Exact analytic solution of the incompressible Navier-Stokes equations

Fabien Salmon¹

Abstract—The Navier-Stokes equations, which govern fluid motions, are not resolved yet. This investigation relates to the application of the power series method to the incompressible Navier-Stokes equations. Power series with unknown coefficients substitute the variables into the equations. Then, the resulting recurrence relation allows the computation of the series coefficients from the initial and boundary conditions. The article begins with the resolution of an accessible multidimensional differential equation that illustrates the approach. Then, the exact analytic solution stemming from the application of the method to the Navier-Stokes equations is detailed. The existence and the convergence domain of the solution are discussed without concluding.

Keywords—Navier-Stokes, incompressible, analytic, exact solution, power series

I. INTRODUCTION

The Navier-Stokes equations describe the fluid motion. They were named in honour of Claude-Louis Navier and George Gabriel Stokes. At present, the general solution of this set of equations remains unknown. Except in specific cases with analytical solution, fluid motion problems request high performance computing.

Many studies handle the existence and uniqueness of solutions to the Navier-Stokes equations. The existence of weak solutions to the incompressible case were proved in [1]. Moreover, the weak solutions of the compressible equations were analysed with the aim of characterizing them [2], [3]. Regarding strong solutions, numerous studies investigated their existence as well as their properties [4], [5]. In the same way, scientists studied solutions of particular problems with specified boundary conditions [6].

This article does not concern such mathematical properties but features the formulation of an analytic solution to the incompressible Navier-Stokes equations. The resolution is based on the power series method [7] that consists in substituting variables by power series in the equations. The power series coefficients are then determined by solving the equations. This approach leads to an exact analytic solution as long as it exists.

First, an effortless 2D differential equation provides an overview of the method and difficulties. To make clear the restriction of this technique, the differences between this approach and a general one applicable to the simple example are indicated. Second, general issues about the incompressible Navier-Stokes equations are discussed as well as the assumptions required by the resolution method. Then, the analytic solution is given without detailing all hand calculations. This publication includes a discussion about the convergence domain.

II. METHOD DESCRIPTION

The method consists in seeking an analytic solution in several dimensions. Basically, it is the same approach as finding a series solution to a 1D differential equation, except it is not in one dimension anymore.

For reasons of brevity, the next section only contains several points of the mathematical resolution of the Navier-Stokes equations. Then, this part is dedicated to the presentation of the entire method through an application to an easy differential equation depending on two variables. This case displays the difficulties encountered with multidimensional series. The differential equation is

$$\frac{\partial f}{\partial x} - \frac{\partial f}{\partial y} = 0 \quad (1)$$

The solution is sought in $\mathbb{R}^+ \times \mathbb{R}^+$. Before solving the equation thanks to power series, the resolution is performed thanks to a substitution. By setting $\psi(x, y) = (u, v) = (x, x + y)$ and $f(x, y) = g(u, v)$,

$$\left\{ \begin{array}{l} \frac{\partial f}{\partial x} = \frac{\partial g}{\partial u} \frac{\partial u}{\partial x} + \frac{\partial g}{\partial v} \frac{\partial v}{\partial x} = \frac{\partial g}{\partial u} + \frac{\partial g}{\partial v} \\ \frac{\partial f}{\partial y} = \frac{\partial g}{\partial u} \frac{\partial u}{\partial y} + \frac{\partial g}{\partial v} \frac{\partial v}{\partial y} = \frac{\partial g}{\partial v} \end{array} \right. \quad (2)$$

¹UMR CNRS 5295 I2M, Bordeaux University, France
Fabien.Salmon@u-bordeaux.fr

Then, the differential equation becomes

$$\frac{\partial g}{\partial u} = 0 \quad (3)$$

Thus, the solutions to the equation (1) are the functions depending on $x + y$: $f(x, y) = g(u, v) = \phi(v) = \phi(x + y)$.

Now, the power series method is used to provide an analytic solution to the equation (1) by introducing

$$f(x, y) = \sum_{n=0}^{\infty} \sum_{m=0}^{\infty} a_{n,m} x^n y^m \quad (4)$$

By replacing f by its power series expansion in (1), the following relation between the coefficients is deduced:

$$a_{n+1,m} = \frac{m+1}{n+1} a_{n,m+1} \quad (5)$$

(5) corresponds to a recurrence relation with two indices. The coefficients must be expressed from the boundary conditions coefficients ($n = 0$ or $m = 0$). The resolution of this relation yields:

$$a_{n,m} = \frac{(m+n)!}{n!m!} a_{0,m+n} \quad (6)$$

So, the analytic solution of (1) is:

$$f(x, y) = \sum_{n=0}^{\infty} \sum_{m=0}^{\infty} \binom{m+n}{m} a_{0,m+n} x^n y^m \quad (7)$$

It does not look like to the solution formerly obtained and some modifications need be achieved. By setting $k = m + n$,

$$f(x, y) = \sum_{k=0}^{\infty} \sum_{m=0}^k \binom{k}{m} a_{0,k} x^{k-m} y^m \quad (8)$$

The binomial theorem simplifies the previous expression:

$$f(x, y) = \sum_{k=0}^{\infty} a_{0,k} (x+y)^k \quad (9)$$

Again, the solutions are the functions such that $f(x, y) = \phi(x + y)$ where ϕ derived from the boundary conditions. The coefficients $a_{0,k}$ correspond to the power series coefficients of $y \mapsto f(0, y)$:

$$f(0, y) = \sum_{m=0}^{\infty} a_{0,m} y^m \quad (10)$$

Therefore, the solution must admit a power series expansion in the neighbourhood of 0 at the boundaries. Thus, the specified boundary conditions must be analytic so that the solution can be analytic too. This obligation constitutes a prerequisite for multidimensional problems.

Moreover, the convergence domain of the series solution depends on the boundary conditions. First, an exponential boundary condition is assumed: $f(0, y) = e^y$. So, necessarily $a_{0,m} = \frac{1}{m!}$. The analytic solution is then

$$f_1(x, y) = \sum_{k=0}^{\infty} \frac{1}{k!} (x+y)^k = e^{x+y} \quad (11)$$

The convergence domain of the power series is \mathbb{R}^2 . Therefore, (11) is the global solution.

Now, $f(0, y) = \frac{1}{y+1}$ is imposed. In such a case, $a_{0,m} = (-1)^m$. The analytic solution is

$$f_2(x, y) = \sum_{k=0}^{\infty} (-1)^k (x+y)^k \quad (12)$$

The convergence domain is $D = \{(x, y) : |x+y| < 1\}$ in spite of the solution being clearly $(x, y) \mapsto \frac{1}{x+y+1}$ on $\mathbb{R}^+ \times \mathbb{R}^+$. Even for such a simple matter, various cases exist, depending on boundary conditions.

To summarize, the described method finds analytic solutions to differential equations. But, some solutions can be non-analytic and this investigation is not focused on them. The convergence domain of the series solution can also be more limited than the real solution domain. Moreover, for multidimensional problems, the analytic solution assumption requires that the boundary conditions be analytic as well. This restriction is not very constraining regarding the Navier-Stokes equations because the fluid boundary conditions are usually analytic.

III. APPLICATION TO THE INCOMPRESSIBLE NAVIER-STOKES EQUATIONS

This section concerns the application of the power series method to the incompressible Navier-Stokes equations:

$$\begin{cases} \nabla \cdot \mathbf{U} = 0 \\ \rho \left(\frac{\partial \mathbf{U}}{\partial t} + \mathbf{U} \cdot \nabla \mathbf{U} \right) = -\nabla P + \mu \nabla^2 \mathbf{U} + \rho \mathbf{g} \end{cases} \quad (13)$$

\mathbf{U} is the flow velocity, ρ is the constant flow density, P is the pressure, μ is the constant dynamic viscosity and \mathbf{g} is the sum of body forces. In what follows, the notations U^1 , U^0 and U^2 designate the x , y and z components of the velocity respectively. The notation U^0 for the second component stems from an arbitrary choice in the following development.

A. Mathematical approach

Each variable in the incompressible Navier-Stokes equations can be expressed as 4-variable power series. For instance, the x -velocity can be written:

$$U^1 = \sum_{\omega, p, q, r=0}^{\infty} u_{\omega, p, q, r}^1 t^{\omega} x^p y^q z^r \quad (14)$$

with the convention $\sum_{\omega, p, q, r=0}^{\infty} = \sum_{\omega=0}^{\infty} \sum_{p=0}^{\infty} \sum_{q=0}^{\infty} \sum_{r=0}^{\infty}$. It applies to U^0 , U^2 and P alike. The convergence domain of the x velocity component corresponds to $D_{U^1} = \{(t, x, y, z) \in \mathbb{R}^4 : \sum_{\omega, p, q, r=0}^{\infty} u_{\omega, p, q, r}^1 t^{\omega} x^p y^q z^r < \infty\}$. Similarly, D_{U^0} , D_{U^2} and D_P are defined. The convergence domains of the power series are assumed to be non-empty.

The resolution requires the body accelerations to be analytic functions

$$g^i = \sum_{\omega, p, q, r=0}^{\infty} g_{\omega, p, q, r}^i t^{\omega} x^p y^q z^r \quad (15)$$

with $i = 0, 1$ or 2 corresponding to the direction (such as the velocity). This assumption is not constraining because it is generally true. For instance, gravity often remains constant.

The initial conditions allow the computation of the coefficients when $\omega = 0$. Moreover, the velocity coefficients when at least one indice among p , q and r is worth 0 or 1 are calculated by the six velocity boundary conditions. As regards pressure, only the terms corresponding to $p = 0$ or $q = 0$ or $r = 0$ are derived from the boundary conditions.

Only the main steps of the calculation are described below. The first step consists in replacing variables by power series in the Navier-Stokes equations. First, the continuity equation becomes:

$$\sum_{\omega, p, q, r=0}^{\infty} [(p+1)u_{\omega, p+1, q, r}^1 + (q+1)u_{\omega, p, q+1, r}^0 + (r+1)u_{\omega, p, q, r+1}^2] t^{\omega} x^p y^q z^r = 0 \quad (16)$$

The coefficients of the power series in (16) are necessarily nil. It leads to:

$$u_{\omega, p, q, r}^0 = -\frac{p+1}{q} u_{\omega, p+1, q-1, r}^1 - \frac{r+1}{q} u_{\omega, p, q-1, r+1}^2 \quad \forall (\omega, p, r) \in \mathbb{N}^3, \forall q > 0 \quad (17)$$

The boundary conditions give the terms corresponding to $q = 0$.

Second, the three momentum equations must be studied. The non linear terms lead to products of series calculated thanks to the Cauchy product:

$$\left(\sum_{i=0}^{\infty} a_i x^i \right) \left(\sum_{j=0}^{\infty} b_j x^j \right) = \sum_{k=0}^{\infty} \left(\sum_{l=0}^k a_l b_{k-l} \right) x^k \quad (18)$$

Only one momentum equation is detailed because the two others are similar. For instance, the x -momentum equation yields

$$\begin{aligned} \frac{1}{p+1} \left\{ (\omega+1)u_{\omega+1, p, q+1, r+1}^1 + \sum_{k=0}^{\omega} \sum_{i=0}^p \sum_{j=0}^{q+1} \sum_{l=0}^{r+1} [(i+1)u_{\omega-k, p-i, q+1-j, r+1-l}^1 u_{k, i+1, j, l}^1 + \right. \\ (j+1)u_{\omega-k, p-i, q+1-j, r+1-l}^0 u_{k, i, j+1, l}^1 + (l+1)u_{\omega-k, p-i, q+1-j, r+1-l}^2 u_{k, i, j, l+1}^1] - \nu [(p+1)(p+2)u_{\omega, p+2, q+1, r+1}^1 + \right. \\ \left. (q+2)(q+3)u_{\omega, p, q+3, r+1}^1 + (r+2)(r+3)u_{\omega, p, q+1, r+3}^1] - g_{\omega, p, q+1, r+1}^1 \right\} = -\frac{1}{\rho} P_{\omega, p+1, q+1, r+1} \quad (19) \end{aligned}$$

with $\omega \geq 0$, $p \geq 0$, $q \geq -1$ and $r \geq -1$.

Because the second component of the velocity is fully determined by (17), the replacement of the pressure coefficients can be carried out thanks to the momentum equation along the y axis. It remains two large equations (20) and (21) combining u^1 , u^0 and u^2 coefficients.

$$\begin{aligned} u_{\omega+1,p,q,r}^1 = & -\frac{p+1}{q(q-1)} [(p+2)u_{\omega+1,p+2,q-2,r}^1 + (r+1)u_{\omega+1,p+1,q-2,r+1}^2] + \frac{\nu}{\omega+1} \left[\frac{(p+2)!}{p!} u_{\omega,p+2,q,r}^1 + \frac{(q+2)!}{q!} u_{\omega,p,q+2,r}^1 + \right. \\ & \left. \frac{(r+2)!}{r!} u_{\omega,p,q,r+2}^1 - \frac{(p+3)!}{q p!} u_{\omega,p+3,q-1,r}^0 - (p+1)(q+1)u_{\omega,p+1,q+1,r}^0 - \frac{(p+1)(r+2)!}{q r!} u_{\omega,p+1,q-1,r+2}^0 \right] - \frac{1}{\omega+1} \sum_{k=0}^{\omega} \\ & \left\{ \sum_{i=0}^p \sum_{j=0}^q \sum_{l=0}^r [(i+1)u_{\omega-k,p-i,q-j,r-l}^1 u_{k,i+1,j,l}^1 + (j+1)u_{\omega-k,p-i,q-j,r-l}^0 u_{k,i,j+1,l}^1 + (l+1)u_{\omega-k,p-i,q-j,r-l}^2 u_{k,i,j,l+1}^1] - \frac{p+1}{q} \right. \\ & \left. \sum_{i=0}^{p+1} \sum_{j=0}^{q-1} \sum_{l=0}^r [(i+1)u_{\omega-k,p+1-i,q-1-j,r-l}^1 u_{k,i+1,j,l}^0 + (j+1)u_{\omega-k,p+1-i,q-1-j,r-l}^0 u_{k,i,j+1,l}^0 + (l+1)u_{\omega-k,p+1-i,q-1-j,r-l}^2 u_{k,i,j,l+1}^0] \right\} \\ & + \frac{1}{\omega+1} \left(g_{\omega,p,q,r}^1 - \frac{p+1}{q} g_{\omega,p+1,q-1,r}^0 \right) \quad (20) \end{aligned}$$

$$\begin{aligned} u_{\omega+1,p,q,r}^2 = & -\frac{r+1}{q(q-1)} [(r+2)u_{\omega+1,p,q-2,r+2}^2 + (p+1)u_{\omega+1,p+1,q-2,r+1}^1] + \frac{\nu}{\omega+1} \left[\frac{(r+2)!}{r!} u_{\omega,p,q,r+2}^2 + \frac{(q+2)!}{q!} u_{\omega,p,q+2,r}^2 + \right. \\ & \left. \frac{(p+2)!}{p!} u_{\omega,p+2,q,r}^2 - \frac{(r+3)!}{q r!} u_{\omega,p,q-1,r+3}^0 - (r+1)(q+1)u_{\omega,p,q+1,r+1}^0 - \frac{(r+1)(p+2)!}{q p!} u_{\omega,p+2,q-1,r+1}^0 \right] - \frac{1}{\omega+1} \sum_{k=0}^{\omega} \\ & \left\{ \sum_{i=0}^p \sum_{j=0}^q \sum_{l=0}^r [(i+1)u_{\omega-k,p-i,q-j,r-l}^1 u_{k,i+1,j,l}^2 + (j+1)u_{\omega-k,p-i,q-j,r-l}^0 u_{k,i,j+1,l}^2 + (l+1)u_{\omega-k,p-i,q-j,r-l}^2 u_{k,i,j,l+1}^2] - \frac{r+1}{q} \right. \\ & \left. \sum_{i=0}^p \sum_{j=0}^{q-1} \sum_{l=0}^{r+1} [(i+1)u_{\omega-k,p-i,q-1-j,r+1-l}^1 u_{k,i+1,j,l}^0 + (j+1)u_{\omega-k,p-i,q-1-j,r+1-l}^0 u_{k,i,j+1,l}^0 + (l+1)u_{\omega-k,p-i,q-1-j,r+1-l}^2 u_{k,i,j,l+1}^0] \right\} \\ & + \frac{1}{\omega+1} \left(g_{\omega,p,q,r}^2 - \frac{r+1}{q} g_{\omega,p,q-1,r+1}^0 \right) \quad (21) \end{aligned}$$

(17) constitutes the third relation between the velocity coefficients. These three recurrence relations enable the calculation of the velocity. Then, the pressure coefficients are calculated from the velocities coefficients by a momentum equation such as (19).

B. Analytic solution

As per the section II, the next step consists in writing the coefficients $u_{\omega,p,q,r}^i$ as a function of the boundary coefficients $u_{\omega,p=0 \text{ or } 1, q=0 \text{ or } 1, r=0 \text{ or } 1}^i$ and the initial ones $u_{\omega=0,p,q,r}^i$. The resolution of the equations (17), (20) and (21) leads to the following theorem:

Theorem 1: The velocity coefficients can be expressed as

$$\begin{aligned} u_{\omega,p,q,r}^{\alpha} = & \sum_{i=0}^{\eta(p,q,r,\alpha,\omega-1)} \left\{ \left[\prod_{j=1}^{\omega} \prod_{k=1}^{2^{j-1}} \Gamma(\rho_1(i, 1, k, j, p, q, r, \alpha, \omega), \rho_0(i, 1, k, j, p, q, r, \alpha, \omega), \rho_2(i, 1, k, j, p, q, r, \alpha, \omega), \right. \right. \\ & \left. \left. \rho_{\alpha}(i, 1, k, j, p, q, r, \alpha, \omega), \rho_{\omega}(i, 1, k, j, p, q, r, \alpha, \omega), \Theta(k-2+2^{j-1}, i, p, q, r, \alpha, \omega, 0)) \right] \right. \\ & \left. \left[\prod_{k=1}^{2^{\omega}} \mathcal{J}(\aleph_1(i, 1, k, p, q, r, \alpha, \omega), \aleph_0(i, 1, k, p, q, r, \alpha, \omega), \aleph_2(i, 1, k, p, q, r, \alpha, \omega), \aleph_{\alpha}(i, 1, k, p, q, r, \alpha, \omega), \aleph_{\omega}(i, 1, k, p, q, r, \alpha, \omega)) \right] \right\} \quad (22) \end{aligned}$$

with

$$\mathcal{J}(p, q, r, \alpha, \omega) = \begin{cases} 1 & \text{if } p < 0 \text{ or } q < 0 \text{ or } r < 0 \text{ or } \alpha < 0 \text{ or } \omega < 0 \\ u_{\omega,p,q,r}^{\alpha} & \text{otherwise} \end{cases} \quad (23)$$

The functions \aleph_i are such that the function \mathcal{J} in (22) always returns an initial or boundary coefficient. The pressure coefficients are calculated by (19). Then,

$$\begin{cases} U^{\alpha} = \sum_{\omega,p,q,r=0}^{\infty} u_{\omega,p,q,r}^{\alpha} t^{\omega} x^p y^q z^r \\ P = \sum_{\omega,p,q,r=0}^{\infty} P_{\omega,p,q,r} t^{\omega} x^p y^q z^r \end{cases} \quad (24)$$

satisfy the incompressible Navier-Stokes equations.

All the functions required to calculate the coefficients are defined in the appendix A. They progressively appear according to order of use in the construction of the functions in (22). The functions \aleph_i , ρ_i and Θ are recursive and no general expressions for these functions have been established because of their complexity. Consequently, they are very time consuming. A personal computer can only manage calculations for $\omega = 1$ and reasonable p, q, r until around 5. Parallel calculations on a powerful computer allow the computation of the coefficients for $\omega = 2$ and reasonable p, q, r as well. Regarding the coefficients with $\omega > 2$, the computational cost is prohibitive.

A check that no miscalculation occurs during the hand calculation has been performed until $\omega = 2$ with the Python code in appendix B. The absence of any error for low indices should substantiate that the relation (22) is correct for higher indices.

Because of the restrictive computational cost, a strategy need be set up to be able to apply this formulation to a physical case. A first option would be to find an expression for each function even if a personal attempt failed because of their apparent erratic behaviour. A second option would be the step by step storage of the functions values for all ω, α, p, q, r . Knowing all the functions values for $\omega < \omega_0$ would simplify the calculation of the functions for $\omega = \omega_0$ because it would only need one step instead of $\omega_0 - 1$ steps. This solution is the most common one to calculate recursive functions. Afterwards, each coefficient would be only a sum of the boundary coefficients. Numerically, it is easily parallelisable and only the sum size could constitute an obstacle.

C. Convergence domain

Despite investigations, no proof regarding the convergence domain has been established. The general expression of $u_{\omega,p,q,r}^{\alpha}$ seems prohibitive to estimate the convergence domain. A simpler formulation appears necessary to manage the theoretical calculation of the convergence domain. Therefore, the existence of an analytic solution cannot be maintained.

However, numerical tests can be undertaken for simple boundary conditions to get an idea of the convergence. Numerical tests on a personal computer show that polynomial boundary conditions yield many zero terms. Moreover, the other terms of the series tend to zero. Unfortunately, the calculation time prevents any conclusion.

IV. CONCLUSION

The investigation concerns the solution of the incompressible Navier-Stokes equations resulting from the application of the power series method. By assuming that the velocity and the pressure are analytic, the problem consists in calculating the power series coefficients. This method only provides an analytic solution if it exists.

The approach is commonly used in one dimension but rarely for multidimensional problems. Thus, it is first applied to an accessible differential equation with the aim of displaying some challenges. In particular, solving multidimensional equations need analytic boundary conditions.

Regarding the incompressible Navier-Stokes equations, an exact power series solution is given. The check can be performed thanks to a Python algorithm provided within the appendix B. Nonetheless, the convergence domain seems not easily computable and it is not investigated in the publication. Therefore, the existence of an analytic solution is not settled.

To complete this study, two major issues should be examined. First, the formulation of the solution is complex and makes the resolution very time-consuming. The recursive functions taking part in the solution must be enhanced to shorten computations. The quick fix could be the storage of each step one and for all. This achievement should contribute to a better understanding of the analytic solution. Second, the convergence domain must be studied theoretically. It should depend on the boundary conditions as well as the initial ones.

If the solution to the general incompressible Navier-Stokes equations is unique, then the solution provided in this publication is the exact solution within its convergence domain.

APPENDIX A

The appendix itemizes the functions necessary in the calculation of the analytic solution (22). Hereinafter, E is the floor function, \mathcal{H} is the Heaviside step function, δ is the Kronecker delta and $\text{Mod}(x, y)$ means x modulo y .

$$Ip(x) = \begin{cases} 2 & \text{if } E\left(\frac{x}{2}\right) = \frac{x}{2} \\ 1 & \text{if } E\left(\frac{x}{2}\right) \neq \frac{x}{2} \end{cases} \quad (25)$$

$$Ip_b(j, k) = \begin{cases} 0 & \text{if } j = 0 \\ Ip\left(E\left(\frac{k+1-2^{j-1}}{2^{j-1}}\right)\right) & \text{if } j \neq 0 \end{cases} \quad (26)$$

$$\mathcal{R}(x, y) = x - yE\left(\frac{x}{y}\right) \quad (27)$$

$$\xi(z, p, q, \alpha, n) = \begin{cases} -1 & \text{if } z = 0 \\ p + 2(\alpha - 1) & \text{if } z = 1 \\ p & \text{if } z = 2 \\ p + 2 - \alpha & \text{if } z = 3 \\ p + 1 & \text{if } z = 4 \\ p + (2 - \alpha)(2E\left(\frac{q}{2}\right) + 1) & \text{if } z = 5 \\ p + (-1)^{\alpha+1}2n + 3\alpha - 4 + 2(\alpha - 1)E\left(\frac{q}{2}\right) & \text{if } z = 6 \\ p + (-1)^{\alpha+1}2n + 2(\alpha - 1)E\left(\frac{q}{2}\right) & \text{if } z = 7 \\ p + (-1)^{\alpha+1}(2n - 1) + 2(\alpha - 1)E\left(\frac{q}{2}\right) & \text{if } z = 8 \end{cases} \quad (28)$$

$$\Delta(z, q) = \begin{cases} -1 & \text{if } z = 0 \\ q & \text{if } z = 1 \\ q + 2 & \text{if } z = 2 \\ q + 1 & \text{if } z = 3 \\ q & \text{if } z = 4 \\ q - 2E\left(\frac{q}{2}\right) + 1 & \text{if } z = 5 \\ q - 2E\left(\frac{q}{2}\right) + 1 & \text{if } z = 6 \\ q - 2E\left(\frac{q}{2}\right) + 2 & \text{if } z = 7 \\ q - 2E\left(\frac{q}{2}\right) + 2 & \text{if } z = 8 \end{cases} \quad (29)$$

$$\epsilon(z, q, r, \alpha, n) = \begin{cases} -1 & \text{if } z = 0 \\ r + 2(2 - \alpha) & \text{if } z = 1 \\ r & \text{if } z = 2 \\ r + \alpha - 1 & \text{if } z = 3 \\ r + 1 & \text{if } z = 4 \\ r + (\alpha - 1)(2E\left(\frac{q}{2}\right) + 1) & \text{if } z = 5 \\ r + (-1)^\alpha 2n - 3\alpha + 5 + 2(2 - \alpha)E\left(\frac{q}{2}\right) & \text{if } z = 6 \\ r + (-1)^\alpha 2n + 2(2 - \alpha)E\left(\frac{q}{2}\right) & \text{if } z = 7 \\ r + (-1)^\alpha (2n - 1) + 2(2 - \alpha)E\left(\frac{q}{2}\right) & \text{if } z = 8 \end{cases} \quad (30)$$

$$\kappa(z, \alpha) = \begin{cases} -1 & \text{if } z = 0 \\ \alpha & \text{if } z = 1 \\ \alpha & \text{if } z = 2 \\ 0 & \text{if } z = 3 \\ 3 - \alpha & \text{if } z = 4 \\ 0 & \text{if } z = 5 \\ 0 & \text{if } z = 6 \\ \alpha & \text{if } z = 7 \\ 3 - \alpha & \text{if } z = 8 \end{cases} \quad (31)$$

& \frac{1}{\omega} \sum_{n=1}^{E\left(\frac{q}{2}\right)-2} \sum_{m=1}^n (-1)^{n+1} \binom{n}{m} \frac{(X_{3-\alpha}+2m)!(q-2-2n)!(X_\alpha-2m+2n+2)!}{p!q!r!} \\
& g_{\omega-1,p+2m(-1)^\alpha+(2-\alpha)(2n+2),q-2-2n,r+2m(-1)^{\alpha+1}+(\alpha-1)(2n+2)}^\alpha \quad (56)
\end{aligned}$$

Notations are required to simplify the following formulae. Three propositions are introduced:

$$P_1 : \omega > 0, p > 1, q > 1, r > 1$$

$$P_2 : \omega < 0 \text{ or } p < 0 \text{ or } q < 0 \text{ or } r < 0$$

$$P_3 : \omega = 0 \text{ or } 0 \leq p \leq 1 \text{ or } 0 \leq q \leq 1 \text{ or } 0 \leq r \leq 1$$

For convenience, the notation $F = F(z, \omega, p, q, r, \alpha, n)$ is used for the next equation,

$$F = \begin{cases} F_0(\omega, p, q, r, \alpha) + \widetilde{F}_0(\omega, p, q, r, \alpha) & \text{if } z = 0 \text{ and } P_1 \text{ is true} \\ u_{\omega,p,q,r}^\alpha & \text{if } z = 0 \text{ and } P_1 \text{ is false} \\ \frac{\nu}{\omega}(X_{3-\alpha}+1)(X_{3-\alpha}+2) & \text{if } z = 1 \text{ and } n = 1 \\ \frac{\nu}{\omega}(q+1)(q+2) & \text{if } z = 2 \text{ and } n = 1 \\ -\frac{\nu}{\omega}(q+1)(X_\alpha+1) & \text{if } z = 3 \text{ and } n = 1 \\ -\frac{\nu}{\omega}(p+1)(r+1)\mathcal{H}(q-4) & \text{if } z = 4 \text{ and } n = 1 \\ \frac{\nu}{\omega}(-1)^{E\left(\frac{q}{2}\right)} \frac{(X_{\alpha}+2E\left(\frac{q}{2}\right)+1)!(q-2E\left(\frac{q}{2}\right)+1)}{X_\alpha!q!} & \text{if } z = 5 \text{ and } n = 1 \\ \frac{\nu}{\omega}(-1)^{E\left(\frac{q}{2}\right)} \frac{(E\left(\frac{q}{2}\right))_{n-1} (X_{\alpha}+2n-1)!(X_{3-\alpha}+2E\left(\frac{q}{2}\right)-2n+2)!(1+q-2E\left(\frac{q}{2}\right))}{p!q!r!} & \text{if } z = 6 \\ 2\frac{\nu}{\omega}(-1)^{E\left(\frac{q}{2}\right)+1} \frac{(E\left(\frac{q}{2}\right)_{n-1}) (X_{\alpha}+2n)!(X_{3-\alpha}+2E\left(\frac{q}{2}\right)-2n)!(1+2q-4E\left(\frac{q}{2}\right))}{p!q!r!} & \text{if } z = 7 \\ 2\mathcal{H}(q-4)\frac{\nu}{\omega}(-1)^{E\left(\frac{q}{2}\right)+1} \frac{(E\left(\frac{q}{2}\right)_{n-1}) (X_{\alpha}+2n-1)!(X_{3-\alpha}+2E\left(\frac{q}{2}\right)-2n+1)!(1+2q-4E\left(\frac{q}{2}\right))}{p!q!r!} & \text{if } z = 8 \\ 0 & \text{otherwise} \end{cases} \quad (57)$$

$$D(p, q, r, \alpha, \tau) = \sum_{j=1}^{9\left(\frac{q}{2}\right)^2-9E\left(\frac{q}{2}\right)+6} \mathcal{H} \left(\frac{\tau-1}{\sum_{k=0}^{j-1} S(p, q, r, \alpha, k)} - 1 \right) \quad (58)$$

$$\mathcal{I}(p, q, r, \alpha, \tau) = \tau - \sum_{j=1}^{9E\left(\frac{q}{2}\right)^2-9E\left(\frac{q}{2}\right)+6} S(p, q, r, \alpha, j-1) \mathcal{H} \left(\frac{\tau-1}{\sum_{k=0}^{j-1} S(p, q, r, \alpha, k)} - 1 \right) \quad (59)$$

$$\begin{aligned}
\sigma(p, q, r, \alpha) = & \left[2E\left(\frac{q}{2}\right)^4 + (4X_\alpha + 6X_{3-\alpha} + 8)E\left(\frac{q}{2}\right)^3 + (9X_\alpha X_{3-\alpha} + 1.5X_\alpha + 3X_{3-\alpha} - 8)E\left(\frac{q}{2}\right)^2 - \right. \\
& \left. (9X_{3-\alpha}X_\alpha + 5.5X_\alpha + 9X_{3-\alpha} + 2)E\left(\frac{q}{2}\right) + 6X_\alpha X_{3-\alpha} + 6X_\alpha + 9X_{3-\alpha} + 9 \right] q - 3.2E\left(\frac{q}{2}\right)^5 - (6X_\alpha + 8X_{3-\alpha} + 8)E\left(\frac{q}{2}\right)^4 + \\
& (6X_{3-\alpha} + 6X_\alpha - 10X_{3-\alpha}X_\alpha + 24)E\left(\frac{q}{2}\right)^3 + (14X_{3-\alpha} + 9X_\alpha + 22.5X_\alpha X_{3-\alpha} - 7)E\left(\frac{q}{2}\right)^2 - \\
& (9X_\alpha + 12X_{3-\alpha} + 12.5X_\alpha X_{3-\alpha} - 2.2)E\left(\frac{q}{2}\right) + 3(X_{3-\alpha} + 1)(X_\alpha + 1) - 8E\left(\frac{q}{2}\right) \quad (60)
\end{aligned}$$

$$\mathcal{T}(p, q, r, \alpha, j) = j + 1 - \sigma(p, q, r, \alpha) E\left(\frac{j}{\sigma(p, q, r, \alpha)}\right) \quad (61)$$

$$\chi(\omega, p, q, r, \alpha, i) = i - \sigma(p, q, r, \alpha)\omega \quad (62)$$

$$\mathcal{N}(\omega, p, q, r, \alpha, i) = \begin{cases} 1 & \text{if } \chi(\omega, p, q, r, \alpha, i) = 0 \\ E\left(\frac{\chi(\omega, p, q, r, \alpha, i) - 1}{8}\right) + 1 & \text{otherwise} \end{cases} \quad (63)$$

$$\mathcal{F}(p, q, r, \alpha, \omega) = \begin{cases} 0 & \text{if } p < 2 \text{ or } q < 2 \text{ or } r < 2 \text{ or } \omega \leq 0 \\ 1 & \text{if } a = 0 \text{ and } q = 2 \\ \sigma(p, q, r, \alpha)\omega + 8E\left(\frac{q}{2}\right) & \text{if } a \neq 0, \omega > 0 \text{ and } p, q, r > 1 \\ \sigma(p+1, q-1, r, 1)\omega + \sigma(p, q-1, r+1, 2)\omega + 16E\left(\frac{q-1}{2}\right) + 1 & \text{otherwise} \end{cases} \quad (64)$$

Two propositions need be introduced afresh:

$$R_1 : "i < \sigma(p, q, r, \alpha)\omega" \quad (65)$$

$$R_2 : "i \leq \mathcal{F}(p+1, q-1, r, 1, \omega)" \quad (66)$$

To minimize the size of the following formulae, "elif" will mean "else if" (same notation as the Python language).

$$T_0(\omega, p, q, r, \alpha, i) = \begin{cases} -1 & \text{if } P_2 \text{ is true} \\ q & \text{if } P_3 \text{ is true and } P_2 \text{ is false} \\ W_0(p, q, r, \alpha, D(p, q, r, \alpha, \mathcal{T}(p, q, r, \alpha, i)), \mathcal{I}(p, q, r, \alpha, \mathcal{T}(p, q, r, \alpha, i))) & \text{elif } (\alpha = 1 \text{ or } 2) \text{ and } R_1 \text{ is true} \\ \Delta(\chi(\omega, p, q, r, \alpha, i) - 8(\mathcal{N}(\omega, p, q, r, \alpha, i) - 1), q) & \text{elif } (\alpha = 1 \text{ or } 2) \text{ and } R_1 \text{ is false} \\ T_0(p+1, q-1, r, 1, i) & \text{elif } \alpha = 0 \text{ and } R_2 \text{ is true} \\ T_0(p, q-1, r+1, 2, i - \mathcal{F}(p+1, q-1, r, 1, \omega) - 1) & \text{otherwise} \end{cases} \quad (67)$$

$$T_1(\omega, p, q, r, \alpha, i) = \begin{cases} -1 & \text{if } P_2 \text{ is true} \\ p & \text{if } P_3 \text{ is true and } P_2 \text{ is false} \\ W_1(p, q, r, \alpha, D(p, q, r, \alpha, \mathcal{T}(p, q, r, \alpha, i)), \mathcal{I}(p, q, r, \alpha, \mathcal{T}(p, q, r, \alpha, i))) & \text{elif } (\alpha = 1 \text{ or } 2) \text{ and } R_1 \text{ is true} \\ \xi(\chi(\omega, p, q, r, \alpha, i) - 8(\mathcal{N}(\omega, p, q, r, \alpha, i) - 1), p, q, \alpha, \mathcal{N}(\omega, p, q, r, \alpha, i)) & \text{elif } (\alpha = 1 \text{ or } 2) \text{ and } R_1 \text{ is false} \\ T_1(p+1, q-1, r, 1, i) & \text{elif } \alpha = 0 \text{ and } R_2 \text{ is true} \\ T_1(p, q-1, r+1, 2, i - \mathcal{F}(p+1, q-1, r, 1, \omega) - 1) & \text{otherwise} \end{cases} \quad (68)$$

APPENDIX B

A Python code comparing the exact analytic solution (22) with (17), (20) and (21) is supplied. The algorithm should yield 0. By replacing all dollar signs \$ by a tabulation, the code can be directly copied and run.
