HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

INTRODUCTION

- Objective:** Construct reduced order models (ROM) for the simulation of turbomachinery with imposed rotation velocity by proper orthogonal decomposition (POD).
- Difficulty:** The POD yields a spatial basis from temporal correlations (here of the velocity).
- Approach:**
 - Extend the Navier-Stokes equations to the solid (rotor) domain by the multiphase approach. The body velocity is enforced via distributed Lagrange multipliers.
 - Build a single POD basis for the multiphase velocity and project the governing equations.

1. MULTIPHASE APPROACH

Level-set Signed distance to the fluid/solid interface $\Gamma_I(t)$:

$$\chi(\mathbf{x}, t) = \begin{cases} +d(\mathbf{x}, \Gamma_I(t)) & \text{if } \mathbf{x} \in \Omega_S(t) \cup \Gamma_I(t), \\ -d(\mathbf{x}, \Gamma_I(t)) & \text{if } \mathbf{x} \in \Omega_F(t) \end{cases}$$

Smoothed Heaviside (immersion depth ϵ)

$$h_\epsilon(\bullet) = \frac{1}{2} \left(1 + \tanh \left(\frac{\pi \bullet}{\epsilon} \right) \right).$$

Membership function for $\Omega_S(t)$

$$\mathbf{1}_{\Omega_S(t)}(\mathbf{x}) = h_\epsilon(\chi(\mathbf{x}, t)).$$

Multiphase quantities

Velocity field over $\Omega = \Omega_S(t) \cup \Omega_F(t)$:

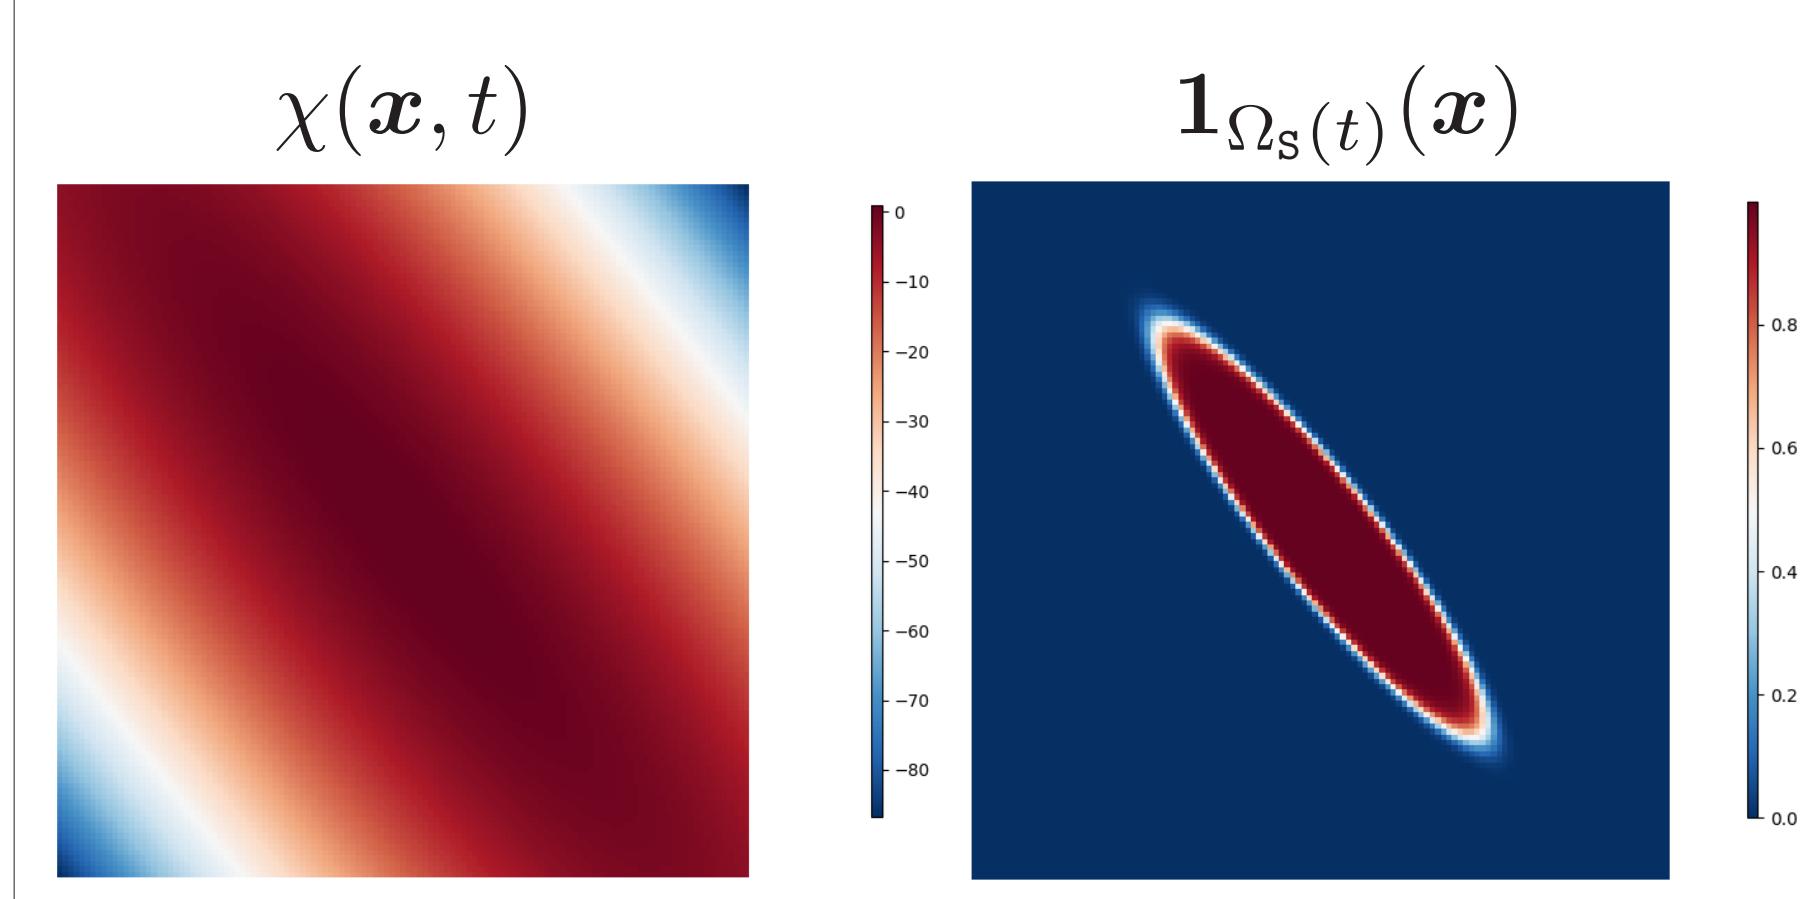

$$\mathbf{u}(\mathbf{x}, t) = \mathbf{1}_{\Omega_S(t)}(\mathbf{x}) \mathbf{u}_S(\mathbf{x}, t) + (\mathbf{I} - \mathbf{1}_{\Omega_S(t)}(\mathbf{x})) \mathbf{u}_F(\mathbf{x}, t).$$

Material properties (density and viscosity):

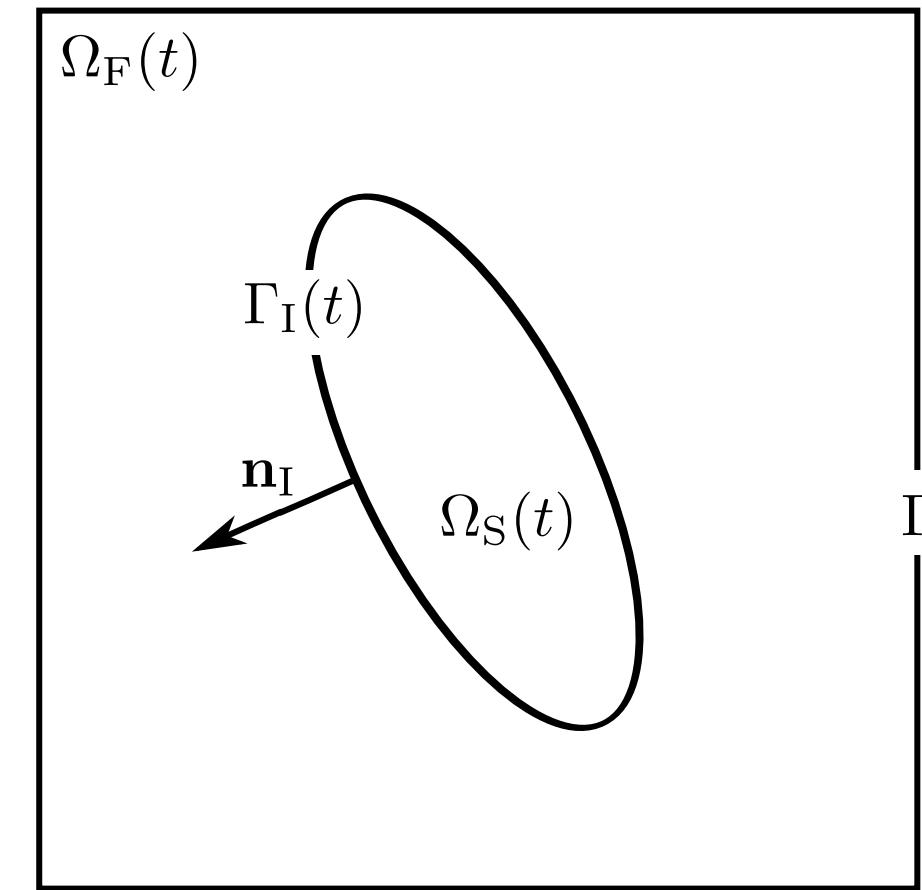

$$\begin{aligned} \rho(\mathbf{x}, t) &= \mathbf{1}_{\Omega_S(t)}(\mathbf{x}) \rho_S + (\mathbf{I} - \mathbf{1}_{\Omega_S(t)}(\mathbf{x})) \rho_F \\ \nu(\mathbf{x}, t) &= \mathbf{1}_{\Omega_S(t)}(\mathbf{x}) \nu_S + (\mathbf{I} - \mathbf{1}_{\Omega_S(t)}(\mathbf{x})) \nu_F \end{aligned}$$

2. FULL ORDER MODEL [1]

Denoting \mathbf{u}_ω the rotation velocity, λ the Lagrange multiplier and μ the test function associated with the rotation constraint, the weak form of the coupled problem is

$$\begin{aligned} 0 &= \int_{\Omega} \rho \left(\frac{\partial \mathbf{u}}{\partial t} + \nabla \mathbf{u} \cdot \mathbf{u} \right) \cdot \mathbf{v} \, dx - \int_{\Omega} \mathbf{f} \cdot \mathbf{v} \, dx \\ &\quad + \int_{\Omega} 2\nu \operatorname{Tr}(\mathbf{D}(\mathbf{u}) \cdot \mathbf{D}(\mathbf{v})) \, dx \\ &\quad - \int_{\Omega} p \nabla \cdot \mathbf{v} \, dx + \int_{\Omega_S(t)} \lambda \cdot \mathbf{v} \, dx \\ &\quad + \int_{\Omega} q \nabla \cdot \mathbf{u} \, dx + \int_{\Omega_S(t)} \mu \cdot (\mathbf{u} - \mathbf{u}_\omega) \, dx, \end{aligned}$$

with an appropriate standard functional setting.

4. PROPOSED POD-ROM

⇒ POD of the membership function

$$\text{POD basis } \Lambda = \left(\Lambda_i(\mathbf{x}) \right)_{1 \leq i \leq N_\Lambda}, \quad N_\Lambda \ll N_X.$$

Decomposition

$$\mathbf{1}_{\Omega_S(t)}(\mathbf{x}) \simeq \sum_{i=1}^{N_\Lambda} \Lambda_i(\mathbf{x}) \gamma_i(t)$$

Periodicity

Coefficients $\gamma_i(t) \rightarrow \hat{\gamma}_i(\theta)$ determined *a priori*.

Insertion in the standard POD-ROM

$$\widehat{\mathbf{A}}(t) \cdot \frac{d\boldsymbol{\alpha}(t)}{dt} = \widehat{\mathbf{B}}(t) \cdot \boldsymbol{\alpha}(t) + \widehat{\mathbf{C}}(t) : \boldsymbol{\alpha}(t) \otimes \boldsymbol{\alpha}(t) + \widehat{\mathbf{F}}(t),$$

⇒ Matrices evaluation at each timestep (cost $\sim N_\Lambda$).

$$\widehat{A}_{ij}(\theta) = \bar{a}_{i,j} + \sum_{k=1}^{N_\Lambda} \tilde{a}_{i,j,k} \gamma_k(\theta),$$

$$\widehat{B}_{ij}(\theta) = \bar{b}_{i,j} + \sum_{k=1}^{N_\Lambda} \tilde{b}_{i,j,k} \gamma_k(\theta),$$

$$\widehat{C}_{ijk}(\theta) = \bar{c}_{i,j,k} + \sum_{l=1}^{N_\Lambda} \tilde{c}_{i,j,k,l} \gamma_l(\theta),$$

$$\widehat{F}_i(\theta) = \bar{f}_i + \sum_{j=1}^{N_\Lambda} \tilde{f}_{i,j} \gamma_j(\theta) + \lambda_i.$$

ACKNOWLEDGMENT

This work has been done in the context of the French National Research Agency Project HECO (ANR-15-CE08-0036).

3. STANDARD POD-ROM [2]

Mean field $\bar{\mathbf{u}}(\mathbf{x}) = \frac{1}{N_T} \sum_{n=1}^{N_T} \mathbf{u}(\mathbf{x}, t_n)$

Fluctuating filed $\tilde{\mathbf{u}}(\mathbf{x}, t) = \mathbf{u}(\mathbf{x}, t) - \bar{\mathbf{u}}(\mathbf{x})$

Data matrix $U_{mn} \equiv \tilde{\mathbf{u}}(\mathbf{x}_m, t_n)$

POD basis: left singular vectors of \mathbf{U}

$$\Phi = \left(\phi_i(\mathbf{x}) \right)_{1 \leq i \leq N_\Phi}, \quad N_\Phi \ll N_T \ll N_X$$

Decomposition

$$\mathbf{u}(\mathbf{x}, t) \simeq \bar{\mathbf{u}}(\mathbf{x}) + \sum_{i=1}^{N_\Phi} \phi_i(\mathbf{x}) \alpha_i(t)$$

Galerkin projection over the POD basis

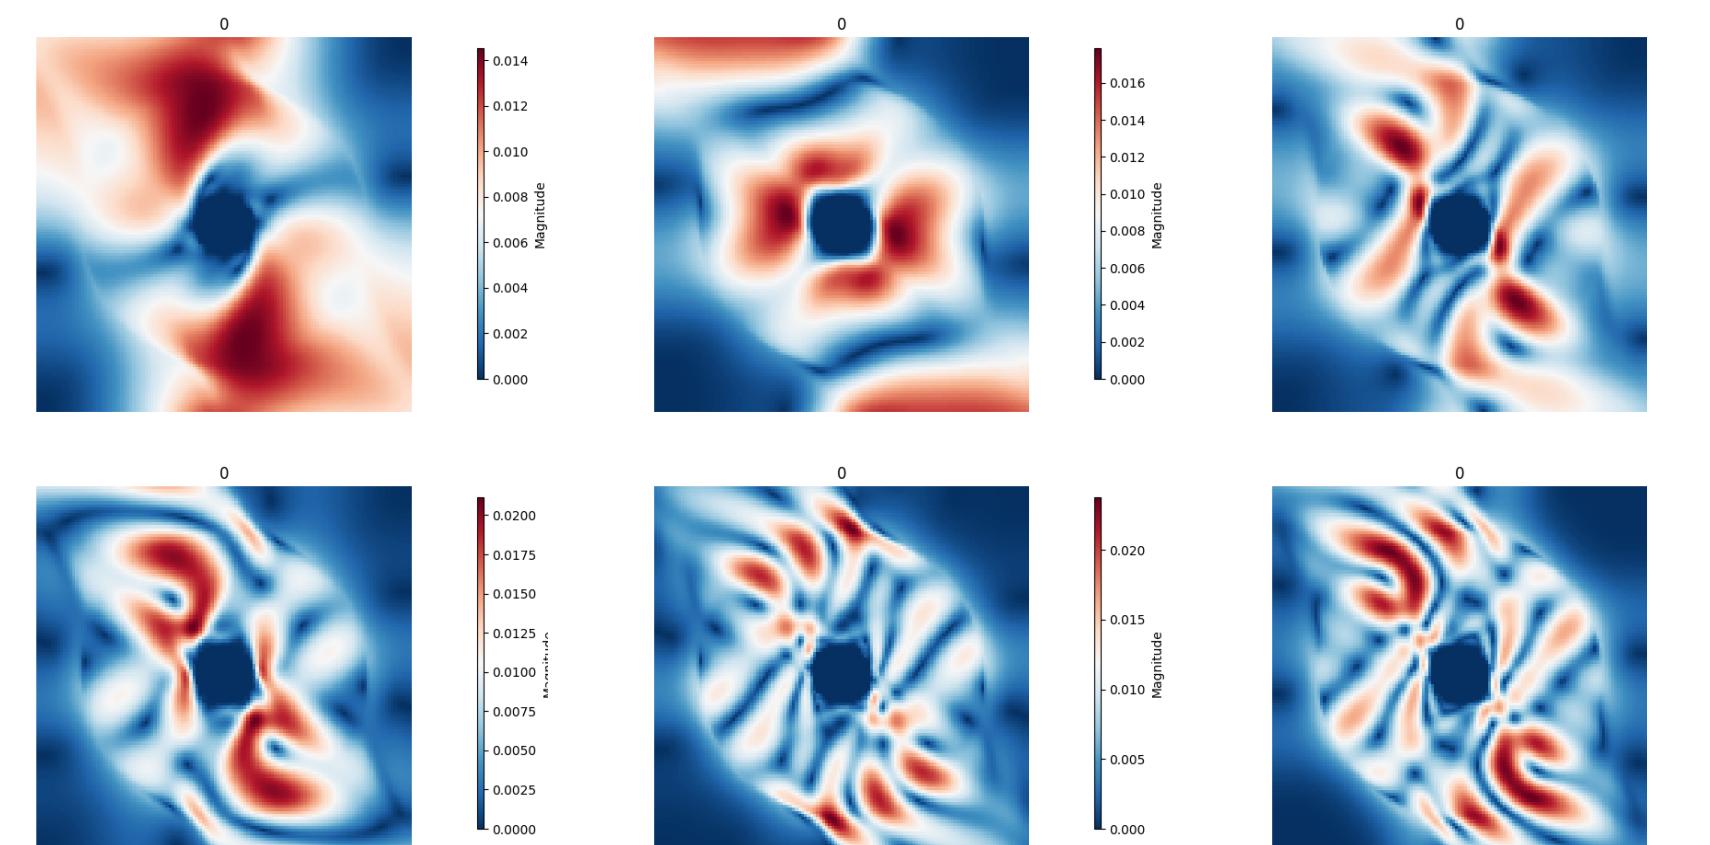

$$\mathbf{A}(t) \cdot \frac{d\boldsymbol{\alpha}(t)}{dt} = \mathbf{B}(t) \cdot \boldsymbol{\alpha}(t) + \mathbf{C}(t) : \boldsymbol{\alpha}(t) \otimes \boldsymbol{\alpha}(t) + \mathbf{F}(t),$$

⇒ Full projection at each timestep (cost $\sim N_X$).

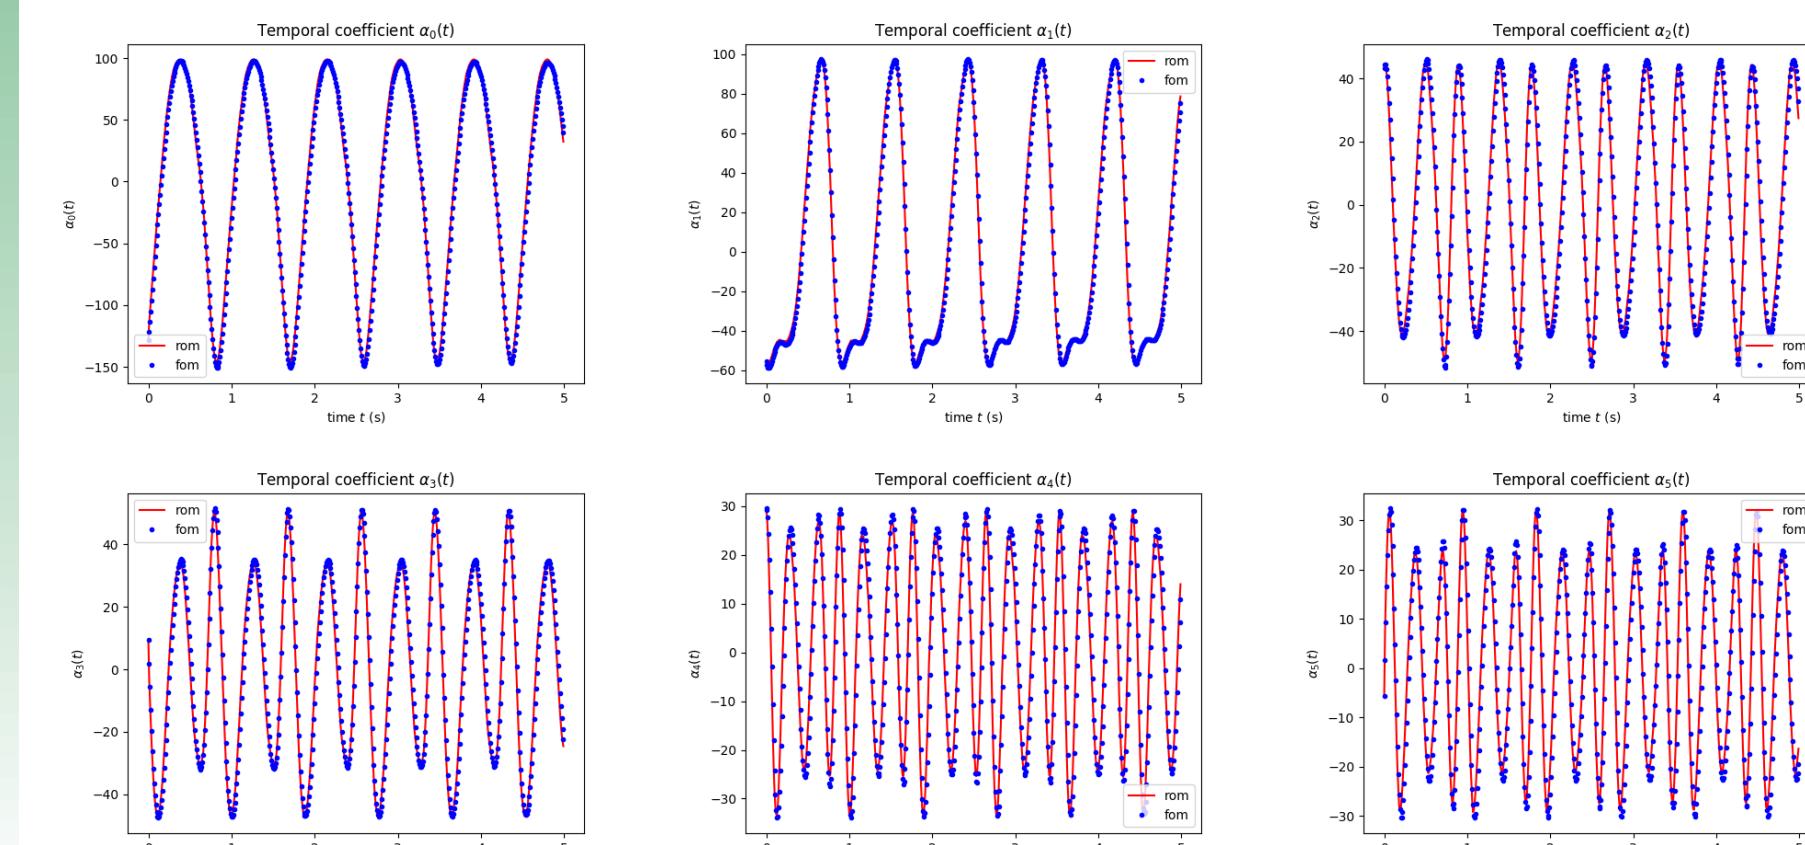

$$\begin{aligned} A_{ij}(t) &= \int_{\Omega} \rho(\mathbf{x}, t) \mathbf{I} \, d\mathbf{x}, \\ B_{ij}(t) &= \int_{\Omega} \rho(\mathbf{x}, t) b_{i,j}^P(\mathbf{x}) \, d\mathbf{x} + \int_{\Omega} \nu(\mathbf{x}, t) b_{i,j}^\nu(\mathbf{x}) \, d\mathbf{x}, \\ C_{ijk}(t) &= \int_{\Omega} \rho(\mathbf{x}, t) c_{i,j,k}(\mathbf{x}) \, d\mathbf{x}, \\ F_i(t) &= \int_{\Omega} \rho(\mathbf{x}, t) f_i^P(\mathbf{x}) \, d\mathbf{x} + \int_{\Omega} \nu(\mathbf{x}, t) f_i^\nu(\mathbf{x}) \, d\mathbf{x} \\ &\quad + \int_{\Omega_S(t)} f_i^\lambda(\mathbf{x}) \, d\mathbf{x}. \end{aligned}$$

5. RESULTS

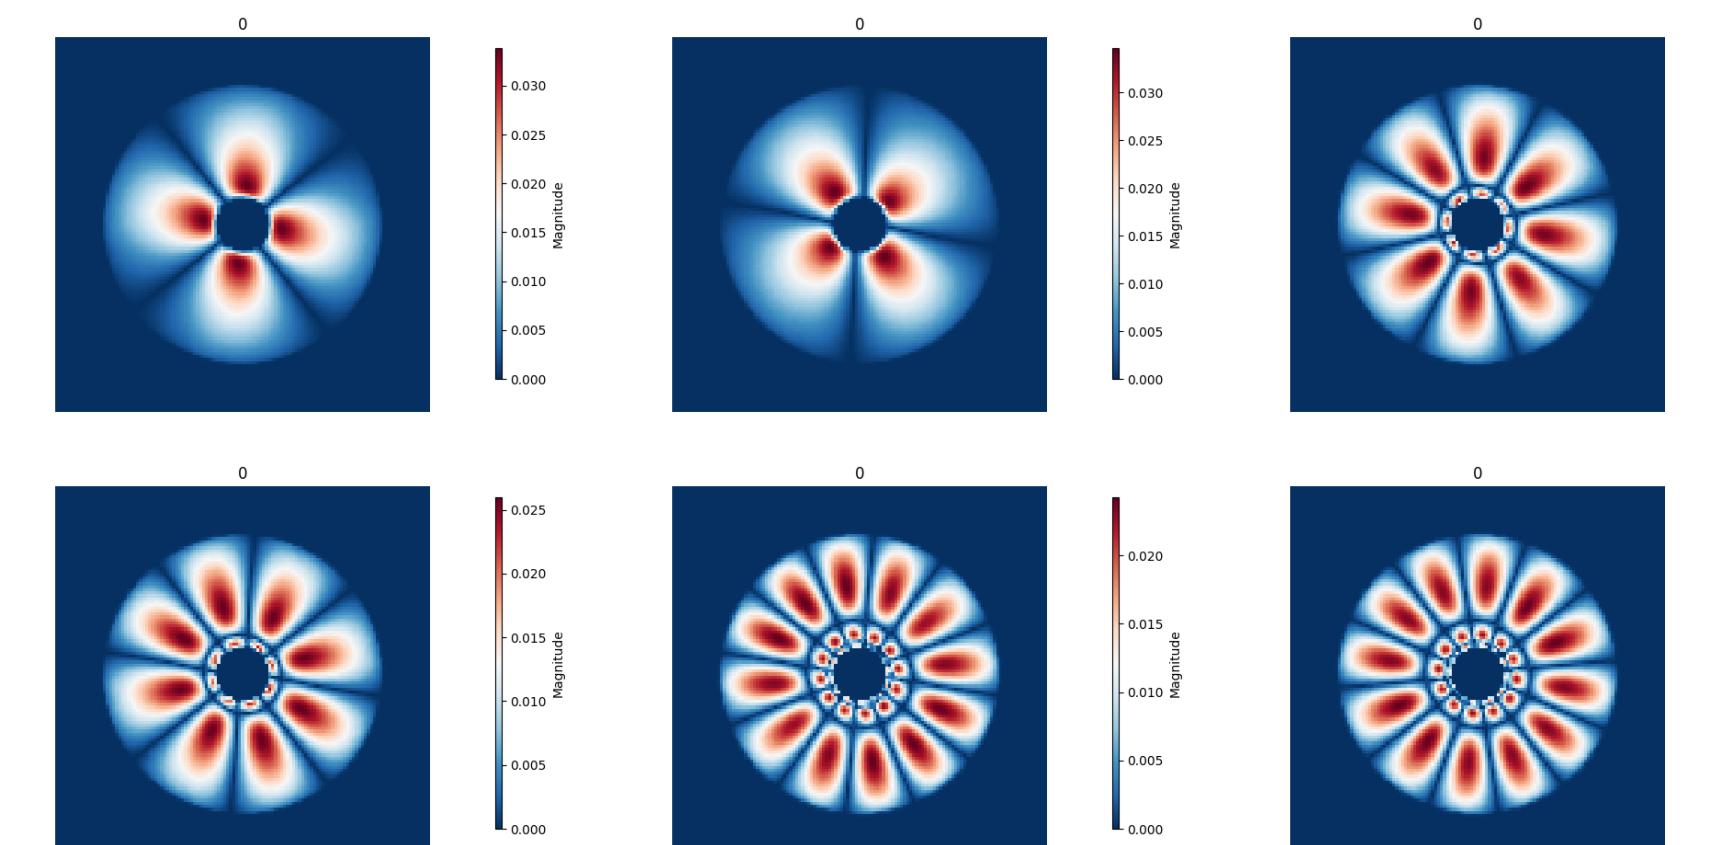

F: POD modes for the velocity

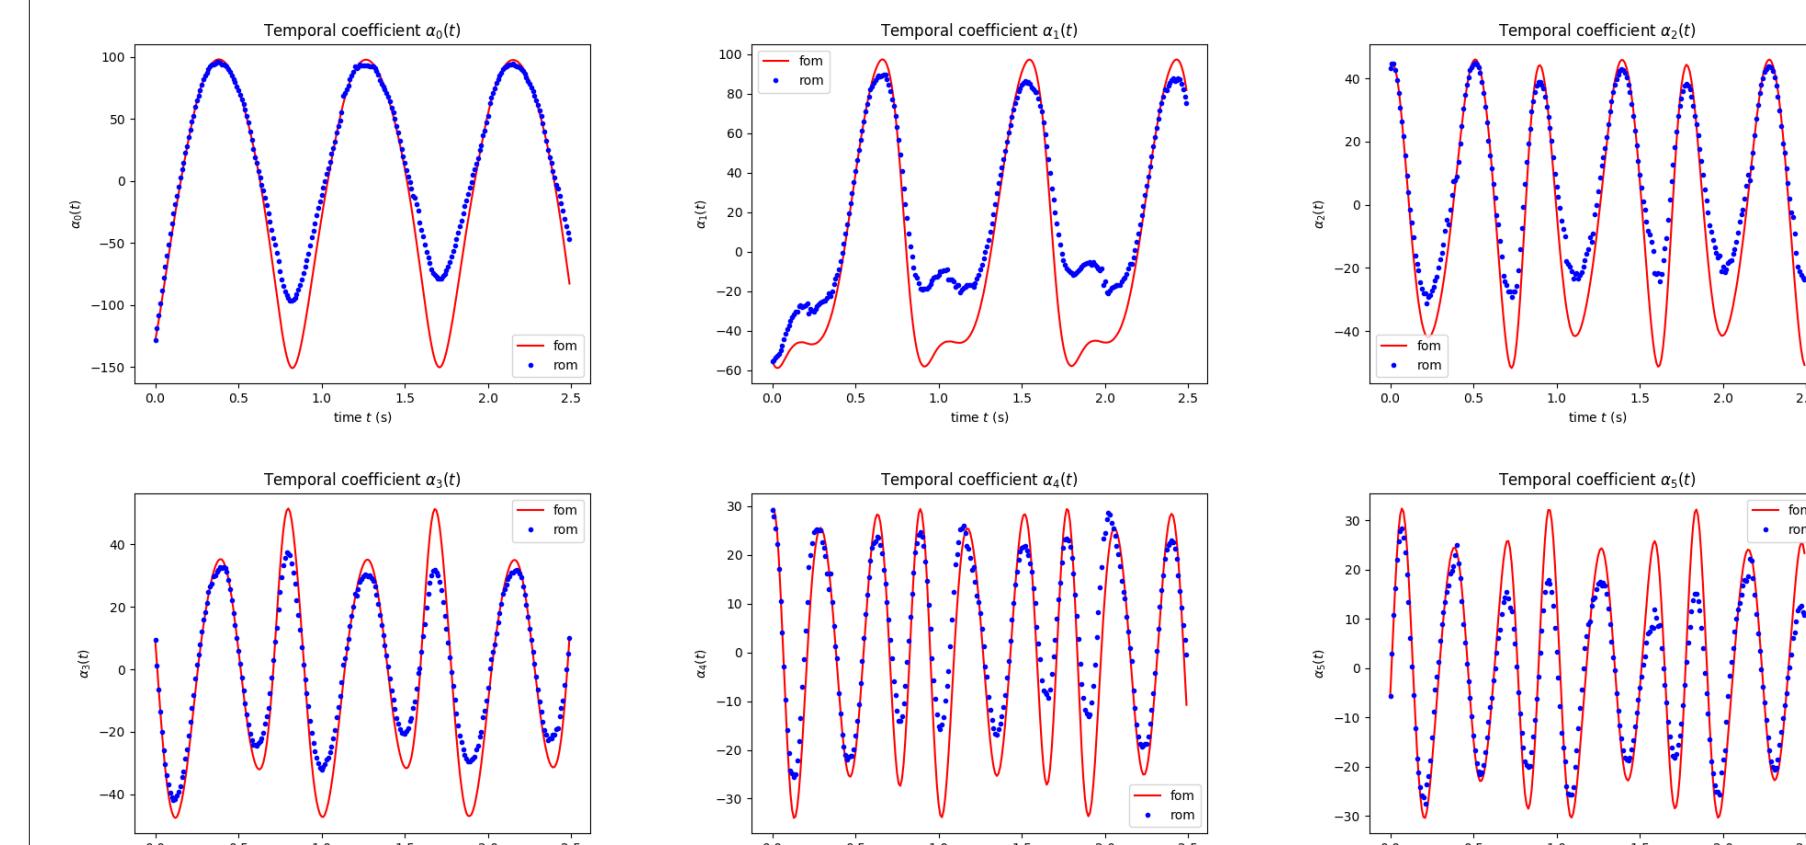

Coeff $\alpha_i(t)$: full order Vs. standard POD-ROM.

A: POD modes for the membership function

Coeff $\alpha_i(t)$: full order Vs. proposed POD-ROM.

CONCLUSION

Contributions

- Efficient reconstruction of the velocity in both the fluid and solid domains, while substantially reducing the computational cost.
- Very general: Any simulation code for the incompressible Navier-Stokes eq. can be used to generate the data $(\mathbf{u}(\mathbf{x}, t_n))_{1 \leq n \leq N_T}$.

Perspectives

- Cope with the reconstruction of the velocity in the solid domain at each iteration by rewriting the governing equations for a rotating subdomain.
- Interpolate between the POD-ROMs over the Grassmann manifold (see e.g. [3]).
