

How plant food bioactives may have benefits for maintaining vascular health in ageing?

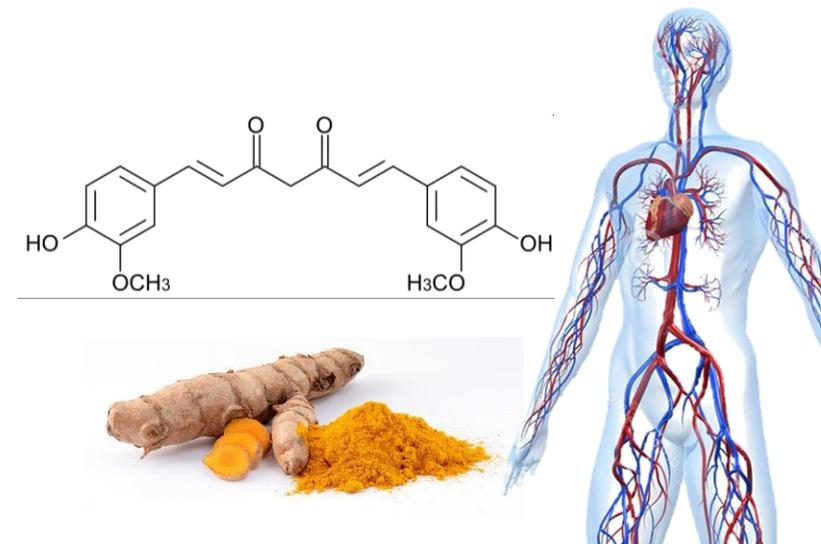

The case of curcumin

Vascular Ageing, related diseases & diet

Adapted from Merz et al. Heart 2016

Vessel remodeling

Cellular changes

- ↑ Oxidative stress
- ↑ Inflammation
- Impaired autophagy
- ↑ senescence
- ↑ EVs secretion

Endothelial function

- Shift to dysfunction:
- Pro-adhesive
 - Pro-coagulant
 - ↑ Inflammation
 - Impaired autophagy

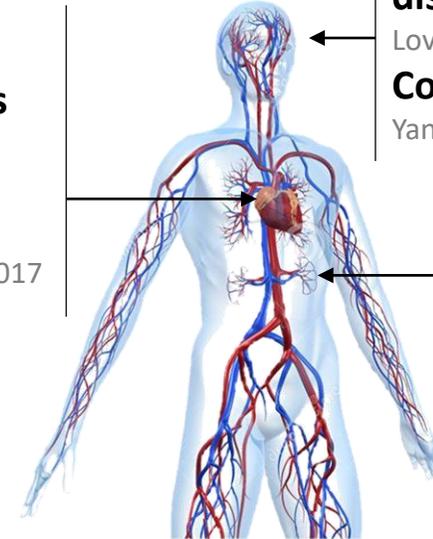

Donato et al. J Mol Cel Card 2015

Vascular ageing:

Cardiovascular diseases

Hypertension, PAD, CAD, Atherosclerosis

Costantino et al J Physiol 2016
 Paneni et al J Am Coll Cardiol 2017

Microvascular ageing:

Neurodegenerative diseases

 Pistollato et al. Trends Food Sci & Technol 2014
 Cicero et al. Food Func 2017

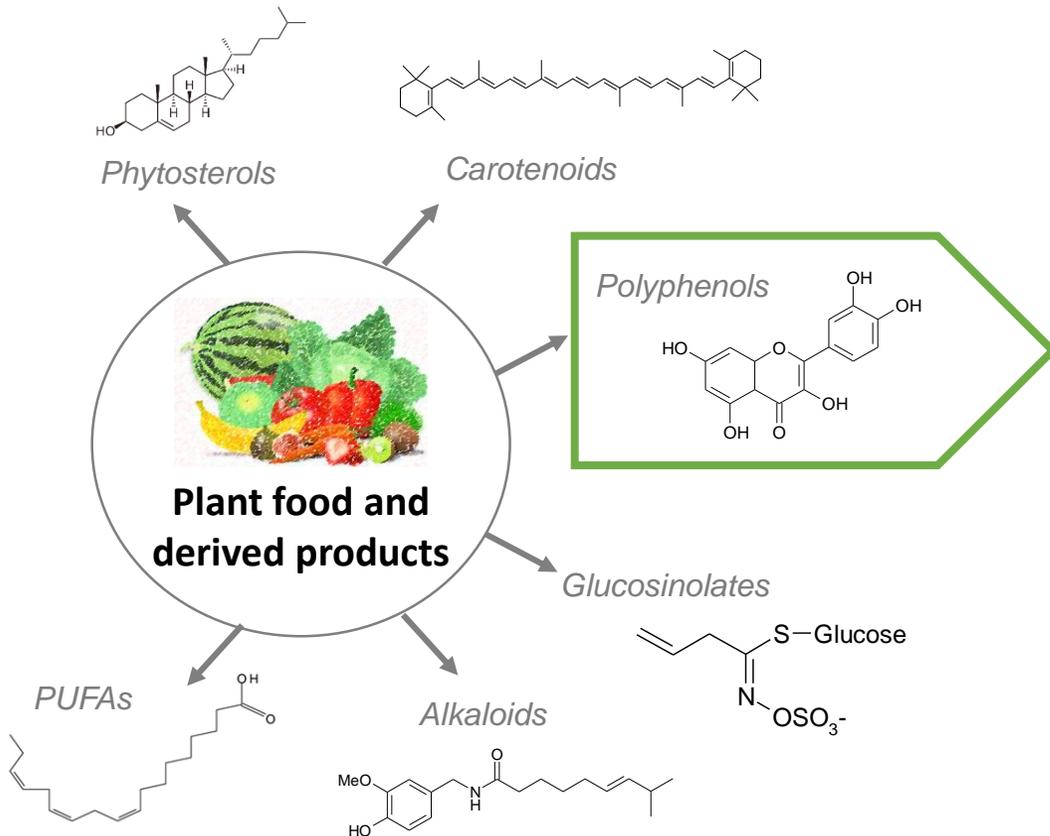

Clinical findings

→ Diet represents a crucial factor for the prevention of chronic degenerative diseases

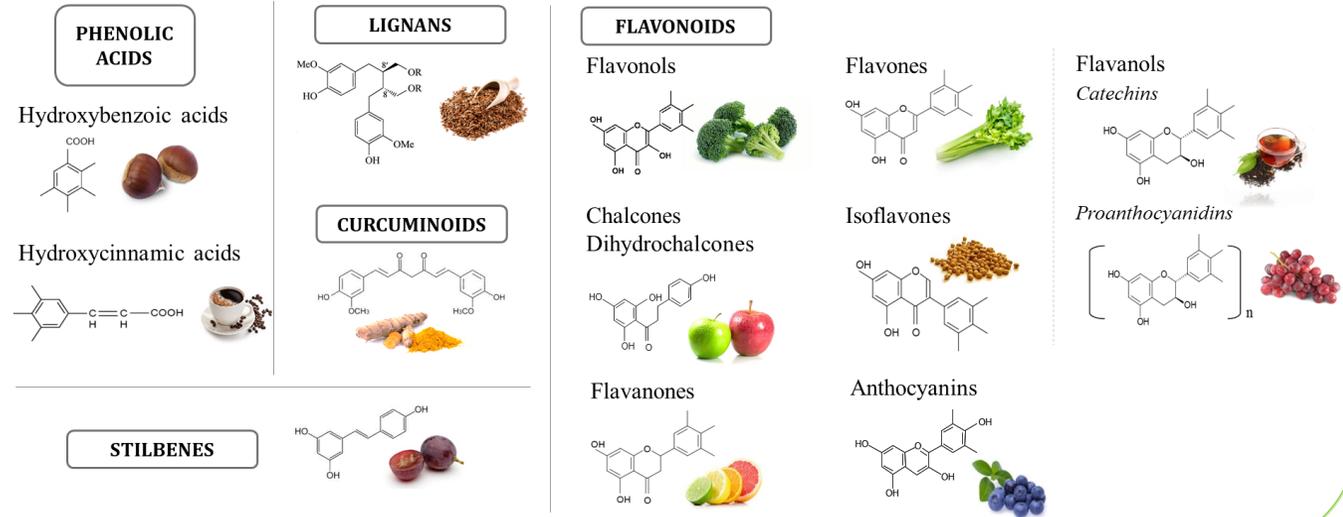

Plant Food: a source of Bioactive Compounds

- Major part of our diet
- **Most protective diet** (Katz & Miller, 2014)
- Exclusive source of a large range of **bioactive compounds**:

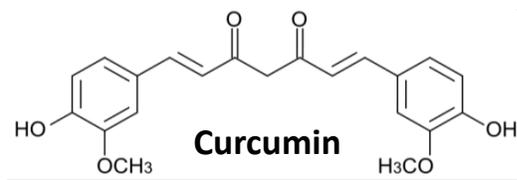

- Secondary metabolites of plants involved in stress response
- Not toxic for human when consumed at dietary doses
- Confer organoleptic properties to plant foods (Color, Bitterness, Astringency, Odor)
- Most abundant dietary antioxidants (1.2g/day)

Pérez-Jiménez J et al. AJCN 2011

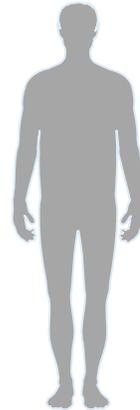

Curcumin and Health

- Polyphenol abundant in the spice turmeric
- Safe and well tolerated even at high doses (up to 8 g/day)
- Used extensively in Ayurvedic medicine for centuries
- Exhibit in vivo pleiotropic biological activities:

Turmeric (*Curcuma longa*)

Antioxidant activity

Anticancer potential

Neuro-protective effect

Anti-inflammation activity

Anti thrombotic properties

Cardioprotection activity

➔ **Potential interest for prevention and treatment of chronic diseases**

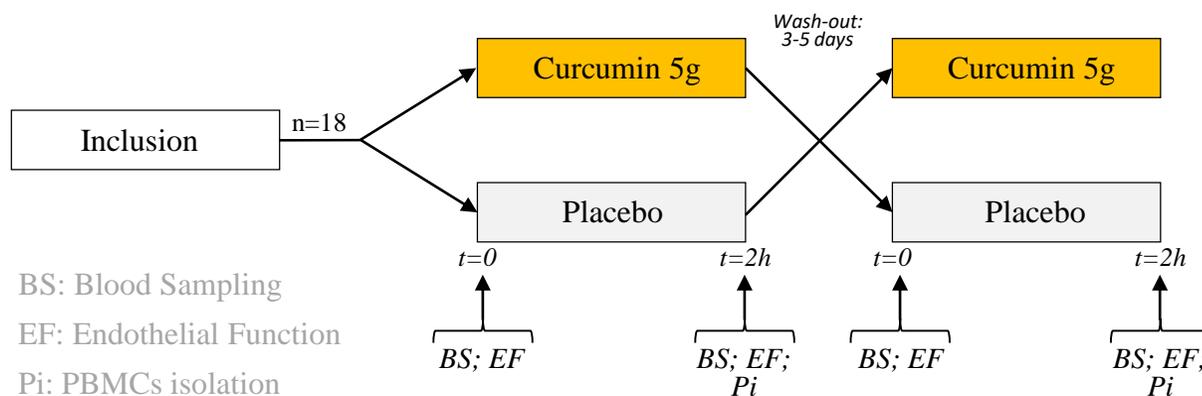

Vascular effect of an acute intake of curcumin

- **Randomized, double-blind, placebo controlled, cross-over study**
- **18 volunteers** (9♀/9♂), aged 50-70 years, healthy without any medication, smokers^{1,2}

¹Impaired endothelial function in chronic smokers (Zeiber et al, Circulation, 1995)

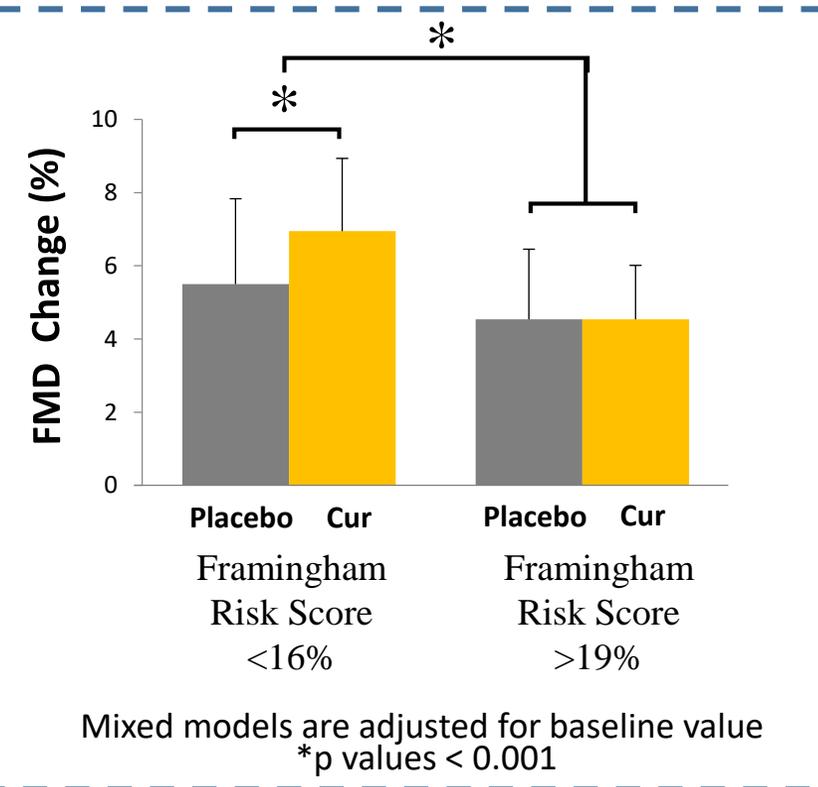

²Good model for studying vasoactive properties of food bioactives (Del Bo et al, 2014)

➤ Primary Objective :

Evaluate the ability of curcumin to acutely reverse endothelial dysfunction

Population stratification in subgroup according the Framingham Risk Score that estimates the 10-year cardiovascular risk of an individual.

Acute intake of curcumin improves endothelial function (+1.4% on FMD) ONLY in low risk CVD subjects

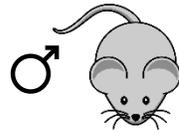

Curcumin reduces atherosclerosis onset in mice

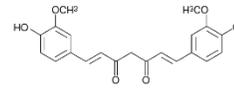

Coban et al.
MNFR 2012

Atherosclerotic model:

ApoE^{-/-} Mice
8 week-old

±

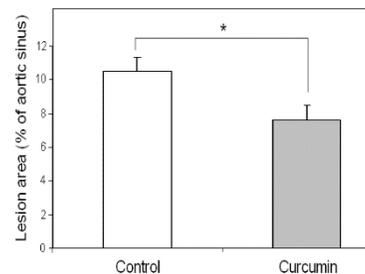

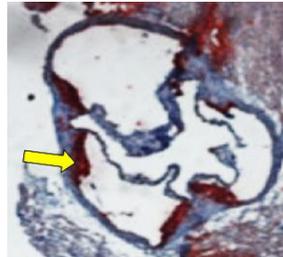

0.2% Curcumin
for 16 weeks

Atherosclerotic lesion (aortic sinus)

Control

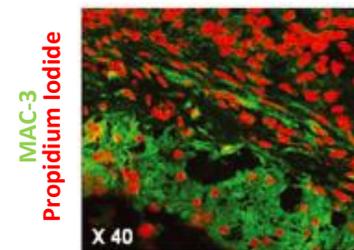

Curcumin

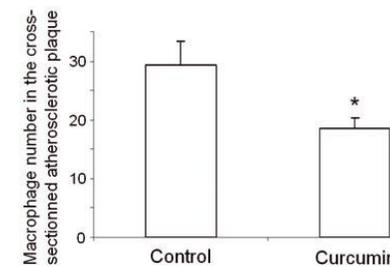

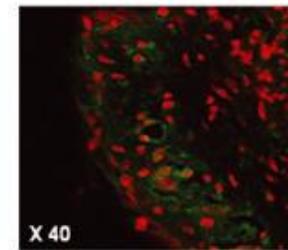

Macrophages within the lesion

Control

Curcumin

Curcumin intake reduces atherosclerotic lesion development and recruitment of immune cells

Vascular protective effects of curcumin

What are the underlying mechanisms of action of curcumin on vascular endothelial cells ?

In vitro studies Endothelial cells

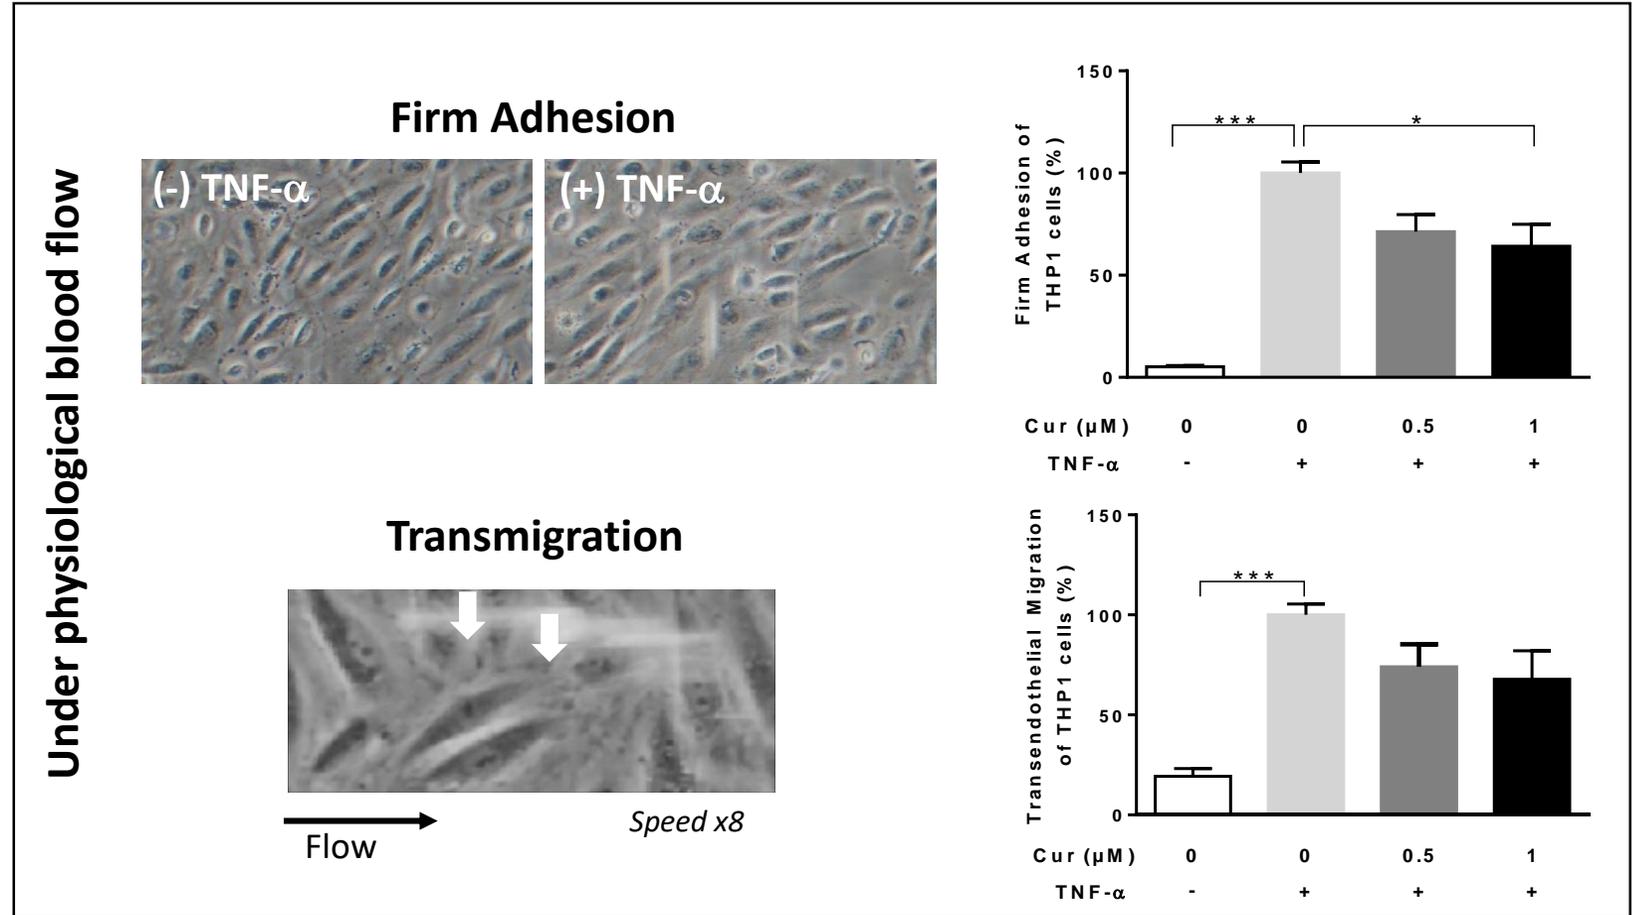

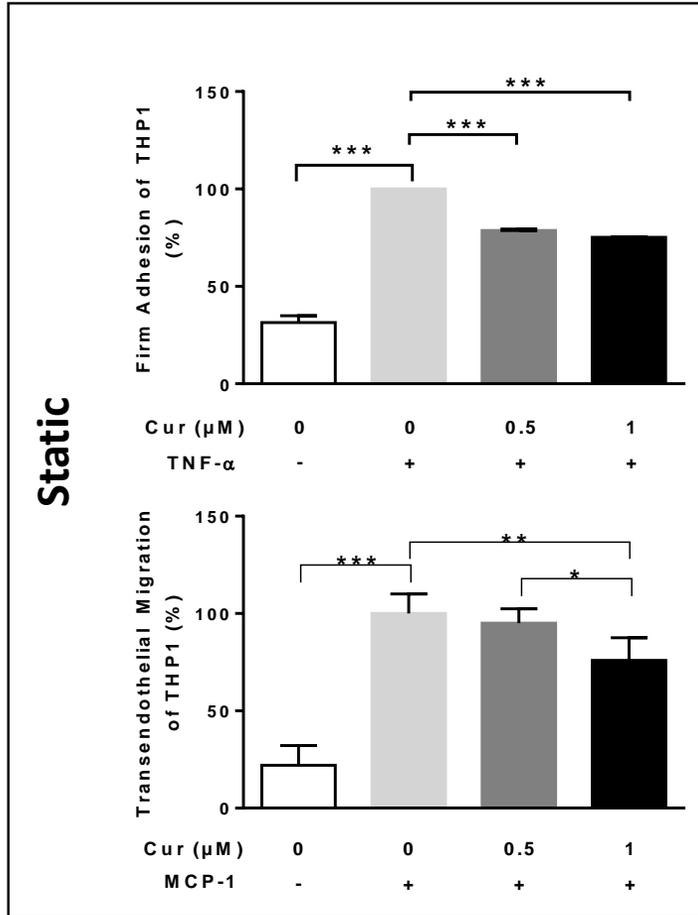

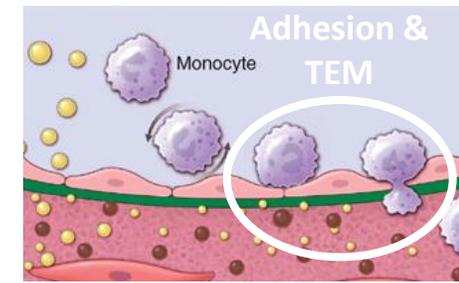

Endothelial functions:

- Barrier: Permeability assay (a)
- Chemotactism (b)
- Adhesion assay (c)
- TEM assay (d)

Mechanistic exploration

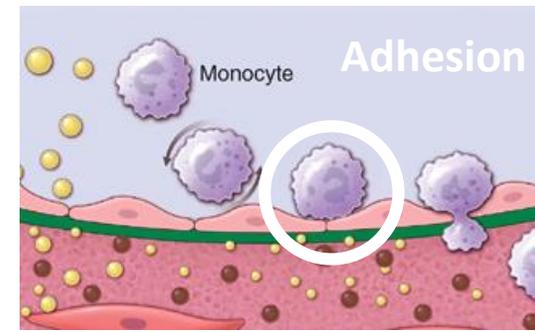

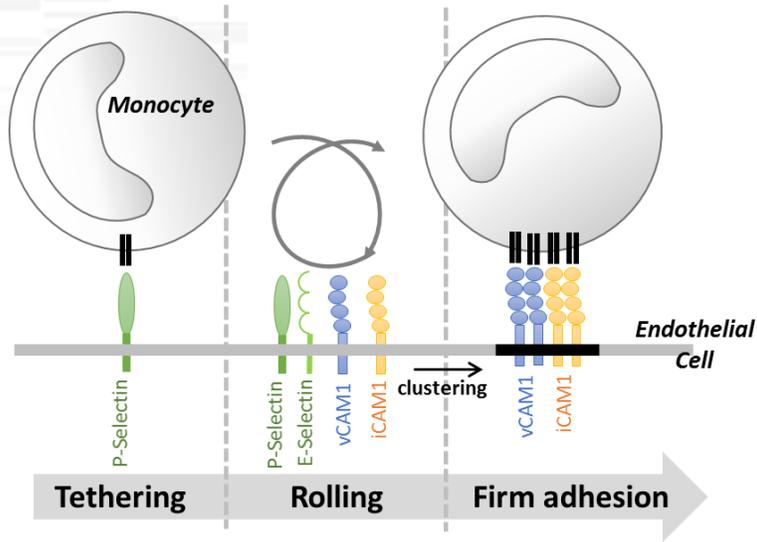

Monfoulet et al. *FRBM* 2017 Nov;112:109-120. Curcumin modulates vascular endothelial permeability and monocyte TEM by affecting endothelial cells dynamics

Effect of curcumin on the adhesive property of endothelial cells

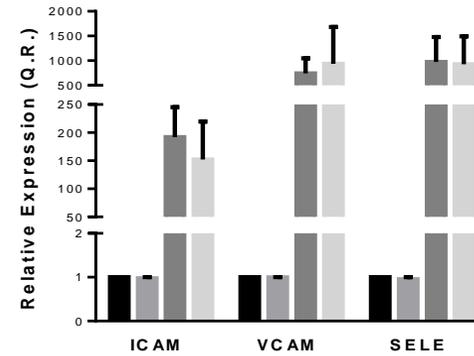

Pre-exposure of endothelial cells to curcumin reduces the adhesion and TEM of monocyte to TNF-activated HUVECs both in static and under vasculo-protective shear-stress

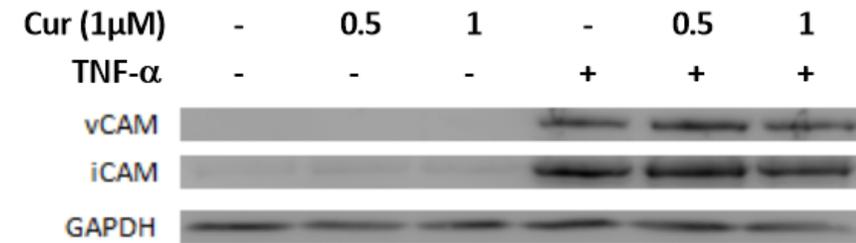

Underlying mechanism of action?

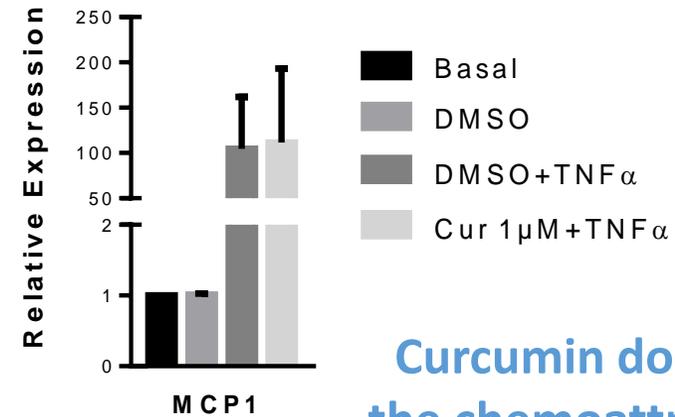

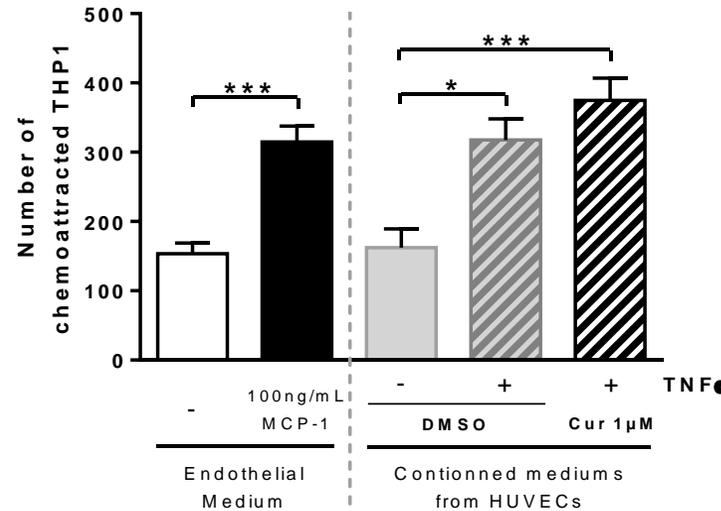

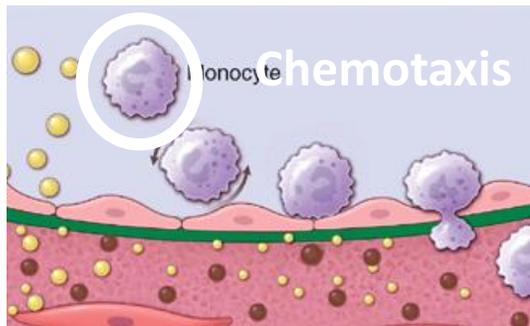

mRNA level

Proteic level

Curcumin does not prevent the induced expression of adhesion molecules

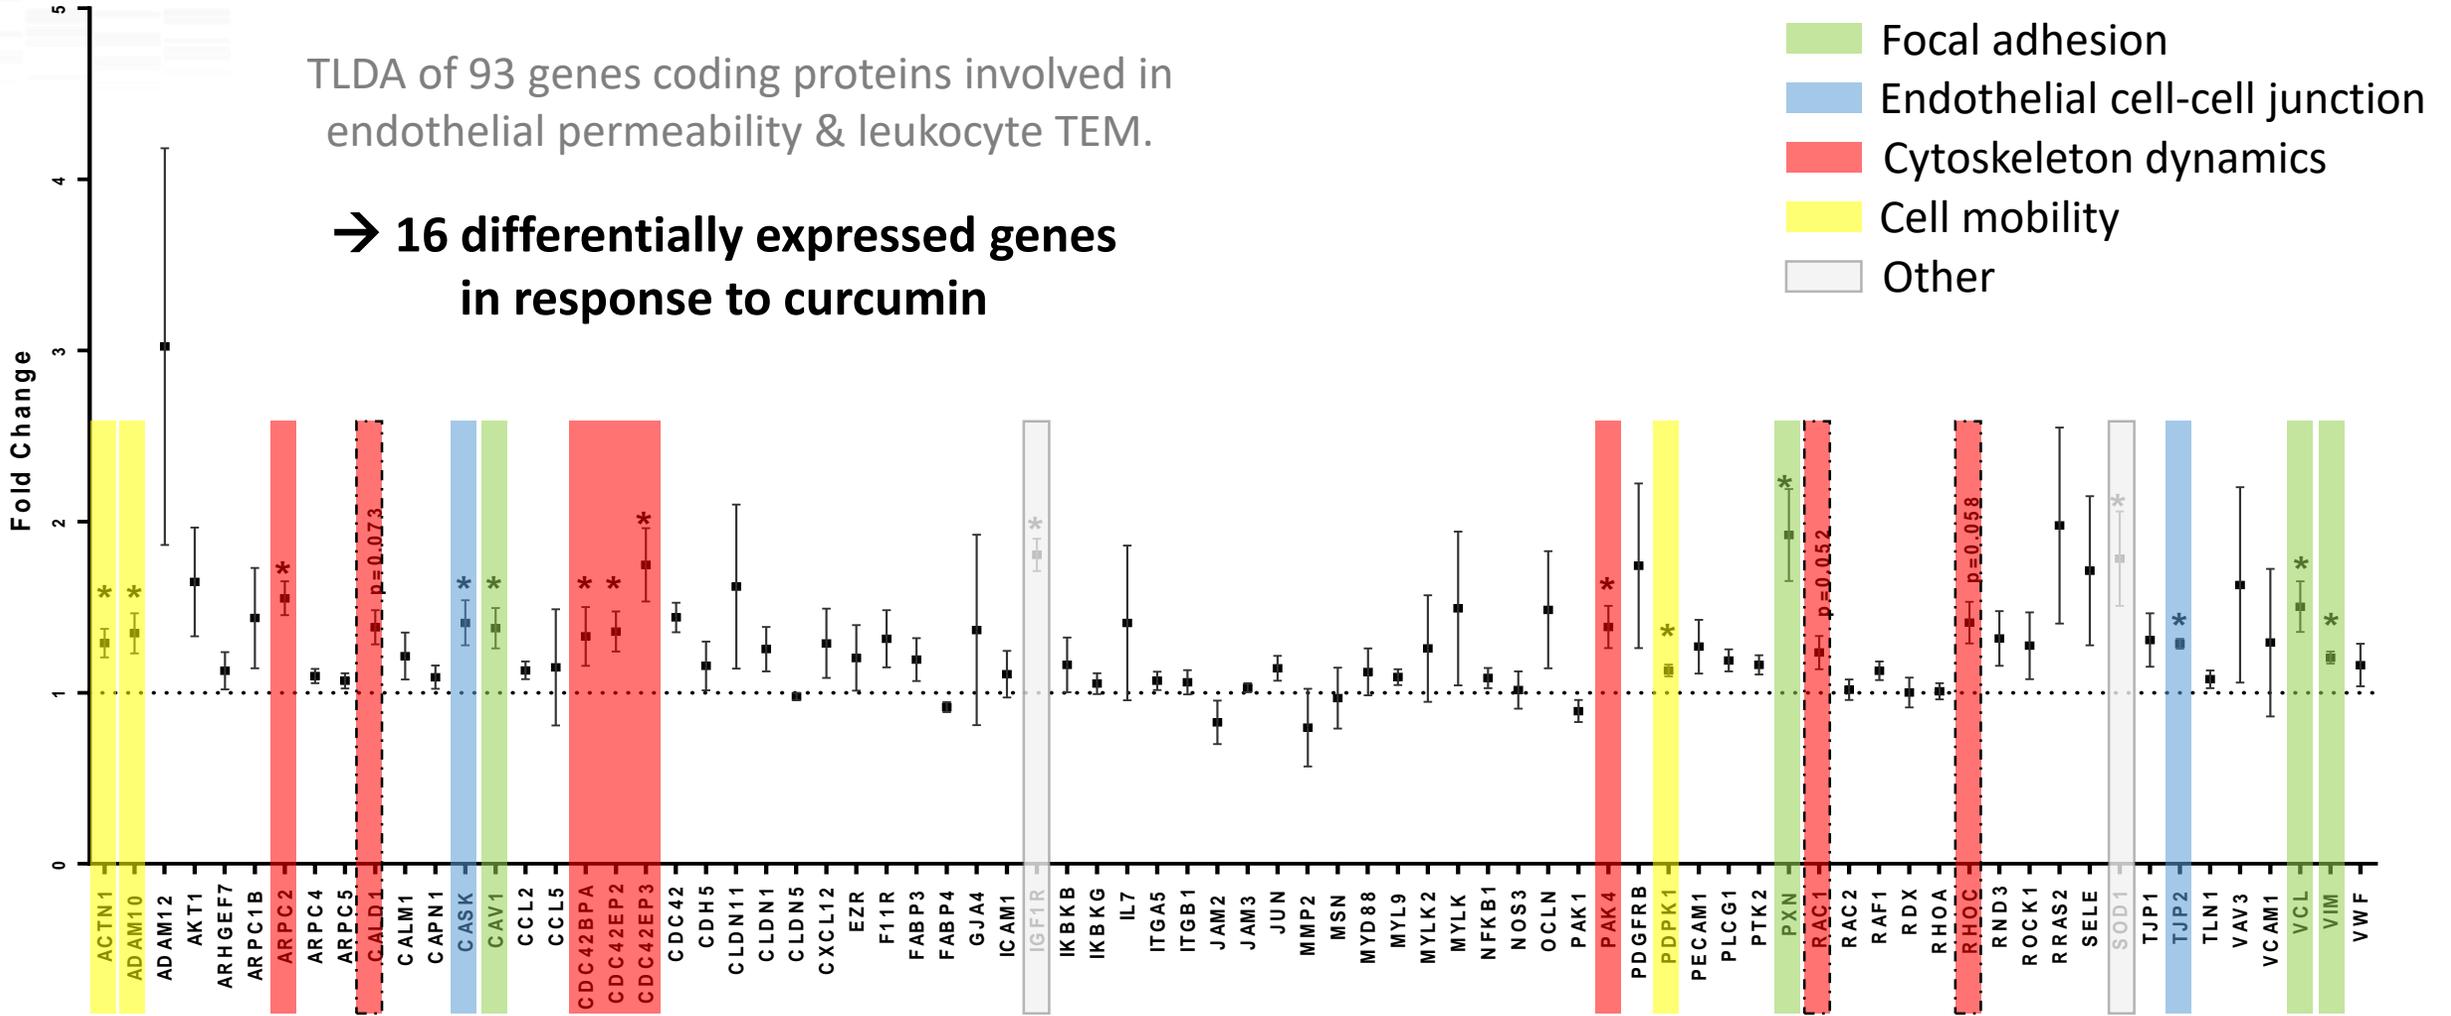

Curcumin does not modulate the chemoattractive potency of activated endothelial cells

Underlying mechanism of action?

Genomic effect of curcumin related to TEM process

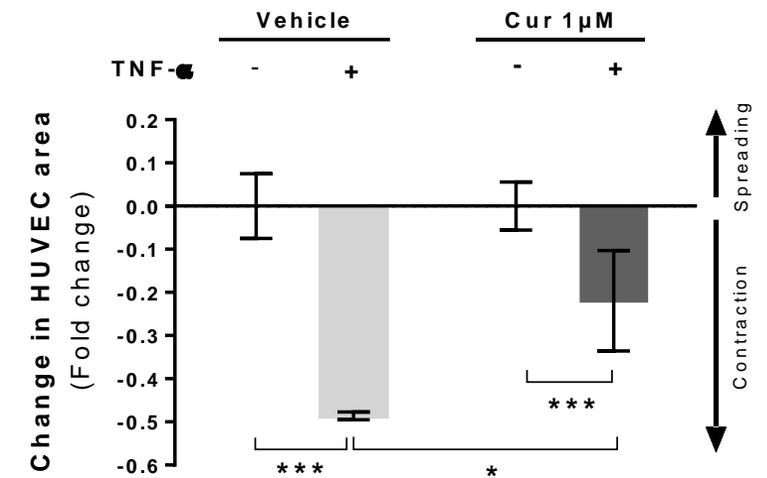

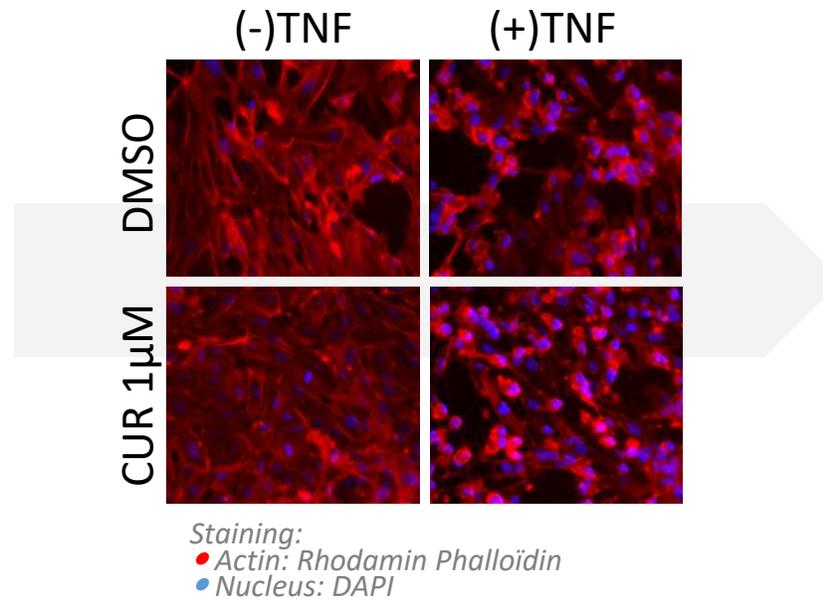

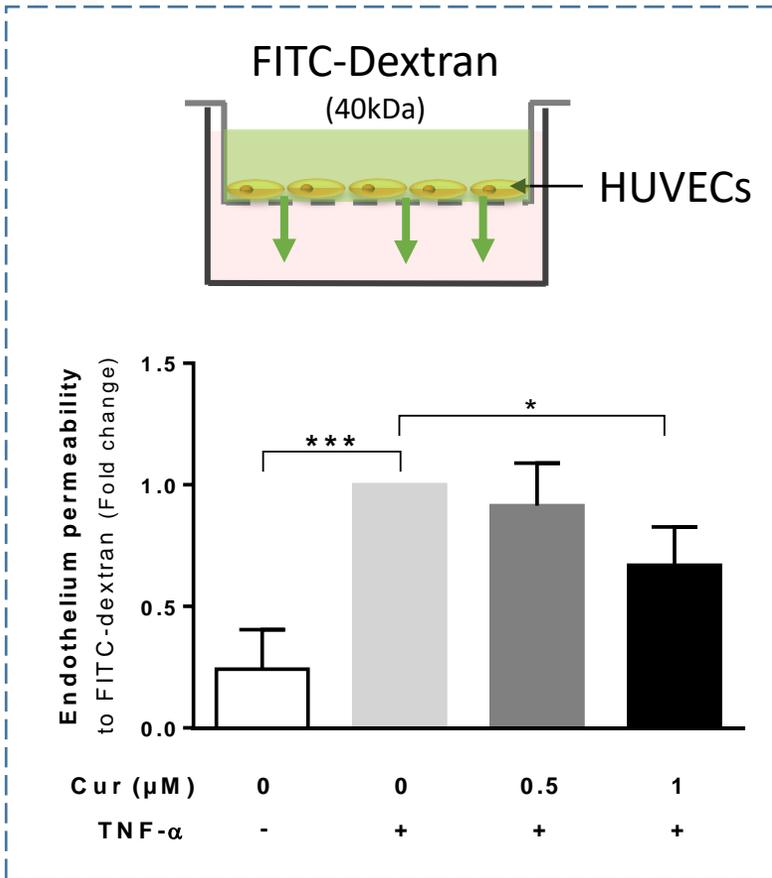

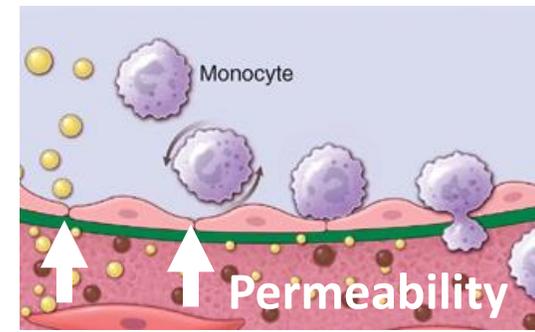

TLDA of 93 genes coding proteins involved in endothelial permeability & leukocyte TEM.

→ 16 differentially expressed genes in response to curcumin

Curcumin could maintain endothelium integrity by reinforcing cell-cell and cell-matrix interactions, and by stabilizing endothelial cell cytoskeleton through nutrigenomic effect

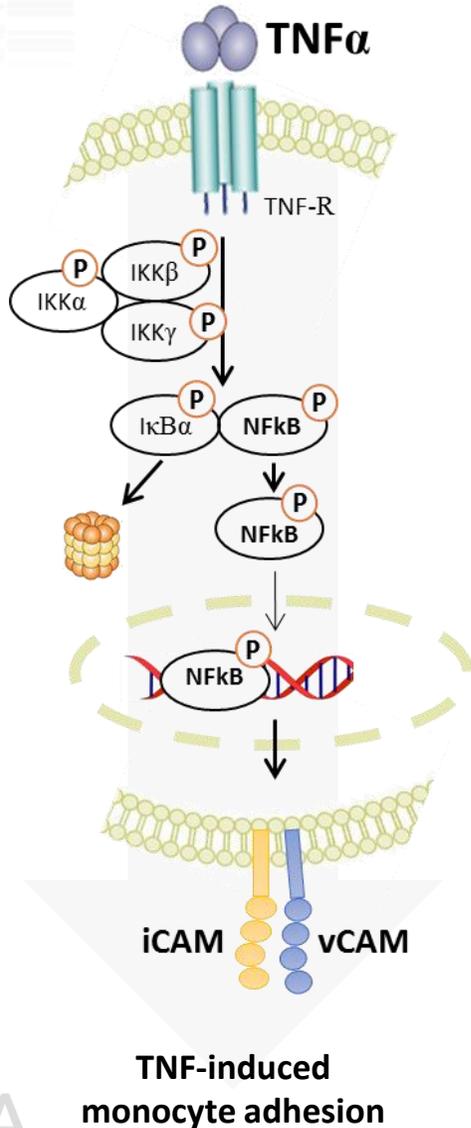

Effect of curcumin on endothelial permeability

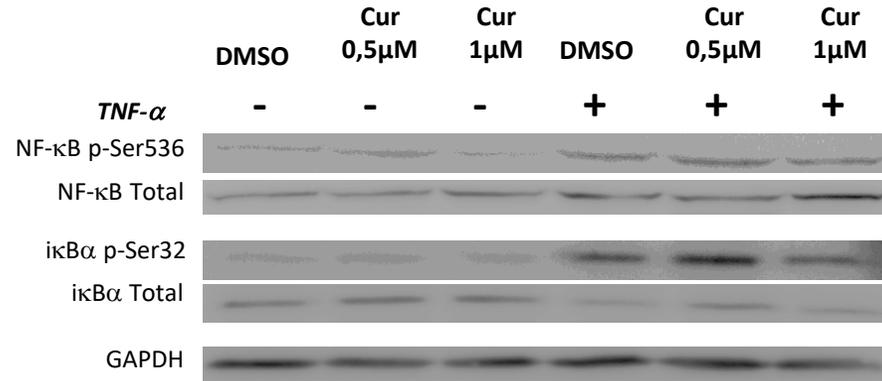

Pre-exposure of Endothelial Cells to curcumin inhibits permeability changes, probably acting on cytoskeleton reorganisation

Underlying mechanism of action?

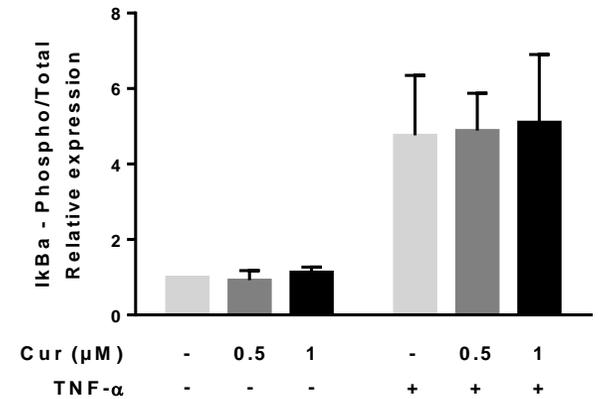

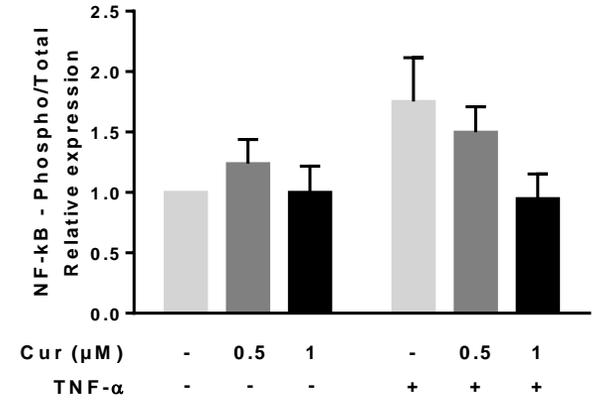

Cell signalling

Western-blot Analysis

Phosphorylation rate

Curcumin inhibits the activation of NFκB pathway, independently of IκBα

To summarize

Curcumin

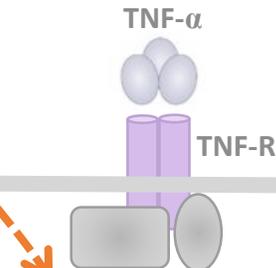

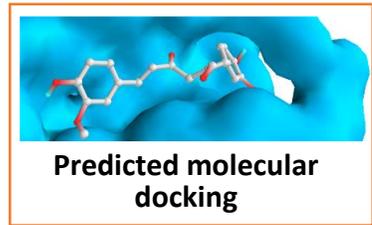

1. Tethering

3. Firm adhesion

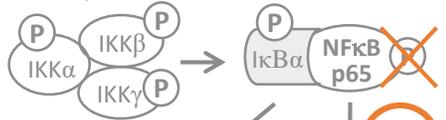

4. Transendothelial migration

2. Rolling

miR-142-5p	miR18a	miR27a
miR-142-3p	miR150	miR155
miR-335-5p	miR101	miR20a
miR-423-5p	miR126	...

Endothelial cell

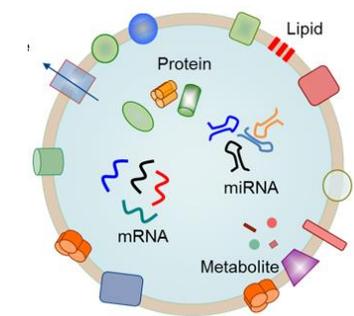

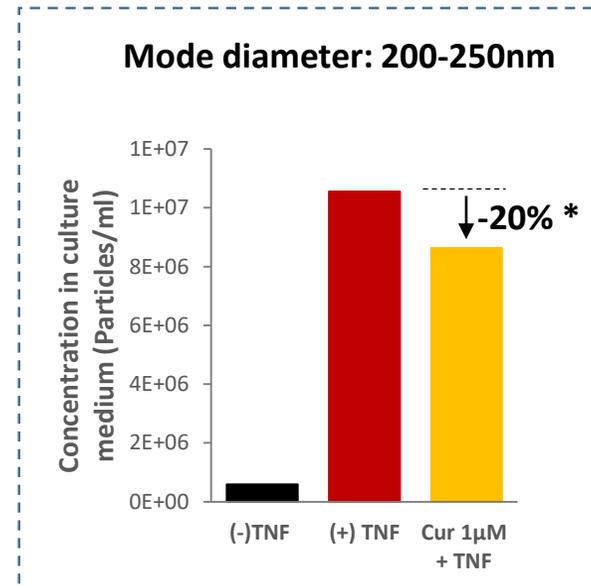

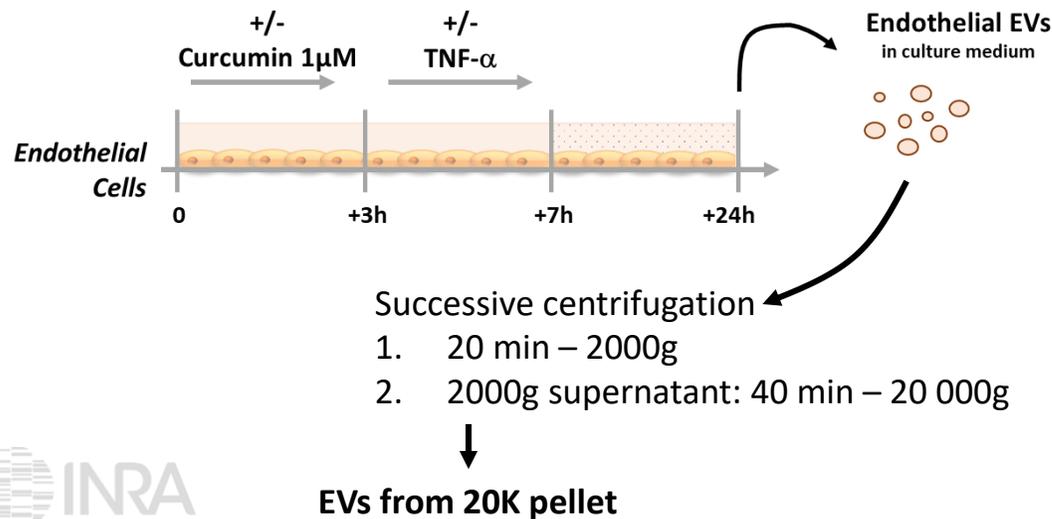

Unpublished results
Submitted for publication
to FRBM

A new mechanism of action of curcumin (Preliminary results)

- EVs are shed membrane particles of less than 1µm in diameter emerging as a hot topic in biology in view of their ability to sustain a cell-to-cell communication in **physiology and pathology**. (Yanez-Mo et al, J Extracell Vesicles 2015)
- **↑ Endo EVs in patients with Cardiometabolic Diseases** (CAD, Metabolic Syndrome, Diabetes, hypertension...)
- **Diet may modify EVs secretion and their bioactivity** (Vafeiadou 2012, Andres 2012, Horn 2014, Heinrich 2015, Ousmaal 2016)

➔ **What about the effect of curcumin on endothelial EVs?**

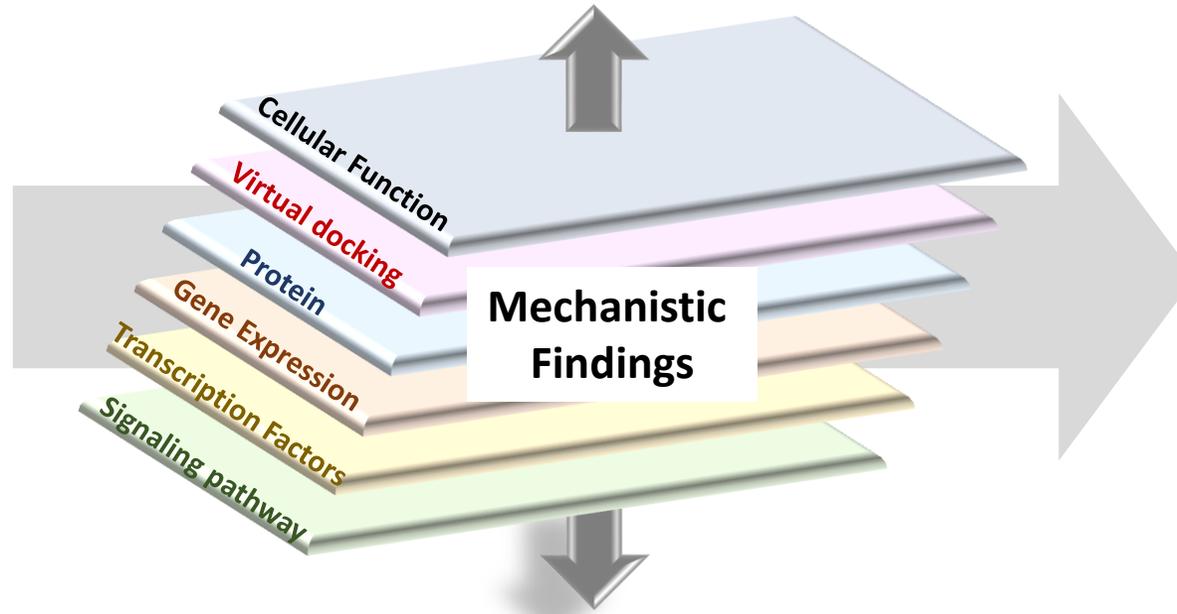

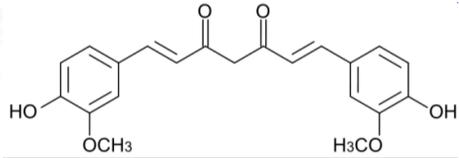

Protein and miRNA content analysis are ongoing

Pre-exposure of Endothelial Cells to curcumin reduces EVs secretion and probably affects proteins and miRNA conveyed.

Conclusion

CURCUMIN

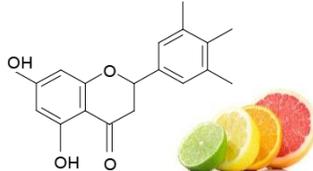

An improved vascular integrity and health

Results from our group showing that other polyphenols exert cardioprotective effects
