## Abstract

The purpose of this document is to illustrate the piecewise polynomial model which has been derived from wind-tunnel measurement data of the Generic Transport Model (GTM) using the `pwpfit` toolbox. For implementation details and use in MATLAB, please refer to the source code at <https://github.com/pwpfit/GTMpw>.

## PRELIMINARIES

If not stated otherwise, all variables are in SI units. We will refer to the following axis systems of ISO 1151-1: the *body axis system* ( $x_f, y_f, z_f$ ) aligned with the aircraft's fuselage; the *air-path axis system* ( $x_a, y_a, z_a$ ) defined by the velocity vector  $\mathbf{V}_A$ ; and the *normal earth-fixed axis system* ( $x_g, y_g, z_g$ ). The orientation of the body axes with respect to the normal earth-fixed system is given by the attitude angles  $\Phi, \Theta, \Psi$  and to the air-path system by angle of attack  $\alpha$  and side-slip  $\beta$ ; the orientation of the air-path axes to the normal earth-fixed system is given by azimuth  $\chi_A$ , inclination  $\gamma_A$ , and bank-angle  $\mu_A$ . (Fig. 1.)

(a) Longitudinal axes ( $\beta = \mu_A = 0$ ). (b) Horizontal axes ( $\gamma_A = 0$ ).

## I. AERODYNAMIC COEFFICIENTS

The piecewise polynomial models of the aerodynamic coefficients are given

$$C_{\odot}(\alpha, \beta, \dots) = \begin{cases} C_{\odot}^{pre}(\alpha, \beta, \dots) & \text{if } \alpha \leq \alpha_0, \\ C_{\odot}^{post}(\alpha, \beta, \dots) & \text{else,} \end{cases} \quad (1)$$

where  $C_{\odot} \in \{C_X, C_Y, C_Z, C_l, C_m, C_n\}$  are polynomials in angle of attack, side-slip, surface deflections, and normalized body rates; and the boundary is found at

$$\alpha_0 = 16.111^\circ. \quad (2)$$

The polynomials in low and high angle of attack,  $C_{\odot}^{pre}$ ,  $C_{\odot}^{post}$ , are sums

$$C_{\odot}^{pre} = C_{\odot\alpha}^{pre}(\alpha) + C_{\odot\beta}^{pre}(\alpha, \beta) + C_{\odot\xi}^{pre}(\alpha, \beta, \xi) + C_{\odot\eta}^{pre}(\alpha, \beta, \eta) + C_{\odot\zeta}^{pre}(\alpha, \beta, \zeta) + C_{\odot p}^{pre}(\alpha, \hat{p}) + C_{\odot q}^{pre}(\alpha, \hat{q}) + C_{\odot r}^{pre}(\alpha, \hat{r}); \quad (3)$$

$$C_{\odot}^{post} = C_{\odot\alpha}^{post}(\alpha) + C_{\odot\beta}^{post}(\alpha, \beta) + C_{\odot\xi}^{post}(\alpha, \beta, \xi) + C_{\odot\eta}^{post}(\alpha, \beta, \eta) + C_{\odot\zeta}^{post}(\alpha, \beta, \zeta) + C_{\odot p}^{post}(\alpha, \hat{p}) + C_{\odot q}^{post}(\alpha, \hat{q}) + C_{\odot r}^{post}(\alpha, \hat{r}). \quad (4)$$

## II. EQUATIONS OF MOTION

We have the aerodynamic forces and moments in body axis

$$\begin{bmatrix} X^A \\ Y^A \\ Z^A \end{bmatrix}_f = \frac{1}{2} \varrho S V_A^2 \begin{bmatrix} C_X \\ C_Y \\ C_Z \end{bmatrix}; \quad \begin{bmatrix} L^A \\ M^A \\ N^A \end{bmatrix}_f = \frac{1}{2} \varrho S V_A^2 \begin{bmatrix} b C_l \\ c_a C_m \\ b C_n \end{bmatrix} + \begin{bmatrix} X^A \\ Y^A \\ Z^A \end{bmatrix}_f \times (\mathbf{x}_{cg} - \mathbf{x}_{cg}^{ref}); \quad (77)$$

and the resulting forces by rotation into the air-path axis system

$$X_a = (X_f^A \cos \alpha + Z_f^A \sin \alpha + X_f^F \cos \alpha) \cos \beta + Y_f^A \sin \beta; \quad (78)$$

$$Y_a = -(X_f^A \cos \alpha + Z_f^A \sin \alpha + X_f^F \cos \alpha) \sin \beta + Y_f^A \cos \beta; \quad (79)$$

$$Z_a = -X_f^A \sin \alpha + Z_f^A \cos \alpha - X_f^F \sin \alpha; \quad (80)$$

with the thrust  $X_f^F = F$  (engines aligned with the  $x_f$ -axis). The resulting forces lead to changes in air speed, side-slip, air-path inclination, and azimuth by

$$\dot{V}_A = \frac{1}{m} (X_a - mg \sin \gamma_A); \quad (81)$$

$$\dot{\beta} = \frac{1}{m V_A} Y_a; \quad (82)$$

$$\dot{\gamma}_A = -\frac{1}{m V_A} (Z_a \cos \mu_A + mg \cos \gamma_A); \quad (83)$$

$$\dot{\chi}_A = -\frac{1}{m V_A} Z_a \sin \mu_A. \quad (84)$$

For a symmetric plane ( $I_{xy} = I_{uz} = 0$ ), the resulting moments in body axis are given as

$$L_f = L_f^A - q r (I_z - I_y) + p q I_{zx}; \quad (85)$$

$$M_f = M_f^A + M_f^F - p r (I_x - I_z) - (p^2 - r^2) I_{zx}; \quad (86)$$

$$N_f = N_f^A - p q (I_y - I_x) - q r I_{zx}; \quad (87)$$

with  $M_f^F = l_t F$  (engines symmetric to the  $x_f$ - $y_f$ -plane and shifted vertically from the origin by  $l_t$ ) and the inertias  $I_x, I_y, I_z, I_{zx}$ . The changes of angular body rates are then given as

$$\dot{p} = \frac{1}{I_x I_z - I_{zx}^{(2)}} (I_z L_f + I_{zx} N_f); \quad (88)$$

$$\dot{q} = \frac{1}{I_y} M_f; \quad (89)$$

$$\dot{r} = \frac{1}{I_x I_z - I_{zx}^{(2)}} (I_{zx} L_f + I_x N_f). \quad (90)$$

Here, the normalized body rates have been used with

$$\begin{bmatrix} \hat{p} \\ \hat{q} \\ \hat{r} \end{bmatrix} = \frac{1}{2 V_A} \begin{bmatrix} b p \\ c_a q \\ b r \end{bmatrix} \iff \begin{bmatrix} p \\ q \\ r \end{bmatrix} = 2 V_A \begin{bmatrix} b^{-1} \hat{p} \\ c_a^{-1} \hat{q} \\ b^{-1} \hat{r} \end{bmatrix} \quad (91)$$

and

$$\begin{bmatrix} \dot{\hat{p}} \\ \dot{\hat{q}} \\ \dot{\hat{r}} \end{bmatrix} = \frac{1}{V_A} \left( \frac{1}{2} \begin{bmatrix} b \dot{p} \\ c_a \dot{q} \\ b \dot{r} \end{bmatrix} - \dot{V}_A \begin{bmatrix} \hat{p} \\ \hat{q} \\ \hat{r} \end{bmatrix} \right). \quad (92)$$

The change of attitude is finally obtained by rotation into normal earth-fixed axis system:

$$\dot{\Phi} = p + q \sin \Phi \tan \Theta + r \cos \Phi \tan \Theta; \quad (93)$$

$$\dot{\Theta} = q \cos \Phi - r \sin \Phi; \quad (94)$$

$$\dot{\Psi} = q \sin \Phi \cos^{-1} \Theta + r \cos \Phi \cos^{-1} \Theta. \quad (95)$$

### III. LONGITUDINAL MODEL

#### A. Aerodynamic Coefficients

The longitudinal aerodynamic coefficients,  $C_L, C_D, C_m$ , are obtained as

$$C_D(\alpha, \eta) = C_{D\alpha}(\alpha) + C_{D\eta}(\alpha, \eta) \quad \text{with}$$

$$C_{D\alpha}(\alpha) = \begin{cases} 0.029 - 0.110\alpha + 2.364\alpha^2 + 3.948\alpha^3 & \text{if } \alpha \leq 16.634^\circ \\ -0.170 + 1.427\alpha + 0.719\alpha^2 - 0.486\alpha^3 & \text{else} \end{cases}, \quad (98)$$

$$\begin{aligned} C_{D\eta}(\alpha, \eta) = & +0.008 - 0.012\alpha + 0.112\eta + 0.040\alpha^2 + 0.183\alpha\eta \\ & - 0.069\eta^2 - 0.053\alpha^3 - 0.043\alpha^2\eta - 0.070\alpha\eta^2 - 0.628\eta^3; \end{aligned} \quad (99)$$

$$C_m(\alpha, \eta) = C_{m\alpha}(\alpha) + C_{m\eta}(\alpha, \eta) \quad \text{with}$$

$$C_{m\alpha}(\alpha) = \begin{cases} 0.117 - 1.475\alpha + 8.475\alpha^2 - 32.729\alpha^3 & \text{if } \alpha \leq 16.634^\circ \\ 0.144 - 2.456\alpha + 2.304\alpha^2 - 0.950\alpha^3 & \text{else} \end{cases}, \quad (100)$$

$$\begin{aligned} C_{m\eta}(\alpha, \eta) = & +0.014 + 0.165\alpha - 1.968\eta - 0.410\alpha^2 + 1.365\alpha\eta \\ & - 0.415\eta^2 + 0.186\alpha^3 - 0.144\alpha^2\eta + 0.948\alpha\eta^2 + 1.356\eta^3. \end{aligned} \quad (101)$$

#### B. Equations of motion

The longitudinal equations of motion are given as

$$\dot{V}_A = \frac{1}{m} \left( F \cos \alpha - \frac{1}{2} \rho S V_A^2 C_D(\alpha, \eta, q) - mg \sin \gamma_A \right), \quad (102)$$

$$\dot{\gamma}_A = \frac{1}{m V_A} \left( F \sin \alpha + \frac{1}{2} \rho S V_A^2 C_L(\alpha, \eta, q) - mg \cos \gamma_A \right), \quad (103)$$

$$\dot{q} = \frac{1}{I_y} \left( l_t F + \frac{1}{2} \rho S c_a V_A^2 C_m(\alpha, \eta, q) - \frac{1}{2} \rho S V_A^2 C_Z(\alpha, \eta, q) (x_{cg}^{ref} - x_{cg}) + \frac{1}{2} \rho S V_A^2 C_X(\alpha, \eta, q) (z_{cg}^{ref} - z_{cg}) \right); \quad (104)$$

with

$$\Theta = \alpha + \gamma. \quad (105)$$
