,2, \ldots, 2^{N R_{E}}\right\}$ the message index and the random message index of transmitter $i$. Let $W_{i}$ be represented by the message index $W_{i, C} \in\left\{1,2, \ldots, 2^{N R_{i, C}}\right\}$ and the message index $W_{i, P} \in\left\{1,2, \ldots, 2^{N R_{i, P}}\right\}$. Transmitter $i$ sends the codeword $\boldsymbol{x}_{i}=\theta_{i}\left(\boldsymbol{v}(\Omega), \boldsymbol{u}_{i}\left(W_{i, C}, \Omega\right), s_{i}\left(W_{i, C}, W_{i, P}, \Omega\right)\right)$, where $\theta_{i}:\left(\mathcal{X}_{1} \cap \mathcal{X}_{2}\right)^{N} \times \mathcal{X}_{i}^{N} \times \mathcal{X}_{i}^{N} \rightarrow$ $\mathcal{X}_{i}^{N}$ is a function that transforms the codewords $\boldsymbol{v}(\Omega), \boldsymbol{u}_{i}\left(W_{i, C}, \Omega\right)$, and $\boldsymbol{s}_{i}\left(W_{i, C}, W_{i, P}, \Omega\right)$ into the $N$-dimensional vector $\boldsymbol{x}_{i}$.
Decoding: Given the channel output $\boldsymbol{y}_{1}$, receiver 1 estimates the unique tuple ( $\Omega, \widehat{W}_{1, C}, \widehat{W}_{1, P}$ ) that satisfies:

$$
\begin{equation*}
\left(\boldsymbol{v}(\Omega), \boldsymbol{u}_{1}\left(\widehat{W}_{1, C}, \Omega\right), \boldsymbol{s}_{1}\left(\widehat{W}_{1, C}, \widehat{W}_{1, P}, \Omega\right), \boldsymbol{u}_{2}\left(\widehat{W}_{2, C}, \Omega\right), \boldsymbol{y}_{1}\right) \in \mathcal{T}_{V U_{1} S_{1} U_{2} Y_{1}}^{(N, \epsilon)}, \tag{27}
\end{equation*}
$$

$R R n^{\circ} 9102$
where $\Omega$ are assumed to be perfectly known by both transmitters and receivers. The set $\mathcal{T}_{V U_{1} S_{1} U_{2} Y_{1}}^{(N, \epsilon)}$ represents the set of jointly typical sequences of the random variables $V, U_{1}, S_{1}, U_{2}$, and $Y_{1}$, with $\epsilon>0$. Finally, receiver 2 follows a similar decoding scheme.

Error Probability Analysis: an error might occur at receiver 1 if the indices $W_{1, C}$ and $W_{1, P}$ are not decoded correctly given that $\Omega$ is known by both transmitters and receivers. These errors might arise for two reasons: $(i)$ there does not exist a tuple ( $\Omega, \widehat{W}_{1, C}, \widehat{W}_{1, P}$ ), for at least one $\widehat{W}_{2, C}$ that satisfy $\sqrt{27}$ ), or (ii) there exist several tuples ( $\Omega, \widehat{W}_{1, C}, \widehat{W}_{1, P}$ ), for at least one $\widehat{W}_{2, C}$ that simultaneously satisfy (27). From the asymptotic equipartion property (AEP) [6], the probability of an error due to $(i)$ tends to zero when $N$ grows to infinity. Consider the error due to (ii) and define the event $\mathrm{E}_{i j k}$ that describes the case in which the codewords $\boldsymbol{v}(\Omega), \boldsymbol{u}_{1}(i, \Omega), \boldsymbol{s}_{1}(i, j, \Omega)$, and $\boldsymbol{u}_{2}(k, \Omega)$ are jointly typical with $\boldsymbol{y}_{1}$. Assume now that the codeword to be decoded corresponds to the indices $(i, j, k)=(1,1,1)$, this is without loss of generality due to the symmetry of the code. No error is declared when codewords $\left(\boldsymbol{v}(\Omega), \boldsymbol{u}_{1}(1, \Omega), \boldsymbol{s}_{1}(1,1, \Omega), \boldsymbol{u}_{2}(\hat{k}, \Omega)\right)$, where $\hat{k} \neq 1$, are the only jointly typical sequences with the received sequence $\boldsymbol{y}_{1}$. Then, the probability of error $P_{e}$ due to (ii), can be bounded as follows:

$$
\begin{align*}
P_{e} & =\operatorname{Pr}\left[\bigcup_{(i, j) \neq(1,1)} \bigcup_{k=1}^{2^{N R_{2, C}}} E_{i j k}\right] \\
\leq & \sum_{i \neq 1, j \neq 1, k \neq 1} \operatorname{Pr}\left[E_{i j k}\right]+\sum_{i=1, j \neq 1, k=1} \operatorname{Pr}\left[E_{i j k}\right]+\sum_{i \neq 1, j \neq 1, k=1} \operatorname{Pr}\left[E_{i j k}\right] \\
& +\sum_{i \neq 1, j=1, k \neq 1} \operatorname{Pr}\left[E_{i j k}\right]+\sum_{i \neq 1, j=1, k=1} \operatorname{Pr}\left[E_{i j k}\right]+\sum_{i=1, j \neq 1, k \neq 1} \operatorname{Pr}\left[E_{i j k}\right] . \tag{28}
\end{align*}
$$

For all $i \in\left\{2,3, \ldots, 2^{N R_{1, C}}\right\}$, the following holds

$$
\begin{align*}
\operatorname{Pr}\left[\left(E_{i 11}\right)\right] & \stackrel{(a)}{=} \operatorname{Pr}\left[\left(\boldsymbol{V}, \boldsymbol{U}_{1}, \boldsymbol{X}_{1}, \boldsymbol{U}_{2}, \boldsymbol{Y}_{1}\right) \in \mathcal{T}_{V U_{1} X_{1} U_{2} Y_{1}}^{(N, \epsilon)}\right] \\
& =\sum_{\left(\boldsymbol{v}, \boldsymbol{u}_{1}, \boldsymbol{x}_{1}, \boldsymbol{u}_{2}, \boldsymbol{y}_{1}\right) \in \mathcal{T}_{V U_{1} X_{1} U_{2} Y_{1}}^{(N, \epsilon)}} P_{\boldsymbol{U}_{1} \boldsymbol{X}_{1} \mid \boldsymbol{V}}\left(\boldsymbol{u}_{1}, \boldsymbol{x}_{1} \mid \boldsymbol{v}\right) P_{\boldsymbol{U}_{2} \boldsymbol{Y}_{1} \mid \boldsymbol{V}}\left(\boldsymbol{u}_{2}, \boldsymbol{y}_{1} \mid \boldsymbol{v}\right) P_{\boldsymbol{V}}(\boldsymbol{v}), \\
\leq & \left|\mathcal{T}_{V U_{1} X_{1} U_{2} Y_{1} \mid}^{(N, \epsilon)}\right| 2^{-N\left(H\left(U_{1}, X_{1} \mid V\right)+H\left(U_{2}, Y_{1} \mid V\right)+H(V)-3 \epsilon\right)} \\
\leq & 2^{-N\left(H\left(U_{1}, X_{1} \mid V\right)+H\left(U_{2}, Y_{1} \mid V\right)+H(V)-H\left(V, U_{1}, X_{1}, U_{2}, Y_{1}\right)-4 \epsilon\right)} \\
= & 2^{-N\left(I\left(X_{1} ; Y_{1} \mid U_{2}, V\right)-4 \epsilon\right)}, \tag{29a}
\end{align*}
$$

where the probability operator $\operatorname{Pr}[$.$] in (a) applies with a probability distribution P_{\boldsymbol{V} \boldsymbol{U}_{1} \boldsymbol{X}_{1} \boldsymbol{U}_{2} \boldsymbol{Y}_{1}}$ that factorizes as $P_{\boldsymbol{V}} P_{\boldsymbol{U}_{1} \boldsymbol{X}_{1} \mid \boldsymbol{V}} P_{\boldsymbol{U}_{2} \boldsymbol{Y}_{1} \mid \boldsymbol{V}}$ given that all the codewords $\boldsymbol{x}_{1}$ and $\boldsymbol{u}_{1}$ are independent from the output of the channel $\boldsymbol{y}_{1}$.

For all $j \in\left\{2,3, \ldots, 2^{N R_{1, P}}\right\}$, the following holds:

$$

$$
\begin{align*}
\operatorname{Pr}\left(E_{i j k}\right) \stackrel{(a)}{=} & \operatorname{Pr}\left[\left(\boldsymbol{V}, \boldsymbol{U}_{1}, \boldsymbol{X}_{1}, \boldsymbol{U}_{2}, \boldsymbol{Y}_{1}\right) \in \mathcal{T}_{V U_{1} X_{1} U_{2} Y_{1}}^{(N, \epsilon)}\right] \\
= & \sum_{\left(\boldsymbol{v}, \boldsymbol{u}_{1}, \boldsymbol{x}_{1}, \boldsymbol{u}_{2}, \boldsymbol{y}_{1}\right) \in \mathcal{T}_{V U_{1} X_{1} U_{2} Y_{1}}^{(N, \epsilon)}} P_{\boldsymbol{U}_{1} \boldsymbol{X}_{1} \boldsymbol{U}_{2} \mid \boldsymbol{V}}\left(\boldsymbol{u}_{1} \boldsymbol{x}_{1} \boldsymbol{u}_{2} \mid \boldsymbol{v}\right) P_{\boldsymbol{Y}_{1} \mid \boldsymbol{V}}\left(\boldsymbol{y}_{1} \mid \boldsymbol{v}\right) P_{\boldsymbol{V}}(\boldsymbol{v}), \\
& \stackrel{(b)}{\leq}\left|\mathcal{T}_{V U_{1} X_{1} U_{2} Y_{1}}^{(N, \epsilon)}\right| 2^{-n\left(H\left(U_{1}, X_{1}, U_{2} \mid V\right)+H\left(Y_{1} \mid V\right)+H(V)-3 \epsilon\right)} \\
\leq & 2^{-N\left(H\left(U_{1}, X_{1}, U_{2} \mid V\right)+H\left(Y_{1} \mid V\right)+H(V)-H\left(V, U_{1}, X_{1}, U_{2}, Y_{1}\right)-4 \epsilon\right)} \\
= & 2^{-N\left(I\left(X_{1}, U_{2} ; Y_{1} \mid V\right)-4 \epsilon\right)}, \tag{29f}
\end{align*}
$$

where the probability operator $\operatorname{Pr}[$.$] in (a) applies with a probability distribution P_{V \boldsymbol{U}_{1} \boldsymbol{X}_{1} \boldsymbol{U}_{2} \boldsymbol{Y}_{1}}$ that factorizes as $P_{\boldsymbol{U}_{1} \boldsymbol{X}_{1} \boldsymbol{U}_{2} \mid \boldsymbol{V}} P_{\boldsymbol{Y}_{1} \mid \boldsymbol{V}} P_{\boldsymbol{V}}(\boldsymbol{v})$ given that all the codewords $\boldsymbol{x}_{1}, \boldsymbol{u}_{1}$ and $\boldsymbol{u}_{2}$ are independent from the output of the channel $\boldsymbol{y}_{1}$.
Using (29) in 28), the following holds:

$$
\begin{align*}
P_{\mathrm{e}} \leq & 2^{N\left(R_{1 c}-I\left(X_{1} ; Y_{1} \mid U_{2}, V\right)+4 \epsilon\right)} 2^{N\left(R_{1 p}-I\left(X_{1} ; Y_{1} \mid U_{1}, U_{2}, V\right)+4 \epsilon\right)} \\
& +2^{N\left(R_{1 c}+R_{1 p}-I\left(X_{1} ; Y_{1} \mid U_{2}, V\right)+4 \epsilon\right)}+2^{N\left(R_{1 c}+R_{2 c}-I\left(U_{2}, X_{1} ; Y_{1} \mid V\right)+4 \epsilon\right)} \\
& +2^{N\left(R_{1 p}+R_{2 c}-I\left(U_{2}, X_{1} ; Y_{1} \mid U_{1}, V\right)+4 \epsilon\right)}+2^{N\left(R_{1 p}+R_{1 c}+R_{2 c}-I\left(U_{2}, X_{1} ; Y_{1} \mid V\right)+4 \epsilon\right)} . \tag{30}
\end{align*}
$$

The same analysis of the probability of error holds for transmitter-receiver pair 2. Hence in general, from 30, reliable decoding holds under the following conditions:

$$
\begin{align*}
R_{1 p} & \leq a_{1},  \tag{31a}\\
R_{1 p}+R_{1 c} & \leq d_{1},  \tag{31b}\\
R_{1 p}+R_{2 c} & \leq e_{1},  \tag{31c}\\
R_{1 p}+R_{1 c}+R_{2 c} & \leq g_{1},  \tag{31d}\\
-R_{1 p} & \leq 0,  \tag{31e}\\
-R_{1 c} & \leq 0, \tag{31f}
\end{align*}
$$

$$
\begin{align*}
R_{2 p} & \leq a_{2}  \tag{31~g}\\
R_{2 p}+R_{2 c} & \leq d_{2}  \tag{31h}\\
R_{2 p}+R_{1 c} & \leq e_{2}  \tag{31i}\\
R_{1 p}+R_{1 c}+R_{2 c} & \leq g_{2}  \tag{31j}\\
-R_{2 p} & \leq 0  \tag{31k}\\
-R_{2 c} & \leq 0 \tag{311}
\end{align*}
$$

where

$$
\begin{align*}
& a_{1}=I\left(Y_{1} ; X_{1} \mid U_{1}, U_{2}, V\right),  \tag{32a}\\
& d_{1}=I\left(Y_{1} ; X_{1} \mid U_{2}, V\right),  \tag{32b}\\
& e_{1}=I\left(Y_{1} ; X_{1}, U_{2} \mid U_{1}, V\right),  \tag{32c}\\
& g_{1}=I\left(Y_{1} ; X_{1}, U_{2} \mid V\right),  \tag{32~d}\\
& a_{2}=I\left(Y_{2} ; X_{2} \mid U_{1}, U_{2}, V\right),  \tag{32e}\\
& d_{2}=I\left(Y_{2} ; X_{2} \mid U_{1}, V\right),  \tag{32f}\\
& e_{2}=I\left(Y_{2} ; X_{2}, U_{1} \mid U_{2}, V\right),  \tag{32~g}\\
& g_{2}=I\left(Y_{2} ; X_{2}, U_{1} \mid V\right) . \tag{32~h}
\end{align*}
$$

The proof continues by applying a Fourrier-Motzkin elimination process on 31.
Set $R_{1 p}=R_{1}-R_{1 c}, R_{2 p}=R_{2}-R_{2 c}$ and eliminate $R_{1 p}, R_{2 p}$ from the set of inequalities (31) to obtain

$$
\begin{align*}
R_{1}-R_{1 c} & \leq a_{1},  \tag{33a}\\
R_{1} & \leq d_{1},  \tag{33b}\\
R_{1}-R_{1 c}+R_{2 c} & \leq e_{1},  \tag{33c}\\
R_{1}+R_{2 c} & \leq g_{1},  \tag{33d}\\
-R_{1}+R_{1 c} & \leq 0,  \tag{33e}\\
-R_{1 c} & \leq 0,  \tag{33f}\\
R_{2}-R_{2 c} & \leq a_{2},  \tag{33~g}\\
R_{2} & \leq d_{2},  \tag{33h}\\
R_{2}-R_{2 c}+R_{1 c} & \leq e_{2},  \tag{33i}\\
R_{2}+R_{1 c} & \leq g_{2},  \tag{33j}\\
-R_{2}+R_{2 c} & \leq 0,  \tag{33k}\\
-R_{2 c} & \leq 0 . \tag{331}
\end{align*}
$$

Collect the inequalities in (33) that do not include $R_{1 c}$ to obtain:

$$
\begin{align*}
R_{1} & \leq d_{1}  \tag{34a}\\
R_{1}+R_{2 c} & \leq g_{1}  \tag{34b}\\
R_{2}-R_{2 c} & \leq a_{2}  \tag{34c}\\
R_{2} & \leq d_{2}  \tag{34d}\\
-R_{2}+T_{2} & \leq 0  \tag{34e}\\
-R_{2 c} & \leq 0 \tag{34f}
\end{align*}
$$

Also, collect the inequalities in (33) that include $R_{1 c}$ with positive coefficients to obtain:

$$
\begin{align*}
R_{2}-R_{2 c}+R_{1 c} & \leq e_{2}  \tag{35a}\\
R_{2}+R_{1 c} & \leq g_{2}  \tag{35b}\\
-R_{1}+R_{1 c} & \leq 0 \tag{35c}
\end{align*}
$$

Furthermore, collect the inequalities in (33) that include $-R_{1 c}$ to obtain:

$$
\begin{align*}
-R_{1 c} \leq 0  \tag{36a}\\
R_{1}-R_{1 c} \leq a_{1}  \tag{36b}\\
R_{1}-R_{1 c}+R_{2 c} \leq e_{1} \tag{36c}
\end{align*}
$$

Next, eliminate $R_{1 c}$ by summing each inequality in with the obtain:

$$
\begin{align*}
R_{2}-R_{2 c} & \leq e_{2}  \tag{37a}\\
R_{2} & \leq g_{2}  \tag{37b}\\
-R_{1} & \leq 0  \tag{37c}\\
R_{1}+R_{2}-R_{2 c} & \leq a_{1}+e_{2}  \tag{37~d}\\
R_{1}+R_{2} & \leq a_{1}+g_{2}  \tag{37e}\\
0 & \leq a_{1}  \tag{37f}\\
R_{1}+R_{2} & \leq e_{1}+e_{2}  \tag{37~g}\\
R_{1}+R_{2}+R_{2 c} & \leq e_{1}+g_{2}  \tag{37h}\\
R_{2 c} & \leq e_{1} \tag{37i}
\end{align*}
$$

Collect the inequalities in (33) and (37) that do not include $R_{2 c}$ to obtain:

$$
\begin{align*}
0 & \leq a_{1}  \tag{38a}\\
R_{1} & \leq d_{1}  \tag{38~b}\\
R_{2} & \leq d_{2}  \tag{38c}\\
R_{2} & \leq g_{2}  \tag{38d}\\
-R_{1} & \leq 0  \tag{38e}\\
R_{1}+R_{2} & \leq a_{1}+g_{2}  \tag{38f}\\
R_{1}+R_{2} & \leq e_{1}+e_{2} \tag{38~g}
\end{align*}
$$

Collect the inequalities in (38) that include $R_{2 c}$ to obtain:

$$
\begin{align*}
R_{2 c} & \leq e_{1},  \tag{39a}\\
R_{1}+R_{2 c} & \leq g_{1},  \tag{39b}\\
R_{1}+R_{2}+R_{2 c} & \leq e_{1}+g_{2},  \tag{39c}\\
-R_{2}+R_{2 c} & \leq 0 . \tag{39d}
\end{align*}
$$

Collect the inequalities in (38) that include $-R_{2 c}$ to obtain:

$$
\begin{align*}
-R_{2 c} \leq 0,  \tag{40a}\\
R_{2}-R_{2 c} \leq a_{2}  \tag{40b}\\
R_{2}-R_{2 c} \leq e_{2}  \tag{40c}\\
R_{1}+R_{2}-R_{2 c} \leq a_{1}+e_{2} . \tag{40d}
\end{align*}
$$

RR n ${ }^{\circ} 9102$

Note that (38a) is redundant due to the positivity of mutual information. The inequality (38d) is redundant with respect to 38 c , given that:

$$
\begin{align*}
g_{2} & =I\left(Y_{2} ; X_{2}, U_{1} \mid V\right) \\
& =I\left(Y_{2} ; U_{1} \mid V\right)+I\left(Y_{2} ; X_{2} \mid U_{1}, V\right) \\
& =d_{2}+I\left(Y_{2} ; U_{1} \mid V\right) \\
& \geq d_{2} . \tag{41}
\end{align*}
$$

The inequality 40 c is redundant with respect to 40b, as shown hereunder:

$$
\begin{align*}
e_{2} & =I\left(Y_{2} ; X_{2}, U_{1} \mid U_{2}, V\right) \\
& =I\left(Y_{2} ; U_{1} \mid U_{2}, V\right)+I\left(Y_{2} ; X_{2} \mid U_{2}, U_{1}, V\right) \\
& =a_{2}+I\left(Y_{2} ; U_{1} \mid U_{2}, V\right) \\
& \geq a_{2} . \tag{42}
\end{align*}
$$

Eliminate $R_{2 c}$ by adding each inequality from 39 to each inequality 40 to obtain inequalities not including $R_{2 c}$ :

$$
\begin{align*}
0 & \leq e_{1}  \tag{43a}\\
R_{1} & \leq g_{1},  \tag{43b}\\
R_{1}+R_{2} & \leq e_{1}+g_{2},  \tag{43c}\\
-R_{2} & \leq 0  \tag{43d}\\
R_{2} & \leq a_{2}+e_{1}  \tag{43e}\\
R_{1}+R_{2} & \leq a_{2}+g_{1}  \tag{43f}\\
R_{1}+2 R_{2} & \leq a_{2}+e_{1}+g_{2},  \tag{43~g}\\
0 & \leq a_{2}  \tag{43h}\\
R_{1}+R_{2} & \leq a_{1}+e_{2}+e_{1}  \tag{43i}\\
2 R_{1}+R_{2} & \leq a_{1}+e_{2}+g_{1}  \tag{43j}\\
2 R_{1}+2 R_{2} & \leq a_{1}+e_{2}+e_{1}+g_{2}  \tag{43k}\\
R_{1} & \leq a_{1}+e_{2} \tag{431}
\end{align*}
$$

Note that 43a and 43h are redundant due to the positivity of mutual information. The inequality (43b) is redundant with respect to 3 (38b), as shown hereunder:

$$
\begin{align*}
g_{1} & =I\left(Y_{1} ; X_{1}, U_{2} \mid V\right) \\
& =I\left(Y_{1} ; U_{2} \mid V\right)+I\left(Y_{1} ; X_{1} \mid U_{2}, V\right) \\
& =d_{1}+I\left(Y_{1} ; U_{2} \mid V\right) \\
& \geq d_{1} . \tag{44}
\end{align*}
$$

The inequality (43c) is redundant with respect to (38f), since

$$
\begin{align*}
e_{1} & =I\left(Y_{1} ; X_{1}, U_{2} \mid U_{1}, V\right) \\
& =I\left(Y_{1} ; U_{2} \mid U_{1}, V\right)+I\left(Y_{1} ; X_{1} \mid U_{1}, U_{2}, V\right) \\
& =a_{1}+I\left(Y_{1} ; U_{2} \mid U_{1}, V\right) \\
& \geq a_{1} . \tag{45}
\end{align*}
$$

RR n ${ }^{\circ} 9102$

Note also that the inequality (43i) is redundant with respect to 38 g$)$. Furthermore, the inequality $(43 \mathrm{k})$ is redundant with respect to $(38 \mathrm{f})$ and $(38 \mathrm{~g})$. Hence, the system of inequalities in (31) can be simplified as folllows:

$$
\begin{align*}
R_{1} & \leq d_{1}  \tag{46a}\\
R_{1} & \leq a_{1}+e_{2}  \tag{46b}\\
R_{2} & \leq d_{2}  \tag{46c}\\
R_{2} & \leq a_{2}+e_{1}  \tag{46d}\\
R_{1}+R_{2} & \leq a_{1}+g_{2}  \tag{46e}\\
R_{1}+R_{2} & \leq a_{2}+g_{1}  \tag{46f}\\
R_{1}+R_{2} & \leq e_{1}+e_{2}  \tag{46~g}\\
2 R_{1}+R_{2} & \leq a_{1}+g_{1}+e_{2}  \tag{46h}\\
R_{1}+2 R_{2} & \leq a_{2}+g_{2}+e_{1} \tag{46i}
\end{align*}
$$

Finally, following the result of [2], the inequalities 46 b and 46 d can be dropped and this completes the proof of Lemma 1 .

The proof of Theorem 1 continues as follows. Let $k \in\{0,1\}$ be fixed. Consider the following Gaussian input distribution for transmitter $k$ :

$$
\begin{equation*}
V \sim \mathcal{N}(0,1) ; U_{k} \sim \mathcal{N}\left(0, \lambda_{k c}\right) ; S_{k} \sim \mathcal{N}\left(0, \lambda_{k p}\right) \tag{47}
\end{equation*}
$$

where $X_{k}=\sqrt{P_{k}} S_{k}+\sqrt{P_{k}} U_{k}+\sqrt{\lambda_{k e} P_{k}} V$; and $\left(\lambda_{k p}, \lambda_{k c}, \lambda_{k e}\right) \in[0,1]^{3}$ and $\lambda_{k p}+\lambda_{k c}+\lambda_{k e} \leq 1$. By symmetry, it suffices to prove 14a, 14c, 14e) and 14f). The choice of the Gaussian input distribution in 47) yields:

$$
\begin{align*}
I\left(X_{1} ; Y_{1} \mid U_{2}, V\right)= & h\left(Y_{1} \mid U_{2}, V\right)-h\left(Y_{1} \mid X_{1}, U_{2}, V\right) \\
= & \frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{1} \mid U_{2}, V\right]\right)-\frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{1} \mid X_{1}, U_{2}, V\right]\right) \\
= & \frac{1}{2} \log \left(2 \pi e\left(\sigma_{1}^{2}+h_{11}^{2}\left(1-\lambda_{1 e}\right) P_{1}-h_{21}^{2} \lambda_{2 p} P_{2}\right)\right) \\
& -\frac{1}{2} \log \left(2 \pi e\left(\sigma_{1}^{2}+h_{21}^{2} \lambda_{2 p} P_{2}\right)\right) \\
= & \frac{1}{2} \log \left(1+\frac{\left(1-\lambda_{1 e}\right) \mathrm{SNR}_{1}}{1+\lambda_{2 p} \mathrm{INR}_{1}}\right),  \tag{48a}\\
I\left(X_{1}, U_{2} ; Y_{1} \mid V\right)= & h\left(Y_{1} \mid V\right)-h\left(Y_{1} \mid X_{1}, U_{2}, V\right) \\
= & \frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{1} \mid V\right]\right)-\frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{1} \mid X_{1}, U_{2}, V\right]\right) \\
= & \frac{1}{2} \log \left(2 \pi e\left(\sigma_{1}^{2}+h_{11}^{2}\left(1-\lambda_{1 e}\right) P_{1}+h_{22}^{2}\left(1-\lambda_{2 e} P_{2}\right)\right)\right. \\
& -\frac{1}{2} \log \left(2 \pi e\left(\sigma_{1}^{2}+h_{21}^{2} \lambda_{2 p} P_{2}\right)\right) \\
= & \frac{1}{2} \log \left(\frac{1+\left(1-\lambda_{1 e}\right) \mathrm{SNR}_{1}+\left(1-\lambda_{2 e}\right) \mathrm{INR}_{1}}{1+\lambda_{2 p} \mathrm{INR}_{1}}\right), \tag{48b}
\end{align*}
$$

$$
\begin{align*}
I\left(X_{2} ; Y_{2} \mid U_{1}, U_{2}, V\right)= & h\left(Y_{2} \mid U_{1}, U_{2}, V\right)-h\left(Y_{2} \mid U_{1}, U_{2}, X_{2}, V\right) \\
= & \frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{2} \mid U_{1}, U_{2}, V\right]\right)-\frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{2} \mid U_{1}, U_{2}, X_{2}, V\right]\right) \\
= & \frac{1}{2} \log \left(2 \pi e\left(\sigma_{2}^{2}+h_{22}^{2} \lambda_{2 p} P_{2}+h_{21}^{2} \lambda_{1 p} P_{1}\right)\right) \\
& -\frac{1}{2} \log \left(2 \pi e\left(\sigma_{2}^{2}+h_{21}^{2} \lambda_{1 p} P_{1}\right)\right) \\
= & \frac{1}{2} \log \left(1+\frac{\lambda_{2 p} \mathrm{SNR}_{2}}{1+\lambda_{1 p} \mathrm{INR}_{2}}\right),  \tag{48c}\\
I\left(X_{1}, U_{2} ; Y_{1} \mid U_{1}, V\right)= & h\left(Y_{1} \mid U_{1}, V\right)-h\left(Y_{1} \mid U_{1}, U_{2}, X_{1}, V\right) \\
= & \frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{1} \mid U_{1}, V\right]\right)-\frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{1} \mid U_{1}, U_{2}, X_{1}, V\right]\right) \\
= & \frac{1}{2} \log \left(2 \pi e\left(\sigma_{1}^{2}+h_{11}^{2} \lambda_{1 p} P_{1}+h_{12}^{2}\left(1-\lambda_{2 e}\right) P_{2}\right)\right) \\
& -\frac{1}{2} \log \left(2 \pi e\left(\sigma_{1}^{2}+h_{12}^{2} \lambda_{2 p} P_{2}\right)\right) \\
= & \frac{1}{2} \log \left(\frac{1+\lambda_{1 p} \mathrm{SNR}_{1}+\left(1-\lambda_{2 e}\right) \mathrm{INR}_{1}}{1+\lambda_{2 p} \mathrm{INR}}\right),  \tag{48d}\\
I\left(X_{2}, U_{1} ; Y_{2} \mid U_{2}, V\right)= & h\left(Y_{2} \mid U_{2}, V\right)-h\left(Y_{2} \mid U_{2}, U_{1}, X_{2}, V\right) \\
= & \frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{2} \mid U_{2}, V\right]\right)-\frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{2} \mid U_{2}, U_{1}, X_{2}, V\right]\right) \\
= & \frac{1}{2} \log \left(2 \pi e\left(\sigma_{1}^{2}+h_{22}^{2} \lambda_{2 p} P_{2}+h_{21}^{2}\left(1-\lambda_{1 e}\right) P_{1}\right)\right) \\
& -\frac{1}{2} \log \left(2 \pi e\left(\sigma_{2}^{2}+h_{21}^{2} \lambda_{1 p} P_{1}\right)\right) \\
= & \frac{1}{2} \log \left(\frac{1+\lambda_{2 p} \mathrm{SNR}_{2}+\left(1-\lambda_{1 e}\right) \mathrm{INR}_{2}}{1+\lambda_{1 p} \mathrm{INR}}\right), \tag{48e}
\end{align*}
$$

which proves $14 \mathrm{a}, 414 \mathrm{c}$ and 14 e . Finally, using $48 \mathrm{c}, 4 \mathrm{~d}$ ) and 48 e , the proof of 14 f , follows immediately .

## A. 2 Proof of 14h

The choice of the channel input in (47) guarantee that the random variables $Y_{3,1}, \ldots, Y_{3, n}$ are independently and identically distributed (i.i.d.). For all $n \in\{1,2, \ldots, N\}, Y_{3, n}$ follows a zeromean Gaussian distribution with variance $\bar{B}$ given by

$$
\begin{aligned}
\bar{B} & =E\left[Y_{3, n}^{2}\right] \\
& =E\left[\left(h_{31} X_{1, n}+h_{32} X_{2, n}+Z_{3, n}\right)^{2}\right] \\
& =h_{31}^{2} E\left[X_{1, n}^{2}\right]+h_{32}^{2} E\left[X_{2, n}^{2}\right]+2 h_{31} h_{32} E\left[X_{1, n} X_{2, n}\right]+\sigma_{3}^{2} \\
& =h_{31}^{2} P_{1}+h_{32}^{2} P_{2}+2 h_{31} h_{32} E\left[X_{1, n} X_{2, n}\right]+\sigma_{3}^{2} \\
& \leq h_{31}^{2} P_{1}+h_{32}^{2} P_{2}+2 h_{31} h_{32} \sqrt{\lambda_{1 e} P_{1} \lambda_{2 e} P_{2}}+\sigma_{3}^{2} .
\end{aligned}
$$

By the weak law of large numbers, it holds that $\forall \epsilon>0$,

$$
\begin{equation*}
\lim _{N \rightarrow \infty} \operatorname{Pr}\left(\left|B^{(N)}-\bar{B}\right|>\epsilon\right)=0 \tag{49}
\end{equation*}
$$

RR n ${ }^{\circ} 9102$

Consequently,

$$
\begin{align*}
& \lim _{N \rightarrow \infty} \operatorname{Pr}\left(B^{(N)}>\bar{B}+\epsilon\right)=0 \quad \text { and }  \tag{50a}\\
& \lim _{N \rightarrow \infty} \operatorname{Pr}\left(B^{(N)}<\bar{B}-\epsilon\right)=0 \tag{50b}
\end{align*}
$$

From 50b, it holds that for any energy rate $B$ which satisfies $0<B \leqslant \bar{B}$, it holds that

$$
\begin{equation*}
\lim _{N \rightarrow \infty} \operatorname{Pr}\left(B^{(N)}<B-\epsilon\right)=0 \tag{51}
\end{equation*}
$$

This proves 14 h and completes the proof of Theorem 1 .

## B Proof of Theorem 2

Fix an information-energy rate triplet $\left(R_{1}, R_{2}, B\right)$ achievable with a given coding scheme (Definition 11. Denote by $\boldsymbol{X}_{1}$ and $\boldsymbol{X}_{2}$ the channel inputs resulting from transmitting the independent message $W_{1}$ and $W_{2}$ using such coding scheme. Denote by $\boldsymbol{Y}_{1}$ and $\boldsymbol{Y}_{2}$ the corresponding channel outputs. The bounds 15 a and 15 b on $R_{1}$ and $R_{2}$ are trivial and can be obtained by removing the interference from the other user and calculating the point-to-point capacity:

$$
\begin{align*}
& N R_{1} \leqslant \sum_{n=1}^{N} h\left(Y_{1, n} \mid X_{2, n}\right)-N h\left(Z_{1}\right)+\mathrm{o}(N) \text { and }  \tag{52}\\
& N R_{2} \leqslant \sum_{n=1}^{N} h\left(Y_{2, n} \mid X_{1, n}\right)-N h\left(Z_{2}\right)+\mathrm{o}(N) \tag{53}
\end{align*}
$$

Define the following random variables:

$$
\begin{align*}
& T_{1}=h_{21} X_{1}+Z_{2},  \tag{54}\\
& T_{2}=h_{12} X_{2}+Z_{1},  \tag{55}\\
& U_{1}=h_{21} X_{1}+Z_{2}^{\prime}, \text { and }  \tag{56}\\
& U_{2}=h_{12} X_{2}+Z_{1}^{\prime}, \tag{57}
\end{align*}
$$

where, $Z_{1}^{\prime}$ and $Z_{2}^{\prime}$ are real Gaussian random variables with zero mean and variances $\sigma_{1}^{2}$ and $\sigma_{2}^{2}$, respectively, independent of each other and of $\left(X_{1}, X_{2}, Z_{1}, Z_{2}\right)$. The outer bound is established by using a genie aided argument. For all $j \in\{1,2\}$, by Fano's inequality, it follows that

$$
\begin{align*}
N R_{j} & =H\left(M_{j}\right) \\
& \leq I\left(M_{j} ; \boldsymbol{Y}_{\boldsymbol{j}}\right)+\mathrm{o}(N) \\
& \leq I\left(\boldsymbol{X}_{j} ; \boldsymbol{Y}_{j}\right)+\mathrm{o}(N), \tag{58}
\end{align*}
$$

where $\frac{\mathrm{o}(N)}{N}$ tends to zero as $N$ tends to infinity. Using the definition of mutual information, yields:

$$
\begin{align*}
I\left(\boldsymbol{X}_{1} ; \boldsymbol{Y}_{1}\right) & =h\left(\boldsymbol{Y}_{1}\right)-h\left(\boldsymbol{Y}_{1} \mid \boldsymbol{X}_{1}\right) \\
& =h\left(\boldsymbol{Y}_{1}\right)-h\left(\boldsymbol{T}_{\mathbf{2}} \mid \boldsymbol{X}_{1}\right) \\
& =h\left(\boldsymbol{Y}_{1}\right)-h\left(\boldsymbol{T}_{2}\right) \\
& \leq \sum_{n=1}^{N} h\left(Y_{1, n}\right)-h\left(\boldsymbol{T}_{2}\right) . \tag{59a}
\end{align*}
$$

$R R n^{\circ} 9102$

Consider the genie-aided channel in which a genie provides $\boldsymbol{U}_{1}$ and $\boldsymbol{X}_{2}$ to receiver 1, then $I\left(\boldsymbol{X}_{1} ; \boldsymbol{Y}_{1}\right)$ can be upper bounded as follows:

$$
\begin{align*}
I\left(\boldsymbol{X}_{1} ; \boldsymbol{Y}_{1}\right) & \leq I\left(\boldsymbol{X}_{1} ; \boldsymbol{Y}_{1}, \boldsymbol{U}_{1}, \boldsymbol{X}_{2}\right) \\
& =I\left(\boldsymbol{X}_{1}, \boldsymbol{U}_{1}\right)+I\left(\boldsymbol{X}_{1}, \boldsymbol{X}_{2} \mid \boldsymbol{U}_{1}\right)+I\left(\boldsymbol{X}_{1} ; \boldsymbol{Y}_{1} \mid \boldsymbol{U}_{1}, \boldsymbol{X}_{2}\right) \\
& =h\left(\boldsymbol{T}_{1}\right)-h\left(\boldsymbol{U}_{1} \mid \boldsymbol{X}_{1}\right)+h\left(\boldsymbol{Y}_{1} \mid \boldsymbol{U}_{1}, \boldsymbol{X}_{2}\right)-h\left(\boldsymbol{Y}_{1} \mid \boldsymbol{X}_{1}, \boldsymbol{U}_{1}, \boldsymbol{X}_{2}\right) \\
& =h\left(\boldsymbol{T}_{1}\right)-h\left(\boldsymbol{U}_{1} \mid \boldsymbol{X}_{1}\right)+h\left(\boldsymbol{Y}_{1} \mid \boldsymbol{U}_{1}, \boldsymbol{X}_{2}\right)-h\left(\boldsymbol{T}_{2} \mid \boldsymbol{X}_{2}\right) \\
& \stackrel{(a)}{\leq} h\left(\boldsymbol{T}_{1}\right)-h\left(\boldsymbol{Z}_{2}^{\prime}\right)+\sum_{n=1}^{N} h\left(Y_{1, n} \mid U_{1, n}, X_{2, n}\right)-h\left(\boldsymbol{Z}_{2}\right) \\
& =h\left(\boldsymbol{T}_{1}\right)-N h\left(Z_{2}^{\prime}\right)+\sum_{n=1}^{N} h\left(Y_{1, n} \mid U_{1, n}, X_{2, n}\right)-N h\left(Z_{2}\right) \tag{59b}
\end{align*}
$$

where (a) follows from the fact that conditioning reduces the entropy. Consider the genie-aided channel in which a genie provides $\boldsymbol{U}_{1}$ to receiver 1 , then $I\left(\boldsymbol{X}_{1} ; \boldsymbol{Y}_{1}\right)$ can be upper bounded as follows:

$$
\begin{align*}
I\left(\boldsymbol{X}_{1} ; \boldsymbol{Y}_{1}\right) & \leq I\left(\boldsymbol{X}_{1} ; \boldsymbol{Y}_{1}, \boldsymbol{U}_{1}\right) \\
& =I\left(\boldsymbol{X}_{1} ; \boldsymbol{U}_{1}\right)+I\left(\boldsymbol{X}_{1} ; \boldsymbol{Y}_{1} \mid \boldsymbol{U}_{1}\right) \\
& =h\left(\boldsymbol{U}_{1}\right)-h\left(\boldsymbol{U}_{1} \mid \boldsymbol{X}_{1}\right)+h\left(\boldsymbol{Y}_{1} \mid \boldsymbol{U}_{1}\right)-h\left(\boldsymbol{Y}_{1} \mid \boldsymbol{X}_{1}, \boldsymbol{U}_{1}\right) \\
& =h\left(\boldsymbol{T}_{1}\right)-h\left(\boldsymbol{U}_{1} \mid \boldsymbol{X}_{1}\right)+h\left(\boldsymbol{Y}_{1} \mid \boldsymbol{U}_{1}\right)-h\left(\boldsymbol{T}_{2}\right) \\
& \stackrel{(a)}{\leq} h\left(\boldsymbol{T}_{1}\right)-h\left(\boldsymbol{T}_{2}\right)-h\left(\boldsymbol{Z}_{2}^{\prime}\right)+\sum_{i=1}^{N} h\left(Y_{1, n} \mid U_{1, n}\right) \\
& =h\left(\boldsymbol{T}_{1}\right)-h\left(\boldsymbol{T}_{2}\right)-N h\left(Z_{2}^{\prime}\right)+\sum_{n=1}^{N} h\left(Y_{1, n} \mid U_{1, n}\right) . \tag{59c}
\end{align*}
$$

Consider the genie-aided channel in which a genie provides $\boldsymbol{X}_{2}$ to receiver 1, then $I\left(\boldsymbol{X}_{1} ; \boldsymbol{Y}_{1}\right)$ can be upper bounded as follows:

$$
\begin{align*}
I\left(\boldsymbol{X}_{1} ; \boldsymbol{Y}_{1}\right) & \leq I\left(\boldsymbol{X}_{1} ; \boldsymbol{Y}_{1}, \boldsymbol{X}_{2}\right) \\
& =I\left(\boldsymbol{X}_{1} ; \boldsymbol{X}_{2}\right)+I\left(\boldsymbol{X}_{1} ; \boldsymbol{Y}_{1} \mid \boldsymbol{X}_{2}\right) \\
& =h\left(\boldsymbol{Y}_{1} \mid \boldsymbol{X}_{2}\right)-h\left(\boldsymbol{Y}_{1} \mid \boldsymbol{X}_{1}, \boldsymbol{X}_{2}\right) \\
& =h\left(\boldsymbol{Y}_{1} \mid \boldsymbol{X}_{2}\right)-h\left(\boldsymbol{T}_{2} \mid \boldsymbol{X}_{2}\right) \\
& \stackrel{(a)}{\leq} \sum_{n=1}^{N} h\left(Y_{1, n} \mid X_{2, n}\right)-h\left(\boldsymbol{Z}_{1}\right) \\
& =\sum_{n=1}^{N} h\left(Y_{1, n} \mid X_{2, n}\right)-N h\left(Z_{1}\right) . \tag{59d}
\end{align*}
$$

By symmetry, similar bounds can be established for $I\left(\boldsymbol{X}_{2} ; \boldsymbol{Y}_{2}\right)$, namely,

$$
\begin{align*}
& I\left(\boldsymbol{X}_{\mathbf{2}} ; \boldsymbol{Y}_{\mathbf{2}}\right) \leq \sum_{n=1}^{N} h\left(Y_{2, n}\right)-h\left(\boldsymbol{T}_{1}\right)  \tag{59e}\\
& I\left(\boldsymbol{X}_{\mathbf{2}} ; \boldsymbol{Y}_{\mathbf{2}}\right) \leq h\left(\boldsymbol{T}_{2}\right)-N h\left(Z_{1}^{\prime}\right)+\sum_{n=1}^{N} h\left(Y_{2, n} \mid U_{2, n}, X_{1, n}\right)-N h\left(Z_{1}\right)  \tag{59f}\\
& I\left(\boldsymbol{X}_{\mathbf{2}} ; \boldsymbol{Y}_{2}\right) \leq h\left(\boldsymbol{T}_{2}\right)-h\left(\boldsymbol{T}_{1}\right)-N h\left(Z_{1}^{\prime}\right)+\sum_{n=1}^{N} h\left(Y_{2, n} \mid U_{2, n}\right)  \tag{59~g}\\
& I\left(\boldsymbol{X}_{2} ; \boldsymbol{Y}_{2}\right) \leq \sum_{n=1}^{N} h\left(Y_{2, n} \mid X_{2, n}\right)-N h\left(Z_{1}\right) \tag{59h}
\end{align*}
$$

The key idea of the proof is to consider a linear combination of the inequalities in (59), where all the terms on $h\left(\boldsymbol{T}_{1}\right)$ and $h\left(\boldsymbol{T}_{2}\right)$ are removed. Adding 59f) and 59a) and plugging into 58) yields the first bound on sum rate:

$$
\begin{equation*}
N\left(R_{1}+R_{2}\right) \leqslant \sum_{n=1}^{N} h\left(Y_{1, n}\right)+\sum_{n=1}^{N} h\left(Y_{2, n} \mid U_{2, n}, X_{1, n}\right)-N h\left(Z_{2}\right)-N h\left(Z_{1}^{\prime}\right)+\mathrm{o}(N) . \tag{60a}
\end{equation*}
$$

Adding 55 b and 59 e and plugging into 58 yields the second bound on sum rate:

$$
\begin{equation*}
N\left(R_{1}+R_{2}\right) \leqslant \sum_{n=1}^{N} h\left(Y_{2, n}\right)+\sum_{n=1}^{N} h\left(Y_{1, n} \mid U_{1, n}, X_{2, n}\right)-N h\left(Z_{1}\right)-N h\left(Z_{2}^{\prime}\right)+\mathrm{o}(N) . \tag{60b}
\end{equation*}
$$

Adding (59c) and 59g and plugging into (58) yields the third bound on sum rate:

$$
\begin{equation*}
N\left(R_{1}+R_{2}\right) \leqslant \sum_{n=1}^{N} h\left(Y_{1, n} \mid U_{1, n}\right)+\sum_{n=1}^{N} h\left(Y_{2, n} \mid U_{2, n}\right)-N h\left(Z_{1}^{\prime}\right)-N h\left(Z_{2}^{\prime}\right)+\mathrm{o}(N) \tag{60c}
\end{equation*}
$$

Adding (59a), (59b) and $\sqrt{59 \mathrm{~g}}$ ) and plugging into $\sqrt{58}$ yields the first bound for the weighted sum rate:

$$
\begin{align*}
N\left(2 R_{1}+R_{2}\right) & \leqslant \sum_{n=1}^{N} h\left(Y_{1, n}\right)+\sum_{n=1}^{N} h\left(Y_{1, n} \mid U_{1, n}, X_{2, n}\right)+\sum_{n=1}^{N} h\left(Y_{2, n} \mid U_{2, n}\right) \\
& -N\left(h\left(Z_{1}\right)+h\left(Z_{2}\right)+h\left(Z_{1}^{\prime}\right)+h\left(Z_{2}^{\prime}\right)\right)+\mathrm{o}(N) \tag{60d}
\end{align*}
$$

Adding (59e), (59f) and (59c) and plugging into (58) yields the second bound for the weighted sum rate :

$$
\begin{align*}
N\left(R_{1}+2 R_{2}\right) & \leqslant \sum_{n=1}^{N} h\left(Y_{2, n}\right)+\sum_{n=1}^{N} h\left(Y_{2, n} \mid U_{2, n}, X_{1, n}\right)+\sum_{n=1}^{N} h\left(Y_{1, n} \mid U_{1, n}\right) \\
& -N\left(h\left(Z_{1}\right)+h\left(Z_{2}\right)+h\left(Z_{1}^{\prime}\right)+h\left(Z_{2}^{\prime}\right)\right)+\mathrm{o}(N) \tag{60e}
\end{align*}
$$

Hence, the information rates can be upper bounded as follows:

$$
\begin{align*}
N R_{1} & \leqslant \sum_{n=1}^{N} h\left(Y_{1, n} \mid X_{2, n}\right)-N h\left(Z_{1}\right)+\mathrm{o}(N),  \tag{61a}\\
N R_{2} & \leqslant \sum_{n=1}^{N} h\left(Y_{2, n} \mid X_{1, n}\right)-N h\left(Z_{2}\right)+\mathrm{o}(N),  \tag{61b}\\
N\left(R_{1}+R_{2}\right) & \leqslant \sum_{n=1}^{N} h\left(Y_{1, n}\right)+\sum_{n=1}^{N} h\left(Y_{2, n} \mid U_{2, n}, X_{1, n}\right)-N h\left(Z_{2}\right)-N h\left(Z_{1}^{\prime}\right)+\mathrm{o}(N),  \tag{61c}\\
N\left(R_{1}+R_{2}\right) & \leqslant \sum_{n=1}^{N} h\left(Y_{2, n}\right)+\sum_{n=1}^{N} h\left(Y_{1, n} \mid U_{1, n}, X_{2, n}\right)-N h\left(Z_{1}\right)-N h\left(Z_{2}^{\prime}\right)+\mathrm{o}(N),  \tag{61d}\\
N\left(R_{1}+R_{2}\right) & \leqslant \sum_{n=1}^{N} h\left(Y_{1, n} \mid U_{1, n}\right)+\sum_{n=1}^{N} h\left(Y_{2, n} \mid U_{2, n}\right)-N h\left(Z_{1}^{\prime}\right)-N h\left(Z_{2}^{\prime}\right)+\mathrm{o}(N),  \tag{61e}\\
N\left(2 R_{1}+R_{2}\right) & \leqslant \sum_{n=1}^{N} h\left(Y_{1, n}\right)+\sum_{n=1}^{N} h\left(Y_{1, n} \mid U_{1, n}, X_{2, n}\right)+\sum_{n=1}^{N} h\left(Y_{2, n} \mid U_{2, n}\right) \\
& -N\left(h\left(Z_{1}\right)+h\left(Z_{2}\right)+h\left(Z_{1}^{\prime}\right)+h\left(Z_{2}^{\prime}\right)\right)+\mathrm{o}(N),  \tag{61f}\\
N\left(R_{1}+2 R_{2}\right) & \leqslant \sum_{n=1}^{N} h\left(Y_{2, n}\right)+\sum_{n=1}^{N} h\left(Y_{2, n} \mid U_{2, n}, X_{1, n}\right)+\sum_{n=1}^{N} h\left(Y_{1, n} \mid U_{1, n}\right) \\
& -N\left(h\left(Z_{1}\right)+h\left(Z_{2}\right)+h\left(Z_{1}^{\prime}\right)+h\left(Z_{2}^{\prime}\right)\right)+\mathrm{o}(N) . \tag{61~g}
\end{align*}
$$

Using assumption 13b, for a given $\epsilon_{N}>0$, for any $\eta>0$ there exist $N_{0}(\eta)$ such that for any $N \geq N_{0}(\eta)$ it holds that

$$
\begin{equation*}
\operatorname{Pr}\left[B^{(N)}<B-\epsilon_{N}\right]<\eta \tag{62}
\end{equation*}
$$

Equivalently,

$$
\begin{equation*}
\operatorname{Pr}\left[B^{(N)} \geq B-\epsilon_{N}\right] \geq 1-\eta \tag{63}
\end{equation*}
$$

From Markov's inequality [7], the following holds:

$$
\begin{equation*}
\left(B-\epsilon_{N}\right) \operatorname{Pr}\left[B^{(N)} \geq B-\epsilon_{N}\right] \leq E\left[B^{(N)}\right] . \tag{64}
\end{equation*}
$$

Combining (63) and (64) yields

$$
\begin{equation*}
\left(B-\epsilon_{N}\right)(1-\eta) \leq E\left[B^{(N)}\right] \tag{65}
\end{equation*}
$$

which can be written as

$$
\begin{equation*}
\left(B-\delta_{N}\right) \leq E\left[B^{(N)}\right] \tag{66}
\end{equation*}
$$

for some $\delta_{N}>\epsilon_{N}$ (for sufficiently large $N$ ).
In the following, for all $n \in \mathbb{N}$, the bounds in 71 and 66 are evaluated assuming that the channel inputs $X_{1, n}$ and $X_{2, n}$ are arbitrary independent with

$$
\begin{align*}
& \mu_{i, n} \triangleq \mathrm{E}\left[X_{i, n}\right]  \tag{67}\\
& \gamma_{i, n}^{2} \triangleq \operatorname{Var}\left[X_{i, n}\right] \tag{68}
\end{align*}
$$

$R R n^{\circ} 9102$
for $n \in\{1, \ldots, N\}$ and for $i \in\{1,2\}$. The input sequence must satisfy the input power constraint in (4), which can be written, for $i \in\{1,2\}$, as

$$
\begin{equation*}
\frac{1}{n} \sum_{n=1}^{N} \mathrm{E}\left[X_{i, n}^{2}\right]=\left(\frac{1}{N} \sum_{n=1}^{N} \gamma_{i, n}^{2}\right)+\left(\frac{1}{N} \sum_{n=1}^{N} \mu_{i, n}^{2}\right) \leqslant P_{i} \tag{69}
\end{equation*}
$$

Using these assumptions the following holds:

$$
\begin{align*}
h\left(Y_{i, n}\right) & \leqslant \frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{i, n}\right]\right) \\
& =\frac{1}{2} \log \left(2 \pi e\left(\sigma^{2}+h_{i i}^{2} \gamma_{i, n}^{2}+h_{i j}^{2} \gamma_{j, n}^{2}\right)\right),  \tag{70a}\\
h\left(Y_{i, n} \mid U_{i, n}, X_{j, n}\right) & \leqslant \frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{i, n} \mid U_{i, n}, X_{j, n}\right]\right) \\
& \leqslant \frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[h_{i i} X_{i, n}+Z_{i, n}, U_{i, n}\right]\right)-\frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[U_{i, n}\right]\right) \\
& =\frac{1}{2} \log \left(\frac{\sigma_{j}^{2} \gamma_{i}^{2} h_{i i}^{2}+\sigma_{1}^{2} \gamma_{i}^{2} h_{j i}^{2}+\sigma_{i}^{2} \sigma_{j}^{2}}{\gamma_{i}^{2} h_{j i}^{2}+\sigma_{j}^{2}}\right) \\
& =\frac{1}{2} \log \left(1+\frac{\frac{h_{i i}^{2} \gamma_{i, n}^{2}}{\sigma_{i}^{2}}}{1+\frac{h_{j i}^{2} \gamma_{i, n}^{2}}{\sigma_{j}^{2}}}\right)+\frac{1}{2} \log \left(2 \pi e \sigma_{i}^{2} \sigma_{j}^{2}\right),  \tag{70b}\\
h\left(Y_{i, n} \mid U_{i, n}\right) & \leqslant \frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{i, n} \mid U_{i, n}\right]\right) \\
& \left.\leqslant \frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{i, n}, U_{i, n}\right]\right]\right)-\frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[U_{i, n}\right]\right) \\
& =\frac{1}{2} \log \left(\frac{\sigma_{j}^{2} \gamma_{i}^{2} h_{i i}^{2}+\sigma_{i}^{2} \gamma_{i, n}^{2} h_{j i}^{2}+h_{i j}^{2} h_{j i}^{2} \gamma_{i, n}^{2} \gamma_{j, n}^{2}+\sigma_{i}^{2} \sigma_{j}^{2}}{\gamma_{i}^{2} h_{j i}^{2}+\sigma_{j}^{2}}\right) \\
& \leqslant \frac{1}{2} \log \left(1+\frac{\frac{h_{i i}^{2} \gamma_{i, n}^{2}}{\sigma_{i}^{2}}+\frac{h_{i j}^{2} \gamma_{j, n}^{2}}{\sigma_{i}^{2}}+\frac{\gamma_{i, n}^{2} \gamma_{j, n}^{2} h_{i j}^{2} 2_{j i}^{2}}{\sigma_{i}^{2} \sigma_{j}^{2}}}{1+\frac{\gamma_{i, n}^{2} h_{j i}^{2}}{\sigma_{j}^{2}}}\right)+\frac{1}{2} \log \left(2 \pi e \sigma_{i}^{2} \sigma_{j}^{2}\right), \tag{70c}
\end{align*}
$$

Finally, plugging (70) in 61, it yields:

$$
\begin{align*}
N R_{1} & \leqslant \sum_{n=1}^{N} \frac{1}{2} \log \left(1+\frac{\gamma_{1, n}^{2} h_{11}^{2}}{\sigma_{1}^{2}}\right)+\mathrm{o}(N),  \tag{71a}\\
N R_{2} & \leqslant \sum_{n=1}^{N} \frac{1}{2} \log \left(1+\frac{\gamma_{2, n}^{2} h_{22}^{2}}{\sigma_{2}^{2}}\right)+\mathrm{o}(N),  \tag{71b}\\
N\left(R_{1}+R_{2}\right) & \leqslant \sum_{n=1}^{N} \log \left(1+\frac{h_{11}^{2} \gamma_{1, n}^{2}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \gamma_{2, n}^{2}}{\sigma_{1}^{2}}\right)+\sum_{n=1}^{N} \frac{1}{2} \log \left(1+\frac{\frac{h_{22}^{2} \gamma_{2, n}^{2}}{\sigma_{2}^{2}}}{1+\frac{h_{12}^{2} \gamma_{2, n}^{2}}{\sigma_{1}^{2}}}\right)+\mathrm{o}(N),  \tag{71c}\\
N\left(R_{1}+R_{2}\right) & \leqslant \sum_{n=1}^{N} \log \left(1+\frac{h_{22}^{2} \gamma_{2, n}^{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \gamma_{1, n}^{2}}{\sigma_{2}^{2}}\right)+\sum_{n=1}^{N} \frac{1}{2} \log \left(1+\frac{\frac{h_{11}^{2} \gamma_{1, n}^{2}}{\sigma_{1}^{2}}}{1+\frac{h_{21}^{2} \gamma_{1, n}^{2}}{\sigma_{2}^{2}}}\right)+\mathrm{o}(N), \tag{71d}
\end{align*}
$$

$$
\begin{align*}
N\left(R_{1}+R_{2}\right) \leqslant & \sum_{n=1}^{N} \frac{1}{2} \log \left(1+\frac{\frac{h_{11}^{2} \gamma_{1, n}^{2}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \gamma_{2, n}^{2}}{\sigma_{1}^{2}}+\frac{\gamma_{1, n}^{2} \gamma_{2, n}^{2} h_{12}^{2} h_{21}^{2}}{\sigma_{1}^{2} \sigma_{2}^{2}}}{1+\frac{\gamma_{1, n}^{2}}{\sigma_{2}^{2}}}\right)  \tag{71e}\\
& +\sum_{n=1}^{N} \frac{1}{2} \log \left(1+\frac{\frac{h_{22}^{2} \gamma_{2, n}^{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \gamma_{1, n}^{2}}{\sigma_{2}^{2}}+\frac{\gamma_{1, n}^{2} \gamma_{2, n}^{2} h_{12}^{2} h_{21}^{2}}{\sigma_{1}^{2} \sigma_{2}^{2}}}{1+\frac{\gamma_{2, n}^{2}, h_{12}^{2}}{\sigma_{1}^{2}}}\right)+\mathrm{o}(N), \\
N\left(2 R_{1}+R_{2}\right) \leqslant & \sum_{n=1}^{N} \frac{1}{2} \log \left(1+\frac{\frac{h_{11}^{2} \gamma_{1, n}^{2}}{\sigma_{1}^{2}}}{1+\frac{h_{12}^{2} \gamma_{1, n}^{2}}{\sigma_{2}^{2}}}\right)+\sum_{n=1}^{N} \log \left(1+\frac{h_{11}^{2} \gamma_{1, n}^{2}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \gamma_{2, n}^{2}}{\sigma_{1}^{2}}\right)  \tag{71f}\\
& +\sum_{n=1}^{N} \frac{1}{2} \log \left(1+\frac{\frac{h_{22}^{2} \gamma_{2, n}^{2}}{\sigma_{2}^{2}}+\frac{h_{12}^{2} \gamma_{1, n}^{2}}{\sigma_{2}^{2}}+\frac{\gamma_{1, n}^{2} \gamma_{2, n}^{2} h_{12}^{2} h_{21}^{2}}{\sigma_{1}^{2} \sigma_{2}^{2}}}{1+\frac{\gamma_{2, n}^{2} h_{12}^{2}}{\sigma_{1}^{2}}}\right)+\mathrm{o}(N), \\
N\left(R_{1}+2 R_{2}\right) \leqslant & \sum_{n=1}^{N} \frac{1}{2} \log \left(1+\frac{\frac{h_{22}^{2} \gamma_{2, n}^{2}}{\sigma_{2}^{2}}}{1+\frac{h_{12}^{2} \gamma_{2, n}^{2}}{\sigma_{1}^{2}}}\right)+\frac{\sum_{n=1}^{N} \log \left(1+\frac{h_{22}^{2} \gamma_{2, n}^{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \gamma_{1, n}^{2}}{\sigma_{2}^{2}}\right)}{}  \tag{71g}\\
& +\sum_{n=1}^{N} \frac{1}{2} \log \left(1+\frac{\frac{h_{11}^{2} \gamma_{1, n}^{2}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \gamma_{2, n}^{2}}{\sigma_{1}^{2}}+\frac{\gamma_{1, n}^{2} \gamma_{2, n}^{2} h_{12}^{2} h_{21}^{2}}{\sigma_{1}^{2} \sigma_{2}^{2}}}{1+\frac{\gamma_{1, n}^{2} h_{21}^{2}}{\sigma_{2}^{2}}}\right)+\mathrm{o}(N) .
\end{align*}
$$

The expectation of the average received energy rate is given by

$$
\begin{align*}
\mathrm{E}\left[B^{(N)}\right]= & \mathrm{E}\left[\frac{1}{N} \sum_{n=1}^{N} Y_{3, n}^{2}\right] \\
= & \sigma_{3}^{2}+h_{31}^{2}\left(\frac{1}{N} \sum_{n=1}^{N}\left(\gamma_{1, n}^{2}+\mu_{1, n}^{2}\right)\right)+h_{32}^{2}\left(\frac{1}{N} \sum_{n=1}^{N}\left(\gamma_{2, n}^{2}+\mu_{2, n}^{2}\right)\right) \\
& +2 h_{31} h_{32} \frac{1}{N} \sum_{n=1}^{N} \mu_{1, n} \mu_{2, n} . \tag{72}
\end{align*}
$$

Using Cauchy-Schwarz inequality, the energy rate in (72) can be upper-bounded as follows:

$$
\begin{align*}
\mathrm{E}\left[B^{(N)}\right] \leqslant & \sigma_{3}^{2}+h_{31}^{2}\left(\frac{1}{N} \sum_{n=1}^{N}\left(\gamma_{1, n}^{2}+\mu_{1, n}^{2}\right)\right)+h_{32}^{2}\left(\frac{1}{N} \sum_{n=1}^{N}\left(\gamma_{2, n}^{2}+\mu_{2, n}^{2}\right)\right) \\
& +2 h_{31} h_{32}\left(\frac{1}{N} \sum_{n=1}^{N} \mu_{1, n}^{2}\right)^{1 / 2}\left(\frac{1}{N} \sum_{n=1}^{N} \mu_{2, n}^{2}\right)^{1 / 2} . \tag{73}
\end{align*}
$$

Combining (66) and (73) yields the following upper-bound on the energy rate $B$ :

$$
\begin{align*}
B & \leqslant \sigma_{3}^{2}+h_{31}^{2}\left(\frac{1}{N} \sum_{n=1}^{N}\left(\gamma_{1, n}^{2}+\mu_{1, n}^{2}\right)\right)+h_{32}^{2}\left(\frac{1}{N} \sum_{n=1}^{N}\left(\gamma_{2, n}^{2}+\mu_{2, n}^{2}\right)\right) \\
& +2 h_{31} h_{32}\left(\frac{1}{N} \sum_{n=1}^{N} \mu_{1, n}^{2}\right)^{1 / 2}\left(\frac{1}{N} \sum_{n=1}^{N} \mu_{2, n}^{2}\right)^{1 / 2}+\delta_{N} . \tag{74}
\end{align*}
$$

In order to obtain a single-letterization of the upper-bound given by constraints 71 and $\sqrt[74]{74}$, define also

$$
\begin{align*}
& \mu_{i}^{2} \triangleq \frac{1}{N} \sum_{n=1}^{N} \mu_{i, t}^{2}, \quad i \in\{1,2\}  \tag{75}\\
& \gamma_{i}^{2} \triangleq \frac{1}{N} \sum_{n=1}^{N} \gamma_{i, n}^{2}, \quad i \in\{1,2\} \tag{76}
\end{align*}
$$

Using these notations, the input power constraint in can be rewritten as

$$
\begin{equation*}
\gamma_{i}^{2}+\mu_{i}^{2} \leqslant P_{i}, \text { with } \quad i \in\{1,2\} . \tag{77}
\end{equation*}
$$

By the concavity of the mutual information, applying Jensen's inequality to the bounds in 71 yields in the asymptotic blocklength regime:

$$
\begin{align*}
& R_{1} \leqslant \frac{1}{2} \log \left(1+\frac{\gamma_{1}^{2} h_{11}^{2}}{\sigma_{1}^{2}}\right),  \tag{78a}\\
& R_{2} \leqslant \frac{1}{2} \log \left(1+\frac{\gamma_{2}^{2} h_{22}^{2}}{\sigma_{2}^{2}}\right),  \tag{78b}\\
& R_{1}+R_{2} \leqslant \log \left(1+\frac{h_{11}^{2} \gamma_{1}^{2}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \gamma_{2}^{2}}{\sigma_{1}^{2}}\right)+\frac{1}{2} \log \left(1+\frac{\frac{h_{22}^{2} \gamma_{2}^{2}}{\sigma_{2}^{2}}}{1+\frac{h_{12}^{2} \gamma_{2}^{2}}{\sigma_{1}^{2}}}\right),  \tag{78c}\\
& R_{1}+R_{2} \leqslant \log \left(1+\frac{h_{22}^{2} \gamma_{2}^{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \gamma_{1}^{2}}{\sigma_{2}^{2}}\right)+\frac{1}{2} \log \left(1+\frac{\frac{h_{11}^{2} \gamma_{1}^{2}}{\sigma_{1}^{2}}}{1+\frac{h_{21}^{2} \gamma_{1}^{2}}{\sigma_{2}^{2}}}\right),  \tag{78d}\\
& R_{1}+R_{2} \leqslant \frac{1}{2} \log \left(1+\frac{\frac{h_{11}^{2} \gamma_{1}^{2}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \gamma_{2}^{2}}{\sigma_{1}^{2}}+\frac{\gamma_{1}^{2} \gamma_{2}^{2} h_{12}^{2} h_{21}^{2}}{\sigma_{1}^{2} \sigma_{2}^{2}}}{1+\frac{\gamma_{1}^{2} h_{21}^{2}}{\sigma_{2}^{2}}}\right)  \tag{78e}\\
& +\frac{1}{2} \log \left(1+\frac{\frac{h_{22}^{2} \gamma_{2}^{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \gamma_{1}^{2}}{\sigma_{2}^{2}}+\frac{\gamma_{1}^{2} \gamma_{2}^{2} h_{12}^{2} h_{21}^{2}}{\sigma_{1}^{2} \sigma_{2}^{2}}}{1+\frac{\gamma_{2, n}^{2} h_{12}^{2}}{\sigma_{1}^{2}}}\right), \\
& 2 R_{1}+R_{2} \leqslant \frac{1}{2} \log \left(1+\frac{\frac{h_{11}^{2} \gamma_{1}^{2}}{\sigma_{1}^{2}}}{1+\frac{h_{21}^{2} \gamma_{1}^{2}}{\sigma_{2}^{2}}}\right)+\log \left(1+\frac{h_{11}^{2} \gamma_{1}^{2}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \gamma_{2}^{2}}{\sigma_{1}^{2}}\right)  \tag{78f}\\
& +\frac{1}{2} \log \left(1+\frac{\frac{h_{22}^{2} \gamma_{2}^{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \gamma_{1}^{2}}{\sigma_{2}^{2}}+\frac{\gamma_{1}^{2} \gamma_{2}^{2} h_{12}^{2} h_{21}^{2}}{\sigma_{1}^{2} \sigma_{2}^{2}}}{1+\frac{\gamma_{2}^{2} h_{12}^{2}}{\sigma_{1}^{2}}}\right), \\
& R_{1}+2 R_{2} \leqslant \frac{1}{2} \log \left(1+\frac{\frac{h_{22}^{2} \gamma_{2}^{2}}{\sigma_{2}^{2}}}{1+\frac{h_{12}^{2} \gamma_{2}^{2}}{\sigma_{1}^{2}}}\right)+\log \left(1+\frac{h_{22}^{2} \gamma_{2}^{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \gamma_{1}^{2}}{\sigma_{2}^{2}}\right)  \tag{78~g}\\
& +\frac{1}{2} \log \left(1+\frac{\frac{h_{11}^{2} \gamma_{1}^{2}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \gamma_{2}^{2}}{\sigma_{1}^{2}}+\frac{\gamma_{1}^{2} \gamma_{2}^{2} h_{12}^{2} h_{21}^{2}}{\sigma_{1}^{2} \sigma_{2}^{2}}}{1+\frac{\gamma_{1}^{2} h_{21}^{2}}{\sigma_{2}^{2}}}\right),
\end{align*}
$$

and the upper-bound on the energy rate 74 yields

$$
\begin{equation*}
B \leqslant \sigma_{3}^{2}+h_{31}^{2}\left(\gamma_{1}^{2}+\mu_{1}^{2}\right)+h_{32}^{2}\left(\gamma_{2}^{2}+\mu_{2}^{2}\right)+2 h_{31} h_{32}\left|\mu_{1}\right|\left|\mu_{2}\right| . \tag{78h}
\end{equation*}
$$

RR n ${ }^{\circ} 9102$

To sum up, it has been shown so far that, in the limit when $N$ tends to infinity, any informationenergy rate triplet
$\left(R_{1}, R_{2}, B\right) \in \mathcal{E}_{b}^{\mathrm{NFB}}$ can be bounded by the constraints in 78 for some $\gamma_{1}, \gamma_{2}, \mu_{1}, \mu_{2}$ satisfying (77). Let $\mathcal{R}_{b}\left(\gamma_{1}, \gamma_{2}, \mu_{1}, \mu_{2}\right)$ denote the set of information-energy rate triplets satisfying 78 for some $\gamma_{1}, \gamma_{2}, \mu_{1}, \mu_{2}$ such that (77) is true. Thus, it holds that

$$
\begin{equation*}
\overline{\mathcal{E}}_{b} \subseteq \bigcup_{\substack{0 \leqslant \gamma_{1}^{2}+\mu_{1}^{2} \leqslant P_{1} \\ 0 \leqslant \gamma_{2}^{2}+\mu_{2}^{2} \leqslant P_{2}}} \mathcal{R}_{b}\left(\gamma_{1}, \gamma_{2}, \mu_{1}, \mu_{2}\right) \tag{79}
\end{equation*}
$$

In this union, it suffices to consider $\mu_{1} \geqslant 0, \mu_{2} \geqslant 0$, and $\gamma_{1}, \gamma_{2}, \mu_{1}$, and $\mu_{2}$ that saturate the input power constraint (i.e., 77) holds with equality). Thus,

$$
\begin{equation*}
\overline{\mathcal{E}}_{b} \subseteq \bigcup_{\substack{ \\0 \leqslant \gamma_{1}^{2}+\mu_{1}^{2} \leqslant P_{1} \\ 0 \leqslant \gamma_{2}^{2}+\mu_{2}^{2} \leqslant P_{2}}} \mathcal{R}_{b}\left(\gamma_{1}^{2}, \gamma_{2}^{2}, \mu_{1}, \mu_{2}\right) \subseteq \bigcup_{\substack{\sigma_{1}^{2}+\mu_{1}^{2}=P_{1} \\ \gamma_{2}^{2}+\mu_{2}^{2}=P_{2}}} \mathcal{R}_{b}\left(\gamma_{1}^{2}, \gamma_{2}^{2}, \mu_{1}, \mu_{2}\right) \tag{80}
\end{equation*}
$$

Let $\beta_{i} \in[0,1]$ be defined as follows:

$$
\begin{equation*}
\beta_{i} \triangleq \frac{\gamma_{i}^{2}}{P_{i}}=\frac{P_{i}-\mu_{i}^{2}}{P_{i}}, \quad i \in\{1,2\} \tag{81}
\end{equation*}
$$

With these notations, any region $\mathcal{R}_{b}\left(\gamma_{1}^{2}, \gamma_{2}^{2}, \mu_{1}, \mu_{2}\right)$ in the union over all $\left(\mu_{1}, \mu_{2}, \gamma_{1}, \gamma_{2}\right)$ that satisfy $\gamma_{1}^{2}+\mu_{1}^{2}=P_{1}$ and $\gamma_{2}^{2}+\mu_{2}^{2}=P_{2}$, can be rewritten as follows:

$$
\begin{align*}
R_{1} \leqslant & \frac{1}{2} \log \left(1+\frac{\beta_{1} P_{1} h_{11}^{2}}{\sigma_{1}^{2}}\right),  \tag{82a}\\
R_{2} \leqslant & \frac{1}{2} \log \left(1+\frac{\beta_{2} P_{2} h_{22}^{2}}{\sigma_{2}^{2}}\right),  \tag{82b}\\
R_{1}+R_{2} \leqslant & \log \left(1+\frac{h_{11}^{2} \beta_{1} P_{1}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \beta_{2} P_{2}}{\sigma_{1}^{2}}\right)+\frac{1}{2} \log \left(1+\frac{\frac{h_{22}^{2} \beta_{2} P_{2}}{\sigma_{2}^{2}}}{1+\frac{h_{12}^{2} \beta_{2} P_{2}}{\sigma_{1}^{2}}}\right),  \tag{82c}\\
R_{1}+R_{2} \leqslant & \log \left(1+\frac{h_{22}^{2} \beta_{2} P_{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \beta_{1} P_{1}}{\sigma_{2}^{2}}\right)+\frac{1}{2} \log \left(1+\frac{\frac{h_{11}^{2} \beta_{1} P_{1}}{\sigma_{1}^{2}}}{1+\frac{h_{21}^{2} \beta_{1} P_{1}}{\sigma_{2}^{2}}}\right),  \tag{82d}\\
R_{1}+R_{2} \leqslant & \frac{1}{2} \log \left(1+\frac{\frac{h_{11}^{2} \beta_{1} P_{1}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \beta_{2} P_{2}}{\sigma_{1}^{2}}+\frac{\beta_{1} \beta_{2} P_{1} P_{2} h_{12}^{2} h_{21}^{2}}{\sigma_{1}^{2} \sigma_{2}^{2}}}{1+\frac{\beta_{1} P_{1} h_{21}^{2}}{\sigma_{2}^{2}}}\right)  \tag{82e}\\
+ & \frac{1}{2} \log \left(1+\frac{\frac{h_{22}^{2} \beta_{2} P_{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \beta_{1} P_{1}}{\sigma_{2}^{2}}+\frac{\beta_{1} \beta_{2} P_{1} P_{2} h_{12}^{2} h_{21}^{2}}{\sigma_{1}^{2} \sigma_{2}^{2}}}{1+\frac{\beta_{2} P_{2} h_{12}^{2}}{\sigma_{1}^{2}}}\right), \\
2 R_{1}+R_{2} \leqslant & \frac{1}{2} \log \left(1+\frac{\frac{h_{11}^{2} \beta_{1} P_{1}}{\sigma_{1}^{2}}}{1+\frac{h_{21}^{2} \beta_{1} P_{1}}{\sigma_{2}^{2}}}\right)+\log \left(1+\frac{h_{11}^{2} \beta_{1} P_{1}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \beta_{2} P_{2}}{\sigma_{1}^{2}}\right)  \tag{82f}\\
& +\frac{1}{2} \log \left(1+\frac{\frac{h_{22}^{2} \beta_{2} P_{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \beta_{1} P_{1}}{\sigma_{2}^{2}}+\frac{\beta_{1} \beta_{2} P_{1} P_{2} h_{12}^{2} h_{21}^{2}}{\sigma_{1}^{2} \sigma_{2}^{2}}}{1+\frac{\beta_{2} P_{2} h_{12}^{2}}{\sigma_{1}^{2}}}\right),
\end{align*}
$$

RR n ${ }^{\circ} 9102$

$$
\begin{align*}
R_{1}+2 R_{2} \leqslant & \frac{1}{2} \log \left(1+\frac{\frac{h_{22}^{2} \beta_{2} P_{2}}{\sigma_{2}^{2}}}{1+\frac{h_{12}^{2} \beta_{2} P_{2}}{\sigma_{1}^{2}}}\right)+\log \left(1+\frac{h_{22}^{2} \beta_{2} P_{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \beta_{1} P_{1}}{\sigma_{2}^{2}}\right)  \tag{82~g}\\
& +\frac{1}{2} \log \left(1+\frac{\frac{h_{11}^{2} \beta_{1} P_{1}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \beta_{2} P_{2}}{\sigma_{1}^{2}}+\frac{\beta_{1} \beta_{2} P_{1} P_{2} h_{12}^{2} h_{21}^{2}}{\sigma_{1}^{2} \sigma_{2}^{2}}}{1+\frac{\beta_{1} P_{1} h_{21}^{2}}{\sigma_{2}^{2}}}\right) \\
B \quad \leqslant & \sigma_{3}^{2}+h_{31}^{2} P_{1}+h_{32}^{2} P_{2}+2 h_{31} h_{32} \sqrt{\left(1-\beta_{1}\right) P_{1}\left(1-\beta_{2}\right) P_{2}}  \tag{82h}\\
B \quad \geqslant & \tag{82i}
\end{align*}
$$

for some $\left(\beta_{1}, \beta_{2}\right) \in[0,1]^{2}$. Hence, such a region contains all information-energy rate triplets $\left(R_{1}, R_{2}, B\right)$ satisfying the constraints of Theorem 2 and this completes the proof of Theorem 2.

## C Proof of Theorem 3

This proof is divided into two parts. The first part consists of the proof of 17a)-17f). The second part consists of the proof of 17 g .

## C. 1 Proof of (17a)-17f)

Lemma 2 For all $\left(R_{1}, R_{2}, B\right) \in \underline{\mathcal{E}}_{b}$, the following holds:

$$
\begin{array}{ll}
R_{1} & \leq I\left(U, X_{1}, U_{2} ; Y_{1} \mid V\right), \\
R_{1} & \leq I\left(U_{1} ; Y_{2} \mid U, X_{2}, V\right)+I\left(X_{1} ; Y_{1} \mid U_{1}, U_{2}, U, V\right), \\
R_{2} & \leq I\left(U, X_{2}, U_{1} ; Y_{2} \mid V\right), \\
R_{2} & \leq I\left(U_{2} ; Y_{1} \mid U, X_{1}, V\right)+I\left(X_{2} ; Y_{2} \mid U_{1}, U_{2}, U, V\right), \\
R_{1}+R_{2} \leq I\left(X_{1} ; Y_{1} \mid U_{1}, U_{2}, U, V\right)+I\left(V, U_{2}, X_{1} ; Y_{1}\right), \\
R_{1}+R_{2} \leq I\left(X_{2} ; Y_{2} \mid U_{1}, U_{2}, U, V\right)+I\left(V, U_{2}, X_{1} ; Y_{1}\right), \tag{88}
\end{array}
$$

over all joint distribution: $P_{V U U_{1} U_{2} S_{1} S_{2}}\left(v, u, u_{1}, u_{2}, s_{1}, s_{2}\right)=$ $P_{V}(v) P_{U \mid V}(u \mid v) P_{U_{1} \mid U V}\left(u_{1} \mid u, v\right) P_{U_{2} \mid U V}\left(u_{2} \mid u, v\right) P_{S_{1} \mid U_{1} U V}\left(s_{1} \mid u_{1}, u, v\right) P_{S_{2} \mid U_{2} U V}\left(s_{2} \mid u_{2}, u, v\right)$.

Proof: Codebook Generation: Fix a strictly positive joint probability distribution: $P_{V U U_{1} U_{2} S_{1} S_{2}}\left(v, u, u_{1}, u_{2}, s_{1}, s_{2}\right)=P_{V}(v) P_{U \mid V}(u \mid v) P_{U_{1} \mid U V}\left(u_{1} \mid u, v\right) P_{U_{2} \mid U, V}\left(u_{2} \mid u, v\right)$ $P_{S_{1} \mid U U_{1} V}\left(x_{1} \mid u, u_{1}, v\right) P_{S_{2} \mid U U_{2} V}\left(s_{2} \mid u, u_{2}, v\right)$, for all $\left(v, u, u_{1}, u_{2}, x_{1}, x_{2}\right) \in \mathcal{X}_{1} \cap \mathcal{X}_{2} \times\left(\mathcal{X}_{1} \cap \mathcal{X}_{2}\right) \times \mathcal{X}_{1} \times$ $\mathcal{X}_{2} \times \mathcal{X}_{1} \times \mathcal{X}_{2}$. Let $R_{E}, R_{1, C}, R_{2, C}, R_{1, P}$ and $R_{2, P}$ be non-negative real numbers. For transmitter 1 , generate $2^{N R_{E}}$ i.i.d N -length codewords $\boldsymbol{v}(\omega)=\left(v_{1}(\omega), \ldots, v_{N}(\omega)\right)$ according to

$$
\begin{equation*}
P_{\boldsymbol{V}}(\boldsymbol{v}(\omega))=\prod_{m=1}^{N} P_{V}\left(v_{m}(\omega)\right) \tag{89}
\end{equation*}
$$

with $\omega \in\left\{1,2, \ldots, 2^{N R_{E}}\right\}$. For each codeword $\boldsymbol{v}(\omega)$, generate $2^{N\left(R_{1, C}+R_{2, C}\right)}$ i.i.d. N-length codewords $\boldsymbol{u}(\omega, s, r)=\left(u_{1}(\omega, s, r), \ldots, u_{N}(\omega, s, r)\right)$ according to

$$
\begin{equation*}
P_{\boldsymbol{U} \mid \boldsymbol{V}}(\boldsymbol{u}(s, r, \omega) \mid \boldsymbol{v}(\omega))=\prod_{m=1}^{N} P_{U \mid V}\left(u_{m}(s, r, \omega) \mid v_{m}(\omega)\right), \tag{90}
\end{equation*}
$$

with $s \in\left\{1, \ldots, 2^{N R_{1, C}}\right\}$ and $r \in\left\{1, \ldots, 2^{N R_{2, C}}\right\}$. For transmitter 1, for each codeword $\boldsymbol{u}(\omega, s, r)$, generate $2^{N R_{1, C}}$ i.i.d. N-length codewords $\boldsymbol{u}_{1}(\omega, s, r, k)=\left(u_{1,1}(\omega, s, r, k), \ldots, u_{1, N}(\omega, s, r, k)\right)$ according to

$$
\begin{equation*}
P_{\boldsymbol{U}_{1} \mid U V}\left(\boldsymbol{u}_{1}(s, r, k, \omega) \mid \boldsymbol{u}(s, r), \boldsymbol{v}(\omega)\right)=\prod_{m=1}^{N} P_{U_{1} \mid U V}\left(u_{1, m}(s, r, k, \omega) \mid u_{m}(s, r, \omega), v_{m}(\omega)\right), \tag{91}
\end{equation*}
$$

with $k \in\left\{1, \ldots, 2^{N R_{1, C}}\right\}$. For each tuple of codewords $\left(\boldsymbol{v}(\omega), \boldsymbol{u}(\omega, s, r), \boldsymbol{u}_{1}(\omega, s, r, k)\right.$ ), generate $2^{N R_{1, P}}$ i.i.d. N-length codewords $\boldsymbol{s}_{1}(\omega, s, r, k, l)=\left(s_{1,1}(\omega, s, r, k, l), \ldots, s_{1, N}(\omega, s, r, k, l)\right)$ according to

$$
\begin{align*}
& P_{\boldsymbol{S}_{\mathbf{1}} \mid \boldsymbol{U}_{\mathbf{1}} \boldsymbol{U} \boldsymbol{V}}\left(s_{1}(\omega, s, r, k, l) \mid \boldsymbol{u}_{1}(\omega, s, r, k), \boldsymbol{u}(s, r), \boldsymbol{v}(\omega)\right)= \\
& \prod_{m=1}^{N} P_{\boldsymbol{S}_{1} \mid \boldsymbol{U}_{1} \boldsymbol{U} \boldsymbol{V}}\left(s_{1, m}(\omega, s, r, k, l) \mid u_{1, m}(\omega, s, r, k), u_{m}(\omega, s, r), v_{m}(\omega)\right) \tag{92}
\end{align*}
$$

with $l \in\left\{1, \ldots, 2^{N R_{1, P}}\right\}$.
For encoder 2 , for each codeword $\boldsymbol{u}(\omega, s, r)$, generate $2^{N R_{2, C}}$ i.i.d. N-length codewords $\boldsymbol{u}_{2}(\omega, s, r, q)$ $=\left(u_{2,1}(\omega, s, r, q), \ldots, u_{2,1}(\omega, s, r, q)\right)$ according to

$$
\begin{equation*}
P_{\boldsymbol{U}_{\mathbf{2}} \mid \boldsymbol{U} \boldsymbol{V}}\left(\boldsymbol{u}_{2}(s, r, q, \omega) \mid \boldsymbol{u}(s, r), \boldsymbol{v}(\omega)\right)=\prod_{m=1}^{N} P_{U_{2} \mid U V}\left(u_{2, m}(\omega, s, r, q) \mid u_{m}(\omega, s, r), v_{m}(\omega)\right) \tag{93}
\end{equation*}
$$

with $q \in\left\{1, \ldots, 2^{N R_{2, C}}\right\}$. For each tuple of codewords $\left(\boldsymbol{v}(\omega), \boldsymbol{u}(\omega, s, r), \boldsymbol{u}_{2}(\omega, s, r, q)\right)$, generate $2^{N R_{2, P}}$ i.i.d. $N$-length codewords $s_{2}(\omega, s, r, q, z)=\left(s_{2,1}(\omega, s, r, q, z), \ldots, s_{2, N}(\omega, s, r, q, z)\right)$ according to

$$
\begin{align*}
& P_{\boldsymbol{S}_{2} \mid \boldsymbol{U}_{2} \boldsymbol{U} \boldsymbol{V}}\left(\boldsymbol{s}_{2}(\omega, s, r, q, z) \mid \boldsymbol{u}_{2}(\omega, s, r, q), \boldsymbol{u}(\omega, s, r), \boldsymbol{v}(\omega)\right) \\
& =\prod_{m=1}^{N} P_{S_{2} \mid U_{2} U V}\left(s_{2, m}(\omega, s, r, q, z) \mid u_{2, m}(\omega, s, r, q), u_{m}(\omega, s, r), v_{m}(\omega)\right), \tag{94}
\end{align*}
$$

with $z \in\left\{1, \ldots, 2^{N R_{2, P}}\right\}$.
Encoding: Let $W_{i}^{(t)}$ be represented by the message index $W_{i, C}^{(t)} \in\left\{1,2, \ldots, 2^{N R_{i, C}}\right\}$ and the message index $W_{i, P}^{(t)} \in\left\{1,2, \ldots, 2^{N R_{i, P}}\right\}$. The message index $W_{i, P}^{(t)}$ must be reliably decoded at receiver $i$ and the message index $\Omega^{(t)}$ is known by both transmitters and receivers. The index $W_{i, C}^{(t-1)}$ must be reliably decoded by transmitter $j$ (via feedback) but not necessarily by receiver $i$.
Consider Markov encoding over $T$ blocks. At encoding step $t$, with $t \in\{1,2, \ldots, T\}$, transmitter 1 sends the codeword $\boldsymbol{x}_{1}^{(t)}=\theta_{1}\left(\left(\boldsymbol{v}^{(t)}(\Omega), \boldsymbol{u}\left(W_{1, C}^{(t-1)}, W_{2, C}^{(t-1)}, \Omega\right), \boldsymbol{u}_{1}\left(W_{1, C}^{(t-1)}, W_{2, C}^{(t-1)}, W_{1, C}^{(t)}, \Omega\right)\right.\right.$, $\left.s_{1}\left(W_{1, C}^{(t-1)}, W_{2, C}^{(t-1)}, W_{1, C}^{(t)}, W_{1, P}^{(t)}, \Omega\right)\right)$, where $\theta_{1}: \mathcal{X}^{N} \times\left(\mathcal{X}_{1} \cup \mathcal{X}_{2}\right)^{N} \times \mathcal{X}_{1} \times \mathcal{X}_{1}^{N} \rightarrow \mathcal{X}_{1}^{N}$ is a function that transforms the codewords $\boldsymbol{v}^{(t)}(\Omega), \boldsymbol{u}\left(W_{1, C}^{(t-1)}, W_{2, C}^{(t-1)}, \Omega\right), \boldsymbol{u}_{1}\left(W_{1, C}^{(t-1)}, W_{2, C}^{(t-1)}, W_{1, C}^{(t)}, \Omega\right)$, and $s_{1}\left(W_{1, C}^{(t-1)}, W_{2, C}^{(t-1)}, W_{1, C}^{(t)}, W_{1, P}^{(t)}, \Omega\right)$ into the $N$-dimensional vector $\boldsymbol{x}_{1}^{(t)}$. The indices $W_{1, C}^{(0)}=$ $W_{1, C}^{(T)}=s^{*}$ and $W_{2, C}^{(0)}=W_{2, C}^{(T)}=r^{*}$, and the pair $\left(s^{*}, r^{*}\right) \in\left\{1,2, \ldots, 2^{N R_{1, C}}\right\} \times\left\{1,2, \ldots, 2^{N R_{2, C}}\right\}$ are pre-defined and known by both receivers and transmitters. Transmitter 2 follows a similar encoding scheme.

Decoding: Both receivers decode their message indices at the end of block $T$ in a backward decoding fashion. At each decoding step $t$, with $t \in\{1,2, \ldots, T\}$, receiver 1 obtains the indices $\left(\widehat{W}_{1, C}^{(T-t)}, \widehat{W}_{2, C}^{(T-t)}, W_{1, P}^{(T-(t-1)}\right)$ from the channel output $\boldsymbol{y}_{1}$.
The tuple $\left(\widehat{W}_{1, C}^{(T-t)}, \widehat{W}_{2, C}^{(T-t)}, W_{1, P}^{(T-(t-1)}\right)$ is the unique tuple that satisfy:

$$
\begin{align*}
& \left(\left(\boldsymbol{v}\left(\Omega^{(t)}\right), \boldsymbol{u}\left(\Omega^{(t)}, \widehat{W}_{1, C}^{(T-t)}, \widehat{W}_{2, C}^{(T-t)}\right), \boldsymbol{u}_{1}\left(\Omega^{(t)}, \widehat{W}_{1, C}^{(T-t)}, \widehat{W}_{2, C}^{(T-t)}, W_{1, C}^{(T-(t-1))}\right),\right.\right. \\
& s_{1}\left(\Omega^{(t)}, \widehat{W}_{1, C}^{(T-t)}, \widehat{W}_{2, C}^{(T-t)}, W_{1, C}^{(T-(t-1))}, W_{1, P}^{(T-(t-1))}\right), \boldsymbol{u}_{2}\left(\Omega^{(t)}, \widehat{W}_{1, C}^{(T-t)}, \widehat{W}_{2, C}^{(T-t)}, W_{2, C}^{(T-(t-1))}\right), \\
& \left.\boldsymbol{y}_{1}^{(T-(t-1))}\right) \in \mathcal{T}_{V U U_{1} S_{1} U_{2} Y_{1}}^{(N,, \epsilon)}, \tag{95}
\end{align*}
$$

where $W_{1, C}^{(T-(t-1))}$ and $W_{2, C}^{(T-(t-1))}$ are assumed to be perfectly decoded in the previous decoding step $t-1$. The set $\mathcal{T}_{V U U_{1} S_{1} U_{2} Y_{1}}^{(N, \epsilon)}$ represent the set of jointly typical sequences of the random variables $V, U, U_{1}, S_{1}, U_{2}$, and $Y_{1}$, with $\epsilon>0$. Finally, receiver 2 follows a similar decoding scheme.
Probability of Error Analysis: An error might occur during encoding step $t$ at transmitter 1 if the index $\widehat{W}_{2, C}^{(t-1)}$ is not correctly decoded. Define the event $E_{k}$ that describes the case in which there exist another message index $k$ that satisfy: $\left(\boldsymbol{v}\left(\Omega^{(t)}\right), \boldsymbol{u}\left(\Omega^{(t)}, W_{1, C}^{(t-2)}, W_{2, C}^{(t-2)}\right)\right.$, $\boldsymbol{u}_{1}\left(\Omega^{(t)}, W_{1, C}^{(t-2)}, W_{2, C}^{(t-2)}, W_{1, C}^{(t-1)}, \Omega\right), \boldsymbol{s}_{1}\left(\Omega^{(t)}, W_{1, C}^{(t-2)}, W_{2, C}^{(t-2)}, W_{1, C}^{(t-1)}, W_{1, P}^{(t-1)}\right)$, $\left.\boldsymbol{u}_{2}\left(\Omega^{(t)}, W_{1, C}^{(t-2)}, W_{2, C}^{(t-2)}, k\right)\right) \in \mathcal{T}_{V U U_{1} S_{1} U_{2} Y_{1}}^{(N,,)}$, with $t \in\{2,3, \ldots, T\}$ and $W_{2, C}^{(t-2)}$ is assumed to be perfectly decoded in the previous block $t-1$. Then, the probability of event $E_{k}$ can be bounded as follows:

$$
\begin{align*}
\operatorname{Pr}\left(E_{k}\right) & \stackrel{(a)}{=} \operatorname{Pr}\left[\left(\boldsymbol{V}, \boldsymbol{U}, \boldsymbol{U}_{1}, \boldsymbol{X}_{1}, \boldsymbol{U}_{2}, \boldsymbol{Y}_{1}\right) \in \mathcal{T}_{V U U_{1} X_{1} U_{2} Y_{1}}^{(N, \epsilon)}\right] \\
& =\sum_{\left(\boldsymbol{v}, \boldsymbol{u}, \boldsymbol{u}_{1}, \boldsymbol{x}_{1}, \boldsymbol{y}_{1}\right) \in \mathcal{T}_{V U U_{1} X_{1} U_{2} Y_{1}}^{(N, \epsilon}} P_{\boldsymbol{V}}(\boldsymbol{v}) P_{\boldsymbol{U}, \boldsymbol{U}_{1}, \boldsymbol{X}_{1}, \boldsymbol{Y}_{1} \mid \boldsymbol{V}}\left(\boldsymbol{u}, \boldsymbol{u}_{1}, \boldsymbol{x}_{\mathbf{1}}, \boldsymbol{y}_{2} \mid \boldsymbol{v}\right) P_{\boldsymbol{U}_{2} \mid \boldsymbol{V}}\left(\boldsymbol{u}_{2} \mid \boldsymbol{v}\right) \\
& \leq \mid \mathcal{T}_{V U U_{1} X_{1} U_{2} U_{1} \mid}^{(N, \epsilon)} 2^{-N\left(H\left(U, U_{1}, X_{1}, Y_{1} \mid V\right)+H\left(U_{2} \mid V\right)+H(V)-4 \epsilon\right)} \\
& \leq 2^{-N\left(H\left(U, U_{1}, X_{1}, Y_{1} \mid V\right)+H\left(U_{2} \mid V\right)+H(V)-H\left(U, U_{1}, U_{2}, X_{1}, Y_{1}\right)-4 \epsilon\right)} \\
& \leq 2^{-N\left(H\left(U, U_{1}, X_{1}, Y_{1} \mid V\right)+H\left(U_{2} \mid V\right)-H\left(U, U_{1}, U_{2}, X_{1}, Y_{1} \mid V\right)-4 \epsilon\right)} \\
& =2^{-N\left(I\left(U, U_{1}, X_{1}, Y_{1} ; U_{2} \mid V\right)-4 \epsilon\right)} \\
& =2^{-N\left(I\left(Y_{1} ; U_{2} \mid X_{1}, V\right)-4 \epsilon\right)} \tag{96}
\end{align*}
$$

where the probability operator $\operatorname{Pr}[$.$] in (a) applies with a probability distribution P_{\boldsymbol{V} \boldsymbol{U} U_{1} \boldsymbol{X}_{1} \boldsymbol{U}_{2} \boldsymbol{Y}_{1}}$ that factorizes as $P_{\boldsymbol{V}} P_{\boldsymbol{U}, \boldsymbol{U}_{1}, \boldsymbol{X}_{1}, \boldsymbol{Y}_{1}} P_{\boldsymbol{U}_{2} \mid \boldsymbol{V}}$ given that all the codewords $\boldsymbol{u}_{2}$ are independent from the output of the channel $\boldsymbol{y}_{1}$. The error probability becomes arbitrarily small (as N goes to infinity) if

$$
\begin{equation*}
R_{2 c} \leq I\left(U_{2}, ; Y_{1} \mid X_{1}, U, V\right) \tag{97}
\end{equation*}
$$

An error might occur during the (backward) decoding step $t$ if the indices $\widehat{W}_{1, C}^{(T-t)}, \widehat{W}_{2, C}^{(T-t)}$ or $\widehat{W}_{1, P}^{(T-(t-1)}$ are not decoded correctly given that the indices $W_{1, C}^{(T-(t-1))}$ and $W_{2, C}^{(T-(t-1))}$ were correctly decoded in the previous decoding step $t-1$. These errors might arise for two reasons: $(i)$ there does not exist a tuple $\left(\widehat{W}_{1, C}^{(T-t)}, \widehat{W}_{2, C}^{(T-t)}, W_{1, P}^{(T-(t-1)}\right)$ that satisfies 95), or (ii) there exist
several tuples $\left(\widehat{W}_{1, C}^{(T-t)}, \widehat{W}_{2, C}^{(T-t)}, W_{1, P}^{(T-(t-1)}\right)$ that simultaneously satisfy 95 . From the asymptotic equipartition property [6], the probability of error due to $(i)$ tends to zero when $N$ grows to infinity. Consider the error due to (ii) and define the event $E_{s r l}$ that describes the case in which the codewords $\boldsymbol{v}\left(\Omega^{(t)}\right), \boldsymbol{u}\left(\Omega^{(t)}, s, r\right), \boldsymbol{u}_{1}\left(\Omega^{(t)}, s, r, W_{1, C}^{(T-(t-1))}\right), s_{1}\left(\Omega^{(t)}, s, r, W_{1, C}^{(T-(t-1))}, l\right)$, and $\boldsymbol{u}_{2}\left(\Omega^{(t)}, s, r, W_{2, C}^{(T-(t-1))}\right)$ are jointly typical with $\boldsymbol{y}_{1}^{(T-(t-1))}$ during decoding step $t$. Assume now that the codeword to be decoded at decoding step $t$ corresponds to the indices $(s, r, l)=(1,1,1)$. This is without loss of generality due to the symmetry of the code. Then, the probability of error due to (ii) during decoding step $t$, can be bounded as follows:

$$
\begin{align*}
& \operatorname{Pr}\left[\bigcup_{(s, r, l) \neq(1,1,1)} E_{s r l}\right] \\
\leq & \sum_{s \neq 1, r \neq 1, l \neq 1} \operatorname{Pr}\left[E_{s r l}\right]+\sum_{s \neq 1, r \neq 1, l=1} \operatorname{Pr}\left[E_{s r l}\right]+\sum_{s \neq 1, r=1, l \neq 1} \operatorname{Pr}\left[E_{s r l}\right] \\
& +\sum_{s \neq 1, r=1, l=1} \operatorname{Pr}\left[E_{s r l}\right]+\sum_{s=1, r \neq 1, l \neq 1} \operatorname{Pr}\left[E_{s r l}\right]+\sum_{s=1, r \neq 1, l=1} \operatorname{Pr}\left[E_{s r l}\right] \\
& +\sum_{s=1, r=1, l \neq 1} \operatorname{Pr}\left[E_{s r l}\right] \tag{98}
\end{align*}
$$

For all $s \in\left\{2,3, \ldots, 2^{N R_{1, C}}\right\}$, the following holds

$$
\begin{align*}
\operatorname{Pr}\left[E_{s 11}\right] & \stackrel{(a)}{=} \operatorname{Pr}\left[\left(\boldsymbol{V}, \boldsymbol{U}, \boldsymbol{U}_{1}, \boldsymbol{X}_{1}, \boldsymbol{U}_{2}, \boldsymbol{Y}_{1}\right) \in \mathcal{T}_{V U U_{1} X_{1} U_{2} Y_{1}}^{(N, \epsilon)}\right] \\

& \leq \mid \mathcal{T}_{V U U_{1}}^{(N, \epsilon)}  \tag{99~g}\\
\leq & 2^{-N\left(H\left(U, U_{1}, U_{2}, U_{2}, Y_{1} \mid V\right)+H\left(X_{1} \mid V\right)+H(V)-H\left(U, U_{1}, U_{2}, X_{1}, Y_{1}\right)-4 \epsilon\right)} 2^{-N\left(H\left(U, U_{1}, U_{2}, Y_{1} \mid V\right)+H\left(X_{1} \mid V\right)+H(V)-4 \epsilon\right)} \\
& =2^{-N\left(I\left(X_{1} ; U, U_{1}, U_{2}, Y_{1} \mid V\right)-4 \epsilon\right)} \\
& =2^{-N\left(I\left(X_{1} ; Y_{1} \mid U, U_{1}, U_{2}, V\right)-4 \epsilon\right)}
\end{align*}
$$

where the probability operator $\operatorname{Pr}[$.$] in (a) applies with a probability distribution P_{\boldsymbol{V} \boldsymbol{U} U_{1} \boldsymbol{X}_{1} \boldsymbol{U}_{2} \boldsymbol{Y}_{1}}$ that factorizes as $P_{\boldsymbol{V}} P_{\boldsymbol{U}, \boldsymbol{U}_{1}, \boldsymbol{U}_{2}, \boldsymbol{Y}_{1} \mid \boldsymbol{V}} P_{\boldsymbol{X}_{1} \mid \boldsymbol{V}}$ given that the codewords $\boldsymbol{x}_{1}$ is independent from the output of the channel $\boldsymbol{y}_{1}$. Plugging (99) into (98) yields:

$$
\begin{align*}
P_{\mathrm{e}} & \leq 2^{N\left(R_{1 C}+R_{2 C}+R_{2 P}-I\left(U, X_{1}, U_{2} ; Y_{1} \mid V\right)+4 \epsilon\right)}+2^{N\left(R_{1 C}+R_{2 C}-I\left(U, X_{1}, U_{2} ; Y_{1} \mid V\right)+4 \epsilon\right)} \\
& +2^{N\left(R_{1 C}+R_{1 P}-I\left(U, X_{1}, U_{2} ; Y_{1} V\right)+4 \epsilon\right)}+2^{N\left(R_{1 C}-I\left(U, X_{1}, U_{2} ; Y_{1} \mid V\right)+4 \epsilon\right)} \\
& +2^{N\left(R_{2 C}+R_{1 P}-I\left(U, X_{1}, U_{2} ; Y_{1} \mid V\right)+4 \epsilon\right)}+2^{N\left(R_{2 C}-I\left(U, X_{1}, U_{2} ; Y_{1} \mid V\right)+4 \epsilon\right)} \\
& +2^{N\left(R_{1 P}-I\left(X_{1} ; Y_{1} \mid U, U_{1}, U_{2}, V\right)+4 \epsilon\right)} . \tag{100}
\end{align*}
$$

The same analysis of the probability of error holds for transmitter-receiver pair 2. Hence in general, from (97) and 100 , reliable decoding holds under the following conditions:

$$
\begin{array}{ll}
R_{2 C} & \leq I\left(U_{2} ; Y_{1} \mid X_{1}, U, V\right) \\
R_{1 P} & \leq I\left(X_{1} ; Y_{1} \mid U_{1}, U_{2}, U, V\right), \\
R_{1 C}+R_{2 C}+R_{1 P} & \leq I\left(U, X_{1}, U_{2} ; Y_{1} \mid V\right) \\
R_{1 C} & \leq I\left(U_{1} ; Y_{2} \mid X_{2}, U, V\right) \\
R_{2 P} & \leq I\left(X_{2} ; Y_{2} \mid U_{1}, U_{2}, U, V\right), \\
R_{1 C}+R_{2 C}+R_{2 P} & \leq I\left(U, X_{2}, U_{1} ; Y_{2} \mid V\right) \tag{101f}
\end{array}
$$

The proof continues by applying a Fourrier-Motzkin elimination process on 101). Set $R_{1 P}=$ $R_{1}-R_{1 C}, R_{2 P}=R_{2}-R_{2 C}$. Eliminate $R_{1 P}, R_{2 P}$ from the inequalities in 101) to obtain:

$$
\begin{align*}
& R_{2 C} \leq a_{1}  \tag{102a}\\
& R_{1}-R_{1 C} \leq a_{2},  \tag{102b}\\
& R_{1}+R_{2 C} \leq a_{3},  \tag{102c}\\
& R_{1 C} \leq b_{1}  \tag{102d}\\
& R_{2}-R_{2 C} \leq b_{2}  \tag{102e}\\
& R_{2}+R_{1 C} \leq b_{3},  \tag{102f}\\
&-R_{1 C} \leq 0  \tag{102~g}\\
&-R_{1}+R_{1 C} \leq 0  \tag{102h}\\
&-R_{2 C} \leq 0  \tag{102i}\\
&-R_{2}+R_{2 C} \leq 0 \tag{102j}
\end{align*}
$$

Collect the inequalities in 102 that do not include $R_{1 C}$ among the above inequalities to obtain:

$$
\begin{align*}
R_{2 C} & \leq a_{1},  \tag{103a}\\
R_{1}+R_{2 C} & \leq a_{3},  \tag{103b}\\
R_{2}-R_{2 C} & \leq b_{2},  \tag{103c}\\
-R_{2 C} & \leq 0  \tag{103d}\\
-R_{2}+R_{2 C} & \leq 0 . \tag{103e}
\end{align*}
$$

Collect the inequalities in 102 that include $R_{1 C}$ with positive coefficients to obtain:

$$
\begin{align*}
R_{1 C} & \leq b_{1},  \tag{104a}\\
R_{2}+R_{1 C} & \leq b_{3},  \tag{104b}\\
-R_{1}+R_{1 C} & \leq 0 . \tag{104c}
\end{align*}
$$

Collect the inequalities in 102 that include $R_{1 C}$ with negative coefficients to obtain:

$$
\begin{align*}
R_{1}-R_{1 C} & \leq a_{2}  \tag{105a}\\
-R_{1 C} & \leq 0 \tag{105b}
\end{align*}
$$

Eliminate $R_{1 C}$ by adding each inequality from 104 and each inequality from 105 to obtain:

$$
\begin{align*}
R_{1} & \leq b_{1}+a_{2}  \tag{106a}\\
R_{2} & \leq b_{3}  \tag{106b}\\
R_{2}+R_{1} & \leq b_{3}+a_{2}  \tag{106c}\\
-R_{1} & \leq 0  \tag{106d}\\
R_{2 C} & \leq a_{1}  \tag{106e}\\
R_{1}+R_{2 C} & \leq a_{3}  \tag{106f}\\
-R_{2}+R_{2 C} & \leq 0  \tag{106~g}\\
R_{2}-R_{2 C} & \leq b_{2}  \tag{106h}\\
-R_{2 C} & \leq 0 \tag{106i}
\end{align*}
$$

RR n ${ }^{\circ} 9102$

Collect the inequalities in 106 that do not include $R_{2 C}$ to obtain:

$$
\begin{align*}
R_{1} & \leq b_{1}+a_{2}  \tag{107a}\\
R_{2} & \leq b_{3}  \tag{107b}\\
R_{2}+R_{1} & \leq b_{3}+a_{2}  \tag{107c}\\
-R_{1} & \leq 0 \tag{107d}
\end{align*}
$$

Collect the inequalities in that include $R_{2 C}$ with positive coefficients to obtain:

$$
\begin{align*}
R_{2 C} & \leq a_{1}  \tag{108a}\\
-R_{2}+R_{2 C} & \leq 0  \tag{108b}\\
R_{1}+R_{2 C} & \leq a_{3} \tag{108c}
\end{align*}
$$

Collect the inequalities in that include $R_{2 C}$ with negative coefficients to obtain:

$$
\begin{align*}
R_{2}-R_{2 C} & \leq b_{2}  \tag{109a}\\
-R_{2 C} & \leq 0 \tag{109b}
\end{align*}
$$

Eliminate $R_{2 C}$ by adding each inequality in with each inequality in 109 to obtain:

$$
\begin{align*}
R_{1} & \leq a_{3}  \tag{110a}\\
R_{1} & \leq b_{1}+a_{2}  \tag{110b}\\
R_{2} & \leq b_{3}  \tag{110c}\\
R_{2} & \leq a_{1}+b_{2}  \tag{110d}\\
R_{1}+R_{2} & \leq b_{3}  \tag{110e}\\
R_{1}+R_{2} & \leq a_{3}+b_{2} \tag{110f}
\end{align*}
$$

This completes the proof of Lemma 2.
The proof of Theorem 4 continues as follows, let $k \in\{0,1\}$ be fixed and consider the following Gaussian input distribution for transmitter $k$ :

$$
\begin{equation*}
V \sim \mathcal{N}(0,1) ; U \sim \mathcal{N}(0, \rho) ; U_{k} \sim \mathcal{N}\left(0, \lambda_{k c}\right) ; \text { and } S_{k} \sim \mathcal{N}\left(0, \lambda_{k p}\right) \tag{111}
\end{equation*}
$$

where $X_{k}=\sqrt{P_{k}} U+\sqrt{P_{k}} X_{k p}+\sqrt{P_{k}} U_{k}+\sqrt{\lambda_{k e} P_{k}} V$; and $\left(\rho, \lambda_{k p}, \lambda_{k c}, \lambda_{k e}\right) \in[0,1]^{4}$ and $\rho+$ $\lambda_{k p}+\lambda_{k c}+\lambda_{k e} \leq 1$. By symmetry, it suffices to prove 17a, 17b and 17e). The choice of the Gaussian input distribution in Lemma 2 yields:

$$
\begin{align*}
I\left(U, X_{1}, U_{2} ; Y_{1} \mid V\right)= & h\left(Y_{1} \mid V\right)-h\left(Y_{1} \mid U, X_{1}, U_{2}, V\right) \\
= & \frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{1} \mid V\right]\right)-\frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{1} \mid U, X_{1}, U_{2}, V\right]\right) \\
= & \frac{1}{2} \log \left(2 \pi e\left(\sigma_{1}^{2}+\left(1-\lambda_{1 e}\right) P_{1} h_{11}^{2}+\left(1-\lambda_{2 e}\right) P_{2} h_{12}^{2}\right)\right) \\
& -\frac{1}{2} \log \left(2 \pi e\left(\sigma_{1}^{2}+\lambda_{2 p} P_{2} h_{12}^{2}\right)\right) \\
= & \frac{1}{2} \log \left(\frac{1+\left(1-\lambda_{1 e}\right) \mathrm{SNR}_{1}+\left(1-\lambda_{2 e}\right) \mathrm{INR}_{1}+2 \rho \sqrt{\mathrm{SNR}_{1} \mathrm{INR}_{1}}}{1+\lambda_{2 p} \mathrm{INR}_{1}}\right) \tag{112a}
\end{align*}
$$

which proves 17a. With the same power setting in 111, the following holds

$$
\begin{align*}
I\left(U_{1} ; Y_{2} \mid U, X_{2}, V\right) & =h\left(Y_{2} \mid U, X_{2}, V\right)-h\left(Y_{2} \mid U, X_{2}, U_{1}, V\right) \\
& =\frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{2} \mid U, X_{2}, V\right]\right)-\frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{2} \mid U, X_{2}, U_{1}, V\right]\right) \\
& =\frac{1}{2} \log \left(2 \pi e\left(\sigma_{2}^{2}+\left(1-\left(\rho+\lambda_{1 e}\right)\right) P_{1} h_{21}^{2}\right)\right) \\
- & \frac{1}{2} \log \left(2 \pi e\left(\sigma_{2}^{2}+\lambda_{1 p} P_{1} h_{21}^{2}\right)\right) \\
& =\frac{1}{2} \log \left(\frac{1+\left(1-\left(\rho+\lambda_{1 e}\right)\right) \mathrm{INR}_{2}}{1+\lambda_{1 p} \mathrm{INR}_{2}}\right), \text { and }  \tag{112b}\\
I\left(X_{1} ; Y_{1} \mid U, U_{1}, U_{2}, V\right) & =h\left(Y_{1} \mid U, U_{1}, U_{2}, V\right)-h\left(Y_{1} \mid U, U_{1}, U_{2}, X_{1}, V\right) \\
& =\frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{1} \mid U, U_{1}, U_{2}, V\right]\right)-\frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{1} \mid U, U_{1}, U_{2}, X_{1}, V\right]\right), \\
& =\frac{1}{2} \log \left(2 \pi e\left(\sigma_{1}^{2}+\lambda 1 p P_{1} h_{11}^{2}+\lambda_{2 p} P_{2} h_{12}^{2}\right)\right) \\
- & \frac{1}{2} \log \left(2 \pi e\left(\sigma_{1}^{2}+\lambda_{2 p} P_{1} h_{21}^{2}\right)\right) \\
& =\frac{1}{2} \log \left(\frac{1+\lambda_{1 p} \mathrm{SNR}_{1}+\lambda_{2 p} \mathrm{INR}_{1}}{1+\lambda_{2 p} \mathrm{INR}_{1}}\right) . \tag{112c}
\end{align*}
$$

This proves 17 b . Finally, using 112 b and 112 c , yields the proof of 17 e .

## C. 2 Proof of 17 g

The choice of the channel input in guarantee that the random variables $Y_{3,1}, \ldots, Y_{3, n}$ are independently and identically distributed (i.i.d.). For all $n \in\{1,2, \ldots, N\}, Y_{3, n}$ follows a zero-mean Gaussian distribution with variance $\bar{B}$ given by

$$
\begin{align*}
\bar{B} & =E\left[Y_{3, n}^{2}\right] \\
& =E\left[\left(h_{31} X_{1, n}+h_{32} X_{2, n}+Z_{3, n}\right)^{2}\right] \\
& =h_{31}^{2} E\left[X_{1, n}^{2}\right]+h_{32}^{2} E\left[X_{2, n}^{2}\right]+2 h_{31} h_{32} E\left[X_{1, n} X_{2, n}\right]+\sigma_{3}^{2} \\
& =h_{31}^{2} P_{1}+h_{32}^{2} P_{2}+2 h_{31} h_{32} E\left[X_{1, n} X_{2, n}\right]+\sigma_{3}^{2} \\
& \leq h_{31}^{2} P_{1}+h_{32}^{2} P_{2}+2 h_{31} h_{32} \sqrt{P_{1} P_{2}}\left(\rho+\sqrt{\lambda_{1 e} \lambda_{2 e}}\right)+\sigma_{3}^{2}, \tag{113}
\end{align*}
$$

By the weak law of large numbers, it holds that $\forall \epsilon>0$

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \operatorname{Pr}\left[B^{(N)}<\bar{B}-\epsilon\right]=0 \tag{114}
\end{equation*}
$$

From (114), it holds that for any energy B which satisfies $0<B \leq \bar{B}$, it holds that

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \operatorname{Pr}\left[B^{(N)}<B-\epsilon\right]=0 \tag{115}
\end{equation*}
$$

This proves 17 g ) and completes the proof of Theorem 3.

## D Proof of Theorem 4

Fix an information-energy rate triplet $\left(R_{1}, R_{2}, B\right)$ achievable with a given coding scheme (Definition 11. Denote by $\boldsymbol{X}_{1}$ and $\boldsymbol{X}_{2}$ the channel inputs resulting from transmitting the independent messages $\left(W_{1}, \Omega\right)$ and $\left(W_{2}, \Omega\right)$ using such coding scheme. Denote by $\boldsymbol{Y}_{1}$ and $\boldsymbol{Y}_{2}$ the corresponding channel outputs. Define the following random variables:

$$
\begin{align*}
& S_{1}=h_{21} X_{1}+Z_{2} \text { and }  \tag{116}\\
& S_{2}=h_{12} X_{2}+Z_{1}, \tag{117}
\end{align*}
$$

where, $Z_{1}$ and $Z_{2}$ are real Gaussian random variables independent of each other with zero means and variances $\sigma_{1}^{2}$ and $\sigma_{2}^{2}$, respectively. Using assumption 13a and Fano's inequality and following similar steps as in [5], it can be shown that the information rates $R_{1}$ and $R_{2}$ must satisfy the following inequalities

$$
\begin{align*}
N R_{1} & \leq \sum_{n=1}^{N}\left[h\left(Y_{1, n}\right)-h\left(Z_{1, n}\right)\right]+\mathrm{o}(N),  \tag{118a}\\
N R_{1} & \left.\leq \sum_{n=1}^{N}\left[h\left(Y_{2, n}\right) \mid X_{2, n}\right)-h\left(Z_{2, n}\right)+h\left(Y_{1, n} \mid X_{2, n}, S_{1, n}\right)-h\left(Z_{1, n}\right)\right]+\mathrm{o}(N),  \tag{118b}\\
N R_{2} & \leq \sum_{n=1}^{N}\left[h\left(Y_{2, n}\right)-h\left(Z_{2, n}\right)\right]+\mathrm{o}(N),  \tag{118c}\\
N R_{2} & \left.\leq \sum_{n=1}^{N}\left[h\left(Y_{1, n}\right) \mid X_{1, n}\right)-h\left(Z_{1, n}\right)+h\left(Y_{2, n} \mid X_{1, n}, S_{2, n}\right)-h\left(Z_{2, n}\right)\right]+\mathrm{o}(N),  \tag{118d}\\
N\left(R_{1}+R_{2}\right) & \leq \sum_{n=1}^{N}\left[h\left(Y_{1, n} \mid S_{1, n}, X_{2, n}\right)-h\left(Z_{1, n}\right)+h\left(Y_{2, n}\right)-h\left(Z_{2, n}\right)\right]+\mathrm{o}(N),  \tag{118e}\\
N\left(R_{1}+R_{2}\right) & \leq \sum_{n=1}^{N}\left[h\left(Y_{2, n} \mid S_{2, n}, X_{1, n}\right)-h\left(Z_{2, n}\right)+h\left(Y_{1, n}\right)-h\left(Z_{1, n}\right)\right]+\mathrm{o}(N) . \tag{118f}
\end{align*}
$$

Using assumptions 13b, for a given $\epsilon^{(N)}>0$, for any $\eta>0$ there exists $N_{0}(\eta)$ such that for any $n \geq N_{0}(\eta)$ it holds that

$$
\begin{equation*}
\operatorname{Pr}\left(B^{(N)}<B-\epsilon^{(N)}\right)<\eta . \tag{119}
\end{equation*}
$$

Equivalently,

$$
\begin{equation*}
\operatorname{Pr}\left(B^{(N)} \geqslant B-\epsilon^{(N)}\right) \geqslant 1-\eta \tag{120}
\end{equation*}
$$

Using Markov's inequality, the probability in (118) can be upper-bounded as follows:

$$
\begin{equation*}
\left(B-\epsilon^{(N)}\right) \operatorname{Pr}\left(B^{(N)} \geqslant B-\epsilon^{(N)}\right) \leqslant \mathrm{E}\left[B^{(N)}\right] . \tag{121}
\end{equation*}
$$

Combining 118 and 119 yields:

$$
\begin{equation*}
\left(B-\epsilon^{(N)}\right)(1-\eta) \leqslant \mathrm{E}\left[B^{(N)}\right] \tag{122}
\end{equation*}
$$

which can be written as

$$
\begin{equation*}
\left(B-\delta^{(N)}\right) \leqslant \mathrm{E}\left[B^{(N)}\right] \tag{123}
\end{equation*}
$$

for some $\delta^{(N)}>\epsilon^{(N)}$ (for sufficiently large $N$ ). The bounds in 116) and 121) are evaluated assuming that the channel inputs $X_{1, n}$ and $X_{2, n}$ are arbitrary correlated random variables with

$$
\begin{align*}
\mu_{i, n} & \triangleq \mathrm{E}\left[X_{i, n}\right]  \tag{124}\\
\gamma_{i, n}^{2} & \triangleq \operatorname{Var}\left[X_{i, n}\right]  \tag{125}\\
\lambda_{n} & \triangleq \operatorname{Cov}\left[X_{1, n} X_{2, n}\right] \tag{126}
\end{align*}
$$

for $n \in\{1, \ldots, N\}$ and for $i \in\{1,2\}$. The input sequence must satisfy the input power constraint which can be written, for $i \in\{1,2\}$, as follows:

$$
\begin{equation*}
\frac{1}{N} \sum_{n=1}^{N} \mathrm{E}\left[X_{i, n}^{2}\right]=\left(\frac{1}{N} \sum_{n=1}^{N} \gamma_{i, n}^{2}\right)+\left(\frac{1}{N} \sum_{n=1}^{N} \mu_{i, n}^{2}\right) \leqslant P_{i} \tag{127}
\end{equation*}
$$

Using these asumptions, the following holds:

$$
\begin{align*}
h\left(Y_{1, n}\right) & \leqslant \frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{1, n}\right]\right) \\
& =\frac{1}{2} \log \left(2 \pi e\left(h_{11}^{2} \gamma_{1, n}^{2}+h_{12}^{2} \gamma_{2, n}^{2}+2 h_{11} h_{12} \lambda_{n}+\sigma_{1}^{2}\right)\right),  \tag{128a}\\
h\left(Y_{2, n} \mid X_{2, n}\right) & \leqslant \frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{2, n} \mid X_{2, n}\right]\right) \\
& =\frac{1}{2} \log \left(2 \pi e\left(\gamma_{2, n}^{2}+\frac{h_{21}^{2}}{\sigma_{2}^{2}}\left(\gamma_{1, n}^{2} \gamma_{2, n}^{2}-\lambda_{n}^{2}\right)\right)\right)-\frac{1}{2} \log \left(2 \pi e \gamma_{2, n}^{2}\right)+\frac{1}{2} \log \left(2 \pi e \sigma_{2}^{2}\right) \\
& =\frac{1}{2} \log \left(1+\gamma_{1, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{1, n}^{2} \gamma_{2, n}^{2}}\right) \frac{h_{21}^{2}}{\sigma_{2}^{2}}\right)+\frac{1}{2} \log \left(2 \pi e \sigma_{2}^{2}\right),  \tag{128b}\\
h\left(Y_{1, n} \mid X_{2, n}, S_{1, n}\right) & \leqslant \frac{1}{2} \log \left(2 \pi e \operatorname{Var}\left[Y_{1, n} \mid X_{2, n}, S_{1, n}\right]\right) \\
& \leqslant \frac{1}{2} \log \left(1+\frac{\left(\gamma_{1, n}^{2} \gamma_{2, n}^{2}-\lambda_{n}^{2}\right) \frac{h_{11}^{2}}{\sigma_{1}^{2}}}{\gamma_{2, n}^{2}+\left(\gamma_{1, n}^{2} \gamma_{2, n}^{2}-\lambda_{n}^{2}\right) \frac{h_{21}^{2}}{\sigma_{2}^{2}}}\right)+\frac{1}{2} \log \left(2 \pi e \sigma_{1}^{2}\right) \\
& =\frac{1}{2} \log \left(1+\frac{\gamma_{1, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{1, n}^{2} \gamma_{2, n}^{2}}\right) \frac{h_{11}^{2}}{\sigma_{1}^{2}}}{1+\gamma_{1, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{1, n}^{2} \gamma_{2, n}^{2}}\right) \frac{h_{21}^{2}}{\sigma_{2}^{2}}}\right)+\frac{1}{2} \log \left(2 \pi e \sigma_{1}^{2}\right) . \tag{128c}
\end{align*}
$$

Given ( $X_{2, n}, S_{1, n}$ ), the variance of $Y_{1, n}$ is upper-bounded by

$$
\begin{equation*}
\operatorname{Var}\left[Y_{1, n} \mid X_{2, n}, S_{1, n}\right] \leqslant K_{Y_{1, n}}-K_{Y_{1, n}\left(X_{2, n}, S_{1, n}\right)} K_{\left(X_{2, n}, S_{1, n}\right)}^{-1} K_{Y_{1, n}\left(X_{2, n}, S_{1, n}\right)}^{\top} \tag{129}
\end{equation*}
$$

where

$$
\begin{aligned}
K_{Y_{1, n}} & =\sigma_{1, n}^{2} h_{11}^{2}+\sigma_{2, n}^{2} h_{12}^{2}+2 \lambda_{n} h_{11} h_{12}+\sigma_{1}^{2}, \\
K_{Y_{1, n}\left(X_{2, n}, S_{1, n}\right)} & =\left[\lambda_{n} h_{11}+h_{12} \gamma_{2, n}^{2}, h_{21} h_{11} \gamma_{1, n}^{2}+\lambda_{n} h_{21} h_{12}\right], \text { and } \\
K_{\left(X_{2, n}, S_{1, n}\right)} & =\left[\begin{array}{cc}
\gamma_{2, n}^{2} & \lambda_{n} h_{21} \\
\lambda_{n} h_{21} & \gamma_{1, n}^{2} h_{21}^{2}+1
\end{array}\right],
\end{aligned}
$$

Finally, the bounds in 116 can be rewritten as follows:

$$
\begin{align*}
N R_{1} \leqslant & \sum_{n=1}^{N} \frac{1}{2} \log \left(\frac{h_{11}^{2} \gamma_{1, n}^{2}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \gamma_{2, n}^{2}}{\sigma_{1}^{2}}+\frac{2 h_{11} h_{12} \lambda_{n}}{\sigma_{1}^{2}}+1\right)+\mathrm{o}(N),  \tag{130a}\\
N R_{1} \leqslant & \sum_{n=1}^{N} \frac{1}{2} \log \left(1+\gamma_{1, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{1, n}^{2} \gamma_{2, n}^{2}}\right) \frac{h_{21}^{2}}{\sigma_{2}^{2}}\right) \\
& +\sum_{n=1}^{N} \frac{1}{2} \log \left(1+\frac{\gamma_{1, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{1, n}^{2} \gamma_{2, n}^{2}}\right) \frac{h_{11}^{2}}{\sigma_{1}^{2}}}{1+\gamma_{1, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{1, n}^{2} \gamma_{2, n}^{2}}\right) \frac{h_{21}^{2}}{\sigma_{2}^{2}}}\right)+\mathrm{o}(N),  \tag{130b}\\
N R_{2} \leqslant & \sum_{n=1}^{N} \frac{1}{2} \log \left(\frac{h_{22}^{2} \gamma_{2, n}^{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \gamma_{1, n}^{2}}{\sigma_{2}^{2}}+\frac{2 h_{22} h_{21} \lambda_{n}}{\sigma_{2}^{2}}+1\right)+\mathrm{o}(N),  \tag{130c}\\
N R_{2} & \sum_{n=1}^{N} \frac{1}{2} \log \left(1+\gamma_{2, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{1, n}^{2} \gamma_{2, n}^{2}}\right) \frac{h_{21}^{2}}{\sigma_{1}^{2}}\right) \\
& +\sum_{n=1}^{N} \frac{1}{2} \log \left(1+\frac{\gamma_{2, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{1, n}^{2} \gamma_{2, n}^{2}}\right) \frac{h_{22}^{2}}{\sigma_{2}^{2}}}{1+\gamma_{2, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{1, n}^{2} \gamma_{2, n}^{2}}\right) \frac{h_{12}^{2}}{\sigma_{1}^{2}}}\right)+\mathrm{o}(N),  \tag{130d}\\
N\left(R_{1}+R_{2}\right) \leqslant & \sum_{n=1}^{N} \frac{1}{2} \log \left(\frac{h_{22}^{2} \gamma_{2, n}^{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \gamma_{1, n}^{2}}{\sigma_{2}^{2}}+\frac{2 h_{22} h_{21} \lambda_{n}}{\sigma_{2}^{2}}+1\right) \\
& +\sum_{n=1}^{N} \frac{1}{2} \log \left(1+\frac{\gamma_{1, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{1, n}^{2} \gamma_{2, n}^{2}}\right) \frac{h_{11}^{2}}{\sigma_{1}^{2}}}{1+\gamma_{1, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{1, n}^{2} \gamma_{2, n}^{2}}\right) \frac{h_{21}^{2}}{\sigma_{2}^{2}}}\right)+\mathrm{o}(N),  \tag{130e}\\
N\left(R_{1}+R_{2}\right) \leqslant & \sum_{n=1}^{N} \frac{1}{2} \log \left(\frac{h_{11}^{2} \gamma_{1, n}^{2}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \gamma_{2, n}^{2}}{\sigma_{1}^{2}}+\frac{2 h_{11} h_{12} \lambda_{n}}{\sigma_{1}^{2}}+1\right) \\
& +\sum_{n=1}^{N} \frac{1}{2} \log \left(1+\frac{\gamma_{2, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{1, n}^{2} \gamma_{2, n}^{2}}\right) \frac{h_{22}^{2}}{\sigma_{2}^{2}}}{1+\gamma_{2, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{1, n}^{2} \gamma_{2, n}^{2}}\right) \frac{h_{12}^{2}}{\sigma_{1}^{2}}}\right)+\mathrm{o}(N) . \tag{130f}
\end{align*}
$$

The expectation of the average received energy rate is given by

$$
\begin{align*}
\mathrm{E}\left[B^{(N)}\right]= & \mathrm{E}\left[\frac{1}{N} \sum_{n=1}^{N} Y_{3, n}^{2}\right] \\
= & \sigma_{3}^{2}+h_{31}^{2}\left(\frac{1}{N} \sum_{n=1}^{N}\left(\gamma_{1, n}^{2}+\mu_{1, n}^{2}\right)\right)+h_{32}^{2}\left(\frac{1}{N} \sum_{n=N}^{n}\left(\gamma_{2, n}^{2}+\mu_{2, n}^{2}\right)\right) \\
& +2 h_{31} h_{32}\left(\frac{1}{N} \sum_{n=1}^{N}\left(\lambda_{n}+\mu_{1, n} \mu_{2, n}\right)\right) . \tag{131}
\end{align*}
$$

Using Cauchy-Schwarz inequality, the expected value on the energy rate in 129 can be upper-
bounded as follows:

$$
\begin{align*}
\mathrm{E}\left[B^{(N)}\right] \leqslant & \sigma_{3}^{2}+h_{31}^{2}\left(\frac{1}{N} \sum_{n=1}^{N}\left(\gamma_{1, n}^{2}+\mu_{1, n}^{2}\right)\right)+h_{32}^{2}\left(\frac{1}{N} \sum_{n=1}^{N}\left(\gamma_{2, n}^{2}+\mu_{2, n}^{2}\right)\right) \\
& +2 h_{31} h_{32}\left(\left|\frac{1}{N} \sum_{n=1}^{N} \lambda_{n}\right|+\left(\frac{1}{N} \sum_{n=1}^{N} \mu_{1, n}^{2}\right)^{1 / 2}\left(\frac{1}{N} \sum_{n=1}^{N} \mu_{2, n}^{2}\right)^{1 / 2}\right) \tag{132}
\end{align*}
$$

Combining 121 and 130 yields the following upper-bound on the energy rate $B$ :

$$
\begin{align*}
B \leqslant & \sigma_{3}^{2}+h_{31}^{2}\left(\frac{1}{N} \sum_{n=1}^{N}\left(\gamma_{1, n}^{2}+\mu_{1, n}^{2}\right)\right)+h_{32}^{2}\left(\frac{1}{N} \sum_{n=1}^{N}\left(\gamma_{2, n}^{2}+\mu_{2, n}^{2}\right)\right) \\
& +2 h_{31} h_{32}\left(\left|\frac{1}{N} \sum_{n=1}^{N} \lambda_{n}\right|+\left(\frac{1}{N} \sum_{n=1}^{N} \mu_{1, n}^{2}\right)^{1 / 2}\left(\frac{1}{N} \sum_{n=1}^{N} \mu_{2, n}^{2}\right)^{1 / 2}\right)+\delta_{N} \tag{133}
\end{align*}
$$

In order to obtain a single-letterization of the upper-bound given by constraints 128) and 131, define also

$$
\begin{align*}
\mu_{i}^{2} & \triangleq \frac{1}{N} \sum_{n=1}^{N} \mu_{i, n}^{2}, \quad i \in\{1,2\},  \tag{134}\\
\gamma_{i}^{2} & \triangleq \frac{1}{N} \sum_{n=1}^{N} \gamma_{i, n}^{2}, \quad i \in\{1,2\},  \tag{135}\\
\rho & \triangleq \frac{\left(\frac{1}{N} \sum_{n=1}^{N} \lambda_{n}\right)}{\left|\gamma_{1}\right|\left|\gamma_{2}\right|} \tag{136}
\end{align*}
$$

With these notations, the input power constraint in 125 can be rewritten as

$$
\begin{equation*}
\gamma_{i}^{2}+\mu_{i}^{2} \leqslant P_{i}, \quad i \in\{1,2\} . \tag{137}
\end{equation*}
$$

## Lemma 3

$$
\begin{equation*}
\frac{1}{N} \sum_{n=1}^{N} \frac{1}{2} \log \left(1+\frac{\gamma_{i, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{i, n}^{2} \gamma_{j, n}^{2}}\right) \frac{h_{i i}^{2}}{\sigma_{i}^{2}}}{1+\gamma_{i, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{i, n}^{2} \gamma_{j, n}^{2}}\right) \frac{h_{j i}^{2}}{\sigma_{j}^{2}}}\right) \leqslant \frac{1}{2} \log \left(1+\frac{\gamma_{i}^{2}\left(1-\rho^{2}\right) \frac{h_{i i}^{2}}{\sigma_{i}^{2}}}{1+\gamma_{i}^{2}\left(1-\rho^{2}\right) \frac{h_{j i}^{2}}{\sigma_{j}^{2}}}\right) \tag{138}
\end{equation*}
$$

Proof: Using the fact that $H_{\alpha, \beta}(x)=\log \left(1+\frac{\alpha x}{1+\beta x}\right)$ is a concave function on $x$ with
positive $\alpha$ and $\beta$, it follows that

$$
\begin{align*}
\frac{1}{N} \sum_{n=1}^{N} & \frac{1}{2} \log \left(1+\frac{\gamma_{i, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{i, n}^{2} \gamma_{j, n}^{2}}\right) \frac{h_{i i}^{2}}{\sigma_{i}^{2}}}{1+\gamma_{i, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{i, n}^{2} \gamma_{j, n}^{2}}\right) \frac{h_{j i}^{2}}{\sigma_{j}^{2}}}\right) \\
& \leqslant \frac{1}{2} \log \left(1+\frac{\frac{1}{N} \sum_{n=1}^{N} \gamma_{i, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{i, n}^{2} \gamma_{j, n}^{2}}\right) \frac{h_{i i}^{2}}{\sigma_{i}^{2}}}{1+\frac{1}{N} \sum_{n=1}^{N} \gamma_{i, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{i, n}^{2} \gamma_{j, n}^{2}}\right) \frac{h_{j i}^{2}}{\sigma_{j}^{2}}}\right) \\
& \stackrel{(a)}{\leqslant} \frac{1}{2} \log \left(1+\frac{\frac{1}{N} \sum_{n=1}^{N} \gamma_{i, n}^{2}\left(1-\frac{\left(\frac{1}{N} \sum_{n=1}^{N} \lambda_{n}\right)^{2}}{\frac{1}{N} \sum_{n=1}^{N} \gamma_{i, n}^{2} \frac{1}{N} \sum_{n=1}^{N} \gamma_{j, n}^{2}}\right) \frac{h_{i i}^{2}}{\sigma_{i}^{2}}}{1+\frac{1}{N} \sum_{n=1}^{N} \gamma_{i, n}^{2}\left(1-\frac{\left(\frac{1}{N} \sum_{n=1}^{N} \lambda_{n}\right)^{2}}{\frac{1}{N} \sum_{n=1}^{N} \gamma_{i, n}^{2} \frac{1}{N} \sum_{n=1}^{N} \gamma_{j, n}^{2}}\right) \frac{h_{j i}^{2}}{\sigma_{j}^{2}}}\right) \\
& =\frac{1}{2} \log \left(1+\frac{\gamma_{i}^{2}\left(1-\rho^{2}\right) \frac{h_{i i}^{2}}{\sigma_{i}^{2}}}{1+\gamma_{i}^{2}\left(1-\rho^{2}\right) \frac{h_{j i}^{2}}{\sigma_{j}^{2}}}\right) \tag{139}
\end{align*}
$$

where (a) follows from the fact that $G\left(\gamma_{i, n}^{2}, \gamma_{j, n}^{2}, \lambda_{n}\right)=\sigma_{i, n}^{2}\left(1-\frac{\lambda_{n}^{2}}{\gamma_{i, n}^{2} \gamma_{j, n}^{2}}\right)$ is a concave function on $\gamma_{i, n}^{2}, \gamma_{j, n}^{2}$ and $\lambda_{n}$; and $K_{\alpha, \beta}(x)=\frac{\alpha x}{1+\beta x}$ is an increasing function on $x$.
By the concavity of the mutual information, applying Jensen's inequality and Lemma 3 in the bounds 128 yields, in the limit when $N \rightarrow \infty$,

$$
\begin{align*}
R_{1} & \leqslant \frac{1}{2} \log \left(\frac{h_{11}^{2} \gamma_{1}^{2}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \gamma_{2}^{2}}{\sigma_{1}^{2}}+2 \rho \sqrt{\frac{h_{11}^{2} h_{12}^{2} \gamma_{1}^{2} \gamma_{2}^{2}}{\sigma_{1}^{4}}}\right),  \tag{140a}\\
R_{1} & \leqslant \frac{1}{2} \log \left(1+\frac{h_{21}^{2}}{\sigma_{2}^{2}} \gamma_{1}^{2}\left(1-\rho^{2}\right)\right)+\frac{1}{2} \log \left(1+\frac{\gamma_{1}^{2}\left(1-\rho^{2}\right) \frac{h_{11}^{2}}{\sigma_{1}^{2}}}{1+\gamma_{1}^{2}\left(1-\rho^{2}\right) \frac{h_{21}^{2}}{\sigma_{2}^{2}}}\right),  \tag{140b}\\
R_{2} & \leqslant \frac{1}{2} \log \left(\frac{h_{22}^{2} \gamma_{2}^{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \sigma_{1}^{2}}{\sigma_{2}^{2}}+2 \rho \sqrt{\frac{h_{22} h_{21} \gamma_{1}^{2} \gamma_{2}^{2}}{\sigma_{2}^{4}}}\right),  \tag{140c}\\
R_{2} & \leqslant \frac{1}{2} \log \left(1+\frac{h_{12}^{2}}{\sigma_{1}^{2}} \gamma_{2}^{2}\left(1-\rho^{2}\right)\right)+\frac{1}{2} \log \left(1+\frac{\gamma_{2}^{2}\left(1-\rho^{2}\right) \frac{h_{22}^{2}}{\sigma_{2}^{2}}}{1+\gamma_{2}^{2}\left(1-\rho^{2}\right) \frac{h_{12}^{2}}{\sigma_{1}^{2}}}\right),  \tag{140d}\\
R_{1}+R_{2} & \leqslant \frac{1}{2} \log \left(\frac{h_{22}^{2} \gamma_{2}^{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \gamma_{1}^{2}}{\sigma_{2}^{2}}+2 \rho \sqrt{\frac{h_{22}^{2} h_{21}^{2} \gamma_{1}^{2} \gamma_{2}^{2}}{\sigma_{2}^{4}}}\right)+\frac{1}{2} \log \left(1+\frac{\gamma_{1}^{2}\left(1-\rho^{2}\right) \frac{h_{11}^{2}}{\sigma_{1}^{2}}}{1+\gamma_{1}^{2}\left(1-\rho^{2}\right) \frac{h_{21}^{2}}{\sigma_{2}^{2}}}\right),  \tag{140e}\\
R_{1}+R_{2} & \leqslant \frac{1}{2} \log \left(\frac{h_{11}^{2} \gamma_{1}^{2}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \gamma_{2}^{2}}{\sigma_{1}^{2}}+2 \rho \sqrt{\frac{h_{11}^{2} h_{12}^{2} \gamma_{1}^{2} \gamma_{2}^{2}}{\sigma_{1}^{4}}}\right)+\frac{1}{2} \log \left(1+\frac{\gamma_{2}^{2}\left(1-\rho^{2}\right) \frac{h_{22}^{2}}{\sigma_{2}^{2}}}{1+\gamma_{2}^{2}\left(1-\rho^{2}\right) \frac{h_{12}^{2}}{\sigma_{1}^{2}}}\right), \tag{140f}
\end{align*}
$$

and the upper-bound on the energy rate $\sqrt[74]{ }$ :

$$
\begin{equation*}
B \leqslant \sigma_{3}^{2}+h_{31}^{2}\left(\gamma_{1}^{2}+\mu_{1}^{2}\right)+h_{32}^{2}\left(\gamma_{2}^{2}+\mu_{2}^{2}\right)+2 h_{21} h_{22}\left(|\rho|\left|\gamma_{1}\right|\left|\gamma_{2}\right|+\left|\mu_{1}\right|\left|\mu_{2}\right|\right) . \tag{140g}
\end{equation*}
$$

To sum up, it has been shown so far that, in the limit when $N$ tends to infinity, any informationenergy rate triplet $\left(R_{1}, R_{2}, B\right) \in \mathcal{E}_{b}^{\mathrm{FB}}$ can be bounded by the constraints in 138) for some $\gamma_{1}^{2}$,
$\gamma_{2}^{2}, \mu_{1}, \mu_{2}$ satisfying 135 and for some $\rho \in[-1,1]$. Let $\mathcal{R}_{b}^{\mathrm{FB}}\left(\gamma_{1}, \gamma_{2}, \mu_{1}, \mu_{2}, \rho\right)$ denote the set of information-energy rate triplets satisfying (138), for some $\gamma_{1}, \gamma_{2}, \mu_{1}, \mu_{2}$ such that 135) is true and for some $\rho \in[-1,1]$. Thus, it holds that

$$
\begin{equation*}
\mathcal{E}_{b}^{\mathrm{FB}} \subseteq \bigcup_{\substack{0 \leqslant \gamma_{1}^{2}+\mu_{1}^{2} \leqslant P_{1} \\ 0 \leqslant \gamma_{2}^{2}+\mu_{2}^{2} \leqslant P_{2} \\-1 \leqslant \rho \leqslant 1}} \mathcal{R}_{b}^{\mathrm{FB}}\left(\gamma_{1}^{2}, \gamma_{2}^{2}, \mu_{1}, \mu_{2}, \rho\right) \tag{141}
\end{equation*}
$$

In this union, it suffices to consider $0 \leqslant \rho \leqslant 1$ because for any $-1 \leqslant \rho \leqslant 1, \mathcal{R}_{b}^{\mathrm{FB}}\left(\gamma_{1}^{2}, \gamma_{2}^{2}, \mu_{1}^{2}, \mu_{2}^{2}, \rho\right)$ $\subseteq \mathcal{R}_{b}^{\mathrm{FB}}\left(\gamma_{1}^{2}, \gamma_{2}^{2}, \mu_{1}^{2}, \mu_{2}^{2},|\rho|\right)$. Thus,

$$
\mathcal{E}_{b}^{\mathrm{FB}} \subseteq \bigcup_{\substack{0 \leqslant \gamma_{1}^{2}+\mu_{1}^{2} \leqslant P_{1} \\ 0 \leqslant \gamma_{2}^{2}+\mu_{2} \leqslant P_{2} \\-1 \leqslant \rho \leqslant 1}} \mathcal{R}_{b}^{\mathrm{FB}}\left(\gamma_{1}^{2}, \gamma_{2}^{2}, \mu_{1}, \mu_{2}, \rho\right) \subseteq \bigcup_{\substack{\gamma_{1}^{2}+\mu_{1}^{2}=P_{1} \\ \gamma_{2}^{2}+\mu_{2}^{2}=P_{2} \\ 0 \leqslant \rho \leqslant 1}} \mathcal{R}_{b}^{\mathrm{FB}}\left(\gamma_{1}^{2}, \gamma_{2}^{2}, \mu_{1}, \mu_{2}, \rho\right) .
$$

Let $\beta_{i} \in[0,1]$ be defined as follows:

$$
\begin{equation*}
\beta_{i} \triangleq \frac{\gamma_{i}^{2}}{P_{i}}=\frac{P_{i}-\mu_{i}^{2}}{P_{i}}, \quad i \in\{1,2\} . \tag{142}
\end{equation*}
$$

Using (140), any region $\mathcal{R}_{b}\left(\gamma_{1}, \gamma_{2}, \mu_{1}, \mu_{2}, \rho\right)$ in the union over all $\left(\mu_{1}, \mu_{2}, \gamma_{1}, \gamma_{2}\right)$ that satisfy $\gamma_{1}^{2}+\mu_{1}^{2}=P_{1}, \gamma_{2}^{2}+\mu_{2}^{2}=P_{2}$ and $0 \leqslant \rho \leqslant 1$, can be rewritten as follows:

$$
\begin{align*}
& R_{1} \leqslant \frac{1}{2} \log \left(\frac{h_{11}^{2} \beta_{1} P_{1}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \beta_{2} P_{2}}{\sigma_{1}^{2}}+2 \rho \sqrt{\frac{h_{11}^{2} h_{12}^{2} \beta_{1} \beta_{2} P_{1} P_{2}}{\sigma_{1}^{4}}}\right),  \tag{143a}\\
& R_{1} \leqslant \frac{1}{2} \log \left(1+\frac{h_{21}^{2}}{\sigma_{2}^{2}} \beta_{1} P_{1}\left(1-\rho^{2}\right)\right)+\frac{1}{2} \log \left(1+\frac{\beta_{1} P_{1}\left(1-\rho^{2}\right) \frac{h_{11}^{2}}{\sigma_{1}^{2}}}{1+\beta_{1} P_{1}\left(1-\rho^{2}\right) \frac{h_{21}^{2}}{\sigma_{2}^{2}}}\right),  \tag{143b}\\
& R_{2} \leqslant \frac{1}{2} \log \left(\frac{h_{22}^{2} \beta_{2} P_{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \beta_{1} P_{1}}{\sigma_{2}^{2}}+2 \rho \sqrt{\frac{h_{22} h_{21} \beta_{1} \beta_{2} P_{1} P_{2}}{\sigma_{2}^{4}}}\right),  \tag{143c}\\
& R_{2} \leqslant \frac{1}{2} \log \left(1+\frac{h_{12}^{2}}{\sigma_{1}^{2}} \beta_{2} P_{2}\left(1-\rho^{2}\right)\right)+\frac{1}{2} \log \left(1+\frac{\beta_{2} P_{2}\left(1-\rho^{2}\right) \frac{h_{22}^{2}}{\sigma_{2}^{2}}}{1+\beta_{2} P_{2}\left(1-\rho^{2}\right) \frac{h_{12}^{2}}{\sigma_{1}^{2}}}\right),  \tag{143d}\\
& R_{1}+R_{2} \leqslant \frac{1}{2} \log \left(\frac{h_{22}^{2} \beta_{2} P_{2}}{\sigma_{2}^{2}}+\frac{h_{21}^{2} \beta_{1} P_{1}}{\sigma_{2}^{2}}+2 \rho \sqrt{\frac{h_{22}^{2} h_{21}^{2} \beta_{1} \beta_{2} P_{1} P_{2}}{\sigma_{2}^{4}}}\right) \\
&+\frac{1}{2} \log \left(1+\frac{\beta_{1} P_{1}\left(1-\rho^{2}\right) \frac{h_{11}^{2}}{\sigma_{1}^{2}}}{1+\beta_{1} P_{1}\left(1-\rho^{2}\right) \frac{h_{21}^{2}}{\sigma_{2}^{2}}}\right),  \tag{143e}\\
& R_{1}+R_{2} \leqslant \frac{1}{2} \log \left(\frac{h_{11}^{2} \beta_{1} P_{1}}{\sigma_{1}^{2}}+\frac{h_{12}^{2} \beta_{2} P_{2}}{\sigma_{1}^{2}}+2 \rho \sqrt{\frac{h_{11}^{2} h_{12}^{2} \beta_{1} \beta_{2} P_{1} P_{2}}{\sigma_{1}^{4}}}\right) \\
&+\frac{1}{2} \log \left(1+\frac{\beta_{2} P_{2}\left(1-\rho^{2}\right) \frac{h_{22}^{2}}{\sigma_{2}^{2}}}{1+\beta_{2} P_{2}\left(1-\rho^{2}\right) \frac{h_{12}^{2}}{\sigma_{1}^{2}}}\right),  \tag{143f}\\
& B \geqslant \sigma_{3}^{2}+h_{31}^{2} P_{1}+h_{32}^{2} P_{2}+2 h_{31} h_{32}\left(|\rho| \sqrt{\left.\beta_{1} P_{1} \beta_{2} P_{2}+\sqrt{\left(1-\beta_{1}\right)\left(1-\beta_{2}\right) P_{1} P_{2}}\right),}\right.  \tag{143~g}\\
& B \geqslant \tag{143h}
\end{align*}
$$

$R R n^{\circ} 9102$
for some $\left(\beta_{1}, \beta_{2}\right) \in[0,1]^{2}$ and $\rho \in[0,1]$. Hence, using the definitions in (7) and 10 , the region (141) contains all information-energy rate triplets $\left(R_{1}, R_{2}, B\right)$ satisfying constraints (18), which completes the proof of Theorem 4.
