HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Introduction:

Among the materials used as bone substitutes, **bioactive glass** (SiO₂ CaO) (BG) has a **high potential**. BG is **biocompatible** and is able to strongly **bind to bone**. It is **bioresorbable** and its dissolution products **stimulate bone regeneration**. However, BG is **not suitable for scaffolds** as it is brittle and its applications are limited to bone fillers. From a chemical point of view, natural bone is a hybrid consisting of a mineral and an organic phase intimately linked at the molecular level. **Thus, combining BG with a polymer** may address BG issues regarding **elasticity** while **preserving its biological properties**. We recently **patented a sol-gel organic-inorganic hybrid porous scaffold** consisting in **BG** and a synthetic polyester, **polycaprolactone (PCL)**. The aim of this study was **to determine and improve the mechanical and biological properties** of this **original biomaterial**. RPO: rat primary osteoblasts; BG-PCL: bioactive glass with PCL; BTB: bovine trabecular bone

Synthesis, characteristics and mechanical properties of BG-PCL scaffolds

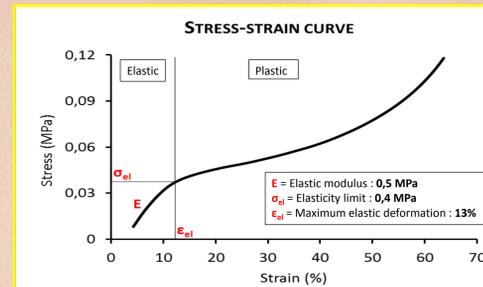

Room temperature synthesis route

Room temperature
Uniform distribution of calcium

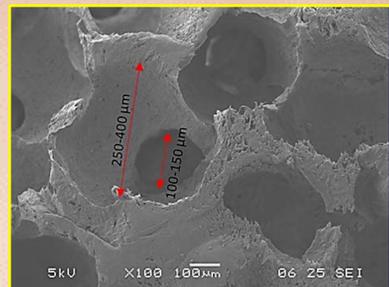

Compatible with polymers
No residual methanol

Elastic-plastic material

None brittle and deformable
Interconnected porosity suitable for cell colonisation

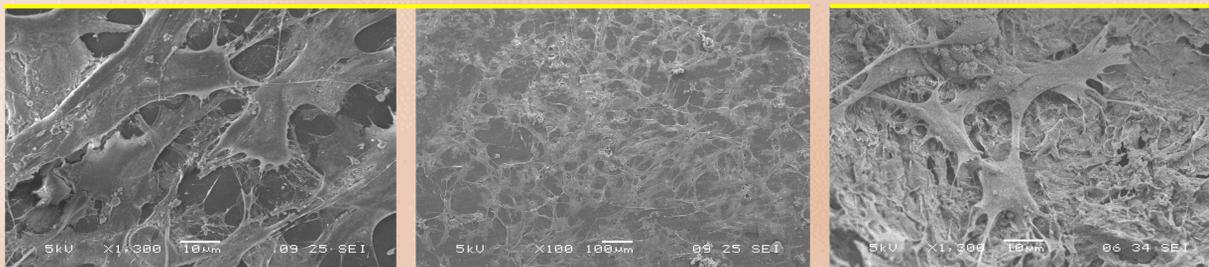

Interconnected porosity

Biological properties of BG-PCL scaffolds

Promotion of cell attachment – Electron scanning microscopy

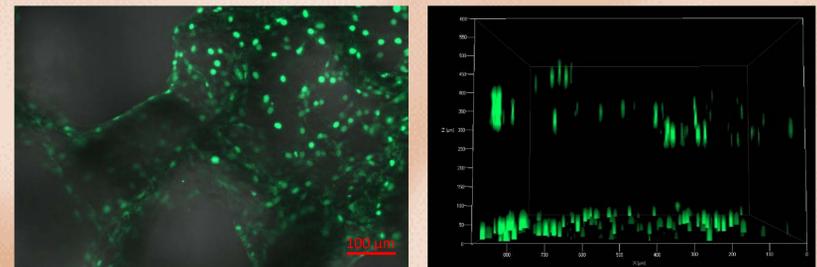

Rat primary osteoblasts (RPO) on a BG-PCL pellet

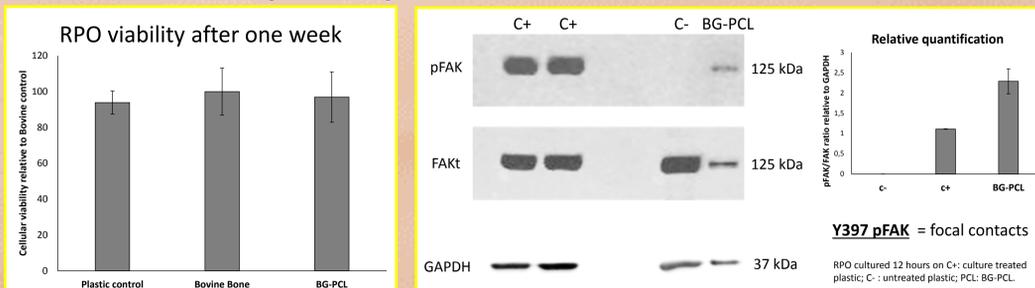

3D cell distribution – Apotome fluorescent microscopy

RPO on a BG-PCL scaffold

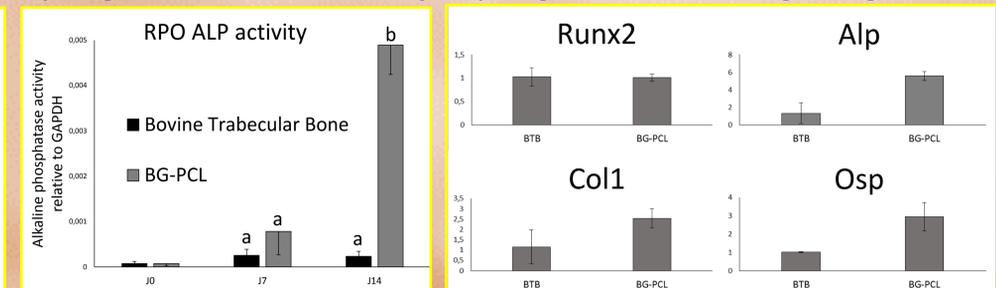

RPO distribution inside scaffolds

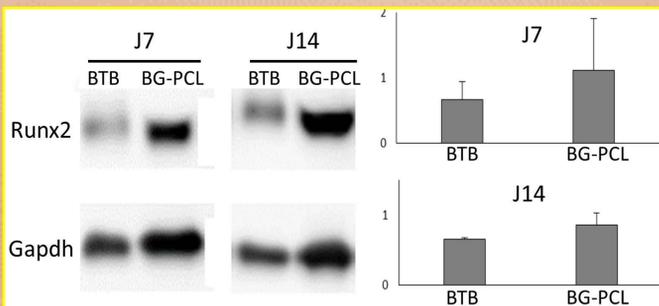

Preserved biocompatibility Stimulation of focal contacts

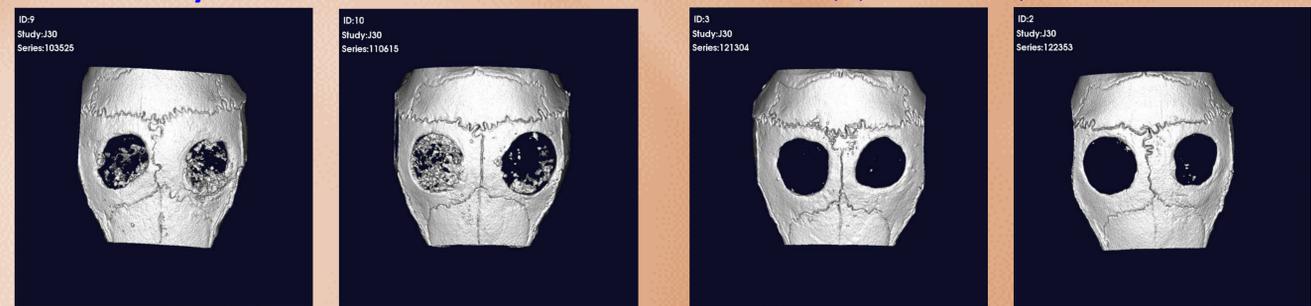

Up-regulation of ALP activity Up-regulation of osteogenic genes

Enhancement of Runx2 in RPO

Validation by in-vivo models - Mineral structures observed at 30 days post- craniotomy in mice

Conclusion:

BG-PCL hybrid scaffolds may represent a **ground-breaking** step in **bone regenerative medicine**. They preserve osteoinductive properties while addressing brittleness of bioactive glasses. Their **synthesis route** at room temperature offers **new opportunities for organic doping and improved bone regeneration**
