HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Context

CLIM4ENERGY project, as part of Copernicus Climate Change Service (C3S), aims to provide climate products tailored for the energy sector. The European electric power system is very sensitive to temperatures. The increase of intermittent renewable energies in the energy mix introduces an additional vulnerability to weather conditions.

The contribution of intermittent renewable energies is analysed through wind and solar capacity factors built using meteorological fields (wind speed, radiation and temperature). Analysis at different time scales is necessary to help energy practitioners to take short and long term decisions.

Objectives

Design indicators tailored to the energy sector based on meteorological fields to anticipate the risk of imbalance.

Climate Change Analysis

Source : Eurocordex Climate projection datasets (>10 models)

Consistency: change is robust if 80 % of the models find the same tendency of change.

Significativity: A statistical test is performed for each model. Change is significative if 80 % of the models find a significative change.

Dispersion analysis: enables evaluation of the weight of the interperiod dispersion (representative of climate change effect) compared to the inter-annual dispersion and to the model dispersion

mean of the reference period for model m anomaly of model mattime t for period p

 $a_{m,p,t}$

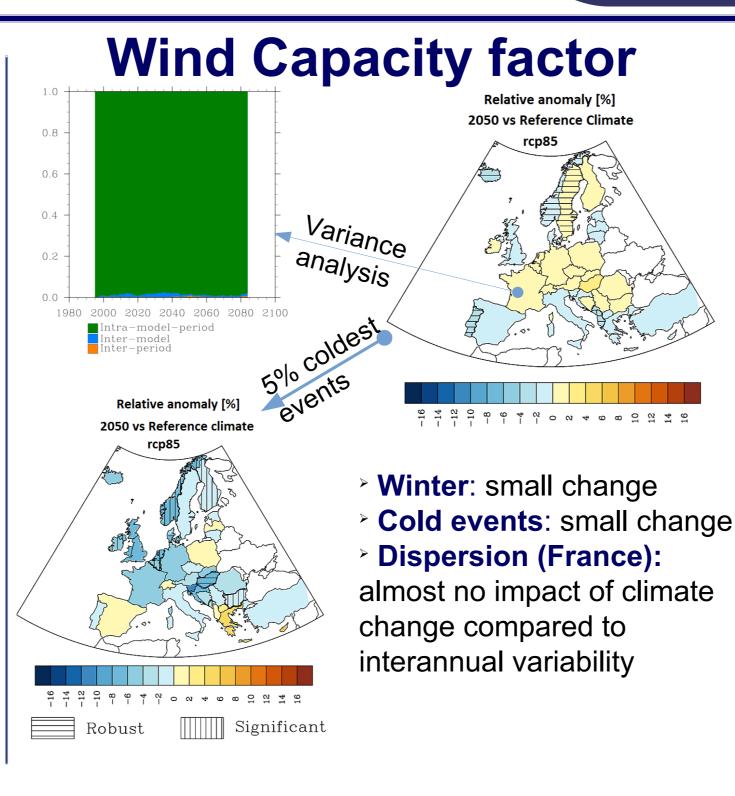

Provide coherent data as well as analysis to energy practitioners at different time scales.

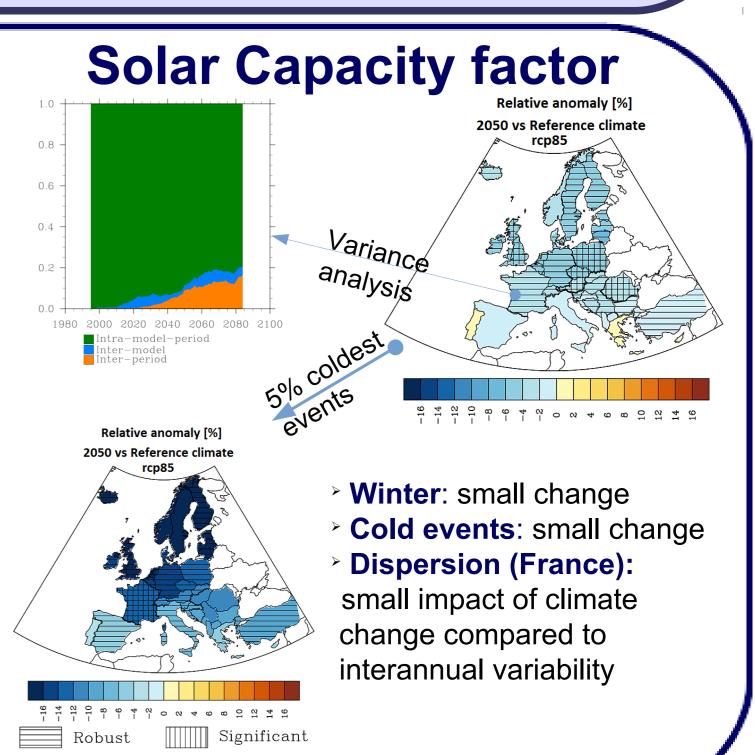

$\sum_{m,p,t} (a_{p,m,t} - \overline{a})^2 = \sum_{\substack{m,p,t \ inter-annual dispersion}} (a_{p,m,t} - \overline{a_{p,m}})^2 + \sum_{\substack{m,p,t \ model dispersion}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2 + \sum_{\substack{m,p,t \ climate change effect}} (\overline{a_{p,m}} - \overline{a_{p}})^2$

 $\overline{X}_{m,ref}$

 $x_{m,p,t} =$

Indicators

Wind capacity factors: based on three power curves representative of three wind turbine generator classes (IEC classes) and 10m-wind speed. 10m-wind speed is extrapolated at hub height.

Solar capacity factors: based on performance ratio (see Jerez et. Al 2015).

Data availability

First data version will soon be available online http://clim4energy.climate.copernicus.eu/

Reanalysis 1981-2010	Seasonal Forecast	Climate Projection	Spatial resolution
	1991-2014	1971-2100	

Solar radiation, as well as other meteorological fields (wind, temperature) can be used to define different indicators.

Heating Degree Day weighted by population: based on thresholded 15°C deviation for temperature weighted by population (Eurostat)

 $HDD = \begin{vmatrix} 15 - T & \text{if } T < 15 \,^{\circ}c \\ 0 & \text{otherwise} \end{vmatrix}$

Electricity consumption: Based on a linear model using Heating degree day weighted by population adapted for each country.

Demand (2 indicators)	WFDEI Daily	ARPEGE-S5 DJF	11 climate models 2 scenarios, Daily	
Wind capacity factor (3 ind.)	WFDEI 3 hrs	ARPEGE-S5 DJF	11 climate models 2 scenarios, 3 hrs	
Solar capacity factor (3 ind.)	WFDEI 3hrs	ARPEGE-S5 DJF	11 climate models 2 scenarios, 3 hrs
