Search for the Decay of the Higgs Boson to Charm Quarks with the ATLAS Experiment

The ATLAS Collaboration

A direct search for the Standard Model Higgs boson decaying to a pair of charm quarks is presented. Associated production of the Higgs and Z bosons, in the decay mode $ZH \rightarrow \ell^+ \ell^- c\bar{c}$ is studied. A dataset with an integrated luminosity of 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ recorded by the ATLAS experiment at the LHC is used. The $H \rightarrow c\bar{c}$ signature is identified using charm-tagging algorithms. The observed (expected) upper limit on $\sigma(pp \rightarrow ZH) \times \mathcal{B}(H \rightarrow c\bar{c})$ is $2.7 (3.9^{+2.1}_{-1.1}) \text{ pb}$ at the 95% confidence level for a Higgs boson mass of 125 GeV, while the Standard Model value is 26 fb.

In July 2012, the ATLAS and CMS collaborations announced the discovery of a new particle with a mass of approximately 125 GeV [1, 2] in searches for the Standard Model (SM) Higgs boson at the Large Hadron Collider (LHC) [3]. Subsequent measurements indicate that this particle is consistent with the SM Higgs boson [4–10]. Direct evidence for the Yukawa coupling of the Higgs boson to the top [11] and bottom [12, 13] quarks was recently obtained. Measurements of the Yukawa coupling of the Higgs boson to quarks in generations other than the third are difficult at hadron colliders, due to small branching fractions, large backgrounds, and challenges in jet flavor identification [14, 15]. This Letter presents a direct search by the ATLAS experiment for the decay of the Higgs boson to a pair of charm (c) quarks. This search targets the production of the Higgs boson in association with a Z boson decaying to charged leptons: $Z(\ell^+\ell^-)H(c\bar{c})$, where $\ell = e, \mu$.

The SM branching fraction for a Higgs boson with a mass of 125 GeV to decay to a pair of charm quarks is predicted to be 2.9% [16]. The inclusive cross-section for $\sigma(pp \rightarrow ZH) \times \mathcal{B}(H \rightarrow c\bar{c})$ is 26 fb at $\sqrt{s} = 13$ TeV [17]. Rare exclusive decays of the Higgs boson to a light vector meson or quarkonium state and a photon can also probe the couplings of the second-generation quarks to the Higgs boson [18–21]. Previously, the ATLAS Collaboration presented an indirect search for the decay of the Higgs boson to c -quarks via the decay to $J/\psi\gamma$, obtaining a branching fraction limit of 1.5×10^{-3} at the 95% confidence level (CL), which approximately corresponds to a limit of 540 times the SM prediction [14, 20]. Bounds on Higgs boson branching fractions to unobserved final states and fits to global rates constrain $\mathcal{B}(H \rightarrow c\bar{c}) < 20\%$ at the 95% CL, assuming SM production cross-sections [22]. These limits can still accommodate large modifications to the Higgs boson coupling to charm quarks from new physics [22]. In this Letter, a new approach is introduced to investigate the coupling of the Higgs boson to charm quarks.

The search is performed using pp collision data recorded in 2015 and 2016 with the ATLAS detector [23] at $\sqrt{s} = 13$ TeV. The ATLAS detector at the LHC covers nearly the entire solid angle around the collision point.¹ It consists of an inner tracking detector surrounded by a thin superconducting solenoid, electromagnetic and hadronic calorimeters, and a muon spectrometer incorporating three large superconducting toroidal magnets. An additional pixel layer was installed for the $\sqrt{s} = 13$ TeV running period [24]. After the application of beam, detector and data-quality requirements, the integrated luminosity corresponds to $36.1 \pm 0.8 \text{ fb}^{-1}$, measured following Ref. [25]. Events are required to contain exactly two same-flavor leptons with an invariant mass consistent with that of the Z boson, and at least two jets of which one or two are identified as charm jets (c -jets). In this Letter, lepton refers to only electrons or muons. The analysis procedure is validated by measuring the yield of ZW and ZZ production, where the sample is enriched in $W \rightarrow cs, cd$ and $Z \rightarrow c\bar{c}$ decays. Further details can be found in Ref. [12].

Monte Carlo (MC) simulated samples were produced for signal and background processes using the full ATLAS detector simulation [26] using GEANT4 [27]. Table 1 provides details of the event generators used for each signal and background sample. Signal events were produced at next-to-leading order (NLO) for the $q\bar{q} \rightarrow ZH$ process and at leading order (LO) for the $gg \rightarrow ZH$ process with PowHEG-BOX v2 [28]. The dominant Z +jets background and the resonant diboson ZW and ZZ processes were generated using SHERPA 2.2.1 [29]. The $t\bar{t}$ background was generated using PowHEG-BOX v2. Backgrounds from single top and multijet production and the contribution from Higgs decays other than $b\bar{b}$ and $c\bar{c}$ are assessed to be

¹ ATLAS uses a right-handed coordinate system with its origin at the nominal interaction point (IP) in the center of the detector and the z -axis along the beam pipe. The x -axis points from the IP to the center of the LHC ring, and the y -axis points upwards. Cylindrical coordinates (r, ϕ) are used in the transverse plane, ϕ being the azimuthal angle around the z -axis. The pseudorapidity is defined in terms of the polar angle θ as $\eta = -\ln \tan(\theta/2)$. Angular distance is measured in units of $\Delta R \equiv \sqrt{(\Delta\eta)^2 + (\Delta\phi)^2}$.

Table 1: The configurations used for event generation of the signal and background processes. If two parton distribution functions (PDFs) are shown, the first is for the matrix element calculation and the second for the parton shower, otherwise the same is used for both. Alternative event generators and configurations, used to estimate systematic uncertainties, are in parentheses. Tune refers to the underlying-event tuned parameters of the parton shower event generator. MG5_AMC refers to `MADGRAPH5_AMC@NLO` 2.2.2 [30]; PYTHIA 8 refers to version 8.212 [31]. Heavy-flavor hadron decays modeled by `EVTGEN` 1.2.0 [32] are used for all samples except those generated using `SHERPA`. The order of the calculation of the cross-sections used to normalize the predictions is indicated. The $q\bar{q} \rightarrow ZH$ cross-section is estimated by subtracting the $gg \rightarrow ZH$ cross-section from the $pp \rightarrow ZH$ cross-section. The asterisk (*) in the last column denotes that the indicated order is for the $pp \rightarrow ZH$ cross-section. NNLO denotes next-to-next-to-leading order; NLL denotes next-to-leading-log and NNLL denotes next-to-next-to-leading log.

negligible and not considered further. The Higgs boson mass is set to $m_H = 125$ GeV and the top-quark mass is set to 172.5 GeV.

Events are required to have at least one reconstructed primary vertex. Electron candidates are reconstructed from energy clusters in the electromagnetic calorimeter that are associated with charged-particle tracks reconstructed in the inner detector [55, 56]. Muon candidates are reconstructed by combining inner detector tracks with muon spectrometer tracks or energy deposits in the calorimeters consistent with the passage of minimum-ionizing particles [57]. For data recorded in 2015, the single-electron (muon) trigger required a candidate with $p_T > 24$ (20) GeV; in 2016 the lepton p_T threshold was raised to 26 GeV. Events are required to contain a pair of same-flavor leptons, both satisfying $p_T > 7$ GeV and $|\eta| < 2.5$. At least one lepton must have $p_T > 27$ GeV and correspond to a lepton that passed the trigger. The two leptons are required to satisfy loose track-isolation criteria with an efficiency greater than 99%. They are required to have opposite charge in dimuon events, but not in dielectron events due to the non-negligible charge misidentification rate of electrons. The invariant mass of the dilepton system is required to be consistent with the mass of the Z boson: $81 \text{ GeV} < m_{\ell\ell} < 101 \text{ GeV}$.

Jets are reconstructed from topological energy clusters in the calorimeters [58, 59] using the anti- k_t algorithm [60] with a radius parameter of 0.4 implemented in the `FASTJET` package [61]. The jet energy is corrected using a jet-area-based technique [62, 63] and calibrated [64, 65] using p_T - and η -dependent correction factors determined from simulation, with residual corrections from internal jet properties. Further corrections from in situ measurements are applied to data. Selected jets must have $p_T > 20$ GeV and $|\eta| < 2.5$. Events are required to contain at least two jets. If a muon is found within a jet, its momentum is added to the selected jet. An overlap removal procedure resolves cases in which the same physical object is reconstructed multiple times, e.g. an electron also reconstructed as a jet.

Figure 1: The c -jet tagging efficiency (colored scale) as a function of the b -jet and l -jet rejection as obtained from simulated $t\bar{t}$ events. The cross, labeled as working point, WP, denotes the selection criterion used in this analysis. The solid and dotted black lines indicate the contours in rejection space for the fixed c -tagging efficiency used in the analysis and two alternatives.

Jets in simulated events are labeled according to the presence of a heavy-flavor hadron with $p_T > 5$ GeV within $\Delta R = 0.3$ from the jet axis. If a b -hadron is found the jet is labeled as a b -jet. If no b -hadron is found, but a c -hadron is present, then the jet is labeled as a c -jet. Otherwise the jet is labeled as a light-flavor jet (l -jet).

Flavor-tagging algorithms exploit the different lifetimes of b -, c - and light-flavor hadrons. A c -tagging algorithm is used to identify c -jets. Charm jets are particularly challenging to tag because c -hadrons have shorter lifetimes and decay to fewer charged particles than b -hadrons. Boosted decision trees (BDTs) are trained to obtain two multivariate discriminants: to separate c -jets from l -jets and c -jets from b -jets. The same variables used for b -tagging [66, 67] are used. Figure 1 shows the selection criteria applied in the two-dimensional multivariate discriminant space, to obtain an efficiency of 41% for c -jets and rejection factors of 4.0 and 20 for b -jets and l -jets. The efficiencies are calibrated to data using b -quarks from $t \rightarrow Wb$ and c -quarks from $W \rightarrow cs, cd$ with methods identical to the b -tagging algorithms [66]. Statistical uncertainties in the simulation are reduced, by weighting events according to the tagging efficiencies of their jets, parameterized as a function of jet flavor, p_T , η and the angular separation between jets, rather than imposing a direct requirement on the c -tagging discriminants.

Data are analyzed in four categories with different expected signal purities. The dijet invariant mass, $m_{c\bar{c}}$, constructed using the two highest- p_T jets, is the discriminating variable in each category. Categories are defined using the transverse momentum of the reconstructed Z boson, p_T^Z ($75 \text{ GeV} \leq p_T^Z < 150 \text{ GeV}$ and $p_T^Z \geq 150 \text{ GeV}$) and the number of c -tags amongst the leading jets (either one or two). The p_T^Z requirements exploit the harder p_T^Z distribution in ZH compared to $Z + \text{jets}$ production. Background events are rejected by requiring the angular separation between the two jets constituting the dijet system, $\Delta R_{c\bar{c}}$, to be less than 2.2, 1.5 or 1.3 for events satisfying $75 \leq p_T^Z < 150 \text{ GeV}$, $150 \leq p_T^Z < 200 \text{ GeV}$ or $p_T^Z \geq 200 \text{ GeV}$. The signal acceptance ranges from 0.5% to 3.4% depending on the category. A joint binned maximum-profile-likelihood fit to $m_{c\bar{c}}$ in the categories is used to extract the signal yield and the $Z + \text{jets}$ background normalization. The fit uses 15 bins in each category within the range of $50 \text{ GeV} < m_{c\bar{c}} < 200 \text{ GeV}$, with

a bin width of 10 GeV. The parameter of interest, μ , common to all categories, is the signal strength, defined as the ratio of the measured signal yield to the SM prediction.

Systematic uncertainties affecting the signal and background predictions include theoretical uncertainties in the signal and background modeling and experimental uncertainties. Table 2 shows their relative impact on the fitted value of μ . Uncertainties in the $m_{c\bar{c}}$ shape of the backgrounds are assessed by comparisons between nominal and alternative event generators as indicated in Table 1.

Systematic uncertainties are incorporated within the statistical model through nuisance parameters that modify the shape and/or normalization of the distributions. Statistical uncertainties in the simulation samples are accounted for. The Z +jets background is normalized from the data through the inclusion of an unconstrained normalization parameter for each category. The fitted normalization parameters range between 1.13 and 1.30. All other background normalization factors are correlated between categories, with acceptance uncertainties of order 10% to account for relative variations between categories.

The dominant contributions to the uncertainty in μ are the efficiency of the tagging algorithms, the jet energy scale and resolution, and the background modeling. The largest uncertainty is due to the normalization of the dominant Z +jets background. The typical uncertainty in the tagging efficiency is 25% for c -jets, 5% for b -jets, and 20% for l -jets.

Table 2: Breakdown of the relative contributions to the total uncertainty in μ . The statistical uncertainty includes the contribution from the floating Z +jets normalization parameters. The sum in quadrature of the individual components differs from the total uncertainty due to correlations between the components.

Source	$\sigma/\sigma_{\text{tot}}$
Statistical	49%
Floating Z + jets normalization	31%
Systematic	87%
Flavor tagging	73%
Background modeling	47%
Lepton, jet and luminosity	28%
Signal modeling	28%
MC statistical	6%

Table 3 shows the fitted signal and background yields. The $m_{c\bar{c}}$ distributions in the 2 c -tag categories are shown in Figure 2 with the background shapes and normalizations according to the result of the fit. Good agreement is observed between the post-fit shapes of the distributions and the data.

The analysis procedure is validated by measuring the yield of ZV production, where V denotes a W or Z boson, with the same event selection. The fraction of the ZZ yield from $Z \rightarrow c\bar{c}$ decays is $\sim 55\%$ (20%) in the 2 c -tag (1 c -tag) category, while the fraction of the ZW yield from $W \rightarrow cs, cd$ is $\sim 65\%$ for both the 2 and 1 c -tag categories. Contributions of Higgs boson decays to $c\bar{c}$ and $b\bar{b}$ are treated as background and constrained to the SM predictions within its theoretical uncertainties. The diboson signal strength is measured to be $\mu_{ZV} = 0.6^{+0.5}_{-0.4}$ with an observed (expected) significance of 1.4 (2.2) standard deviations.

The best-fit value for the $ZH(c\bar{c})$ signal strength is $\mu_{ZH} = -69 \pm 101$. By assuming a signal with the kinematics of the SM Higgs boson, model-dependent corrections are made to extrapolate to the inclusive

Table 3: Post-fit yields for the signal and background processes in each category from the profile likelihood fit. Uncertainties include statistical and systematic contributions. The pre-fit SM expected $ZH(c\bar{c})$ signal yields are indicated in parenthesis.

Sample	Yield, $50 \text{ GeV} < m_{c\bar{c}} < 200 \text{ GeV}$			
	1 c-tag		2 c-tags	
	$75 \leq p_T^Z < 150 \text{ GeV}$	$p_T^Z \geq 150 \text{ GeV}$	$75 \leq p_T^Z < 150 \text{ GeV}$	$p_T^Z \geq 150 \text{ GeV}$
Z + jets	69400 ± 500	15650 ± 180	5320 ± 100	1280 ± 40
ZW	750 ± 130	290 ± 50	53 ± 13	20 ± 5
ZZ	490 ± 70	180 ± 28	55 ± 18	26 ± 8

phase space. Hence, an upper limit on $\sigma(pp \rightarrow ZH) \times \mathcal{B}(H \rightarrow c\bar{c})$ is computed using a modified frequentist CL_s method [68, 69] with the profile likelihood ratio as the test statistic. The observed (expected) upper limit is found to be 2.7 ($3.9^{+2.1}_{-1.1}$) pb at the 95% CL. This corresponds to an observed (expected) upper limit on μ at the 95% CL of 110 (150^{+80}_{-40}). The uncertainties in the expected limits correspond to the $\pm 1\sigma$ interval of background-only pseudo-experiments. With the current sensitivity, the result depends weakly on the assumption of the SM rate for $H \rightarrow b\bar{b}$. The observed limit remains within 5% of the nominal value when the assumed value for normalization of the $ZH(b\bar{b})$ background is varied from zero to twice the SM prediction.

Figure 2: Observed and predicted $m_{c\bar{c}}$ distributions in the 2 c -tag analysis categories. The expected signal is scaled by a factor of 100. Backgrounds are corrected to the results of the fit to the data. The predicted background from the simulation is shown as red dashed histograms. The ratios of the data to the fitted background are shown in the lower panels. The error bands indicate the sum in quadrature of the statistical and systematic uncertainties in the background prediction.

A search for the decay of the Higgs boson to charm quarks has been performed using 36.1 fb^{-1} of data collected with the ATLAS detector in pp collisions at $\sqrt{s} = 13 \text{ TeV}$ at the LHC. No significant excess of $ZH(c\bar{c})$ production is observed over the SM background expectation. The observed upper limit on $\sigma(pp \rightarrow ZH) \times \mathcal{B}(H \rightarrow c\bar{c})$ is 2.7 pb at the 95% CL. The corresponding expected upper limit is $3.9^{+2.1}_{-1.1} \text{ pb}$. This is the most stringent limit to date in direct searches for the inclusive decay of the Higgs boson to charm quarks.

We thank CERN for the very successful operation of the LHC, as well as the support staff from our institutions without whom ATLAS could not be operated efficiently.

(Commissariat à l'Energie Atomique et aux Energies Alternatives), Gif-sur-Yvette, France

¹³⁹ Santa Cruz Institute for Particle Physics, University of California Santa Cruz, Santa Cruz CA, United States of America

¹⁴⁰ Department of Physics, University of Washington, Seattle WA, United States of America

¹⁴¹ Department of Physics and Astronomy, University of Sheffield, Sheffield, United Kingdom

¹⁴² Department of Physics, Shinshu University, Nagano, Japan

¹⁴³ Department Physik, Universität Siegen, Siegen, Germany

¹⁴⁴ Department of Physics, Simon Fraser University, Burnaby BC, Canada

¹⁴⁵ SLAC National Accelerator Laboratory, Stanford CA, United States of America

¹⁴⁶ ^(a) Faculty of Mathematics, Physics & Informatics, Comenius University, Bratislava; ^(b) Department of Subnuclear Physics, Institute of Experimental Physics of the Slovak Academy of Sciences, Kosice, Slovak Republic

¹⁴⁷ ^(a) Department of Physics, University of Cape Town, Cape Town; ^(b) Department of Physics, University of Johannesburg, Johannesburg; ^(c) School of Physics, University of the Witwatersrand, Johannesburg, South Africa

¹⁴⁸ ^(a) Department of Physics, Stockholm University; ^(b) The Oskar Klein Centre, Stockholm, Sweden

¹⁴⁹ Physics Department, Royal Institute of Technology, Stockholm, Sweden

¹⁵⁰ Departments of Physics & Astronomy and Chemistry, Stony Brook University, Stony Brook NY, United States of America

¹⁵¹ Department of Physics and Astronomy, University of Sussex, Brighton, United Kingdom

¹⁵² School of Physics, University of Sydney, Sydney, Australia

¹⁵³ Institute of Physics, Academia Sinica, Taipei, Taiwan

¹⁵⁴ Department of Physics, Technion: Israel Institute of Technology, Haifa, Israel

¹⁵⁵ Raymond and Beverly Sackler School of Physics and Astronomy, Tel Aviv University, Tel Aviv, Israel

¹⁵⁶ Department of Physics, Aristotle University of Thessaloniki, Thessaloniki, Greece

¹⁵⁷ International Center for Elementary Particle Physics and Department of Physics, The University of Tokyo, Tokyo, Japan

¹⁵⁸ Graduate School of Science and Technology, Tokyo Metropolitan University, Tokyo, Japan

¹⁵⁹ Department of Physics, Tokyo Institute of Technology, Tokyo, Japan

¹⁶⁰ Tomsk State University, Tomsk, Russia

¹⁶¹ Department of Physics, University of Toronto, Toronto ON, Canada

¹⁶² ^(a) INFN-TIFPA; ^(b) University of Trento, Trento, Italy

¹⁶³ ^(a) TRIUMF, Vancouver BC; ^(b) Department of Physics and Astronomy, York University, Toronto ON, Canada

¹⁶⁴ Faculty of Pure and Applied Sciences, and Center for Integrated Research in Fundamental Science and Engineering, University of Tsukuba, Tsukuba, Japan

¹⁶⁵ Department of Physics and Astronomy, Tufts University, Medford MA, United States of America

¹⁶⁶ Department of Physics and Astronomy, University of California Irvine, Irvine CA, United States of America

¹⁶⁷ ^(a) INFN Gruppo Collegato di Udine, Sezione di Trieste, Udine; ^(b) ICTP, Trieste; ^(c) Dipartimento di Chimica, Fisica e Ambiente, Università di Udine, Udine, Italy

¹⁶⁸ Department of Physics and Astronomy, University of Uppsala, Uppsala, Sweden

¹⁶⁹ Department of Physics, University of Illinois, Urbana IL, United States of America

¹⁷⁰ Instituto de Fisica Corpuscular (IFIC), Centro Mixto Universidad de Valencia - CSIC, Spain

¹⁷¹ Department of Physics, University of British Columbia, Vancouver BC, Canada

¹⁷² Department of Physics and Astronomy, University of Victoria, Victoria BC, Canada

¹⁷³ Department of Physics, University of Warwick, Coventry, United Kingdom

- ¹⁷⁴ Waseda University, Tokyo, Japan
¹⁷⁵ Department of Particle Physics, The Weizmann Institute of Science, Rehovot, Israel
¹⁷⁶ Department of Physics, University of Wisconsin, Madison WI, United States of America
¹⁷⁷ Fakultät für Mathematik und Naturwissenschaften, Fachgruppe Physik, Bergische Universität Wuppertal, Wuppertal, Germany
¹⁷⁸ Fakultät für Physik und Astronomie, Julius-Maximilians-Universität, Würzburg, Germany
¹⁷⁹ Department of Physics, Yale University, New Haven CT, United States of America
¹⁸⁰ Yerevan Physics Institute, Yerevan, Armenia
¹⁸¹ Centre de Calcul de l’Institut National de Physique Nucléaire et de Physique des Particules (IN2P3), Villeurbanne, France
¹⁸² Academia Sinica Grid Computing, Institute of Physics, Academia Sinica, Taipei, Taiwan
^a Also at Department of Physics, King’s College London, London, United Kingdom
^b Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku, Azerbaijan
^c Also at Novosibirsk State University, Novosibirsk, Russia
^d Also at TRIUMF, Vancouver BC, Canada
^e Also at Department of Physics & Astronomy, University of Louisville, Louisville, KY, United States of America
^f Also at Physics Department, An-Najah National University, Nablus, Palestine
^g Also at Department of Physics, California State University, Fresno CA, United States of America
^h Also at Department of Physics, University of Fribourg, Fribourg, Switzerland
ⁱ Also at II Physikalisches Institut, Georg-August-Universität, Göttingen, Germany
^j Also at Departament de Fisica de la Universitat Autonoma de Barcelona, Barcelona, Spain
^k Also at Tomsk State University, Tomsk, and Moscow Institute of Physics and Technology State University, Dolgoprudny, Russia
^l Also at The Collaborative Innovation Center of Quantum Matter (CICQM), Beijing, China
^m Also at Universita di Napoli Parthenope, Napoli, Italy
ⁿ Also at Institute of Particle Physics (IPP), Canada
^o Also at Horia Hulubei National Institute of Physics and Nuclear Engineering, Bucharest, Romania
^p Also at CPPM, Aix-Marseille Université and CNRS/IN2P3, Marseille, France
^q Also at Department of Physics, St. Petersburg State Polytechnical University, St. Petersburg, Russia
^r Also at Borough of Manhattan Community College, City University of New York, New York City, United States of America
^s Also at Department of Financial and Management Engineering, University of the Aegean, Chios, Greece
^t Also at Centre for High Performance Computing, CSIR Campus, Rosebank, Cape Town, South Africa
^u Also at Louisiana Tech University, Ruston LA, United States of America
^v Also at Institucio Catalana de Recerca i Estudis Avancats, ICREA, Barcelona, Spain
^w Also at Department of Physics, The University of Michigan, Ann Arbor MI, United States of America
^x Also at LAL, Univ. Paris-Sud, CNRS/IN2P3, Université Paris-Saclay, Orsay, France
^y Also at Graduate School of Science, Osaka University, Osaka, Japan
^z Also at Fakultät für Mathematik und Physik, Albert-Ludwigs-Universität, Freiburg, Germany
^{aa} Also at Institute for Mathematics, Astrophysics and Particle Physics, Radboud University Nijmegen/Nikhef, Nijmegen, Netherlands
^{ab} Also at Institute of Theoretical Physics, Ilia State University, Tbilisi, Georgia
^{ac} Also at CERN, Geneva, Switzerland
^{ad} Also at Georgian Technical University (GTU), Tbilisi, Georgia
^{ae} Also at Ochadai Academic Production, Ochanomizu University, Tokyo, Japan

- af* Also at Manhattan College, New York NY, United States of America
ag Also at Hellenic Open University, Patras, Greece
ah Also at The City College of New York, New York NY, United States of America
ai Also at Departamento de Fisica Teorica y del Cosmos, Universidad de Granada, Granada, Portugal
aj Also at Department of Physics, California State University, Sacramento CA, United States of America
ak Also at Moscow Institute of Physics and Technology State University, Dolgoprudny, Russia
al Also at Departement de Physique Nucleaire et Corpusculaire, Université de Genève, Geneva, Switzerland
am Also at Department of Physics, The University of Texas at Austin, Austin TX, United States of America
an Also at Institut de Física d'Altes Energies (IFAE), The Barcelona Institute of Science and Technology, Barcelona, Spain
ao Also at School of Physics, Sun Yat-sen University, Guangzhou, China
ap Also at Institute for Nuclear Research and Nuclear Energy (INRNE) of the Bulgarian Academy of Sciences, Sofia, Bulgaria
aq Also at Faculty of Physics, M.V.Lomonosov Moscow State University, Moscow, Russia
ar Also at National Research Nuclear University MEPhI, Moscow, Russia
as Also at Department of Physics, Stanford University, Stanford CA, United States of America
at Also at Institute for Particle and Nuclear Physics, Wigner Research Centre for Physics, Budapest, Hungary
au Also at Giresun University, Faculty of Engineering, Turkey
av Also at Institute of Physics, Academia Sinica, Taipei, Taiwan
aw Also at University of Malaya, Department of Physics, Kuala Lumpur, Malaysia
ax Also at Budker Institute of Nuclear Physics, SB RAS, Novosibirsk, Russia
