#### Abstract

Many articles were devoted to the problem of estimating recursively the eigenvectors and eigenvalues in decreasing order of the expectation of a random matrix using an i.i.d. sample of it. The present study makes the following contributions. The convergence of a normed process is proved under more general assumptions: the random matrices are not supposed i.i.d. and a new data mini-batch or all data until the current step are taken into account at each step without storing them; three types of processes are studied; this is applied to online principal component analysis of a data stream, assuming that data are realizations of a random vector $Z$ whose expectation is unknown and must be estimated online, as well as possibly the metrics used when it depends on unknown characteristics of $Z$.

Keywords: Big data, Data stream, Online estimation, Principal component analysis, Stochastic approximation.

## 1 Introduction

Data stream factorial analysis is defined as the factorial analysis of data that arrive continuously such as process control data, web data, telecommunication data, medical data, financial data,.... Recursive stochastic algorithms can be used for observations arriving sequentially to estimate principal components or factors, whose estimations are updated by each new arriving observation vector. When using such processes, it is not necessary to store the data and, due to the relative simplicity of the computation involved, much more data than with other methods can be taken into account during the same duration of time.

Consider the following model: suppose that p quantitative variables are observed on individuals ( p may be very large); data vectors in $\mathbb{R}^{p}$ are thus obtained. Considering that $z_{n}$ is observed at time n (or more generally that several observations, a data mini-batch, are made at time $n$ ), there is a sequence of data vectors $z_{1}, \ldots, z_{n}, \ldots$ Assume that, for $n \geq 1, z_{n}$ is a realization of a random variable $Z_{n}$ defined on a probability space $(\Omega, A, P)$ and that $\left(Z_{1}, \ldots, Z_{n}, \ldots\right)$ is an i.i.d sample of a random vector Z. Denote $\theta$ the expectation of $Z$ and $C$ its covariance matrix which are unknown in the case of a data stream.

Let $M$ be a positive definite symmetric $p \times p$ matrix called metrics. Recall briefly the principal component analysis (PCA) algorithm of the random vector $Z$. At step $l$ of PCA is determined a linear combination $c_{l}^{\prime} Z$ of the components of $Z$, called $l^{t h}$ principal component, uncorrelated with the previous ones and of maximal variance, under the normalization constraint $c_{l}^{\prime} M^{-1} c_{l}=1 ; c_{l}$ is a $M^{-1}$-unit eigenvector of $M C$ corresponding to the $l^{\text {th }}$ largest eigenvalue $\lambda_{l}$. For $l=1, \ldots, r$, a $M$-unit direction vector $u_{l}$ of the $l^{\text {th }}$ principal axis is defined as $M^{-1} c_{l}$; the vectors $u_{l}$ are $M$-orthonormal and are eigenvectors of the matrix $C M$ corresponding respectively to the same eigenvalues $\lambda_{l}$. A particular case is normed PCA, where $M$ is the diagonal matrix of the inverses of variances of the $p$ components of $Z$. This is equivalent to use standardized data, i.e. observations of $M(Z-\theta)$, and the identity metrics. But the expectation $\theta$ and the variances of the components of $Z$ are usually unknown and only raw data are observed. One application of this article is to recursively estimate the $c_{l}$ or the $u_{l}$ using stochastic approximation processes.

[^0]Many articles were devoted to this problem when supposing $M$ and $\theta$ known or more generally to the problem of estimating eigenvectors and eigenvalues in decreasing order of the expectation $B$ of a random matrix, using an i.i.d. sample of it. See for example the well-known algorithms of Benzécri [1], Krasulina [2], Karhunen and Oja [3], Oja and Karhunen [4], Brandière [5],[6], Brandière and Duflo [7]. Recall the normed process studied in [3][4]:

$$
X_{n+1}=\frac{\left(I+a_{n} B_{n}\right) X_{n}}{\left\|\left(I+a_{n} B_{n}\right) X_{n}\right\|}
$$

with $E\left[B_{n}\right]=B, a_{n}>0, \sum_{n=1}^{\infty} a_{n}=\infty, \sum_{n=1}^{\infty} a_{n}^{2}<\infty$.
This work makes the following contributions. The convergence of this process is proved under more general assumptions: the random matrices $B_{n}$ are not supposed i.i.d. and a new data mini-batch or all data until the current step are taken into account at each step without storing them; this is applied to online estimation of principal components in PCA of a random vector $Z$, when its expectation is unknown, as well as possibly the metrics used, and must be estimated online.

Denote $Q$ a metrics in $\mathbb{R}^{p},\langle.,$.$\rangle and \|$.$\| respectively the inner product and the norm induced by Q$ : $\langle x, y\rangle=x^{\prime} Q y, x^{\prime}$ denoting the transposed of the column vector $x$. Remind that a $p \times p$ matrix $A$ is $Q$ symmetric if $(Q A)^{\prime}=Q A$; then $A$ has $p$ real eigenvalues and there exists a $Q$-orthonormal basis of $\mathbb{R}^{p}$ composed of eigenvectors of $A$. The norm of a matrix $A$ is the spectral norm denoted $\|A\|$.

Let $B$ be a $Q$-symmetric matrix. Denote $T_{n}$ the $\sigma$-field generated by the events before time $n$.
In the next section, the almost sure (a.s.) convergence of the normed process to eigenvectors of $B$ is studied. Three cases are considered:

- $E\left[B_{n} \mid T_{n}\right]$ converges a.s. to $B$;
- $B_{n}=\omega_{1 n} B_{n}^{1}+\omega_{2 n} B_{n}^{2}$ with $\omega_{1 n}+\omega_{2 n}=1, B_{n}^{2}$ is $T_{n}$-measurable, $E\left[B_{n}^{1} \mid T_{n}\right]$ and $B_{n}^{2}$ converge a.s. to $B$; - $B_{n}$ converges a.s. to $B$.

For each case, firstly a theorem of a.s. convergence of $\left(X_{n}\right)$ to a unit eigenvector of $B$ associated to its greatest eigenvalue is proved with, in the first case, a method following that of [8] under more general assumptions, a corollary in the second case and another method of proof in the third case; secondly, using arguments of exterior algebra, the convergence of processes $\left(X_{n}^{i}\right), i=1, . ., r$ of the same type, obtained by Gram-Schmidt orthonormalization, to unit eigenvectors associated to eigenvalues of $B$ in decreasing order is proved as a corollary.

Then, in the following section, the whole results are applied to online estimation of principal components in PCA. In order to reduce computing time, particularly in the case of a data stream, and to avoid numerical explosions, it is proposed:
a) to estimate the eigenvectors $a_{l}$ of the symmetric $\mathrm{p} \times \mathrm{p}$ matrix $B=M^{\frac{1}{2}} C M^{\frac{1}{2}}$ (symmetrization); then the orthonormalization is computed with respect to $I$; estimates of $c_{l}$ and $u_{l}$ can be obtained from that of $a_{l}$; b) to replace $Z_{n}$ by $Z_{n}-m, m$ being an estimation of $E[Z]$ computed in a preliminary phase with a small number of observations e.g. 1000 (pseudo-centering);
c) to use a data mini-batch at step $n$ or all observations until step $n$ without storing them.

This yields the following definitions of $B_{n},\left(Z_{n, 1}, \ldots, Z_{n, m_{n}}\right)$ denoting the new observations taken into account at step $n, \bar{Z}_{n-1}$ the mean of the sample ( $Z_{1,1}, \ldots, Z_{n-1, m_{n-1}}$ ), $M_{n-1}$ an estimation of $M$ depending on this sample, for $i=1, \ldots, r, Z_{n, i}^{c}=Z_{n, i}-m$ and $\bar{Z}_{n}^{c}=\bar{Z}_{n}-m$ :

$$
\begin{aligned}
B_{n}^{1} & =M_{n-1}^{\frac{1}{2}}\left(\frac{1}{m_{n}} \sum_{i=1}^{m_{n}} Z_{n, i}^{c}\left(Z_{n, i}^{c}\right)^{\prime}-\bar{Z}_{n-1}^{c}\left(\bar{Z}_{n-1}^{c}\right)^{\prime}\right) M_{n-1}^{\frac{1}{2}} \\
B_{n}^{2} & =M_{n-1}^{\frac{1}{2}}\left(\frac{1}{\sum_{i=1}^{n} m_{i}} \sum_{i=1}^{n} \sum_{j=1}^{m_{i}} Z_{i, j}^{c}\left(Z_{i, j}^{c}\right)^{\prime}-\bar{Z}_{n}^{c}\left(\bar{Z}_{n}^{c}\right)^{\prime}\right) M_{n-1}^{\frac{1}{2}}
\end{aligned}
$$

and a combination of both.
Three cases are studied: at each step are taken into account:

- a data mini-batch, supposing $Z$ and $M_{n-1}$ uniformly bounded,
- or all observations until this step with different weights for observations in the past, which are not stored, and observations at this step, supposing $Z$ and $M_{n-1}$ uniformly bounded,
- or all observations until this step with uniform weights.

The paper ends with a brief conclusion.

## 2 Convergence of a normed process

Let $\left(B_{n}\right)$ be a sequence of random $p \times p$ matrices, $B$ a $p \times p$ matrix, $\left(a_{n}\right)$ a sequence of positive numbers, $X_{1}$ a random variable of norm 1 in $\mathbb{R}^{p}$ independent from the sequence of random matrices $\left(B_{n}\right)$ and ( $X_{n}$ ) a stochastic process in $\mathbb{R}^{p}$ recursively defined at step $n$ by:

$$
X_{n+1}=\frac{\left(I+a_{n} B_{n}\right) X_{n}}{\left\|\left(I+a_{n} B_{n}\right) X_{n}\right\|}
$$

### 2.1 First case

### 2.1.1 Theorem of almost sure convergence

Suppose $B_{n}$ not $T_{n}$-measurable ( $B_{n}$ is $T_{n+1}$-measurable). Make the following assumptions:
(H1a) $B$ is $Q$-symmetric.
(H1b) $B$ has distinct eigenvalues: $\lambda_{1}>\lambda_{2}>\ldots>\lambda_{p}$. Denote $V_{i}$ a unit eigenvector of $B$ associated to $\lambda_{i}, i=1, . ., p$.
(H2a) There exists a positive number $b$ such that $\sup _{n}\left\|B_{n}\right\|<b$ a.s.
(H2b) $E\left[\sum_{n=1}^{\infty} a_{n}| | E\left[B_{n} \mid T_{n}\right]-B \|\right]<\infty \quad$ a.s.
(H3) $a_{n}>0, \sum_{n=1}^{\infty} a_{n}=\infty, \sum_{n=1}^{\infty} a_{n}^{2}<\infty$.
Denote $\left.U_{n}=\stackrel{n=1}{\left\langle X_{n}\right.}, B X_{n}\right\rangle, \stackrel{n=1}{W_{n}}=\left\langle X_{n}, B_{n} X_{n}\right\rangle$.
Theorem 1 Suppose assumptions H1a,b,H2a,b,H3 hold. Then :

1) Almost surely, $U_{n}$ converges to one of the eigenvalues of B; on $E_{j}=\left\{U_{n} \longrightarrow \lambda_{j}\right\}, X_{n}$ converges to $V_{j}$ or $-V_{j}, \sum_{n=1}^{\infty} a_{n}\left(\lambda_{j}-U_{n}\right)$ and $\sum_{n=1}^{\infty} a_{n}\left(\lambda_{j}-W_{n}\right)$ converge.

State two lemmas of Duflo [8] used in the proof.
Lemma 2 Let $\left(M_{n}\right)$ be a square-integrable martingale adapted to the filtration $\left(T_{n}\right)$ and $\left(\langle M\rangle_{n}\right)$ its increasing process defined by:

$$
\begin{aligned}
\langle M\rangle_{1} & =M_{1}^{2} \\
\langle M\rangle_{n+1}-\langle M\rangle_{n}=E\left[\left(M_{n+1}-M_{n}\right)^{2} \mid T_{n}\right] & =E\left[M_{n+1}^{2} \mid T_{n}\right]-M_{n}^{2} .
\end{aligned}
$$

Let $\langle M\rangle_{\infty}=\lim \langle M\rangle_{n}$. If $E\left[\langle M\rangle_{\infty}\right]<\infty$, then $\left(M_{n}\right)$ converges a.s. and in mean square to a finite random variable.

Lemma 3 Let $\left(\gamma_{n}\right)$ be a sequence of positive numbers such that $\sum_{n=1}^{\infty} \gamma_{n}^{2}<\infty$. Let $\left(Z_{n}\right)$ and $\left(\delta_{n}\right)$ be two sequences of random variables adapted to a filtration $\left(T_{n}\right)$, and $\epsilon_{n}$ a noise adapted to $\left(T_{n}\right)$.
Suppose on the set $\Gamma$ :

1) For every integer $n$, $Z_{n+1}=Z_{n}\left(1+\delta_{n}\right)+\gamma_{n} \epsilon_{n+1}$;
2) $\left(Z_{n}\right)$ is bounded;
3) $\sum_{n=1}^{\infty} \delta_{n}^{2}<\infty, \delta_{n} \geq 0$ for $n$ sufficiently large and there exists a sequence of positive numbers ( $b_{n}$ ) such that $\sum_{n=1}^{\infty} b_{n}=\infty$ and $\sum_{n=1}^{\infty}\left(b_{n}-\delta_{n}\right)$ converges;
4) for an $a>2, E\left[\left|\epsilon_{n+1}\right|^{a} \mid T_{n}\right]=O$ (1) and $\liminf E\left[\epsilon_{n+1}^{2} \mid T_{n}\right]>0$ a.s.

Then, $P(\Gamma)=0$.

## Proof of Theorem 1

## Step 1: expression of $\mathbf{X}_{n+1}$

Under H2a, as $\left\|\left(I+a_{n} B_{n}\right) X_{n}\right\|^{2}=1+2 a_{n} W_{n}+a_{n}^{2}\left\|B_{n} X_{n}\right\|^{2}$ :

$$
\begin{gathered}
\frac{1}{\left\|\left(I+a_{n} B_{n}\right) X_{n}\right\|}=1-a_{n} W_{n}-\frac{1}{2} a_{n}^{2}\left\|B_{n} X_{n}\right\|^{2}+\alpha_{n}, \quad \alpha_{n}=O\left(a_{n}^{2}\right) \\
X_{n+1}=\left(I+a_{n} B_{n}\right)\left(1-a_{n} W_{n}-\frac{1}{2} a_{n}^{2}\left\|B_{n} X_{n}\right\|^{2}+\alpha_{n}\right) X_{n} \\
=\left(I+a_{n}\left(B_{n}-W_{n} I\right)+a_{n} \beta_{n}\right) X_{n}, \text { with } \\
\beta_{n}=-a_{n} W_{n} B_{n}-\frac{1}{2} a_{n}\left\|B_{n} X_{n}\right\|^{2} I-\frac{1}{2} a_{n}^{2} B_{n}\left\|B_{n} X_{n}\right\|^{2}+a_{n}^{-1} \alpha_{n} I+\alpha_{n} B_{n} . \\
X_{n+1}=\left(I+a_{n}\left(B-U_{n} I\right)+a_{n} \Gamma_{n}\right) X_{n}, \text { with } \\
\Gamma_{n}=\left(B_{n}-B\right)-\left\langle X_{n},\left(B_{n}-B\right) X_{n}\right\rangle I+\beta_{n},\left\|\beta_{n}\right\|=O\left(a_{n}\right) .
\end{gathered}
$$

$\beta_{n}$ and $\Gamma_{n}$ are uniformly bounded by assumption H 2 a .
Step 2: convergence of $\mathbf{U}_{n}$

$$
\begin{aligned}
E\left[U_{n+1} \mid T_{n}\right]= & E\left[\left\langle\left(I+a_{n}\left(B-U_{n} I\right)+a_{n} \Gamma_{n}\right) X_{n}, B\left(I+a_{n}\left(B-U_{n} I\right)+a_{n} \Gamma_{n}\right) X_{n}\right\rangle \mid T_{n}\right] \\
= & U_{n}+2 a_{n}\left\langle\left(B-U_{n} I\right) X_{n}, B X_{n}\right\rangle+2 a_{n} E\left[\left\langle\Gamma_{n} X_{n}, B X_{n}\right\rangle \mid T_{n}\right]+a_{n}^{2} \eta_{n} \\
\text { with } \eta_{n}= & \left\langle\left(B-U_{n} I\right) X_{n}, B\left(B-U_{n} I\right) X_{n}\right\rangle+2 E\left[\left\langle\Gamma_{n} X_{n}, B\left(B-U_{n} I\right) X_{n}\right\rangle \mid T_{n}\right] \\
& +E\left[\left\langle\Gamma_{n} X_{n}, B \Gamma_{n} X_{n}\right\rangle \mid T_{n}\right] \text { a.s. }
\end{aligned}
$$

As $\left\|X_{n}\right\|=1$, denoting $\mu_{n}=2 a_{n}\left\langle E\left[\Gamma_{n} \mid T_{n}\right] X_{n}, B X_{n}\right\rangle+a_{n}^{2} \eta_{n}$ :

$$
\begin{aligned}
\left\langle\left(B-U_{n} I\right) X_{n}, B X_{n}\right\rangle & =\left\|B X_{n}\right\|^{2}-U_{n}^{2}=\left\|B X_{n}-U_{n} X_{n}\right\|^{2} \geqslant 0 \\
E\left[U_{n+1} \mid T_{n}\right] & \geq U_{n}+\mu_{n} \text { a.s. } \\
E\left[U_{n+1}-\sum_{i=1}^{n} \mu_{i} \mid T_{n}\right] & \geq U_{n}-\sum_{i=1}^{n-1} \mu_{i} \text { a.s. }
\end{aligned}
$$

Prove the convergence of the submartingale $U_{n}-\sum_{i=1}^{n-1} \mu_{i}$. By H2a:

$$
\begin{aligned}
\left\|\beta_{n}\right\| \leq & \frac{3}{2} a_{n}\left\|B_{n}\right\|^{2}+\frac{1}{2} a_{n}^{2}\left\|B_{n}\right\|^{3}+a_{n}^{-1}\left|\alpha_{n}\right|+\left|\alpha_{n}\right|\left\|B_{n}\right\|=O\left(a_{n}\right) \\
\left\|\Gamma_{n}\right\| \leq & 2\left\|B_{n}-B\right\|+\left\|\beta_{n}\right\|=O(1) \\
\left\|\eta_{n}\right\| \leq & 4\|B\|^{3}+4\|B\|^{2}\left\|E\left[\Gamma_{n} \mid T_{n}\right]\right\|+\|B\| E\left[\left\|\Gamma_{n}\right\|^{2} \mid T_{n}\right]=O(1) \\
& \left\|E\left[\Gamma_{n} \mid T_{n}\right]\right\| \leq 2\left\|E\left[B_{n} \mid T_{n}\right]-B\right\|+\left\|E\left[\beta_{n} \mid T_{n}\right]\right\| \text { a.s. }
\end{aligned}
$$

By H2b and H3:

$$
E\left[\left|\sum_{i=1}^{n-1} \mu_{i}\right|\right] \leq 4\|B\| E\left[\sum_{i=1}^{\infty} a_{i}\left\|E\left[B_{i} \mid T_{i}\right]-B\right\|\right]+2\|B\| E\left[\sum_{i=1}^{\infty} a_{i}\left\|E\left[\beta_{i} \mid T_{i}\right]\right\|\right]+E\left[\sum_{i=1}^{\infty} a_{i}^{2}\left\|\eta_{i}\right\|\right]
$$

$$
<\infty
$$

By Doob lemma the submartingale $U_{n}-\sum_{i=1}^{n-1} \mu_{i}$ converges a.s. to an integrable random variable. As $\sum_{i=1}^{n-1} \mu_{i}$ converges, $U_{n}$ converges a.s.

Step 3: convergence of $\mathbf{X}_{n}^{j}=\left\langle\mathbf{X}_{n}, \mathbf{V}_{j}\right\rangle$
Denote $\Gamma_{n}^{j}=\left\langle\Gamma_{n} X_{n}, V_{j}\right\rangle$.

$$
X_{n+1}^{j}=\left\langle\left(I+a_{n}\left(B-U_{n} I\right)+a_{n} \Gamma_{n}\right) X_{n}, V_{j}\right\rangle=X_{n}^{j}\left(1+a_{n}\left(\lambda_{j}-U_{n}\right)\right)+a_{n} \Gamma_{n}^{j}
$$

$$
\begin{aligned}
\left(X_{n+1}^{j}\right)^{2}= & \left(X_{n}^{j}\right)^{2}\left(1+2 a_{n}\left(\lambda_{j}-U_{n}\right)\right)+a_{n}^{2}\left(\lambda_{j}-U_{n}\right)^{2}\left(X_{n}^{j}\right)^{2} \\
& +2 a_{n}\left(1+a_{n}\left(\lambda_{j}-U_{n}\right)\right) X_{n}^{j} \Gamma_{n}^{j}+a_{n}^{2}\left(\Gamma_{n}^{j}\right)^{2} \\
= & \left(X_{n}^{j}\right)^{2}\left(1+2 a_{n}\left(\lambda_{j}-U_{n}\right)\right)+a_{n}^{2}\left(\left(\lambda_{j}-U_{n}\right) X_{n}^{j}+\Gamma_{n}^{j}\right)^{2}+2 a_{n} X_{n}^{j} \Gamma_{n}^{j} \\
= & \left(X_{1}^{j}\right)^{2}+2 \sum_{l=1}^{n} a_{l}\left(\lambda_{j}-U_{l}\right)\left(X_{l}^{j}\right)^{2}+\sum_{l=1}^{n} a_{l}^{2}\left(\left(\lambda_{j}-U_{l}\right) X_{l}^{j}+\Gamma_{l}^{j}\right)^{2}+2 \sum_{l=1}^{n} a_{l} X_{l}^{j} \Gamma_{l}^{j} \\
= & \left(X_{1}^{j}\right)^{2}+(1)+(2)+(3) .
\end{aligned}
$$

Study the convergence of the terms (2), (3), (1) of this decomposition.
(i) $(2)=\sum_{l=1}^{n} a_{l}^{2}\left(\left(\lambda_{j}-U_{l}\right) X_{l}^{j}+\Gamma_{l}^{j}\right)^{2}$ converges a.s. by H2a and H3.
(ii) Consider now (3).

$$
\begin{aligned}
& \sum_{l=1}^{n} a_{l} X_{l}^{j} \Gamma_{l}^{j}=\sum_{l=1}^{n} a_{l} X_{l}^{j}\left(\Gamma_{l}^{j}-E\left[\Gamma_{l}^{j} \mid T_{l}\right]\right)+\sum_{l=1}^{n} a_{l} X_{l}^{j} E\left[\Gamma_{l}^{j} \mid T_{l}\right] \\
& \sum_{l=1}^{n} a_{l}\left|X_{l}^{j} E\left[\Gamma_{l}^{j} \mid T_{l}\right]\right| \leq \sum_{l=1}^{n} a_{l}\left|\left\langle E\left[\Gamma_{l} \mid T_{l}\right] X_{l}, V_{j}\right\rangle\right| \\
& \leq \sum_{l=1}^{n} a_{l}| | E\left[\Gamma_{l} \mid T_{l}\right]| | \leq \sum_{l=1}^{n} a_{l}\left(2\left\|E\left[B_{l} \mid T_{l}\right]-B\right\|+\| E\left[\beta_{l} \mid T_{l}\right]| |\right)
\end{aligned}
$$

By H2a,b and H 3 , as $\left\|\beta_{n}\right\|=O\left(a_{n}\right), \sum_{l=1}^{+\infty} a_{l} X_{l}^{j} E\left[\Gamma_{l}^{j} \mid T_{l}\right]$ is convergent.
Let $M_{n}^{j}=\sum_{l=1}^{n-1} a_{l} X_{l}^{j}\left(\Gamma_{l}^{j}-E\left[\Gamma_{l}^{j} \mid T_{l}\right]\right) ;\left(M_{n}^{j}\right)$ is a square-integrable martingale adapted to the filtration $\left(T_{n}\right) ;$ denote $\left(\left\langle M^{j}\right\rangle_{n}\right)$ its increasing process. By H2a:

$$
\begin{aligned}
\left\langle M^{j}\right\rangle_{n+1}-\left\langle M^{j}\right\rangle_{n} & =E\left[\left(M_{n+1}^{j}-M_{n}^{j}\right)^{2} \mid T_{n}\right]=a_{n}^{2} E\left[\left(X_{n}^{j}\right)^{2}\left(\Gamma_{n}^{j}-E\left[\Gamma_{n}^{j} \mid T_{n}\right]\right)^{2} \mid T_{n}\right] \\
& \left.\leq a_{n}^{2}\left(E\left[\left(\Gamma_{n}^{j}\right)^{2} \mid T_{n}\right]-\left(E\left[\Gamma_{n}^{j} \mid T_{n}\right]\right)^{2} \mid T_{n}\right]\right) \leq a_{n}^{2} E\left[\left(\left\|\Gamma_{n}\right\|^{2} \mid T_{n}\right]\right.
\end{aligned}
$$

is the general term of a convergent and uniformly bounded series; thus by lemma $2\left(M_{n}^{j}\right)$ converges a.s. to a finite random variable.

Therefore (3) converges a.s.
(iii) Consider finally (1). Let $\omega$ fixed belonging to the convergence set of $U_{n}$. The writing of $\omega$ will be omitted in the following. Denote $L$ the limit of $U_{n}$. If $L \neq \lambda_{j}$, the sign of $\lambda_{j}-U_{n}$ is constant from a certain rank $N$ depending on $\omega$. Thus there exists $A>0$ such that:

$$
\begin{aligned}
& 2 \sum_{l=N}^{n} a_{l}\left|\lambda_{j}-U_{l}\right|\left(X_{l}^{j}\right)^{2}=2\left|\sum_{l=N}^{n} a_{l}\left(\lambda_{j}-U_{l}\right)\left(X_{l}^{j}\right)^{2}\right| \\
= & \left|\left(X_{n+1}^{j}\right)^{2}-\left(X_{N}^{j}\right)^{2}-\sum_{l=N}^{n} a_{l}^{2}\left(\left(\lambda_{j}-U_{l}\right) X_{l}^{j}+\Gamma_{l}^{j}\right)^{2}-2 \sum_{l=N}^{n} a_{l} X_{l}^{j} \Gamma_{l}^{j}\right| \\
< & A
\end{aligned}
$$

Then for $L \neq \lambda_{j}, 2 \sum_{l=N}^{n} a_{l}\left|\lambda_{j}-U_{l}\right|\left(X_{l}^{j}\right)^{2}$ converges.
It follows from the convergence of (1), (2) and (3) that for $L \neq \lambda_{j},\left(X_{n}^{j}\right)^{2}$ converges a.s.

## Step 4: convergence of $X_{n}$

If the limit of $U_{n}$ is different from $\lambda_{j}$, then by convergence of (1) in step $3, \sum_{l=1}^{\infty} a_{l}\left(X_{l}^{j}\right)^{2}<\infty$ and $X_{n}^{j}$ converges a.s. to 0 . As $\left\|X_{n}\right\|=1$, this can not be true for every $j$.

Thus the limit of $U_{n}$ is one of the eigenvalues of $\mathrm{B}, \lambda_{i}$.
For $j \neq i, X_{n}^{j}$ converges to 0 , therefore $\left(X_{n}^{i}\right)^{2}$ converges to 1 and since

$$
X_{n+1}-X_{n}=a_{n}\left(\left(B-U_{n} I\right)+\Gamma_{n}\right) X_{n}
$$

$X_{n+1}-X_{n}$ converges to 0 and the limit of $X_{n}$ is $V_{i}$ or $-V_{i}$ on $E_{i}=\left\{U_{n} \longrightarrow \lambda_{i}\right\}$ (first assertion of theorem 1).

Consider now the decomposition:

$$
\begin{aligned}
\sum_{n=1}^{\infty} a_{n}\left(\lambda_{i}-W_{n}\right)= & \sum_{n=1}^{\infty} a_{n}\left(\lambda_{i}-U_{n}\right)+\sum_{n=1}^{\infty} a_{n}\left\langle X_{n},\left(B_{n}-E\left[B_{n} \mid T_{n}\right]\right) X_{n}\right\rangle \\
& +\sum_{n=1}^{\infty} a_{n}\left\langle X_{n},\left(E\left[B_{n} \mid T_{n}\right]-B\right) X_{n}\right\rangle
\end{aligned}
$$

(i) Using the decomposition of $\left(X_{n}^{i}\right)^{2}$ in step 3 , the convergence of $\left(X_{n}^{i}\right)^{2}$ and of (2) and (3) yields that $\sum_{n=1}^{\infty} a_{n}\left(\lambda_{i}-U_{n}\right)$ converges a.s. (second assertion of theorem 1).
(ii) By H2b: $\sum_{n=1}^{\infty} a_{n}\left\langle X_{n},\left(E\left[B_{n} \mid T_{n}\right]-B\right) X_{n}\right\rangle$ converges a.s.
(iii) Let $M_{n}=\sum_{l=1}^{n-1} a_{l}\left\langle X_{l},\left(B_{l}-E\left[B_{l} \mid T_{l}\right]\right) X_{l}\right\rangle .\left(M_{n}\right)$ is a square-integrable martingale adapted to the filtration $\left(T_{n}\right)$. Its increasing process $\left(\langle M\rangle_{n}\right)$ converges; indeed:

$$
\begin{aligned}
\langle M\rangle_{n+1}-\langle M\rangle_{n} & =E\left[\left(M_{n+1}-M_{n}\right)^{2} \mid T_{n}\right] \\
& =a_{n}^{2} E\left[\left\langle X_{n},\left(B_{n}-E\left[B_{n} \mid T_{n}\right]\right) X_{n}\right\rangle^{2} \mid T_{n}\right] \\
& \leq a_{n}^{2} E\left[| | B_{n}-E\left[B_{n} \mid T_{n}\right]| |^{2} \mid T_{n}\right]
\end{aligned}
$$

is the general term of a convergent and uniformly bounded series. Thus $\left(M_{n}\right)$ converges a.s. to a finite random variable.

Therefore by (i), (ii) and (iii), $\sum_{n=1}^{\infty} a_{n}\left(\lambda_{i}-W_{n}\right)$ converges (third assertion of theorem 1).
Step 5: convergence of $X_{n}$ to $\pm V_{1}$
Suppose $i>1$.

$$
\begin{aligned}
X_{n+1}^{1} & =\left(1+a_{n}\left(\lambda_{1}-U_{n}\right)\right) X_{n}^{1}+a_{n}\left\langle\Gamma_{n} X_{n}, V_{1}\right\rangle \\
& =\left(1+a_{n}\left(\left(\lambda_{1}-\lambda_{i}\right)+\left(\lambda_{i}-U_{n}\right)\right)\right) X_{n}^{1}+a_{n}\left\langle\Gamma_{n} X_{n}, V_{1}\right\rangle
\end{aligned}
$$

In the following, apply lemma 3 to the sequence $\left(X_{n}^{1}\right)$ on $E_{i}=\left\{X_{n} \longrightarrow V_{i}\right\}, i>1$, with $\gamma_{n}=a_{n}$, $\delta_{n}=a_{n}\left(\lambda_{1}-U_{n}\right) \geqslant 0, b_{n}=a_{n}\left(\lambda_{1}-\lambda_{i}\right)>0, \epsilon_{n+1}=\left\langle\Gamma_{n} X_{n}, V_{1}\right\rangle$.
(i) $X_{n}^{1}$ is bounded.
(ii) $\sum_{n=1}^{\infty} a_{n}^{2}<\infty, \sum_{n=1}^{\infty} a_{n}^{2}\left(\lambda_{1}-U_{n}\right)^{2}<\infty$ by $\mathrm{H} 3, \sum_{n=1}^{\infty} a_{n}\left(\lambda_{1}-\lambda_{i}\right)=\infty, \sum_{n=1}^{\infty} a_{n}\left(\lambda_{i}-U_{n}\right)$ converges a.s.
(iii) Consider the decomposition:

$$
\begin{aligned}
\left\langle\Gamma_{n} X_{n}, V_{1}\right\rangle & =\left\langle\left(B_{n}-B\right) X_{n}, V_{1}\right\rangle-\left\langle\left(B_{n}-B\right) X_{n}, X_{n}\right\rangle\left\langle X_{n}, V_{1}\right\rangle+\left\langle\beta_{n} X_{n}, V_{1}\right\rangle \\
& =\left\langle B_{n} X_{n}, V_{1}\right\rangle-\left\langle X_{n}, V_{1}\right\rangle\left(\lambda_{1}+\left\langle\left(B_{n}-B\right) X_{n}, X_{n}\right\rangle\right)+\left\langle\beta_{n} X_{n}, V_{1}\right\rangle .
\end{aligned}
$$

By H2a, there exists a positive number $c$ such that a.s.:

$$
\begin{aligned}
& E\left[\left(\left\langle\Gamma_{n} X_{n}, V_{1}\right\rangle-\left\langle B_{n} X_{n}, V_{1}\right\rangle\right)^{2} \mid T_{n}\right] \\
\leq & 2\left(X_{n}^{1}\right)^{2} E\left[\left(\lambda_{1}+\left\langle\left(B_{n}-B\right) X_{n}, X_{n}\right\rangle\right)^{2} \mid T_{n}\right]+2 E\left[\left(\left\langle\beta_{n} X_{n}, V_{1}\right\rangle\right)^{2} \mid T_{n}\right] \\
\leq & c\left(X_{n}^{1}\right)^{2}+2 E\left[\left\|\beta_{n}\right\|^{2} \mid T_{n}\right]_{n \rightarrow+\infty}^{\longrightarrow} 0
\end{aligned}
$$

since $\left\|\beta_{n}\right\|=O\left(a_{n}\right)$ and $X_{n}^{1} \underset{n \rightarrow+\infty}{\longrightarrow} 0$. Likewise:

$$
E\left[\left(\left\langle\Gamma_{n} X_{n}, V_{1}\right\rangle-\left\langle B_{n} X_{n}, V_{1}\right\rangle\right)\left\langle B_{n} X_{n}, V_{1}\right\rangle \mid T_{n}\right] \underset{n \rightarrow+\infty}{\longrightarrow} 0
$$

Then, if $\liminf E\left[\left\langle B_{n} X_{n}, V_{1}\right\rangle^{2} \mid T_{n}\right]>0, \liminf E\left[\left\langle\Gamma_{n} X_{n}, V_{1}\right\rangle^{2} \mid T_{n}\right]>0$.
By lemma 3, under (i), (ii), (iii), $P\left(E_{i}\right)=0, i>1$.
Then, $P\left(E_{1}\right)=1$ (fourth assertion of theorem 1 ).

### 2.1.2 Simultaneous estimation of several eigenvectors

In this part, for $i=1, \ldots, r, X_{n}^{i}$ does not denote the $i^{t h}$ component of $X_{n}$, but a random variable in $\mathbb{R}^{p}$ recursively defined by:

$$
\begin{aligned}
Y_{n+1}^{i} & =\left(I+a_{n} B_{n}\right) X_{n}^{i} \\
T_{n+1}^{i} & =Y_{n+1}^{i}-\sum_{j<i}\left\langle Y_{n+1}^{i}, X_{n+1}^{j}\right\rangle X_{n+1}^{j}, \quad X_{n+1}^{i}=\frac{T_{n+1}^{i}}{\left\|T_{n+1}^{i}\right\|}
\end{aligned}
$$

$\left(X_{n+1}^{1}, \ldots, X_{n+1}^{r}\right)$ is obtained by Gram-Schmidt orthonormalization of $\left(Y_{n+1}^{1}, \ldots, Y_{n+1}^{r}\right)$.
Corollary 4 Suppose assumptions H1a,b, H2a,b and H3 hold.

1) For $i=1, \ldots, r$, almost surely $X_{n}^{i}$ converges to one of the eigenvectors of $B$.
2) If moreover, for $i=1, \ldots, r$, almost surely on $\left.\bigcup_{j=i+1}^{p}\left\{X_{n}^{i} \longrightarrow \pm V_{j}\right\}, \liminf E\left[\left\langle B_{n} X_{n}^{i}, V_{i}\right)\right\rangle^{2} \mid T_{n}\right]>0$, then $X_{n}^{i}$ converges a.s. to $V_{i}$ or $-V_{i}, \sum_{n=1}^{\infty} a_{n}\left|\lambda_{i}-\left\langle B X_{n}^{i}, X_{n}^{i}\right\rangle\right|$ and $\sum_{n=1}^{\infty} a_{n}\left(\lambda_{i}-\left\langle B_{n} X_{n}^{i}, X_{n}^{i}\right\rangle\right)$ converge a.s.

Before the proof, some concepts of exterior algebra are reminded.
Let $\left(e_{1}, \ldots, e_{p}\right)$ be a basis of $\mathbb{R}^{p}$. For $r \leq p$, denote ${ }^{r} \Lambda \mathbb{R}^{p}$ the exterior power of order $r$ of $\mathbb{R}^{p}$, generated by the $C_{p}^{r}$ exterior products $e_{i_{1}} \wedge e_{i_{2}} \wedge \ldots \wedge e_{i_{r}}, i_{1}<i_{2}<\ldots<i_{r} \in\{1, \ldots, p\}$.
a) Let $Q$ be a metrics in $\mathbb{R}^{p}$. Define the inner product in ${ }^{r} \Lambda \mathbb{R}^{p}$ induced by the metrics $Q$, also denoted $\langle.,$.$\rangle ,$ such that:

$$
\left\langle e_{i_{1}} \wedge \ldots \wedge e_{i_{r}}, e_{k_{1}} \wedge \ldots \wedge e_{k_{r}}\right\rangle=\sum_{\sigma \in G_{r}}(-1)^{s(\sigma)}\left\langle e_{i_{1}}, e_{\sigma\left(k_{1}\right)}\right\rangle \ldots\left\langle e_{i_{r}}, e_{\sigma\left(k_{r}\right)}\right\rangle
$$

$G_{r}$ being the set of permutations $\sigma$ of $\left\{k_{1}, \ldots, k_{r}\right\}$ and $s(\sigma)$ the number of inversions of $\sigma$.
Denote also $\|\cdot\|$ the associated norm. Note that if $x_{1}, \ldots, x_{r}$ are $Q$-orthogonal, $\left\|x_{1} \wedge \ldots \wedge x_{r}\right\|=\prod_{i=1}^{r}\left\|x_{i}\right\|$, and if $\left(e_{1}, \ldots, e_{p}\right)$ is a $Q$-orthonormal basis of $\mathbb{R}^{p}$, then the set of the $C_{p}^{r}$ exterior products $e_{i_{1}} \wedge \ldots \wedge e_{i_{r}}$ is an orthonormal basis of ${ }^{r} \Lambda \mathbb{R}^{p}$.
b) Let $U$ be an endomorphism in $\mathbb{R}^{p}$. Define for $j=1, \ldots, r$ the endomorphism ${ }^{r j} U$ in ${ }^{r} \Lambda \mathbb{R}^{p}$ such that:

$$
\begin{gathered}
{ }^{r j} U\left(x_{1} \wedge \ldots \wedge x_{r}\right)=\sum_{1 \leq i_{1}<i_{2}<\ldots<i_{j} \leq r} x_{1} \wedge \ldots \wedge U x_{i_{1}} \wedge \ldots \wedge U x_{i_{j}} \wedge \ldots \wedge x_{r} . \\
\text { For } \mathrm{j}=1,{ }^{r 1} U\left(x_{1} \wedge \ldots \wedge x_{r}\right)=\sum_{i=1}^{r} x_{1} \wedge \ldots \wedge U x_{i} \wedge \ldots \wedge x_{r} .
\end{gathered}
$$

Denote ${ }^{r} \Lambda U$ the endomorphism ${ }^{r r} U$ such that:

$$
{ }^{r} \Lambda U\left(x_{1} \wedge \ldots \wedge x_{r}\right)=U x_{1} \wedge U x_{2} \wedge \ldots \wedge U x_{r}
$$

c) The following properties hold:
(i) Suppose that the eigenvalues $\lambda_{1}>\ldots>\lambda_{p}$ of $U$ are distinct and denote for $j=1, \ldots, r, V_{j}$ an eigenvector associated to $\lambda_{j}$. Then the $C_{p}^{r}$ vectors $V_{i_{1}} \wedge \ldots \wedge V_{i_{r}}, 1 \leq i_{1}<\ldots<i_{r} \leq p$, are eigenvectors of ${ }^{r 1} U$ respectively associated to the eigenvalues $\lambda_{i_{1}}+\ldots+\lambda_{i_{r}}$.
(ii) ${ }^{r} \Lambda(I+U)=I+\sum_{j=1}^{r}{ }^{r j} U$.
(iii) There exists $c(r)>0$ such that, for every endomorphism $U$ in $\mathbb{R}^{p}$ and for $1 \leq j \leq r,\left\|{ }^{r j} U\right\| \leq c(r)\|U\|^{j}$.

## Proof

## Step 1

For $i=1, \ldots, r$, it follows from the orthogonality of $T_{n}^{1}, \ldots, T_{n}^{i}$ that:

$$
\left\|T_{n+1}^{1} \wedge \ldots \wedge T_{n+1}^{i}\right\|=\prod_{l=1}^{i}\left\|T_{n+1}^{l}\right\| .
$$

Then, denoting ${ }^{i} X_{n+1}=X_{n+1}^{1} \wedge \ldots \wedge X_{n+1}^{i}$ and $D_{n}^{i}={ }^{i 1} B_{n}+\sum_{j=2}^{i} a_{n}^{j-1{ }^{i j}} B_{n}$ :

$$
\begin{aligned}
{ }^{i} X_{n+1} & =\frac{T_{n+1}^{1} \wedge \ldots \wedge T_{n+1}^{i}}{\left\|T_{n+1}^{1} \wedge \ldots \wedge T_{n+1}^{i}\right\|}=\frac{Y_{n+1}^{1} \wedge \ldots \wedge Y_{n+1}^{i}}{\left\|Y_{n+1}^{1} \wedge \ldots \wedge Y_{n+1}^{i}\right\|}=\frac{{ }^{i} \Lambda\left(I+a_{n} B_{n}\right)^{i} X_{n}}{\left\|{ }^{i} \Lambda\left(I+a_{n} B_{n}\right)^{i} X_{n}\right\|} \\
& =\frac{\left(I+a_{n}{ }^{i 1} B_{n}+\sum_{j=2}^{i} a_{n}^{j}{ }^{i j} B_{n}\right){ }^{i} X_{n}}{\left\|\left(I+a_{n}{ }^{i 1} B_{n}+\sum_{j=2}^{i} a_{n}^{j}{ }^{i j} B_{n}\right){ }^{i} X_{n}\right\|}=\frac{\left(I+a_{n} D_{n}^{i}\right)^{i} X_{n}}{\left\|\left(I+a_{n} D_{n}^{i}\right)^{i} X_{n}\right\|} .
\end{aligned}
$$

As $\left\|{ }^{i j} B_{n}\right\| \leq c(i)\left\|B_{n}\right\|^{j}$, assumptions H2a and H3 yield that there exists $b_{1}>0$ such that for all $n$, $\left\|D_{n}^{i}\right\| \leq b_{1}$.

Moreover, as $U \mapsto^{i 1} U$ is a linear application, assumptions H2a,b and H 3 yield that:

$$
\begin{aligned}
& E\left[\sum_{n=1}^{\infty} a_{n}\left\|E\left[D_{n}^{i} \mid T_{n}\right]-{ }^{i 1} B\right\|\right]=E\left[\sum_{n=1}^{\infty} a_{n}\left\|E\left[{ }^{i 1} B_{n}-{ }^{i 1} B+\sum_{j=2}^{i} a_{n}^{j-1}{ }^{i j} B_{n} \mid T_{n}\right]\right\| \|\right] \\
\leq & E\left[\sum_{n=1}^{\infty} a_{n}\left(\| \|^{i 1} E\left[B_{n}-B \mid T_{n}\right] \|+\sum_{j=2}^{i} a_{n}^{j-1} E\left[\left\|{ }^{i j} B_{n}\right\| \mid T_{n}\right]\right)\right] \\
\leq & \left.c(i) E\left[\sum_{n=1}^{\infty} a_{n}\left(\| E\left[B_{n} \mid T_{n}\right]-B\right] \|+\sum_{j=2}^{i} a_{n}^{j-1} E\left[\left\|B_{n}\right\|^{j} \mid T_{n}\right]\right)\right]<\infty .
\end{aligned}
$$

Applying first assertion of theorem 1 yields that almost surely,
${ }^{i} X_{n}$ converges to a unit eigenvector $\pm V_{j_{1}} \wedge \ldots \wedge V_{j_{i}}$ of ${ }^{i 1} B$,
$\sum_{n=1}^{\infty} a_{n}\left(\lambda_{j_{1}}+\ldots+\lambda_{j_{i}}-\left\langle{ }^{i 1} B^{i} X_{n},{ }^{i} X_{n}\right\rangle\right)$ and
$\sum_{n=1}^{\infty} a_{n}\left(\lambda_{j_{1}}+\ldots+\lambda_{j_{i}}-\left\langle D_{n}^{i}{ }^{i} X_{n},{ }^{i} X_{n}\right\rangle\right)$ converge.
Moreover by H2a and H3, $\sum_{n=1}^{\infty} a_{n}\left(\lambda_{j_{1}}+\ldots+\lambda_{j_{i}}-\left\langle{ }^{i 1} B_{n}{ }^{i} X_{n},{ }^{i} X_{n}\right\rangle\right)$ converges a.s.

## Step 2

Suppose that for $k=1, \ldots, i-1, X_{n}^{k} \underset{n \rightarrow+\infty}{\longrightarrow} \pm V_{k}$, which is verified for $k=1$, and prove that $X_{n}^{i} \underset{n \rightarrow+\infty}{\longrightarrow} \pm V_{i}$.

1) Prove that there exists $j>i-1$ such that $X_{n}^{i} \underset{n \rightarrow+\infty}{\longrightarrow} \pm V_{j}$. Suppose that there exists $k \in\{1, \ldots, i-1\}$ such that, for $l=1, \ldots, i, V_{j_{l}} \neq \pm V_{k}$; then, for $l=1, \ldots, i,\left\langle X_{n}^{k}, V_{j_{l}}\right\rangle_{n \rightarrow+\infty}^{\longrightarrow} 0$ and $\left\langle X_{n}^{1} \Lambda \ldots \Lambda X_{n}^{i}, V_{j_{1}} \Lambda \ldots \Lambda V_{j_{i}}\right\rangle \underset{n \rightarrow+\infty}{\longrightarrow} 0$, a contradiction. Therefore for all $k \in\{1, \ldots, i-1\}$, there exists $j_{l}$ such that $V_{j_{l}}= \pm V_{k}$ and there exists $j$ such that

$$
{ }^{i} X_{n}=X_{n}^{1} \wedge \ldots \wedge X_{n}^{i} \underset{n \rightarrow+\infty}{\longrightarrow} \pm V_{1} \Lambda \ldots \Lambda V_{i-1} \wedge V_{j} .
$$

The only term which has a non-zero limit in the development of

$$
\left\langle X_{n}^{1} \wedge \ldots \wedge X_{n}^{i}, \pm V_{1} \wedge \ldots \wedge V_{i-1} \wedge V_{j}\right\rangle
$$

whose limit is 1 as $n \longrightarrow \infty$, is $\left\langle X_{n}^{1}, V_{1}\right\rangle\left\langle X_{n}^{2}, V_{2}\right\rangle \ldots\left\langle X_{n}^{i-1}, V_{i-1}\right\rangle\left\langle X_{n}^{i}, V_{j}\right\rangle$ obtained for $\sigma=I d$. As for $k=$ $1, \ldots, i-1,\left\langle X_{n}^{k}, V_{k}\right\rangle \underset{n \rightarrow+\infty}{\longrightarrow} \pm 1$, then $\left\langle X_{n}^{i}, V_{j}\right\rangle_{n \rightarrow+\infty}^{\longrightarrow} \pm 1$. Therefore $X_{n}^{i} \underset{n \rightarrow+\infty}{\longrightarrow} \pm V_{j}$.
2) Prove now that $V_{j}= \pm V_{i}$. Suppose $X_{n}^{i} \underset{n \rightarrow+\infty}{\longrightarrow} \pm V_{j} \neq \pm V_{i}$.

Denote $G_{i}$ the set of permutations $\sigma$ of $\{1, \ldots, i\}$ with $\sigma=(\sigma(1), \ldots, \sigma(i))$ and $s(\sigma)$ the number of inversions of $\sigma$.

$$
\begin{aligned}
\left\langle{ }^{i 1} B_{n}\left(X_{n}^{1} \wedge \ldots \wedge X_{n}^{i}\right), V_{1} \wedge \ldots \wedge V_{i}\right\rangle= & \sum_{l=1}^{i}\left\langle X_{n}^{1} \wedge \ldots \wedge B_{n} X_{n}^{l} \wedge \ldots \wedge X_{n}^{i}, V_{1} \wedge \ldots \wedge V_{i}\right\rangle \\
= & \sum_{l=1}^{i} \sum_{\sigma \in G_{i}}(-1)^{s(\sigma)}\left\langle X_{n}^{1}, V_{\sigma(1)}\right\rangle \ldots\left\langle B_{n} X_{n}^{l}, V_{\sigma(l)}\right\rangle \ldots\left\langle X_{n}^{i}, V_{\sigma(i)}\right\rangle . \\
& E\left[\left\langle{ }^{i 1} B_{n}\left(X_{n}^{1} \wedge \ldots \wedge X_{n}^{i}\right), V_{1} \wedge \ldots \wedge V_{i}\right\rangle^{2} \mid T_{n}\right] \\
= & E\left[\left(\sum_{l=1}^{i} \sum_{\sigma \in G_{i}}(-1)^{s(\sigma)}\left\langle X_{n}^{1}, V_{\sigma(1)}\right\rangle \ldots\left\langle B_{n} X_{n}^{l}, V_{\sigma(l)}\right\rangle \ldots\left\langle X_{n}^{i}, V_{\sigma(i)}\right\rangle\right)^{2} \mid T_{n}\right]
\end{aligned}
$$

As for $k=1, \ldots, i-1, X_{n}^{k} \underset{n \rightarrow+\infty}{\longrightarrow} \pm V_{k}$, the only term with a non-zero limit in the development of this conditional expectation is

$$
\left\langle X_{n}^{1}, V_{1}\right\rangle^{2} \ldots\left\langle X_{n}^{i-1}, V_{i-1}\right\rangle^{2} E\left[\left\langle B_{n} X_{n}^{i}, V_{i}\right\rangle^{2} \mid T_{n}\right]
$$

and

$$
\liminf E\left[\left\langle{ }^{i 1} B_{n}\left(X_{n}^{1} \wedge \ldots \wedge X_{n}^{i}\right), V_{1} \wedge \ldots \wedge V_{i}\right\rangle^{2} \mid T_{n}\right]=\liminf E\left[\left\langle B_{n} X_{n}^{i}, V_{i}\right\rangle^{2} \mid T_{n}\right]>0
$$

Moreover, by H2a and $\lim _{n \longrightarrow \infty} a_{n}=0$ :

$$
\begin{aligned}
& \lim \inf E\left[\left\langle\sum_{j=2}^{i} a_{n}^{j-1 i j} B_{n}\left(X_{n}^{1} \wedge \ldots \wedge X_{n}^{i}\right), V_{1} \wedge \ldots \wedge V_{i}\right\rangle^{2} \mid T_{n}\right] \\
= & \liminf E\left[\left(\sum_{j=2}^{i} a_{n}^{j-1}\left\langle{ }^{i j} B_{n}\left(X_{n}^{1} \wedge \ldots \wedge X_{n}^{i}\right), V_{1} \wedge \ldots \wedge V_{i}\right\rangle\right)^{2} \mid T_{n}\right]=0 .
\end{aligned}
$$

Then $\lim \inf E\left[\left\langle D_{n}^{i}\left(X_{n}^{1} \wedge \ldots \wedge X_{n}^{i}\right), V_{1} \wedge \ldots \wedge V_{i}\right\rangle^{2} \mid T_{n}\right]>0$.
Applying second assertion of theorem 1 yields almost surely:

$$
\begin{aligned}
& X_{n}^{1} \wedge \ldots \wedge X_{n}^{i} \underset{n \rightarrow+\infty}{\longrightarrow} \pm V_{1} \wedge \ldots \wedge V_{i}, \text { therefore } X_{n}^{i} \underset{n \rightarrow+\infty}{\longrightarrow} \pm V_{i} \\
& \sum_{n=1}^{\infty} a_{n}\left(\sum_{l=1}^{i} \lambda_{l}-\left\langle{ }^{i 1} B^{i} X_{n},{ }^{i} X_{n}\right\rangle\right) \text { and } \sum_{n=1}^{\infty} a_{n}\left(\sum_{l=1}^{i} \lambda_{l}-\left\langle D_{n}^{i}{ }^{i} X_{n},{ }^{i} X_{n}\right\rangle\right) \text { converge }
\end{aligned}
$$

then by H2a and $\mathrm{H} 3, \sum_{n=1}^{\infty} a_{n}\left(\sum_{l=1}^{i} \lambda_{l}-\left\langle{ }^{i 1} B_{n}{ }^{i} X_{n},{ }^{i} X_{n}\right\rangle\right)$ converges.

## Step 3

$$
\left\langle{ }^{i 1} B^{i} X_{n},{ }^{i} X_{n}\right\rangle=\sum_{k=1}^{i} \sum_{\sigma \in G_{i}}(-1)^{s(\sigma)}\left\langle X_{n}^{1}, X_{n}^{\sigma(1)}\right\rangle \ldots\left\langle B X_{n}^{k}, X_{n}^{\sigma(k)}\right\rangle \ldots\left\langle X_{n}^{i}, X_{n}^{\sigma(i)}\right\rangle
$$

As $X_{n}^{1}, \ldots, X_{n}^{i}$ are orthonormal, this sum is equal to

$$
\sum_{k=1}^{i}\left\langle X_{n}^{1}, X_{n}^{1}\right\rangle \ldots\left\langle B X_{n}^{k}, X_{n}^{k}\right\rangle \ldots\left\langle X_{n}^{i}, X_{n}^{i}\right\rangle=\sum_{k=1}^{i}\left\langle B X_{n}^{k}, X_{n}^{k}\right\rangle .
$$

Then, as $\sum_{l=1}^{i} \lambda_{l}$ is the greatest eigenvalue of ${ }^{i 1} B$ :

$$
\begin{aligned}
\lambda_{i}-\left\langle B X_{n}^{i}, X_{n}^{i}\right\rangle & =\left(\sum_{l=1}^{i} \lambda_{l}-\left\langle{ }^{i 1} B^{i} X_{n},{ }^{i} X_{n}\right\rangle\right)-\left(\sum_{l=1}^{i-1} \lambda_{l}-\left\langle{ }^{i-1,1} B^{i-1} X_{n},{ }^{i-1} X_{n}\right\rangle\right) \\
& =\left|\sum_{l=1}^{i} \lambda_{l}-\left\langle{ }^{i 1} B^{i} X_{n},{ }^{i} X_{n}\right\rangle\right|-\left|\sum_{l=1}^{i-1} \lambda_{l}-\left\langle{ }^{i-1,1} B^{i-1} X_{n},{ }^{i-1} X_{n}\right\rangle\right| .
\end{aligned}
$$

Almost surely, $\sum_{n=1}^{\infty} a_{n}\left|\sum_{l=1}^{i} \lambda_{l}-\left\langle{ }^{i 1} B^{i} X_{n},{ }^{i} X_{n}\right\rangle\right|<\infty$, then $\sum_{n=1}^{\infty} a_{n}\left|\lambda_{i}-\left\langle B X_{n}^{i}, X_{n}^{i}\right\rangle\right|<\infty$.
Likewise, as almost surely $\sum_{n=1}^{\infty} a_{n}\left(\sum_{l=1}^{i} \lambda_{l}-\left\langle{ }^{i 1} B_{n}{ }^{i} X_{n},{ }^{i} X_{n}\right\rangle\right)$ converges, then $\sum_{n=1}^{\infty} a_{n}\left(\lambda_{i}-\left\langle B_{n} X_{n}^{i}, X_{n}^{i}\right\rangle\right)$ converges.

### 2.2 Second case

Consider the same processes $\left(X_{n}\right)$ and $\left(X_{n}^{i}\right)$ as in the first case.
Suppose now $B_{n}=\omega_{1 n} B_{n}^{1}+\omega_{2 n} B_{n}^{2}$ with $\omega_{1 n}>0, \omega_{2 n} \geqslant 0, \omega_{1 n}+\omega_{2 n}=1, B_{n}^{2} T_{n}$-measurable.

### 2.2.1 Theorem of almost sure convergence

Make the following assumptions:
( $\mathrm{H} 2 \mathrm{a}^{\prime}$ ) There exists a positive number $b_{1}$ such that $\sup _{n}\left\|B_{n}^{1}\right\|<b_{1}$ a.s.
(H2b') $E\left[\sum_{n=1}^{\infty} a_{n}\left\|E\left[B_{n}^{1} \mid T_{n}\right]-B\right\|\right]<\infty$.
(H2c') $B_{n}^{2} T_{n}$-measurable, $B_{n}^{2} \underset{n \rightarrow+\infty}{\longrightarrow} B, E\left[\sum_{n=1}^{\infty} a_{n}\left\|B_{n}^{2}-B\right\|\right]<\infty$ a.s.
Theorem 5 Suppose assumptions H1a,b, H2a', $b^{\prime}, c^{\prime}$ and H3 hold. Then :

1) Almost surely, $U_{n}$ converges to one of the eigenvalues of B; on $E_{j}=\left\{U_{n} \longrightarrow \lambda_{j}\right\}, X_{n}$ converges to $V_{j}$ or $-V_{j}, \sum_{n=1}^{\infty} a_{n}\left(\lambda_{j}-U_{n}\right)$ and $\sum_{n=1}^{\infty} a_{n}\left(\lambda_{j}-W_{n}\right)$ converge.
2) If moreover $\lim _{n \rightarrow \infty} \omega_{1 n}=\omega_{1}>0$ and on $\stackrel{u}{j=2}_{p} E_{j}$, $\liminf E\left[\left\langle B_{n}^{1} X_{n}, V_{1}\right\rangle^{2} \mid T_{n}\right]>0$ a.s., then $P\left(E_{1}\right)=1$.

Proof
Apply theorem 1.
Under assumptions $\mathrm{H} 2 \mathrm{a}^{\prime}, \mathrm{b}^{\prime}, \mathrm{c}^{\prime}$, assumptions $\mathrm{H} 2 \mathrm{a}, \mathrm{b}$ are verified. Thus first part of theorem 1 holds.
Prove that $\lim \inf E\left[\left\langle B_{n} X_{n}, V_{1}\right\rangle^{2} \mid T_{n}\right]>0$ a.s. when $\lim _{n \longrightarrow}^{\lim } X_{n}= \pm V_{j} \neq \pm V_{1}$.

$$
\begin{aligned}
& E\left[\left\langle\left(\omega_{1 n} B_{n}^{1}+\omega_{2 n} B_{n}^{2}\right) X_{n}, V_{1}\right\rangle^{2} \mid T_{n}\right] \\
= & \left(\omega_{2 n}\right)^{2}\left\langle B_{n}^{2} X_{n}, V_{1}\right\rangle^{2}+2 \omega_{1 n} \omega_{2 n}\left\langle B_{n}^{2} X_{n}, V_{1}\right\rangle E\left[\left\langle B_{n}^{1} X_{n}, V_{1}\right\rangle \mid T_{n}\right] \\
& +\left(\omega_{1 n}\right)^{2} E\left[\left\langle B_{n}^{1} X_{n}, V_{1}\right\rangle^{2} \mid T_{n}\right] \text { a.s. }
\end{aligned}
$$

When $\lim _{n \rightarrow \infty} X_{n}= \pm V_{j} \neq \pm V_{1}, \lim _{n \longrightarrow \infty}\left\langle B_{n}^{2} X_{n}, V_{1}\right\rangle= \pm\left\langle B V_{j}, V_{1}\right\rangle= \pm \lambda_{j}\left\langle V_{j}, V_{1}\right\rangle=0$. Then:
$\liminf E\left[\left\langle\left(\omega_{1 n} B_{n}^{1}+\omega_{2 n} B_{n}^{2}\right) X_{n}, V_{1}\right\rangle^{2} \mid T_{n}\right]=\left(\omega_{1}\right)^{2} \liminf E\left[\left\langle B_{n}^{1} X_{n}, V_{1}\right\rangle^{2} \mid T_{n}\right]>0$ a.s.

### 2.2.2 Simultaneous estimation of several eigenvectors

Corollary 6 Suppose assumptions H1a,b, H2a', $b^{\prime}, c^{\prime}$ and H3 hold. Then:

1) For $i=1, \ldots, r$, almost surely $X_{n}^{i}$ converges to one of the eigenvectors of $B$.
2) If moreover $\lim _{n \longrightarrow \infty} \omega_{1 n}=\omega_{1}>0$ and for $i=1, \ldots, r$, a.s. on $\underset{j=i+1}{p}\left\{X_{n}^{i} \longrightarrow \pm V_{j}\right\}, \liminf E\left[\left\langle B_{n}^{1} X_{n}^{i}, V_{i}\right\rangle^{2} \mid T_{n}\right]>0$,
then almost surely $X_{n}^{i}$ converges to $\pm V_{i}, \sum_{n=1}^{\infty} a_{n}\left|\lambda_{i}-\left\langle B X_{n}^{i}, X_{n}^{i}\right\rangle\right|$ and $\sum_{n=1}^{\infty} a_{n}\left(\lambda_{i}-\left\langle B_{n} X_{n}^{i}, X_{n}^{i}\right\rangle\right)$ converge.
It is a direct application of corollary 4 whose assumptions are verified as proved above.

### 2.3 Third case

It is assumed in the second case that $\omega_{1}>0$. Now assume $\omega_{1 n}=\omega_{1}=0$.

### 2.3.1 Theorem of almost sure convergence

Recursively define the process $\left(\widetilde{X}_{n}\right)$ such that

$$
\widetilde{X}_{n+1}=\left(I+a_{n} B_{n}\right) \widetilde{X}_{n}
$$

and the process $\left(\widetilde{U}_{n}\right)$ such that

$$
\begin{aligned}
\widetilde{U}_{n+1} & =\frac{\widetilde{X}_{n+1}}{\prod_{i=1}^{n}\left(1+\lambda_{1} a_{i}\right)}=\frac{I+a_{n} B_{n}}{1+\lambda_{1} a_{n}} \widetilde{U}_{n} \\
& =\widetilde{U}_{n}+\frac{a_{n}}{1+\lambda_{1} a_{n}}\left(B_{n} \widetilde{U}_{n}-\lambda_{1} \widetilde{U}_{n}\right), \widetilde{U}_{1}=\widetilde{X}_{1} .
\end{aligned}
$$

Note that $\frac{\widetilde{U}_{n}}{\left\|\tilde{U}_{n}\right\|}=\frac{\widetilde{X}_{n}}{\left\|\widetilde{X}_{n}\right\|}=X_{n}$. Make the following assumptions:
(H1c) $\|B\|=\lambda_{1}$.
(H2c) $\sum_{n=1}^{\infty} a_{n}\left\|B_{n}-B\right\|<\infty$ a.s.
(H2d) For all $n, I+a_{n} B_{n}$ is invertible (especially verified if $B_{n}$ is non-negative).
(H5) $\widetilde{X}_{1}$ is an absolutely continuous random variable, independent from $B_{1}, \ldots, B_{n}, \ldots$.
Theorem 7 Suppose assumptions H1a,b,c, H2c,d, H3 and H5 hold. Almost surely, $\widetilde{U}_{n}$ converges to a random vector colinear to $V_{1}$, therefore $X_{n}$ converges to $\pm V_{1}, \sum_{n=1}^{\infty} a_{n}\left(\lambda_{1}-\left\langle B X_{n}, X_{n}\right\rangle\right)$ and $\sum_{n=1}^{\infty} a_{n}\left|\lambda_{1}-\left\langle B_{n} X_{n}, X_{n}\right\rangle\right|$ converge.

Remark 8 1) Note that assumption H2a is not required.
2) Since $\omega \in \Omega$ is fixed throughout the following proof, $a_{n}$ can be a positive random variable.

Lemma 9 Suppose for all $n,\left(z_{n}\right),\left(\alpha_{n}\right),\left(\beta_{n}\right)$ and $\left(\gamma_{n}\right)$ are four sequences of non-negative numbers such that:

$$
\text { for all } n \geqslant 1, z_{n+1} \leq z_{n}\left(1+\alpha_{n}\right)+\beta_{n}-\gamma_{n}, \sum_{n=1}^{\infty} \alpha_{n}<\infty, \sum_{n=1}^{\infty} \beta_{n}<\infty
$$

Then the sequence $\left(z_{n}\right)$ converges and $\sum_{n=1}^{\infty} \gamma_{n}<\infty$.
This is a deterministic form of the Robbins-Siegmund lemma [10], whose proof is based on the convergence of the decreasing sequence

$$
u_{n}=\frac{z_{n}}{\prod_{l=1}^{n-1}\left(1+\alpha_{l}\right)}-\sum_{k=1}^{n-1} \frac{\beta_{k}-\gamma_{k}}{\prod_{l=1}^{k}\left(1+\alpha_{l}\right)} .
$$

## Proof

Let $\omega$ be fixed, belonging to $C_{1}=\left\{\sum_{n=1}^{\infty} a_{n}\left\|B_{n}-B\right\|<\infty\right\}$. The writing of $\omega$ will be omitted in the following.

## Step 1

$$
\begin{aligned}
\left\|\widetilde{U}_{n+1}\right\|^{2}= & \left\|\widetilde{U}_{n}\right\|^{2}+2 \frac{a_{n}}{1+\lambda_{1} a_{n}}\left\langle\widetilde{U}_{n},\left(B_{n}-\lambda_{1} I\right) \widetilde{U}_{n}\right\rangle+\frac{a_{n}^{2}}{\left(1+\lambda_{1} a_{n}\right)^{2}}\left\|\left(B_{n}-\lambda_{1} I\right) \widetilde{U}_{n}\right\|^{2} \\
= & \left\|\widetilde{U}_{n}\right\|^{2}+2 \frac{a_{n}}{1+\lambda_{1} a_{n}}\left\langle\widetilde{U}_{n},\left(B_{n}-B\right) \widetilde{U}_{n}\right\rangle+\frac{a_{n}^{2}}{\left(1+\lambda_{1} a_{n}\right)^{2}}\left\|\left(B_{n}-\lambda_{1} I\right) \widetilde{U}_{n}\right\|^{2} \\
& -2 \frac{a_{n}}{1+\lambda_{1} a_{n}}\left\langle\widetilde{U}_{n},\left(\lambda_{1} I-B\right) \widetilde{U}_{n}\right\rangle .
\end{aligned}
$$

$\lambda_{1} I-B$ is a non-negative $Q$-symmetric matrix, with eigenvalues $0, \lambda_{1}-\lambda_{2}, \ldots, \lambda_{1}-\lambda_{p}$.

$$
\begin{aligned}
\left\|B_{n}-\lambda_{1} I\right\|^{2} \leq & 2\left\|B_{n}-B\right\|^{2}+2\left\|\lambda_{1} I-B\right\|^{2} \\
\left\|\widetilde{U}_{n+1}\right\|^{2} \leq & \left\|\widetilde{U}_{n}\right\|^{2}\left(1+2 a_{n}\left\|B_{n}-B\right\|+2 a_{n}^{2}\left\|B_{n}-B\right\|^{2}+2 a_{n}^{2}\left(\lambda_{1}-\lambda_{p}\right)^{2}\right) \\
& -2 \frac{a_{n}}{1+\lambda_{1} a_{n}}\left\langle\widetilde{U}_{n},\left(\lambda_{1} I-B\right) \widetilde{U}_{n}\right\rangle
\end{aligned}
$$

By assumptions H 2 c and H 3 , applying lemma 9 yields:

$$
\left\|\widetilde{U}_{n}\right\|^{2} \underset{n \rightarrow+\infty}{\longrightarrow} \widetilde{U}, \quad \sum_{n=1}^{\infty} a_{n}\left\langle\widetilde{U}_{n},\left(\lambda_{1} I-B\right) \widetilde{U}_{n}\right\rangle=\sum_{n=1}^{\infty} a_{n}\left\|\widetilde{U}_{n}\right\|^{2}\left(\lambda_{1}-\frac{\left\langle\widetilde{U}_{n}, B \widetilde{U}_{n}\right\rangle}{\left\|\widetilde{U}_{n}\right\|^{2}}\right)<\infty
$$

As $\sum_{n=1}^{\infty} a_{n}=\infty$, either $\left\|\widetilde{U}_{n}\right\| \underset{n \rightarrow+\infty}{\longrightarrow} 0$ or $\sum_{n=1}^{\infty} a_{n}\left(\lambda_{1}-\left\langle X_{n}, B X_{n}\right\rangle\right)<\infty$.
Step 2: convergence of $\widetilde{U}_{n}^{j}=\left\langle\widetilde{U}_{n}, V_{j}\right\rangle$

$$
\begin{aligned}
\widetilde{U}_{n+1}^{j} & =\left\langle V_{j}, \frac{I+a_{n} B_{n}}{1+\lambda_{1} a_{n}} \widetilde{U}_{n}\right\rangle=\left\langle V_{j}, \frac{1}{1+\lambda_{1} a_{n}}\left(I+a_{n} B+a_{n}\left(B_{n}-B\right)\right) \widetilde{U}_{n}\right\rangle \\
& =\frac{1+\lambda_{j} a_{n}}{1+\lambda_{1} a_{n}} \widetilde{U}_{n}^{j}+\frac{a_{n}}{1+\lambda_{1} a_{n}}\left\langle V_{j},\left(B_{n}-B\right) \widetilde{U}_{n}\right\rangle
\end{aligned}
$$

a) For $j>1$, as $a_{n} \xrightarrow[n \rightarrow+\infty]{\longrightarrow} 0$, there exists $\alpha_{n}=O\left(a_{n}\right)>0$ such that for $n$ sufficiently large:

$$
\begin{aligned}
\left|\widetilde{U}_{n+1}^{j}\right| & \leq \frac{1+\lambda_{j} a_{n}}{1+\lambda_{1} a_{n}}\left|\widetilde{U}_{n}^{j}\right|+a_{n}\left\|B_{n}-B\right\|\left\|\widetilde{U}_{n}\right\| \\
& \leq\left(1-\alpha_{n}\right)\left|\widetilde{U}_{n}^{j}\right|+a_{n}\left\|B_{n}-B\right\|\left\|\widetilde{U}_{n}\right\| .
\end{aligned}
$$

By H2c and as $\left\|\widetilde{U}_{n}\right\|$ converges, applying lemma 9 yields:

$$
\left|\widetilde{U}_{n}^{j}\right|_{n \rightarrow+\infty}^{\longrightarrow} \widetilde{U}^{j}, \quad \sum_{n=1}^{\infty} \alpha_{n}\left|\widetilde{U}_{n}^{j}\right|<\infty . \text { As } \sum_{n=1}^{\infty} a_{n}=\infty, \widetilde{U}^{j}=0
$$

b) For $j=1$, by H2c and $\left\|\widetilde{U}_{n}\right\|_{n \rightarrow+\infty}^{\longrightarrow} \sqrt{\widetilde{U}}$ :

$$
\begin{aligned}
\widetilde{U}_{n+1}^{1} & =\widetilde{U}_{n}^{1}+\frac{a_{n}}{1+\lambda_{1} a_{n}}\left\langle V_{1},\left(B_{n}-B\right) \widetilde{U}_{n}\right\rangle=\widetilde{U}_{1}^{1}+\sum_{i=1}^{n} \frac{a_{i}}{1+\lambda_{1} a_{i}}\left\langle V_{1},\left(B_{i}-B\right) \widetilde{U}_{i}\right\rangle \\
\underset{n \rightarrow+\infty}{\longrightarrow} \widetilde{U}^{1} & =\widetilde{U}_{1}^{1}+\sum_{i=1}^{\infty} \frac{a_{i}}{1+\lambda_{1} a_{i}}\left\langle V_{1},\left(B_{i}-B\right) \widetilde{U}_{i}\right\rangle .
\end{aligned}
$$

Now:

$$
\begin{aligned}
\widetilde{U}_{n+1}^{1} & =\left\langle V_{1}, \widetilde{U}_{n+1}\right\rangle=\left\langle V_{1}, \prod_{i=1}^{n} \frac{I+a_{i} B_{i}}{1+\lambda_{1} a_{i}} \widetilde{U}_{1}\right\rangle \underset{n \rightarrow+\infty}{\longrightarrow}\left\langle V_{1}, \prod_{i=1}^{\infty} \frac{I+a_{i} B_{i}}{1+\lambda_{1} a_{i}} \widetilde{U}_{1}\right\rangle \\
& =V_{1}^{\prime} Q S \widetilde{U}_{1}=\widetilde{U}^{1} \text { with } S=\prod_{i=1}^{\infty} \frac{I+a_{i} B_{i}}{1+\lambda_{1} a_{i}} .
\end{aligned}
$$

As $\widetilde{U}_{1}$ is absolutely continuous, if $V_{1}^{\prime} Q S \neq 0, P\left(V_{1}^{\prime} Q S \widetilde{U}_{1}=0 \mid S\right)=0$, then $P\left(\widetilde{U}^{1}=0\right)=0$. Prove that $V_{1}^{\prime} Q S \neq 0$.

## Step 3

Denote $C_{2}=\left\{\widetilde{U}_{1} \neq 0\right\}$. Suppose $\omega \in C_{1} \cap C_{2}$.
Under H2c, there exists $N$ such that $\sum_{n=N}^{\infty} a_{n}\left\|B_{n}-B\right\|<\ln 2$.

$$
\begin{aligned}
V_{1}^{\prime} Q S & =V_{1}^{\prime} Q \prod_{i=N}^{\infty} \frac{I+a_{i} B_{i}}{1+\lambda_{1} a_{i}} \prod_{i=1}^{N-1} \frac{I+a_{i} B_{i}}{1+\lambda_{1} a_{i}} \\
& =V_{1}^{\prime} Q R \prod_{i=1}^{N-1} \frac{I+a_{i} B_{i}}{1+\lambda_{1} a_{i}} \text { with } R=\prod_{i=N}^{\infty} \frac{I+a_{i} B_{i}}{1+\lambda_{1} a_{i}}
\end{aligned}
$$

Under H2d, $V_{1}^{\prime} Q S \neq 0 \Leftrightarrow V_{1}^{\prime} Q R \neq 0$.
Denote $C_{n}=\frac{a_{n}\left\|B_{n}-B\right\|}{1+\lambda_{1} a_{n}}$ and $\left(W_{n}, n \geqslant N\right)$ the process $\left(\widetilde{U}_{n}, n \geqslant N\right)$ with $W_{N}=V_{1}$.
As $\|B\|=\lambda_{1},\left\|I+a_{i-1} B\right\|=1+\lambda_{1} a_{i-1}$. By step 2 , as $W_{N}=V_{1}$ :

$$
\begin{aligned}
W_{n+1}^{1} & =\left\langle V_{1}, W_{n+1}\right\rangle=1+\sum_{i=N}^{n} \frac{a_{i}}{1+\lambda_{1} a_{i}}\left\langle V_{1},\left(B_{i}-B\right) W_{i}\right\rangle \geqslant 1-\sum_{i=N}^{n} C_{i}\left\|W_{i}\right\| \\
\left\|W_{i}\right\| & \leq \frac{\left\|I+a_{i-1} B_{i-1}\right\|}{1+\lambda_{1} a_{i-1}}\left\|W_{i-1}\right\| \\
& \leq \frac{\left\|I+a_{i-1} B\right\|+a_{i-1}\left\|B_{i-1}-B\right\|}{1+\lambda_{1} a_{i-1}}\left\|W_{i-1}\right\|=\left(1+C_{i-1}\right)\left\|W_{i-1}\right\| \\
& \leq \prod_{l=N}^{i-1}\left(1+C_{l}\right), i=N+1, \ldots, n .
\end{aligned}
$$

As $\sum_{n=N}^{\infty} C_{n}<\ln 2$, it follows that:

$$
\begin{aligned}
W_{n+1}^{1} & \geqslant 1-\sum_{i=N}^{n} C_{i} \prod_{l=N}^{i-1}\left(1+C_{l}\right)=1-\left(\prod_{l=N}^{n}\left(1+C_{l}\right)-1\right) \\
& =2-\prod_{l=N}^{n}\left(1+C_{l}\right) \geqslant 2-e^{\sum_{l=N}^{n} C_{l}} \geqslant 2-e^{\sum_{l=N}^{\infty} C_{l}}>0
\end{aligned}
$$

By step 2, $W_{n}^{1}$ converges to $\left\langle V_{1}, R V_{1}\right\rangle=V_{1}^{\prime} Q R V_{1}$ which is therefore strictly positive, thus $V_{1}^{\prime} Q R \neq 0$.

## Step 4: conclusion

It follows that $\left(\widetilde{U}_{n}\right)$ converges to $\widetilde{U}^{1} V_{1} \neq 0$, therefore $\frac{\widetilde{U}_{n}}{\left\|\tilde{U}_{n}\right\|}=X_{n}$ converges to $\pm V_{1}$, and by the conclusion of step $1, \sum_{n=1}^{\infty} a_{n}\left(\lambda_{1}-\left\langle X_{n}, B X_{n}\right\rangle\right)<\infty$.

Moreover by H2c:

$$
\begin{aligned}
\sum_{n=1}^{\infty} a_{n}\left|\lambda_{1}-\left\langle X_{n}, B_{n} X_{n}\right\rangle\right| & =\sum_{n=1}^{\infty} a_{n}\left|\lambda_{1}-\left\langle X_{n},\left(B_{n}-B\right) X_{n}\right\rangle-\left\langle X_{n}, B X_{n}\right\rangle\right| \\
& \leq \sum_{n=1}^{\infty} a_{n}\left(\lambda_{1}-\left\langle X_{n}, B X_{n}\right\rangle\right)+\sum_{n=1}^{\infty} a_{n}\left\|B_{n}-B\right\|<\infty
\end{aligned}
$$

Remark 10 Step 1 can be replaced by:
$\left\|\widetilde{U}_{n+1}\right\| \leq \frac{\left\|I+a_{n} B_{n}\right\|}{1+\lambda_{1} a_{n}}\left\|\widetilde{U}_{n}\right\| \leq\left(1+\frac{a_{n}\left\|B_{n}-B\right\|}{1+\lambda_{1} a_{n}}\right)\left\|\widetilde{U}_{n}\right\|$.
Under H2c, $\left\|\widetilde{U}_{n}\right\|$ converges a.s. Assumption $\sum_{n=1}^{\infty} a_{n}^{2}<\infty$ is not used and can be replaced by $a_{n} \underset{n \rightarrow+\infty}{\longrightarrow} 0$, but in this case, the convergence of $\sum_{n=1}^{\infty} a_{n}\left(\lambda_{1}-\left\langle B X_{n}, X_{n}\right\rangle\right)$ and $\sum_{n=1}^{\infty} a_{n}\left|\lambda_{1}-\left\langle B_{n} X_{n}, X_{n}\right\rangle\right|$ is not proved.

### 2.3.2 Simultaneous estimation of several eigenvectors

For $i=1, \ldots, r$, recursively define the process $\left(\widetilde{X}_{n}^{i}\right)$ by:

$$
\begin{aligned}
\tilde{Y}_{n+1}^{i} & =\left(I+a_{n} B_{n}\right) \widetilde{X}_{n}^{i} \\
\widetilde{X}_{n+1}^{i} & =\widetilde{Y}_{n+1}^{i}-\sum_{j<i}\left\langle\widetilde{Y}_{n+1}^{i}, \frac{\widetilde{X}_{n+1}^{j}}{\left\|\widetilde{X}_{n+1}^{j}\right\|}\right\rangle \frac{\widetilde{X}_{n+1}^{j}}{\left\|\widetilde{X}_{n+1}^{j}\right\|}
\end{aligned}
$$

Note that $\frac{\widetilde{X}_{n}^{i}}{\left\|\widetilde{X}_{n}^{i}\right\|}=X_{n}^{i}$.
Denote $D_{n}^{i}={ }^{i 1} B_{n}+\sum_{j=2}^{i} a_{n}^{j-1{ }^{i j}} B_{n}$.
Make the following assumptions:
(H1c') For $i=1, \ldots, r,\left\|^{i 1} B\right\|=\lambda_{1}+\ldots+\lambda_{i}$.
(H2d') For $i=1, \ldots, r, I+a_{n} D_{n}^{i}$ is invertible.
(H5') For $i=1, \ldots, r, X_{1}^{i}$ is an absolutely continuous random variable, independent from $B_{1}, \ldots, B_{n}, \ldots$
Corollary 11 Suppose assumptions H1a,b, c', H2c, d', H3 and H5' hold. Then, for $i=1, \ldots, r$, almost surely $X_{n}^{i}$ converges to $\pm V_{i}, \sum_{n=1}^{\infty} a_{n}\left|\lambda_{i}-\left\langle X_{n}^{i}, B X_{n}^{i}\right\rangle\right|$ and $\sum_{n=1}^{\infty} a_{n}\left|\lambda_{i}-\left\langle X_{n}^{i}, B_{n} X_{n}^{i}\right\rangle\right|$ converge.

## Proof

$\omega$ is fixed throughout the proof, belonging to the intersection of the a.s. convergence sets. Its writing will be omitted.

Let $i \in\{1, \ldots, r\}$.

$$
\begin{aligned}
{ }^{i} \widetilde{X}_{n+1} & =\widetilde{X}_{n+1}^{1} \wedge \ldots \wedge \widetilde{X}_{n+1}^{i}=\widetilde{Y}_{n+1}^{1} \wedge \ldots \wedge \widetilde{Y}_{n+1}^{i}={ }^{i} \Lambda\left(I+a_{n} B_{n}\right)^{i} \widetilde{X}_{n} \\
& =\left(I+a_{n}{ }^{i 1} B_{n}+a_{n} \sum_{j=2}^{i} a_{n}^{j-1}{ }^{i j} B_{n}\right){ }^{i} \widetilde{X}_{n}=\left(I+a_{n} D_{n}^{i}\right)^{i} \widetilde{X}_{n}
\end{aligned}
$$

Note that $\frac{{ }^{i} \widetilde{X}_{n+1}}{\left\|\tilde{X}_{n+1}\right\|}=\frac{\widetilde{X}_{n+1}^{1}}{\left\|\tilde{X}_{n+1}^{1}\right\|} \wedge \ldots \wedge \frac{\widetilde{X}_{n+1}^{i}}{\left\|\widetilde{X}_{n+1}^{i}\right\|}=\frac{{ }^{i} \Lambda\left(I+a_{n} B_{n}\right)^{i} \widetilde{X}_{n}}{\| \|^{i} \Lambda\left(I+a_{n} B_{n}\right)^{i} \widetilde{X}_{n} \|}={ }^{i} X_{n+1}$.
By H2c and H3:

$$
\begin{aligned}
\sum_{n=1}^{\infty} a_{n}\left\|D_{n}^{i}-{ }^{i 1} B\right\| & =\sum_{n=1}^{\infty} a_{n}\| \|^{i 1}\left(B_{n}-B\right)+\sum_{j=2}^{i} a_{n}^{j-1}{ }^{i j} B_{n} \| \\
& \leq c(i)\left(\sum_{n=1}^{\infty} a_{n}\left\|B_{n}-B\right\|+\sum_{j=2}^{i} \sum_{n=1}^{\infty} a_{n}^{j}\left\|B_{n}\right\|^{j}\right)<\infty
\end{aligned}
$$

As $B$ is $Q$-symmetric with distinct eigenvalues, ${ }^{i 1} B$ has the same properties ; $V_{1} \wedge . . \wedge V_{i}$ is an eigenvector associated to its greatest eigenvalue $\lambda_{1}+\ldots+\lambda_{i}$. Applying theorem 7 yields that:

$$
\begin{aligned}
& { }^{i} X_{n} \text { converges to } \pm V_{1} \wedge . . \wedge V_{i} \\
& \sum_{n=1}^{\infty} a_{n}\left(\sum_{l=1}^{i} \lambda_{l}-\left\langle{ }^{i 1} B^{i} X_{n},{ }^{i} X_{n}\right\rangle\right) \text { and } \sum_{n=1}^{\infty} a_{n}\left|\sum_{l=1}^{i} \lambda_{l}-\left\langle D_{n}^{i}{ }^{i} X_{n},{ }^{i} X_{n}\right\rangle\right| \text { converge, }
\end{aligned}
$$

$$
\text { which implies that } \sum_{n=1}^{\infty} a_{n}\left|\sum_{l=1}^{i} \lambda_{l}-\left\langle{ }^{i 1} B_{n}{ }^{i} X_{n},{ }^{i} X_{n}\right\rangle\right| \text { converges. }
$$

Suppose that, for $k=1, \ldots, i-1, X_{n}^{k}$ converges to $\pm V_{k}$, which is verified for $k=1$, and prove that it is true for $k=i$.

In the development of $\left\langle X_{n}^{1} \wedge \ldots \wedge X_{n}^{i}, \pm V_{1} \wedge \ldots \wedge V_{i}\right\rangle$, which converges to $\pm 1$, the only term which has a non-zero limit is $\left\langle X_{n}^{1}, V_{1}\right\rangle \ldots\left\langle X_{n}^{i-1}, V_{i-1}\right\rangle\left\langle X_{n}^{i}, V_{i}\right\rangle$; since for $k=1, \ldots, i-1,\left\langle X_{n}^{k}, V_{k}\right\rangle$ converges to $\pm 1$, it follows that $\left\langle X_{n}^{i}, V_{i}\right\rangle$ converges to $\pm 1$.

Applying the same proof as that of corollary 4, step 3, yields:
$\sum_{n=1}^{\infty} a_{n}\left|\lambda_{i}-\left\langle X_{n}^{i}, B X_{n}^{i}\right\rangle\right|<\infty$. By H2c:

$$
\sum_{n=1}^{\infty} a_{n}\left|\lambda_{i}-\left\langle X_{n}^{i}, B_{n} X_{n}^{i}\right\rangle\right| \leqslant \sum_{n=1}^{\infty} a_{n}\left|\lambda_{i}-\left\langle X_{n}^{i}, B X_{n}^{i}\right\rangle\right|+\sum_{n=1}^{\infty} a_{n}\left\|B_{n}-B\right\|<\infty
$$

## 3 Application to sequential principal component analysis of a data stream

Let $Z_{11}, \ldots, Z_{1 m_{1}}, Z_{21}, \ldots, Z_{2 m_{2}}, \ldots, Z_{n 1}, \ldots, Z_{n m_{n}}, \ldots$ be an i.i.d sample of a random vector $Z$ in $\mathbb{R}^{p}$ whose components are denoted $Z^{1}, \ldots, Z^{p}$. Denote $M$ the metrics used for PCA and $B=M^{\frac{1}{2}} E\left[(Z-E[Z])(Z-E[Z])^{\prime}\right] M^{\frac{1}{2}}$. Let $m$ belonging to $\mathbb{R}^{p}$ (in practice $m$ is an estimation of $E[Z]$ ); denoting $Z^{c}=Z-m$ :

$$
B=M^{\frac{1}{2}}\left(E\left[Z^{c} Z^{c^{\prime}}\right]-E\left[Z^{c}\right] E\left[Z^{c}\right]^{\prime}\right) M^{\frac{1}{2}}
$$

Denote $\bar{Z}_{n-1}$ the mean of the sample $\left(Z_{11}, \ldots, Z_{n-1, m_{n-1}}\right)$ of $Z$ and $M_{n-1}$ a $T_{n}$-measurable estimation of $M$.

### 3.1 Use of a data mini-batch at each step

Note that the metrics used for orthonormalization is the identity because of the symmetrization.
Recursively define the processes $\left(X_{n}^{i}\right), i=1, \ldots, r$, by

$$
\begin{aligned}
Y_{n+1}^{i} & =\left(I+a_{n} B_{n}\right) X_{n}^{i} \\
T_{n+1}^{i} & =Y_{n+1}^{i}-\sum_{j<i}\left\langle Y_{n+1}^{i}, X_{n+1}^{j}\right\rangle X_{n+1}^{j}, \quad X_{n+1}^{i}=\frac{T_{n+1}^{i}}{\left\|T_{n+1}^{i}\right\|}
\end{aligned}
$$

Denote $Z_{n i}^{c}=Z_{n i}-m, \bar{Z}_{n-1}^{c}=\bar{Z}_{n-1}-m$. Take

$$
B_{n}=M_{n-1}^{\frac{1}{2}}\left(\frac{1}{m_{n}} \sum_{i=1}^{m_{n}} Z_{n i}^{c} Z_{n i}^{c}{ }^{\prime}-\bar{Z}_{n-1}^{c}\left(\bar{Z}_{n-1}^{c}\right)^{\prime}\right) M_{n-1}^{\frac{1}{2}}
$$

Make the following assumptions:
(H3') $a_{n}>0, \sum_{n=1}^{\infty} a_{n}=\infty, \sum_{n=1}^{\infty} \frac{a_{n}}{\sqrt{n}}<\infty, \sum_{n=1}^{\infty} a_{n}^{2}<\infty$.
(H4a) $\|Z\|$ is a.s. bounded.
(H4b) There is no affine or quadratic relation between the components of $Z$.
(H6a) There exists a positive number $d$ such that $\sup _{n}\left\|M_{n}^{\frac{1}{2}}\right\|<d$.
(H6b) $M_{n}^{\frac{1}{2}} \longrightarrow M^{\frac{1}{2}}$ a.s.
(H6c) $E\left[\sum_{n=1}^{\infty} a_{n}\left\|M_{n-1}^{\frac{1}{2}}-M^{\frac{1}{2}}\right\|\right]<\infty$.
Corollary 12 Suppose assumptions H1b, H3', H4a,b and H6a,b,c hold. Then $X_{n}^{i}$ converges a.s. to $\pm V_{i}$, $\sum_{n=1}^{\infty} a_{n}\left|\lambda_{i}-\left(X_{n}^{i}\right)^{\prime} B X_{n}^{i}\right|$ and $\sum_{n=1}^{\infty} a_{n}\left(\lambda_{i}-\left(X_{n}^{i}\right)^{\prime} B_{n} X_{n}^{i}\right)$ converge a.s. for $i=1, \ldots, r$.

## Proof

Verify the assumptions of corollary 4.
(H1a) $B$ is symmetric.
(H2a) Under H4a and H6a, $\sup _{n}\left\|B_{n}\right\|$ is a.s. uniformly bounded.
(H2b) Almost surely:

$$
\begin{aligned}
& E\left[B_{n} \mid T_{n}\right]-B \\
= & E\left[\left.M_{n-1}^{\frac{1}{2}}\left(\frac{1}{m_{n}} \sum_{i=1}^{m_{n}} Z_{n i}^{c} Z_{n i}^{c} \prime^{\prime}-\bar{Z}_{n-1}^{c}\left(\bar{Z}_{n-1}^{c}\right)^{\prime}\right) M_{n-1}^{\frac{1}{2}} \right\rvert\, T_{n}\right] \\
& -M^{\frac{1}{2}}\left(E\left[Z^{c} Z^{c^{\prime}}\right]-E\left[Z^{c}\right] E\left[Z^{c}\right]^{\prime}\right) M^{\frac{1}{2}} \\
= & \left.M_{n-1}^{\frac{1}{2}}\left(E\left[Z^{c} Z^{c^{\prime}}\right]-\bar{Z}_{n-1}^{c} \bar{Z}_{n-1}^{c}\right)^{\prime}\right) M_{n-1}^{\frac{1}{2}}-M^{\frac{1}{2}}\left(E\left[Z^{c} Z^{c^{\prime}}\right]-E\left[Z^{c}\right] E\left[Z^{c}\right]^{\prime}\right) M^{\frac{1}{2}} \\
= & \left(M_{n-1}^{\frac{1}{2}}-M^{\frac{1}{2}}\right)\left(E\left[Z^{c} Z^{c^{\prime}}\right]-E\left[Z^{c}\right] E\left[Z^{c}\right]^{\prime}\right) M_{n-1}^{\frac{1}{2}} \\
& +M^{\frac{1}{2}}\left(E\left[Z^{c} Z^{c^{\prime}}\right]-E\left[Z^{c}\right] E\left[Z^{c}\right]^{\prime}\right)\left(M_{n-1}^{\frac{1}{2}}-M^{\frac{1}{2}}\right) \\
& -M_{n-1}^{\frac{1}{2}}\left(\bar{Z}_{n-1}^{c}-E\left[Z^{c}\right]\right) \bar{Z}_{n-1}^{c} M_{n-1}^{\frac{1}{2}}-M_{n-1}^{\frac{1}{2}} E\left[Z^{c}\right]\left(\bar{Z}_{n-1}^{c}-E\left[Z^{c}\right]\right)^{\prime} M_{n-1}^{\frac{1}{2}} .
\end{aligned}
$$

If $Z$ has $4^{\text {th }}$ order moments and $a_{n}>0, \sum_{n=1}^{\infty} \frac{a_{n}}{\sqrt{n}}<\infty$ :

$$
\sum_{n=1}^{\infty} a_{n} E\left[\left\|\bar{Z}_{n-1}^{c}-E\left[Z^{c}\right]\right\|\right]=\sum_{n=1}^{\infty} a_{n} E\left[\left\|\bar{Z}_{n-1}-E[Z]\right\|\right]<\infty .[9]
$$

Therefore, under H4a, H6a,c, $E\left[\sum_{n=1}^{\infty} a_{n}\left\|E\left[B_{n} \mid T_{n}\right]-B\right\|\right]<\infty$.
By corollary 4 , for $k=1, \ldots, r$, almost surely, $X_{n}^{k}$ converges a.s. to one of the eigenvectors of $B$.
Prove now that $\lim _{n \rightarrow \infty} E\left[\left(X_{n}^{k \prime} B_{n} V_{k}\right)^{2} \mid T_{n}\right]>0$ a.s. on the set $\left\{X_{n} \longrightarrow V_{j}\right\}$ for $j \neq k$ to apply second part of corollary 4.

In the following of the proof, $X_{n}^{k}$ is denoted $X_{n}$.

Decompose $E\left[\left(X_{n}^{\prime} B_{n} V_{k}\right)^{2} \mid T_{n}\right]$ into the sum of three terms (1),(2),(3):

$$
\begin{align*}
& E\left[\left.\left(X_{n}^{\prime} M_{n-1}^{\frac{1}{2}}\left(\frac{1}{m_{n}} \sum_{i=1}^{m_{n}} Z_{n i}^{c} Z_{n i}^{c}{ }^{\prime}-\bar{Z}_{n-1}^{c} \bar{Z}_{n-1}^{c}{ }^{\prime}\right) M_{n-1}^{\frac{1}{2}} V_{k}\right)^{2} \right\rvert\, T_{n}\right] \\
= & E\left[\left.\left(\frac{1}{m_{n}} \sum_{i=1}^{m_{n}}\left(X_{n}^{\prime} M_{n-1}^{\frac{1}{2}} Z_{n i}^{c}\right)\left(Z_{n i}^{c}{ }^{\prime} M_{n-1}^{\frac{1}{2}} V_{k}\right)-\left(X_{n}^{\prime} M_{n-1}^{\frac{1}{2}} \bar{Z}_{n-1}^{c}\right)\left(\bar{Z}_{n-1}^{c}{ }^{\prime} M_{n-1}^{\frac{1}{2}} V_{k}\right)\right)^{2} \right\rvert\, T_{n}\right] \\
= & E\left[\left.\left(\frac{1}{m_{n}} \sum_{i=1}^{m_{n}}\left(X_{n}^{\prime} M_{n-1}^{\frac{1}{2}} Z_{n i}^{c}\right)\left(Z_{n i}^{c}{ }^{\prime} M_{n-1}^{\frac{1}{2}} V_{k}\right)\right)^{2} \right\rvert\, T_{n}\right](1)  \tag{1}\\
& -2\left(X_{n}^{\prime} M_{n-1}^{\frac{1}{2}} \bar{Z}_{n-1}^{c}\right)\left(\bar{Z}_{n-1}^{c}{ }^{\prime} M_{n-1}^{\frac{1}{2}} V_{k}\right) \frac{1}{m_{n}} \sum_{i=1}^{m_{n}} E\left[\left.\left(X_{n}^{\prime} M_{n-1}^{\frac{1}{2}} Z_{n i}^{c}\right)\left(Z_{n i}^{c}{ }^{\prime} M_{n-1}^{\frac{1}{2}} V_{k}\right) \right\rvert\, T_{n}\right]  \tag{2}\\
& +\left(X_{n}^{\prime} M_{n-1}^{\frac{1}{2}} \bar{Z}_{n-1}^{c}\right)^{2}\left(\bar{Z}_{n-1}^{c}{ }^{\prime} M_{n-1}^{\frac{1}{2}} V_{k}\right)^{2} .(3)
\end{align*}
$$

Note that the two random variables $R=V_{j}^{\prime} M^{\frac{1}{2}} Z^{c}$ and $S=V_{k}^{\prime} M^{\frac{1}{2}} Z^{c}$ are uncorrelated, then $E[R S]=$ $E[R] E[S]:$

$$
\begin{aligned}
E[(R-E[R])(S-E[S])] & =E\left[V_{j}^{\prime} M^{\frac{1}{2}}(Z-E[Z]) \cdot V_{k}^{\prime} M^{\frac{1}{2}}(Z-E[Z])\right] \\
& =V_{j}^{\prime} M^{\frac{1}{2}} E\left[(Z-E[Z])(Z-E[Z])^{\prime}\right] M^{\frac{1}{2}} V_{k}=\lambda_{k} V_{j}^{\prime} V_{k}=0
\end{aligned}
$$

Consider (1). Under H6b:

$$
\begin{aligned}
(1) & =\frac{1}{m_{n}^{2}} \sum_{i=1}^{m_{n}} \sum_{l=1}^{m_{n}} E\left[\left.\left(X_{n}^{\prime} M_{n-1}^{\frac{1}{2}} Z_{n i}^{c}\right)\left(Z_{n i}^{c}{ }^{\prime} M_{n-1}^{\frac{1}{2}} V_{k}\right)\left(X_{n}^{\prime} M_{n-1}^{\frac{1}{2}} Z_{n l}^{c}\right)\left(Z_{n l}^{c}{ }^{\prime} M_{n-1}^{\frac{1}{2}} V_{k}\right) \right\rvert\, T_{n}\right] \\
& =X_{n}^{\prime} M_{n-1}^{\frac{1}{2}} \frac{1}{m_{n}^{2}} \sum_{i=1}^{m_{n}} \sum_{l=1}^{m_{n}} E\left[\left.\left(V_{k}^{\prime} M_{n-1}^{\frac{1}{2}} Z_{n i}^{c}\right) Z_{n i}^{c} Z_{n l}^{c \prime}\left(Z_{n l}^{c \prime} M_{n-1}^{\frac{1}{2}} V_{k}\right) \right\rvert\, T_{n}\right] M_{n-1}^{\frac{1}{2}} X_{n} \\
& \xrightarrow{\longrightarrow} V_{j}^{\prime} M^{\frac{1}{2}} E\left[\left(V_{k}^{\prime} M^{\frac{1}{2}} Z^{c}\right) Z^{c} Z^{c \prime}\left(Z^{c \prime} M^{\frac{1}{2}} V_{k}\right)\right] M^{\frac{1}{2}} V_{j} \\
& =E\left[\left(V_{k}^{\prime} M^{\frac{1}{2}} Z^{c}\right)^{2}\left(V_{j}^{\prime} M^{\frac{1}{2}} Z^{c}\right)^{2}\right] \text { a.s. }
\end{aligned}
$$

Consider (2):

$$
\begin{aligned}
& (2) \underset{n \rightarrow+\infty}{\longrightarrow}-2 E\left[V_{j}^{\prime} M^{\frac{1}{2}} Z^{c}\right] E\left[Z^{c \prime} M^{\frac{1}{2}} V_{k}\right] E\left[\left(V_{j}^{\prime} M^{\frac{1}{2}} Z^{c}\right)\left(Z^{c \prime} M^{\frac{1}{2}} V_{k}\right)\right] \\
= & -2 E\left[\left(V_{j}^{\prime} M^{\frac{1}{2}} Z^{c}\right)\left(V_{k}^{\prime} M^{\frac{1}{2}} Z^{c}\right)\right]^{2} \text { a.s. }
\end{aligned}
$$

Consider (3):

$$
(3) \underset{n \rightarrow+\infty}{\longrightarrow}\left(E\left[V_{j}^{\prime} M^{\frac{1}{2}} Z^{c}\right] E\left[V_{k}^{\prime} M^{\frac{1}{2}} Z^{c}\right]\right)^{2}=E\left[\left(V_{j}^{\prime} M^{\frac{1}{2}} Z^{c}\right)\left(V_{k}^{\prime} M^{\frac{1}{2}} Z^{c}\right)\right]^{2} \text { a.s. }
$$

As a result:

$$
E\left[\left(X_{n}^{\prime} B_{n} V_{k}\right)^{2} \mid T_{n}\right] \underset{n \rightarrow+\infty}{\longrightarrow} E\left[\left(V_{j}^{\prime} M^{\frac{1}{2}} Z^{c}\right)^{2}\left(V_{k}^{\prime} M^{\frac{1}{2}} Z^{c}\right)^{2}\right]-E\left[\left(V_{j}^{\prime} M^{\frac{1}{2}} Z^{c}\right)\left(V_{k}^{\prime} M^{\frac{1}{2}} Z^{c}\right)\right]^{2}
$$

$$
=\operatorname{Var}\left[V_{j}^{\prime} M^{\frac{1}{2}} Z^{c} . V_{k}^{\prime} M^{\frac{1}{2}} Z^{c}\right]>0 \text { a.s. by } \mathrm{H} 4 \mathrm{~b}
$$

### 3.2 Use of all observations until the current step with different weights

At each step, all observations until the current step are taken into account but with different weights for observations at the current step and observations in the past.

In the definition of processes $\left(X_{n}^{i}\right), i=1, \ldots, r$, take now

$$
\begin{aligned}
B_{n} & =w_{1} B_{n}^{1}+w_{2} B_{n}^{2}, w_{1}+w_{2}=1, w_{1}>0, w_{2} \geqslant 0, \text { with } \\
B_{n}^{1} & =M_{n-1}^{\frac{1}{2}}\left(\frac{1}{m_{n}} \sum_{j=1}^{m_{n}} Z_{n j}^{c} Z_{n j}^{c}{ }^{\prime}-\bar{Z}_{n-1}^{c} \bar{Z}_{n-1}^{c}{ }^{\prime}\right) M_{n-1}^{\frac{1}{2}}, \\
B_{n}^{2} & =M_{n-1}^{\frac{1}{2}}\left(\frac{1}{\sum_{i=1}^{n-1} m_{i}} \sum_{i=1}^{n-1} \sum_{j=1}^{m_{i}} Z_{i j}^{c} Z_{i j}^{c}{ }^{\prime}-\bar{Z}_{n-1}^{c} \bar{Z}_{n-1}^{c}{ }^{\prime}\right) M_{n-1}^{\frac{1}{2}} .
\end{aligned}
$$

Corollary 13 Suppose assumptions H1b, H3', H4a,b and H6a,b,c hold. Then $X_{n}^{i}$ converges a.s. to $\pm V_{i}$, $\sum_{n=1}^{\infty} a_{n}\left|\lambda_{i}-\left(X_{n}^{i}\right)^{\prime} B X_{n}^{i}\right|$ and $\sum_{n=1}^{\infty} a_{n}\left(\lambda_{i}-\left(X_{n}^{i}\right)^{\prime} B_{n} X_{n}^{i}\right)$ converge a.s. for $i=1, \ldots, r$.

## Proof

Verify the assumptions of corollary 6 .
(i) It is established in the proof of corollary 12 that $E\left[\sum_{n=1}^{\infty} a_{n}\left\|E\left[B_{n}^{1} \mid T_{n}\right]-B\right\|\right]<\infty$ a.s. under assumptions H3', H4a and H6a,c.
(ii) Prove now that $\mathrm{E}\left[\sum_{n=1}^{\infty} a_{n}\left\|B_{n}^{2}-B\right\|\right]<\infty$ a.s.

$$
\begin{aligned}
B_{n}^{2}= & M_{n-1}^{\frac{1}{2}} C_{n-1} M_{n-1}^{\frac{1}{2}} \text { with } \\
C_{n-1}= & \frac{1}{\sum_{i=1}^{n-1} m_{i}} \sum_{i=1}^{n-1} \sum_{j=1}^{m_{i}} Z_{i j}^{c} Z_{i j}^{c}{ }^{\prime}-\bar{Z}_{n-1}^{c} \bar{Z}_{n-1}^{c}{ }^{\prime}=\frac{1}{\sum_{i=1}^{n-1} m_{i}} \sum_{i=1}^{n-1} \sum_{j=1}^{m_{i}} Z_{i j} Z_{i j}{ }^{\prime}-\bar{Z}_{n-1} \bar{Z}_{n-1}{ }^{\prime} . \\
B= & M^{\frac{1}{2}} C M^{\frac{1}{2}} \text { with } C=E\left[Z Z^{\prime}\right]-E[Z] E\left[Z^{\prime}\right] . \\
B_{n}^{2}-B= & M_{n-1}^{\frac{1}{2}} C_{n-1} M_{n-1}^{\frac{1}{2}}-M^{\frac{1}{2}} C M^{\frac{1}{2}} \\
= & \left(M_{n-1}^{\frac{1}{2}}-M^{\frac{1}{2}}\right) C_{n-1} M_{n-1}^{\frac{1}{2}}+M^{\frac{1}{2}}\left(C_{n-1}-C\right) M_{n-1}^{\frac{1}{2}}+M^{\frac{1}{2}} C\left(M_{n-1}^{\frac{1}{2}}-M^{\frac{1}{2}}\right) . \\
C_{n-1}-C= & \frac{1}{n-1} \sum_{i=1}^{n-1} \sum_{j=1}^{m_{i}} Z_{i j} Z_{i j}^{\prime}-E\left[Z Z^{\prime}\right]-\left(\bar{Z}_{n-1}-E[Z]\right) \bar{Z}_{n-1}^{\prime}-E[Z]\left(\bar{Z}_{n-1}-E[Z]\right)^{\prime} .
\end{aligned}
$$

Under assumptions H3' and H4a:

$$
\sum_{n=1}^{\infty} a_{n} E\left[\left\|\bar{Z}_{n-1}-E[Z]\right\|\right]<\infty, \sum_{n=1}^{\infty} a_{n} E\left[\left\|{\overline{Z Z^{\prime}}}_{n-1}-E\left[Z Z^{\prime}\right]\right\|\right]<\infty[9] .
$$

Therefore, under H4a and H6a, c, $E\left[\sum_{n=1}^{\infty} a_{n}\left\|B_{n}^{2}-B\right\|\right]<\infty$.
(iii) Prove finally that $\lim _{n \rightarrow \infty} E\left[\left(X_{n}^{k \prime} B_{n} V_{k}\right)^{2} \mid T_{n}\right]>0$ when $\lim _{n \longrightarrow \infty} X_{n}^{k}= \pm V_{j} \neq \pm V_{k}$ a.s. By the proof of corollary 12, as $\lim _{n \longrightarrow \infty} X_{n}^{k \prime} B_{n}^{2} V_{k}= \pm V_{j}^{\prime} B V_{k}=0$, under H4b and H6b:

$$
\begin{aligned}
\lim _{n \longrightarrow \infty} E\left[\left(X_{n}^{k \prime} B_{n} V_{k}\right)^{2} \mid T_{n}\right] & =\left(\omega_{1}\right)^{2} \lim _{n \longrightarrow \infty} E\left[\left(X_{n}^{k^{\prime}} B_{n}^{1} V_{k}\right)^{2} \mid T_{n}\right] \\
& =\left(\omega_{1}\right)^{2} \operatorname{Var}\left[V_{j}^{\prime} M^{\frac{1}{2}} Z^{c} . V_{k}^{\prime} M^{\frac{1}{2}} Z^{c}\right]>0 \text { a.s. }
\end{aligned}
$$

### 3.3 Use of all observations until the current step with uniform weights

Take now

$$
B_{n}=M_{n}^{\frac{1}{2}}\left(\frac{1}{\sum_{i=1}^{n} m_{i}} \sum_{i=1}^{n} \sum_{j=1}^{m_{i}} Z_{i j}^{c} Z_{i j}^{c}{ }^{\prime}-\bar{Z}_{n}^{c} \bar{Z}_{n}^{c,}\right) M_{n}^{\frac{1}{2}} .
$$

Make the following assumptions:
(H4c) $Z$ has $4^{\text {th }}$ order moments.
(H6d) $\sum_{n=1}^{\infty} a_{n}\left\|M_{n}^{\frac{1}{2}}-M^{\frac{1}{2}}\right\|<\infty$ a.s.
Corollary 14 Suppose assumptions H1b, H3', H4c, H5' and H6b,d hold. Then, for $i=1, \ldots, r$, almost surely $X_{n}^{i}$ converges to $\pm V_{i}, \sum_{n=1}^{\infty} a_{n}\left|\lambda_{i}-\left\langle X_{n}^{i}, B X_{n}^{i}\right\rangle\right|$ and $\sum_{n=1}^{\infty} a_{n}\left|\lambda_{i}-\left\langle X_{n}^{i}, B_{n} X_{n}^{i}\right\rangle\right|$ converge.

## Proof

It suffices to verify assumption $\mathrm{H} 2 \mathrm{c}, \sum_{n=1}^{\infty} a_{n}\left\|B_{n}-B\right\|<\infty$ a.s. to apply corollary 11. Under assumptions H 4 c and $\mathrm{H} 6 \mathrm{~b}, \mathrm{~d}$, proof is similar to that of corollary 13 for $B_{n}^{2}$ without taking expectation.

In the particular case of normed principal component analysis, $M$ is the diagonal matrix of the inverses of variances of $Z^{1}, \ldots, Z^{p}$. Denote for $j=1, \ldots, p, V_{n}^{j}$ the variance of the sample $\left(Z_{11}^{j}, \ldots, Z_{n, m_{n}}^{j}\right)$ of $Z^{j}$ and $M_{n}$ the diagonal matrix of order $p$ whose element $(j, j)$ is the inverse of $\frac{\mu_{n}}{\mu_{n}-1} V_{n}^{j}$ with $\mu_{n}=\sum_{i=1}^{n} m_{i}$. Under H4c, H6b holds; it is established in [9] (lemma5) that H6d holds under H4c and H3'.

## 4 Conclusion

In this article we gave theorems of almost sure convergence of a normed stochastic approximation process to eigenvectors of a $Q$-symmetric matrix $B$ associated to eigenvalues in decreasing order, assuming that $E\left[B_{n} \mid T_{n}\right]$ or $B_{n}$ converges a.s. to $B$. This extends previous results assuming $B_{n}$ i.i.d. with $E\left[B_{n}\right]=B$. Several observations can be used at each step or all observations until the current step.

These results are applied to online estimation of principal components in PCA when the data arrive continously. In this case, the expectation and the variance of the variables are unknown and are estimated online in parallel with the estimation of principal components. To reduce the computing time and to avoid numerical explosions, we proposed to use symmetrisation ( $B$ is $I$-symmetric) and pseudo-centering with respect to a preliminary estimation of the expectation.

We made a first set of experiments: several processes, with or without symmetrization, with or without pseudo-centering, with different numbers of observations used at each step or with all observations until the current step, were compared on datasets or simulations (data not shown). It appeared that processes with symmetrization, pseudo-centering and use of all observations until the current step typically yield the best results.

Acknowledgment Results incorporated in this article received funding from the investments for the Future program under grant agreement No ANR-15-RHU-0004.
