# 2D Multilayer Analysis of Electrified Roads with Charging Box Discontinuities

Armelle Chabot and Pawan Deep

Materials and Structures Department

# Introduction

## Context and background

In order to attain the reduction of CO<sub>2</sub> emissions under the objectives of European Energy Agency (EEA 2016), one of the solutions proposed being is the electrified Roads (eRoad)

→ Challenge for 2030!

### Catenary Conduction

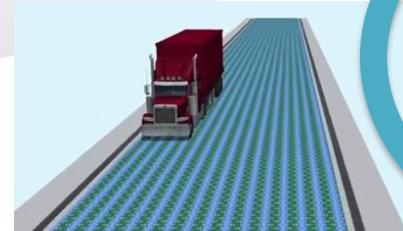

<http://www.siemens.com/presspicl/SIEMENS>

[https://www.youtube.com/watch?v=BtaAp\\_wTr7E](https://www.youtube.com/watch?v=BtaAp_wTr7E)

### Solar

### Induction

ORGANIZERS:

# Induction charging solution Without any contact

## Static

- Already tested (Nguyen et al., 2015)  
(Pérez et al., MC2016) ...
- Almost ready for the future...

## Dynamic / Main benefits for vehicles

- Time... no needs to park the EVs
- Smaller and lighter batteries (Seugmin et al., 2015)

Still Pb to solve from M&S pt of vue!

# Outlines

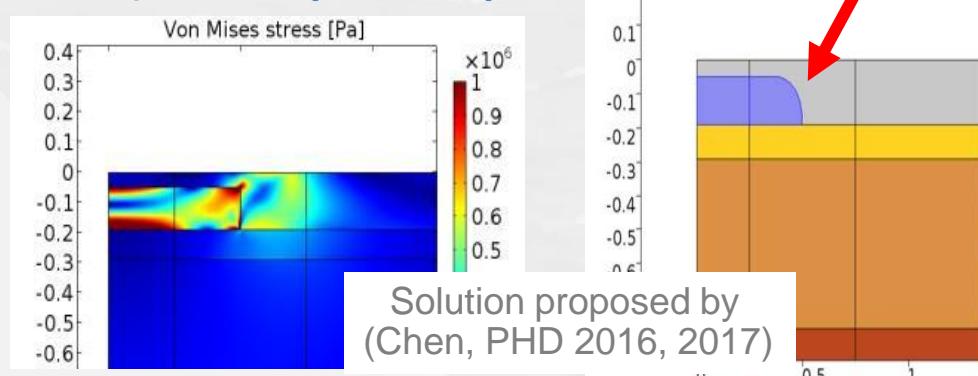

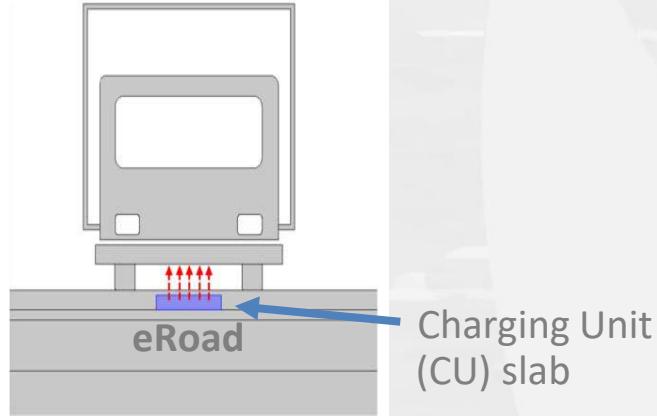

- 1 Intro / Context
- 2 M&S pavement needs: asphalt tRoads → eRoads
- 3 M4-5nW developments for eRoad analysis
- 4 Results and 1 alternative M&S eRoad proposal
- 5 Conclusion & Prospects

# M&S pavement needs

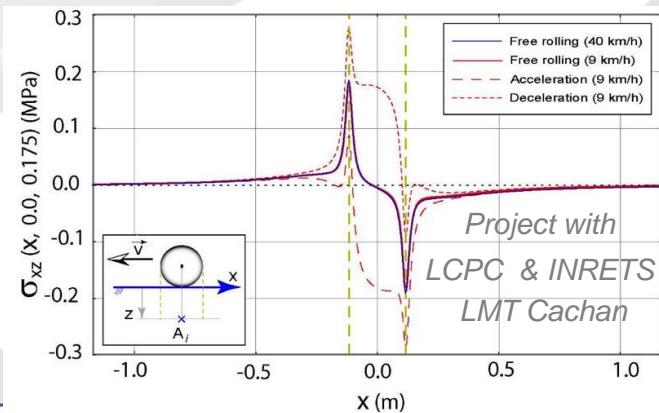

## Top layer problems

### Box inclusion (CC material) in asphalt pavements

Solution proposed by  
(Chen, PHD 2016, 2017)

### Lateral loads effects

Project with  
LCPC & INRETS  
LMT Cachan

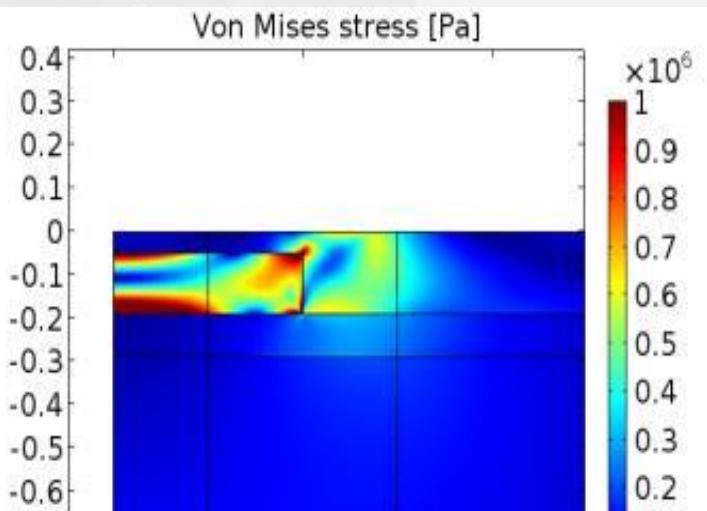

Hammou F. et al., 2010. Accelerating and Decelerating Effects of Tramway Loads moving on Bituminous Pavement. *M&S*, 43:1257-1269

# M&S pavement needs discontinuities...

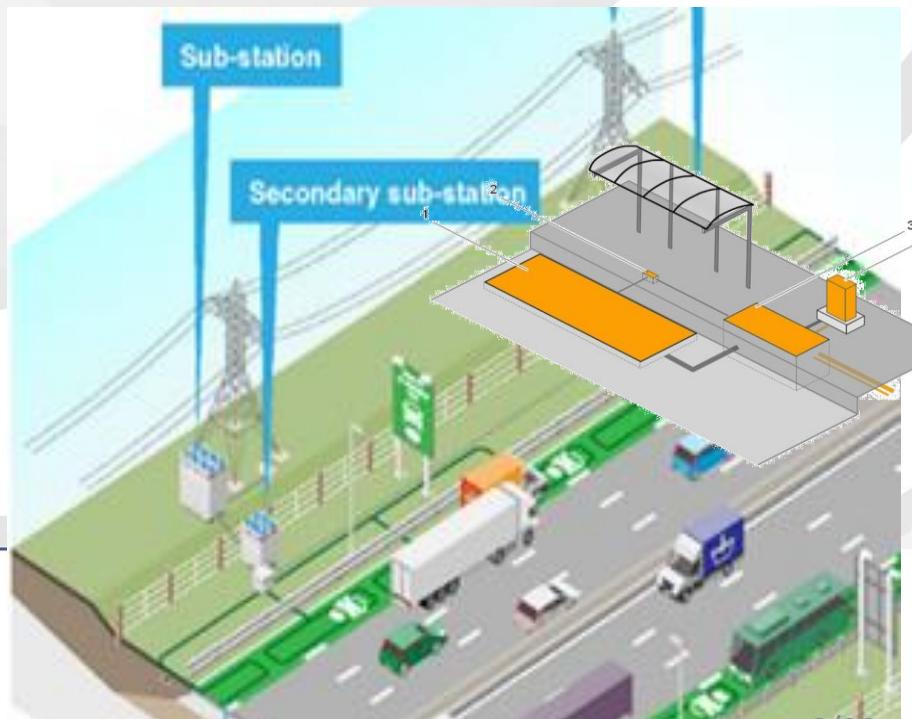

## Debonding (RILEM MCD2016, MCD STAR ChIII: Petit et al. 2018, Chen et al. 2018)

- $E_{layer}/E_{CU} \rightarrow (T^{\circ}\text{C}, \text{Load speed})$
- Boundary conditions

(Chen, PHD 2016, 2017)

Any cables somewhere?

# Outlines

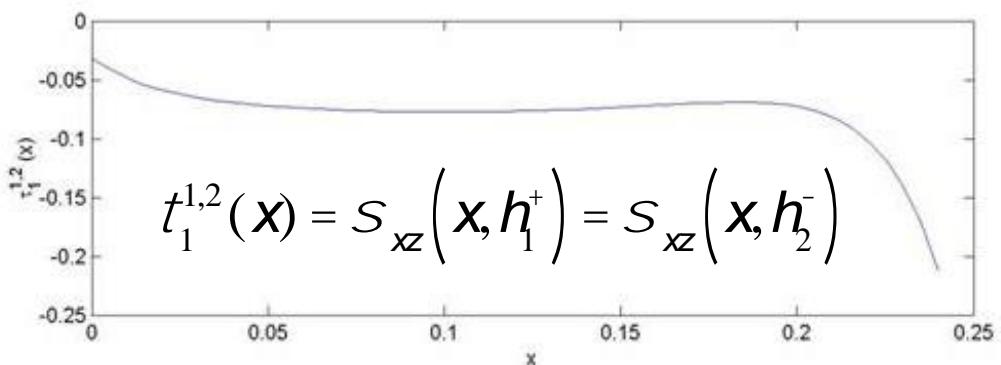

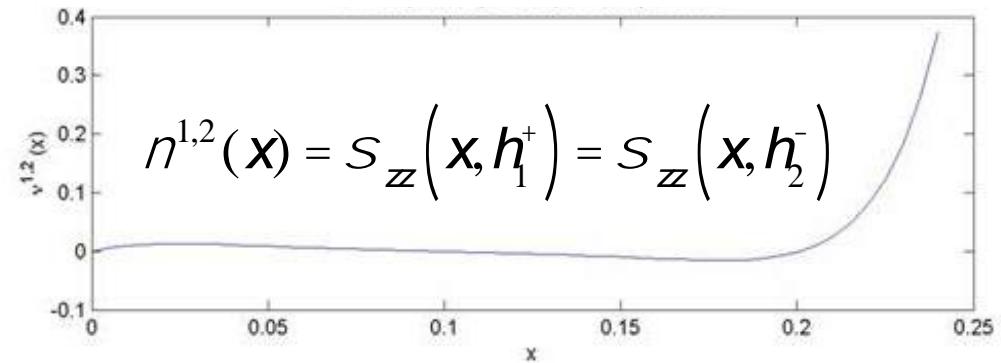

- 1 Intro / Context
- 2 M&S pavement needs: asphalt tRoads → eRoads
- 3 M4-5nW developments for eRoad analysis
- 4 Results and 1 alternative M&S eRoad proposal
- 5 Conclusion & Prospects

# Why? Debonding criteria ?

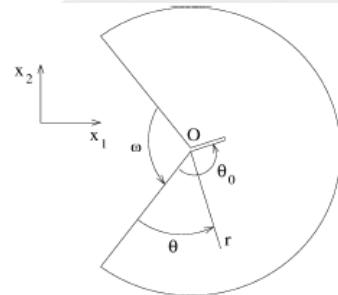

Interface stresses (2D strain plane)

For homogeneous material ok!

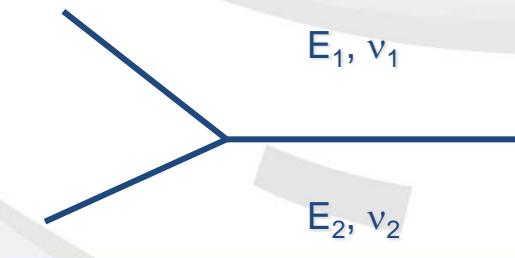

$$\bar{\bar{\sigma}} = \frac{K_I}{\sqrt{r}} f_I(\theta) + \frac{K_{II}}{\sqrt{r}} f_{II}(\theta) + \dots \quad \left\{ \begin{array}{l} G(\bar{\bar{\sigma}}, \bar{u}) = - \frac{\partial E_p(\bar{\bar{\sigma}}, \bar{u}, a)}{\partial a} \\ G < G_c \end{array} \right.$$

$$U(x_1, x_2) = U(O) + kr^\lambda u(\theta) + \dots$$

The critical value  $k_c$  depends on the opening  $\omega$  of the notch, it must be experimentally determined. The factors  $k$  and  $k_c$  are strongly dependent of the singularity and in particular of the exponent  $\lambda$ . Units for

For bi-material, it is worst,  $\lambda$  can be a complexe field

- Point stress?
- Average stress?
- Energy release rate -> fatigue...: Paris law?

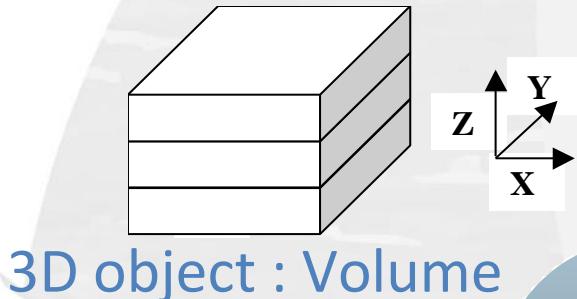

# Multi-particle Model of Multi-layer Materials (M4) – 5n

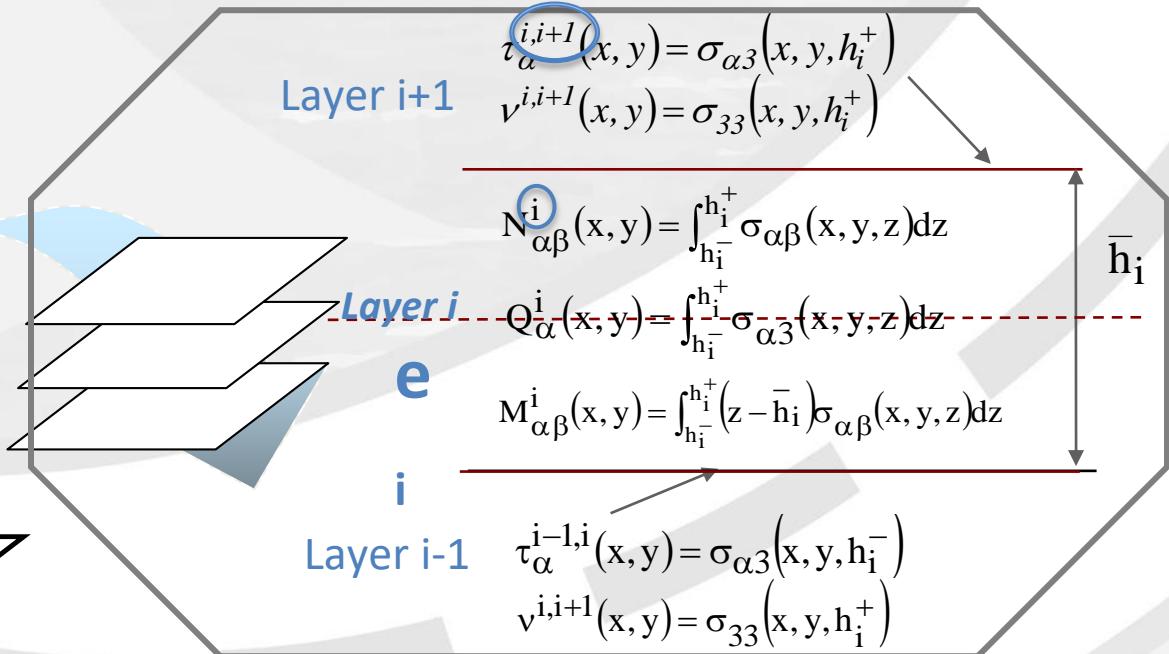

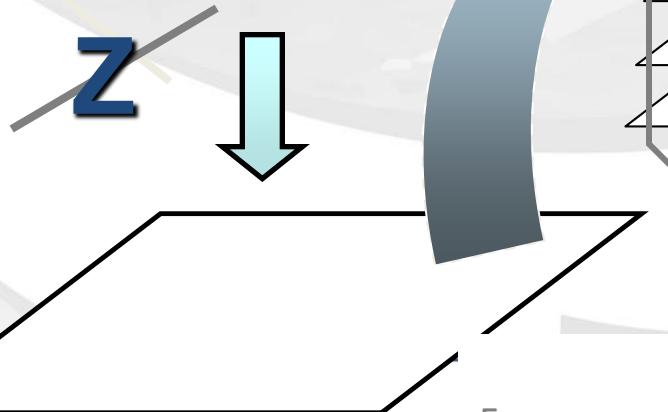

(Chabot, 1997)

(Chabot & Ehrlacher, 1998)

- Polynomial approximation per layer  $i$  in  $z$  for  $\sigma_{ij}$
- Hellinger-Reissner formulation (Reissner, 1950)

3D object : Volume

Chabot A., Ehrlacher A. 1998, JNC11, Arcachon, 3, 1389-1397

For pavements (Tran et al., RILEM CP2004) (Chabot et al., BLPC2005) etc

# M4-5nW 2D tool

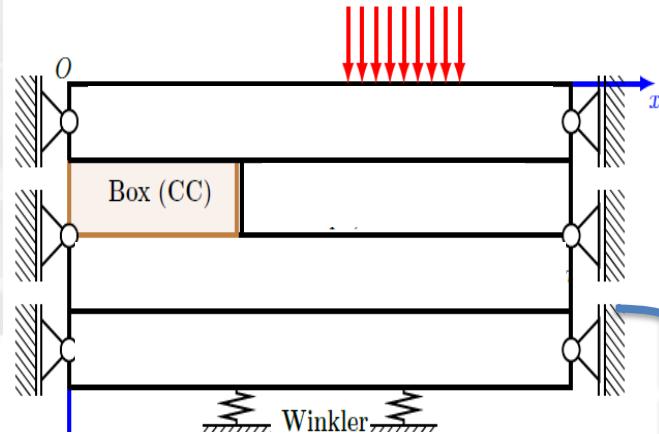

(Nasser, PHD 2016) (Nasser and Chabot, 2018)

2D Problem → only 1D system to solve with matrix (12,12)

$$AX''(x) + BX'(x) + CX(x) = DY^{0,1'}(x) + EY^{n,n+1'}(x) + FY^{0,1}(x) + GY^{n,n+1}(x)$$

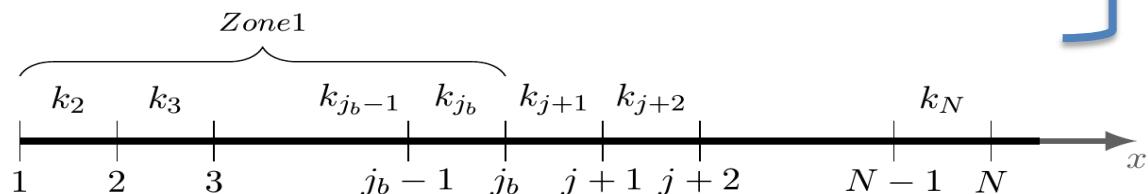

$$X = \begin{bmatrix} X^1 \\ X^2 \\ X^3 \\ X^4 \end{bmatrix}_{12 \times 1} \quad [X^i] = \begin{bmatrix} U_1^i \\ \phi_1^i \\ U_3^i \end{bmatrix}$$

$$[Y^{i,i+1}] = \begin{bmatrix} \tau_1^{i,i+1} \\ \nu^{i,i+1} \end{bmatrix}$$

Numerically → Newmark method

$$\frac{X'_{j+1} + X'_j}{2} = \frac{X_{j+1} + X_j}{k_{j+1}}$$

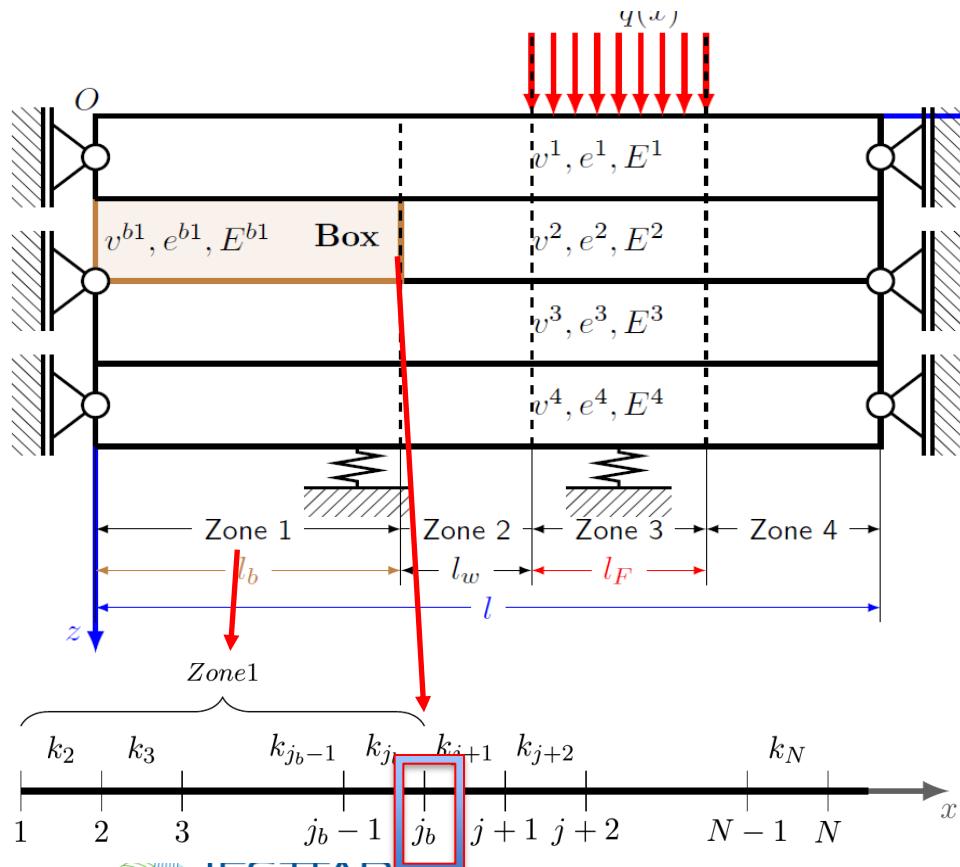

Nasser H., Chabot A., 2018. A Half-analytical Elastic Solution for 2D Analysis of Cracked Pavements. Advances in Engineering Software, 117: 107-122

$$U_1(x, z) = U_1^i(x) + (z - \bar{h}_i)\phi_1^i(x) + \Delta U_1^i(x)$$

# Introducing the material discontinuity (Deep, 2017)

$$A^I X''(x) + B^I X'(x) + C^I X(x) = D^I Y^{0,1'}(x) + E + F^I Y^{0,1}(x) + G^I Y^{n,n+1}(x)$$

## For zone with index I (CU)

1. Discretization posed issues as derivatives: in Newmark scheme used left and right nodes
2. All the matrices relating to zone 1 was to be modified in the code even before discretization, after discretization and for post processing

## After discretization

$$\mathbf{AX}(x) = \mathbf{BY}^{0,1}(x) + \mathbf{CY}^{n,n+1}(x) + \mathbf{D}$$

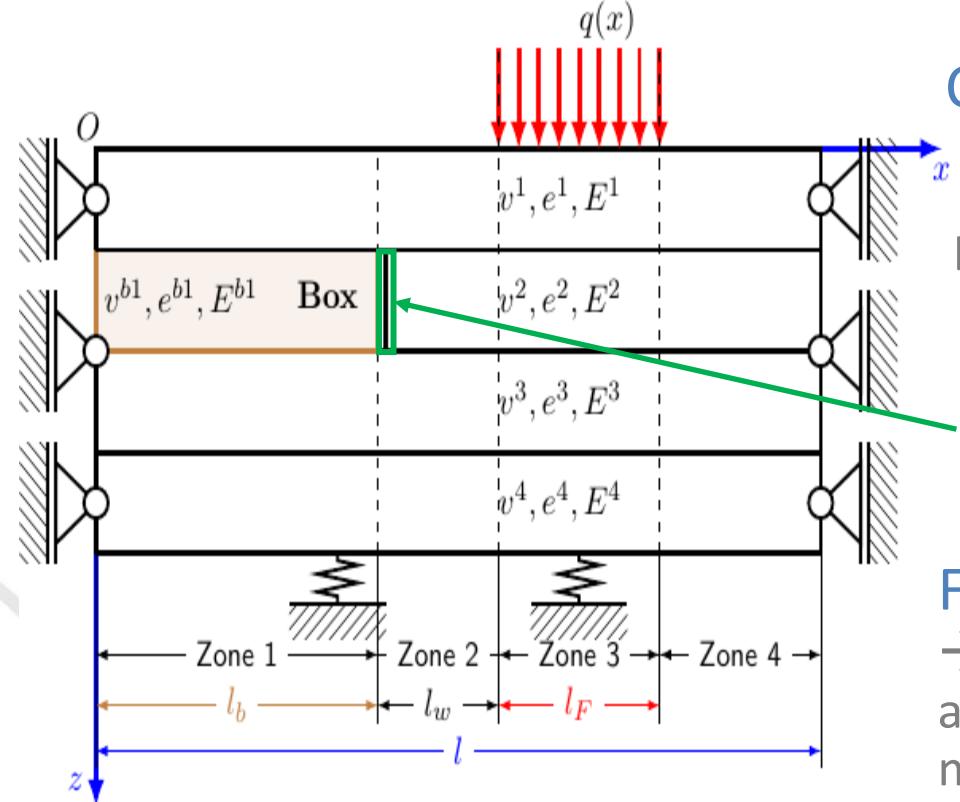

ORGANIZERS:

# Introducing material discontin. & 1 vertical crack

(Deep, 2017)

$$A^I X''(x) + B^I X'(x) + C^I X(x) = D^I Y^{0,1'}(x) + E^I Y^{n,n+1'}(x) + F^I Y^{0,1}(x) + G^I Y^{n,n+1}(x)$$

Crack discretization  $X_f = X_{jb}$

$$X_0 \quad | \quad X_f \quad | \quad X_{f+1} \quad | \quad X_N \quad x$$

Layer 2 stresses around this node are zero

$$\begin{cases} N_{11}^2(X_f) = 0 \\ M_{11}^2(X_f) = 0 \\ Q_1^2(X_f) = 0 \end{cases} \quad et \quad \begin{cases} N_{11}^2(X_{f+1}) = 0 \\ M_{11}^2(X_{f+1}) = 0 \\ Q_1^2(X_{f+1}) = 0 \end{cases}$$

For layer 2

→ Boundary condition on the left and right at the point of crack and so changes are made in the system

$$\mathbb{A}\mathbb{X}(x) = \mathbb{B}\mathbb{Y}^{0,1}(x) + \mathbb{C}\mathbb{Y}^{n,n+1}(x) + \mathbb{D}$$

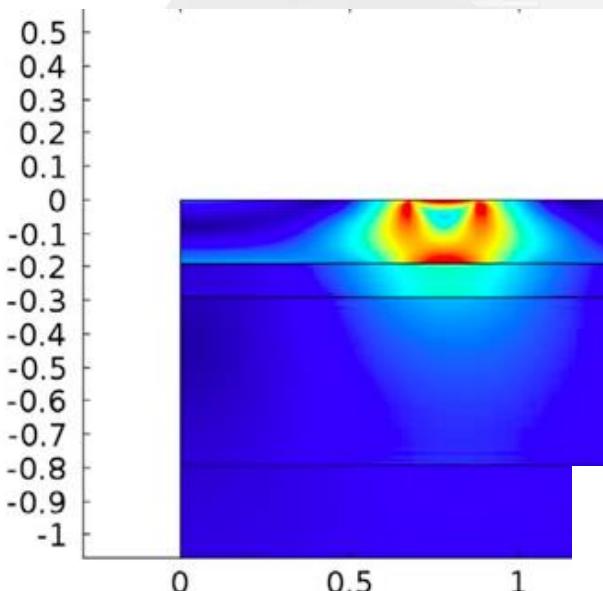

# Outlines

- 1 Intro / Context
- 2 M&S pavement needs: asphalt tRoads → eRoads
- 3 M4-5nW developments for eRoad analysis
- 4 Results and 1 alternative M&S eRoad proposal
- 5 Conclusion & Prospects

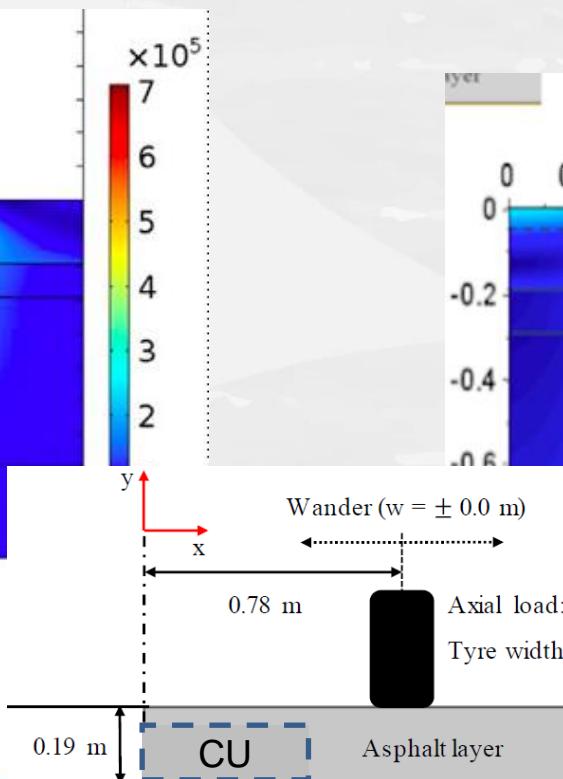

# 2D comparison M4-5nW vs (Chen, 2016) for tRoad

$$w=0, E^1=1000 \text{ MPa} = E^2$$

(Chen, 2016)(in Pa)

(d) Von Mises (MPa)

M4-5nW

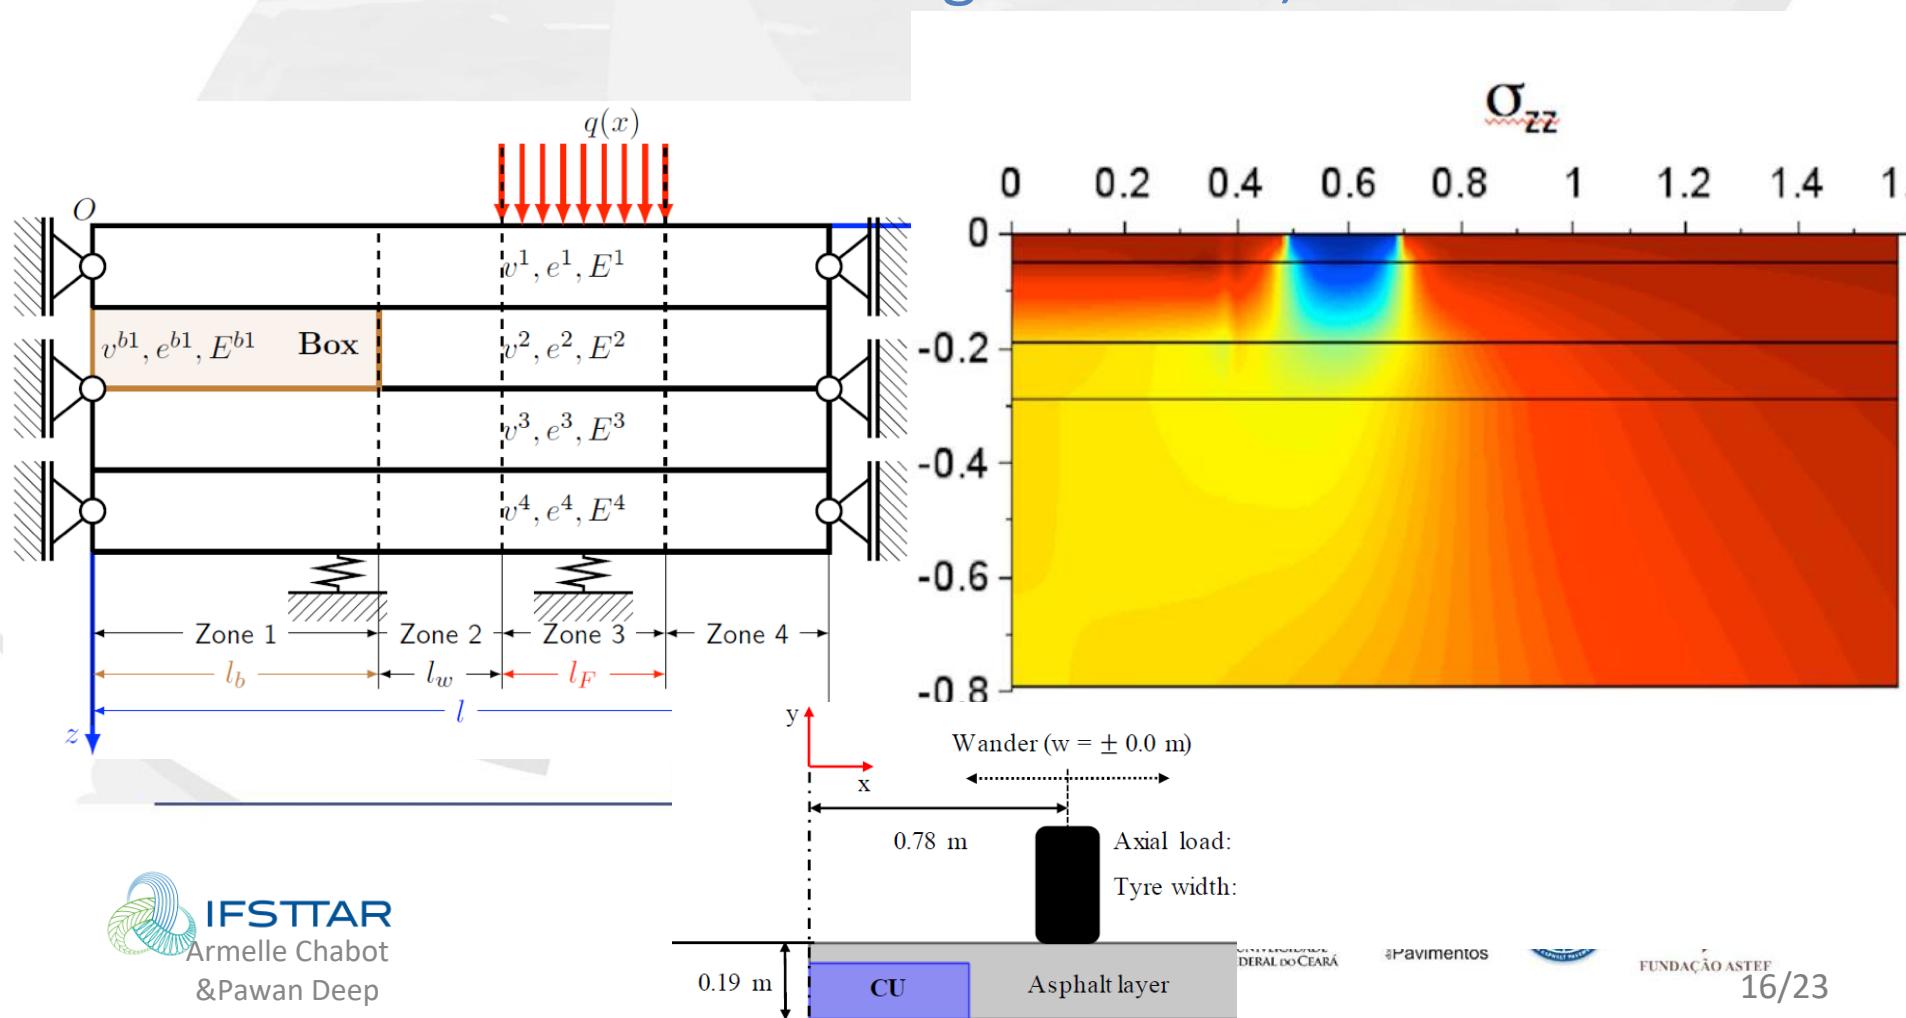

The material in the first layer is at more than 30°C at 10 Hz  
When the material in box is same as in layer, results match.

# M4-5nW Results

(Deep, 2017)

## Results due to load wandering at $w=-0.2$ , $E_1=1000\text{MPa}$ = $E_2$

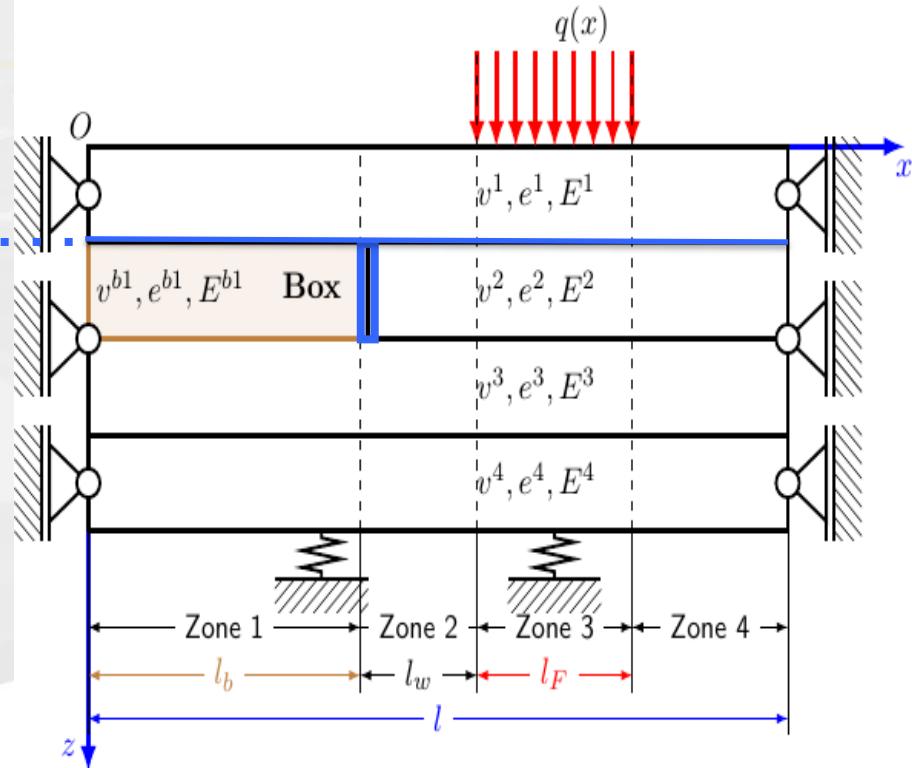

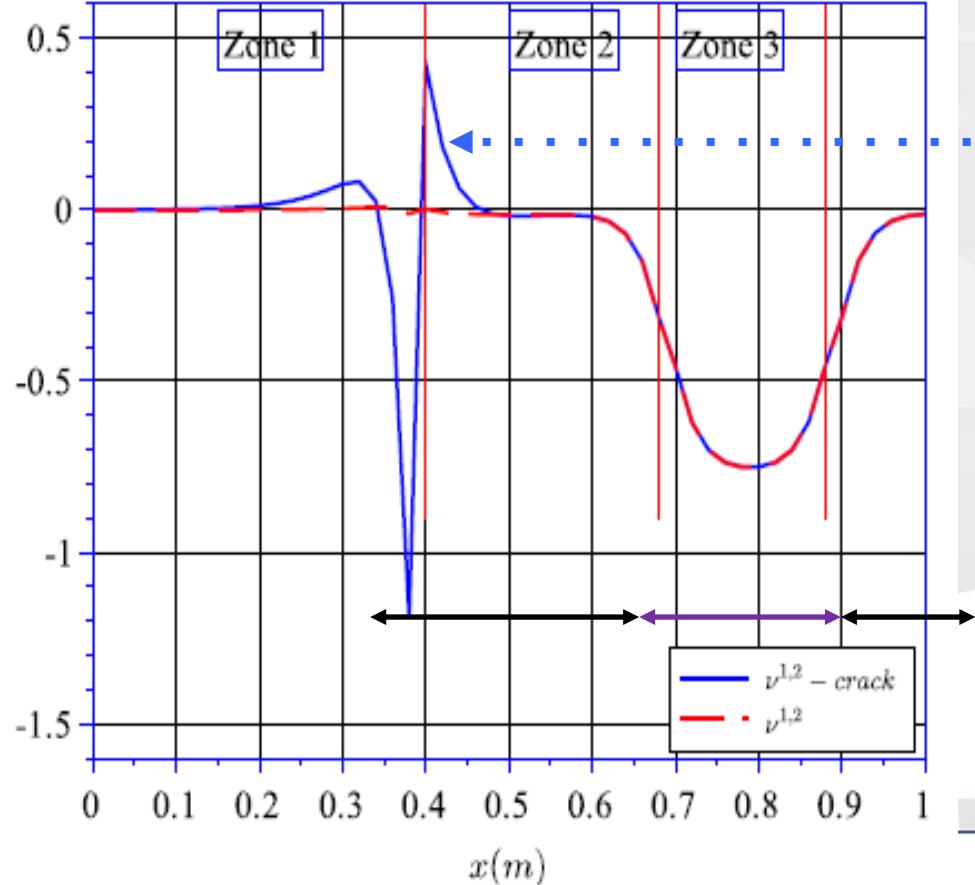

# Introducing the vertical crack

## Results at w=0

Interface Normal stresses

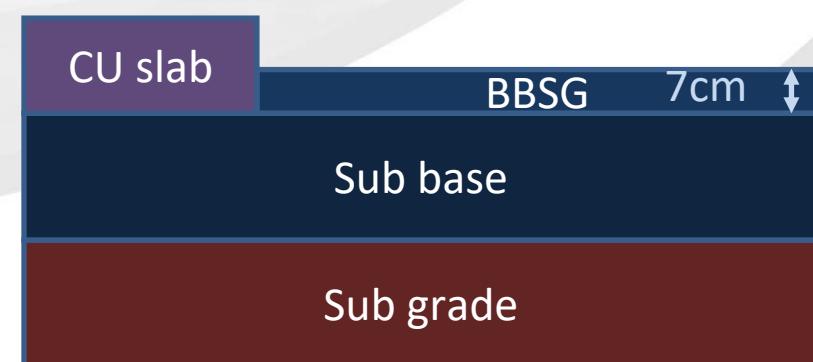

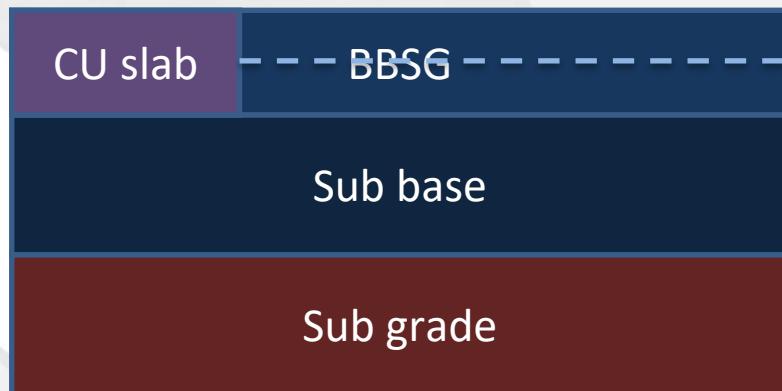

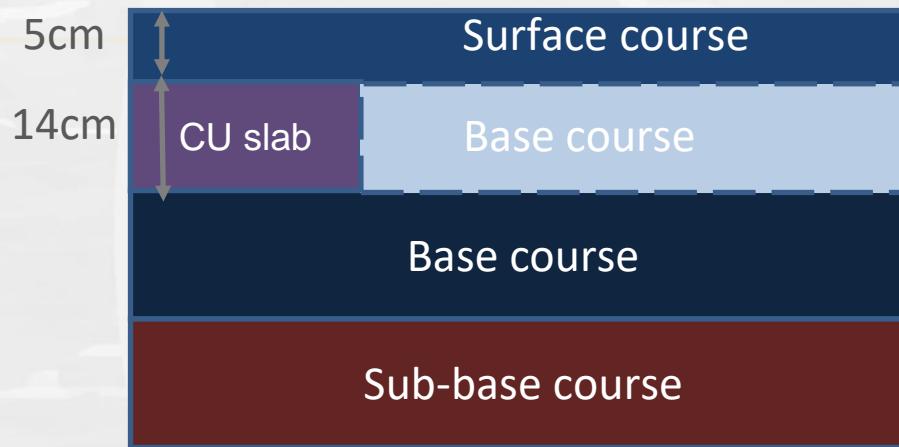

High interface stresses in case  
of vertical crack at  $w=0$

$$n^{1,2}(x) = S_{33}(x, h_1^+) = S_{33}(x, h_2^-)$$

# Adaptation of tRoads for eRoads?

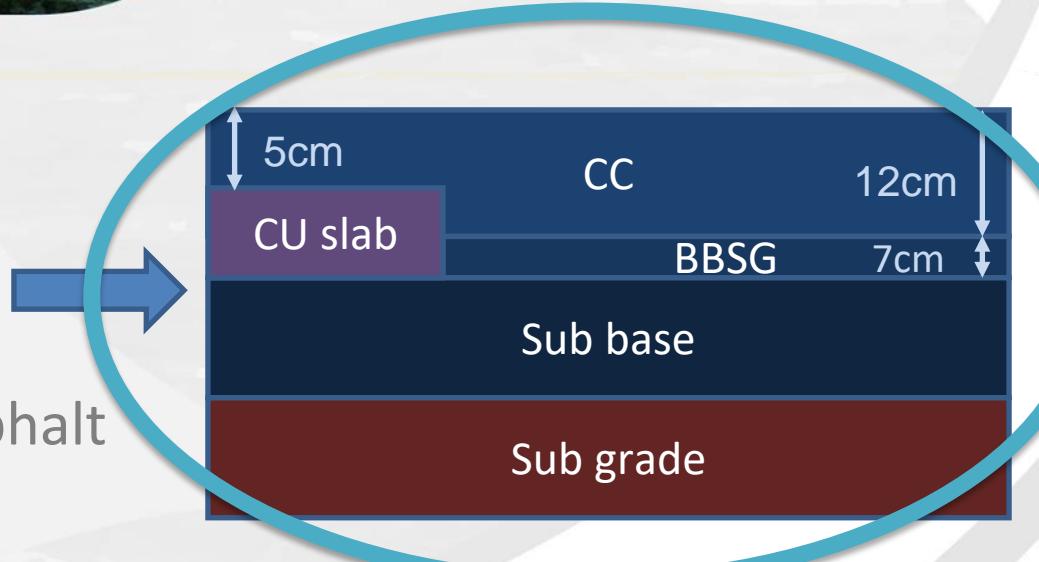

# Proposal

## 1 solution for the Adaption of tRoads

Why not using composite pavement such as UTW?

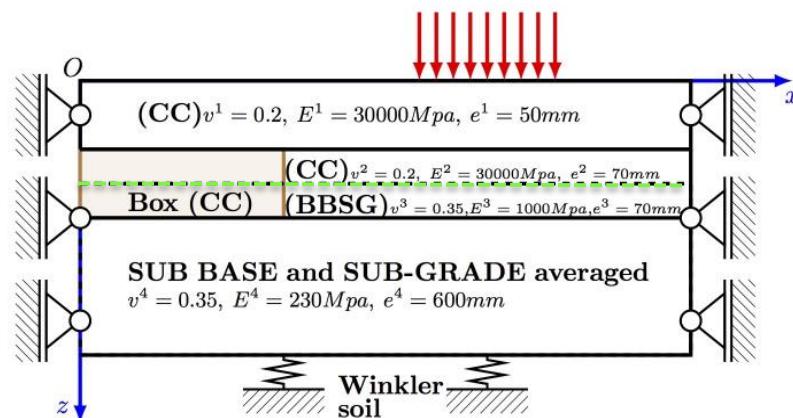

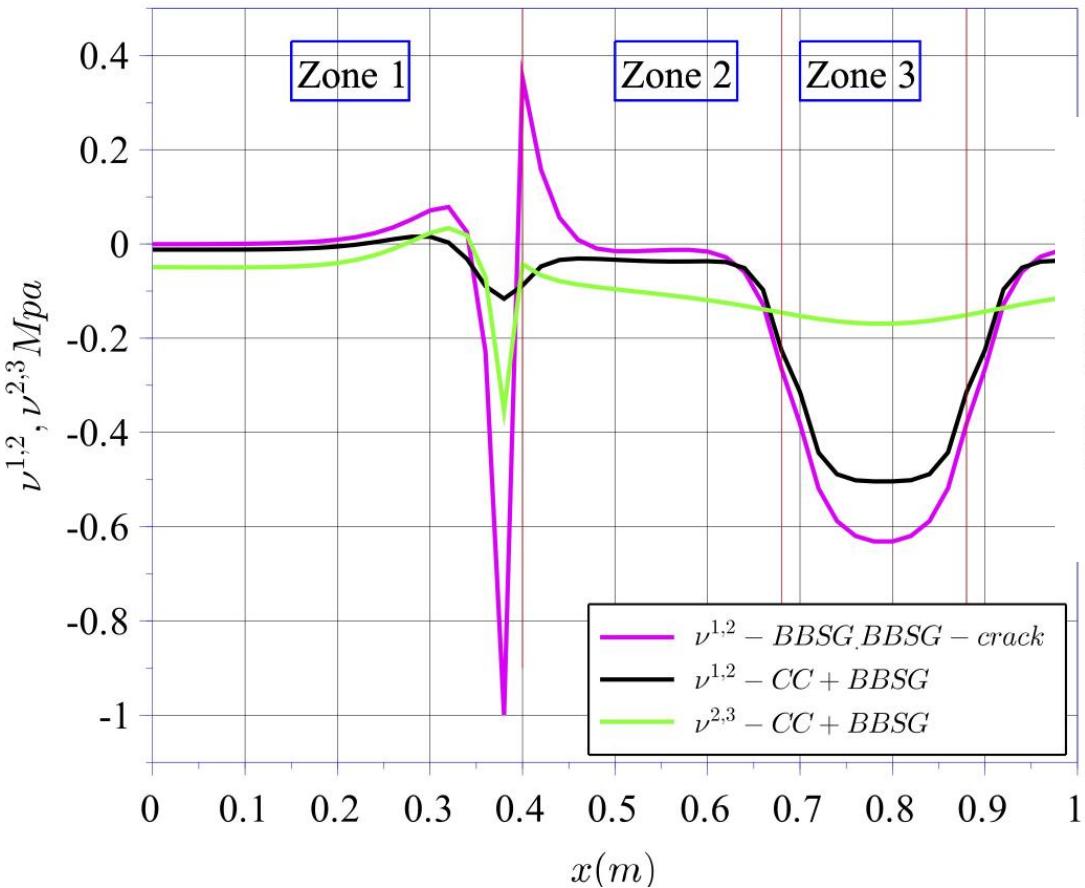

Knowing that Cement concrete(CC) overlaid on asphalt has a good bond (such as in UTW pavement) (Silfwerbrand,1998) (Pouteau et al., 2004) (Rasmussen et al., 2004) (Hun et al.,CP2012) (Chabot et al., 2008 2013 2017) (Barman et al., 2017) (Mateos, 2017), ...

Joints → cables

# Proposal

$$n^{1,2}(x) = S_{zz}(x, h_1^+) = S_{zz}(x, h_2^-)$$
$$n^{2,3}(x) = S_{zz}(x, h_2^+) = S_{zz}(x, h_3^-)$$

# Outlines

- 1 Intro / Context
- 2 M&S design needs: asphalt tRoads → eRoads
- 3 M4-5nW developments for eRoad analysis
- 4 Results and 1 alternative M&S eRoad proposal
- 5 Conclusion & Prospects

# Conclusion & prospects

eRoad PB tested with viscoelasticity model in (Chen, 2016), here discontinuities are studied between the CU & material layer

A better access to interface stress field plays for a better understanding of the PB → need to use alternative modeling

## Prospects

- Use of M4-5n 3D new development with FreeFem++ code (Nasser et al., 2018) → Partial debonding boundary conditions
- Lateral loading study according to (Hammoum et al., 2010)
- Thermal gradient effect studies specially for the use of top layers made with CC materials as done by (Chabot et al., 2005)
