**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

### Joint Congress on Evolutionary Biology 2018

# Interactions between a pathogenic bacteria and the microbiota of its insect host

Marine Cambon

- ► Infections have been for long considered as one host/one pathogen interactions
- but infections are often **mixtures** of microorganisms:
  - Multiple infections
  - Pathogen phenotypic heterogeneity
  - Host microbiota

#### Uninfected host

#### Pathogen

- ► Infections have been for long considered as one host/one pathogen interactions
- but infections are often mixtures of microorganisms:
  - Multiple infections
  - Pathogen phenotypic heterogeneity
  - Host microbiota

#### Uninfected host

- ► Infections have been for long considered as one host/one pathogen interactions
- but infections are often mixtures of microorganisms:
  - Multiple infections
  - Pathogen phenotypic heterogeneity
  - Host microbiota

#### Uninfected host

#### Pathogen

- ► Infections have been for long considered as one host/one pathogen interactions
- but infections are often mixtures of microorganisms:
  - Multiple infections
  - Pathogen phenotypic heterogeneity
  - ► Host microbiota

#### Uninfected host

#### Pathogen

### Why does it matter? Two examples

Interactions with host microbiota can change the infection outcome!

#### **Facilitation**

► The pathogen can be helped by the host microbiota

#### Competition

► The pathogen can be cleared by the host microbiota

Shao et al. 2017)

#### Why does it matter? Two examples

Interactions with host microbiota can change the infection outcome!

#### **Facilitation**

► The pathogen can be **helped by the host microbiota** 

#### Competition

► The pathogen can be cleared by the host microbiota

(Shao et al. 2017)

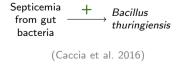

#### Why does it matter? Two examples

Interactions with host microbiota can change the infection outcome!

#### **Facilitation**

► The pathogen can be **helped by the host microbiota** 

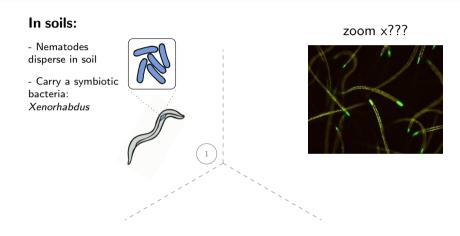

#### Competition

► The pathogen can be cleared by the host microbiota

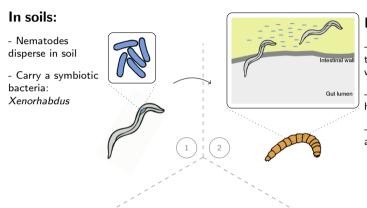

(Shao et al. 2017)

## Life cycle of the Steinernema-Xenorhabdus pair

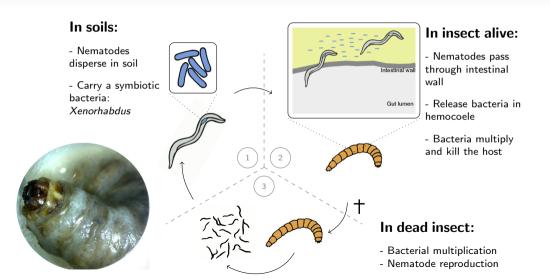

## Life cycle of the Steinernema-Xenorhabdus pair

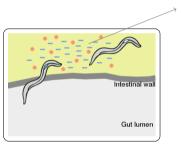

#### In insect alive:

- Nematodes pass through intestinal wall
- Release bacteria in hemocoele
- Bacteria multiply and kill the host

## Life cycle of the Steinernema-Xenorhabdus pair

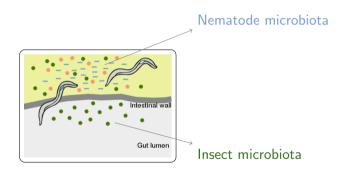

## What happens in microbial community in insects cadavers?

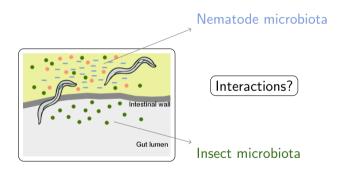

Nematode microbiota

## What happens in microbial community in insects cadavers?

## What happens in microbial community in insects cadavers?

## Studying the outcome of these interactions

#### Xenorhabdus produces antibiotics:

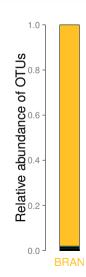

A way to dominate the community before transmission?

Two steps for a first exploratory approach:

- 1. **Create an experimental system** to control for the insect characteristics but with a 'natural' microbiota
- 2. Assess the **impact of the presence of the pathogen** on the bacterial community composition in the host cadaver

#### 1. Associating lab-reared *Tenebrio molitor* to 'natural' microbiota

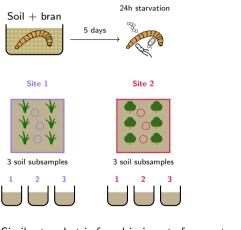

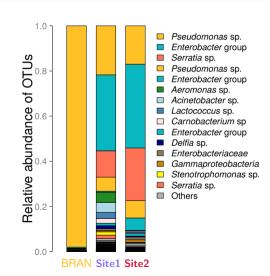

Pseudomonas sp.
Enterobacter group
Serratia sp.
Pseudomonas sp.
Enterobacter group
Aeromonas sp.
Acinetobacter sp.
Lactococcus sp.
Carnobacterium sp
Enterobacter group
Delfia sp.
Enterobacteriaceae
Gammaproteobacteria
Stenotrophomonas sp.
Serratia sp.

Others

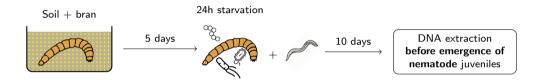

#### 1. Associating lab-reared *Tenebrio molitor* to 'natural' microbiota

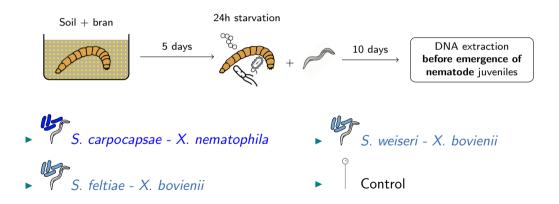

Similar to what is found in insects from natural environment (i.e. Wang and Rozen 2017)

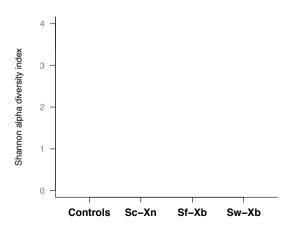

#### 2. Infection of insects by nematode-bacteria couples

#### 2. Infection of insects by nematode-bacteria couples

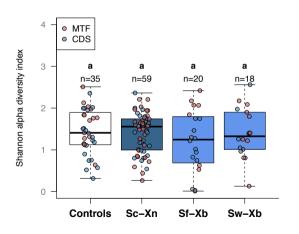

#### The presence of the pathogen does not reduce alpha diversity

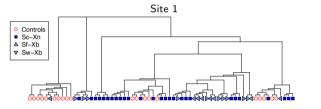

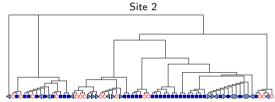

▶ If Xenorhabdus dominates the community we expect a decrease of alpha diversity...

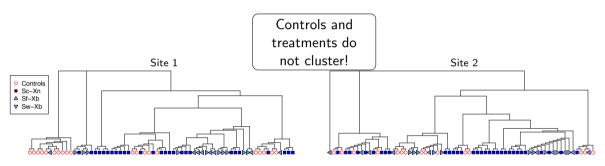

#### The presence of the pathogen does not reduce alpha diversity

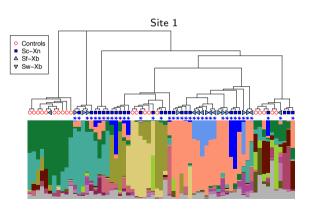

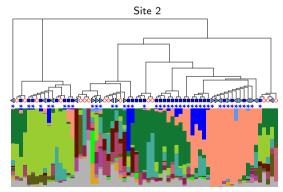

- If Xenorhabdus dominates the community we expect a decrease of alpha diversity...
- ...but diversity is low even in controls!

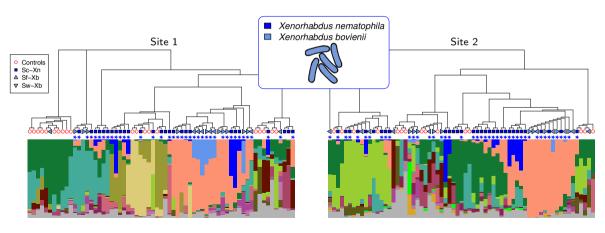

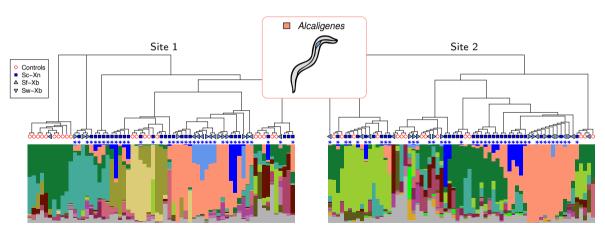

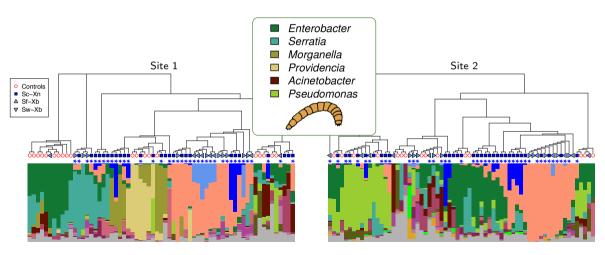

Before reassociation with the vector for transmission:

▶ Xenorhabdus is usually not dominant in the community

Before reassociation with the vector for transmission:

- ▶ Xenorhabdus is usually not dominant in the community
- ► Some other bacteria from the host microbiota or brought by the vector can be dominant

Before reassociation with the vector for transmission:

- ► Xenorhabdus is usually not dominant in the community
- ► Some other bacteria from the host microbiota or brought by the vector can be dominant
- ▶ The identity of the dominant bacteria is variable between individuals and site

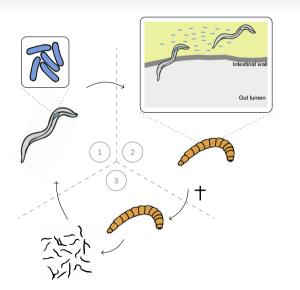

Before reassociation with the vector for transmission:

- ► Xenorhabdus is usually not dominant in the community
- ► Some other bacteria from the host microbiota or brought by the vector can be dominant
- ▶ The identity of the dominant bacteria is variable between individuals and site

#### Possible competition/facilitation?

Ongoing qPCR and network analysis

#### What consequences for *Xenorhabdus* transmission?

► Do nematodes reproduce when Xenorhabdus is not the dominant bacteria?

► If so, do they reassociate with *Xenorhabdus*?

#### Acknowledgments
