1 Introduction

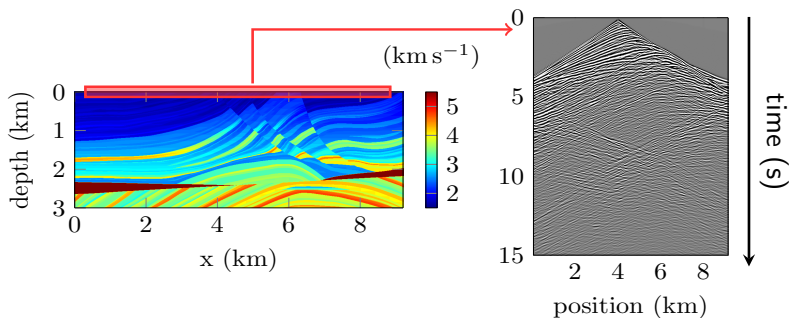

Seismic inverse problem

Reconstruction of subsurface Earth properties from seismic campaign: collection of **wave** propagation data at the surface.

Seismic data

We work with **back-scattered partial data** from **one-side** illumination on large domain.

Seismic data

We work with **back-scattered partial data** from **one-side** illumination on large domain.

Seismic data

We work with **back-scattered partial data** from **one-side** illumination on large domain.

Seismic data

We work with **back-scattered partial data** from **one-side** illumination on large domain.

Seismic data

Inverse problem: from seismic traces to subsurface?

nonlinear, ill-posed inverse problem.

Plan

2 Time-Harmonic Inverse Problem, FWI

Time-harmonic wave equation

We consider propagation in acoustic media, given by the Euler's equations, for the recovery of the medium parameters κ and ρ :

$$\begin{cases} -i\omega\rho\mathbf{v} = -\nabla p, \\ -i\omega p = -\kappa\nabla\cdot\mathbf{v} + f. \end{cases}$$

p : scalar pressure field,
 \mathbf{v} : vectorial velocity field,
 f : source term,

κ : bulk modulus,
 ρ : density,
 ω : angular frequency.

Time-harmonic wave equation

We consider propagation in acoustic media, given by the Euler's equations, for the recovery of the medium parameters κ and ρ :

$$\begin{cases} -i\omega\rho\mathbf{v} = -\nabla p, \\ -i\omega p = -\kappa\nabla\cdot\mathbf{v} + f. \end{cases}$$

p : scalar pressure field,

\mathbf{v} : vectorial velocity field,

f : source term,

κ : bulk modulus,

ρ : density,

ω : angular frequency.

The system reduces to the Helmholtz equation when ρ is constant,

$$(-\omega^2 c^{-2} - \Delta)p = 0,$$

$$\text{with } c = \sqrt{\kappa\rho^{-1}}.$$

Dual-sensors devices

The inverse problem aims the recovery of the subsurface medium parameters from surface measurements of pressure **and** normal (vertical) velocity:

$$\mathcal{F} : m = (\kappa, \rho) \rightarrow \{\mathcal{F}_p ; \mathcal{F}_v\} = \{p(\mathbf{x}_1), p(\mathbf{x}_2), \dots, p(\mathbf{x}_{n_{rcv}}); v_n(\mathbf{x}_1), v_n(\mathbf{x}_2), \dots, v_n(\mathbf{x}_{n_{rcv}})\}.$$

Full Waveform Inversion (FWI)

FWI provides a **quantitative reconstruction** of the subsurface parameters by solving a minimization problem,

$$\min_{m \in \mathcal{M}} \mathcal{J}(m) = \frac{1}{2} \|\mathcal{F}(m) - d\|^2.$$

- ▶ d are the observed data,
- ▶ $\mathcal{F}(m)$ represents the simulation using an initial model m :

Numerical methods

- ▶ Adjoint-method for the gradient computation,
- ▶ forward problem resolution with Discontinuous Galerkin methods,
- ▶ parallel computation, HPC, large-scale optimization,
- ▶ Rk: the code also works for **elastic** anisotropy and **viscous** media.

Plan

3 Reconstruction procedure using dual-sensors data

Minimization of the cost function

The appropriate misfit functional to minimize with pressure and vertical velocity measurements.

- Compare the pressure and velocity fields separately:

$$\mathcal{J}_{L2} = \sum_{source} \frac{1}{2} \|\mathcal{F}_p^{(s)} - d_p^{(s)}\|^2 + \frac{1}{2} \|\mathcal{F}_v^{(s)} - d_v^{(s)}\|^2.$$

Minimization of the cost function

The appropriate misfit functional to minimize with pressure and vertical velocity measurements.

- ▶ Compare the pressure and velocity fields separately:

$$\mathcal{J}_{L2} = \sum_{source} \frac{1}{2} \|\mathcal{F}_p^{(s)} - d_p^{(s)}\|^2 + \frac{1}{2} \|\mathcal{F}_v^{(s)} - d_v^{(s)}\|^2.$$

- ▶ Compare the fields multiplication for all combinations:

$$\mathcal{J}_G = \frac{1}{2} \sum_{s_1} \sum_{s_2} \|d_v^{(s_1)T} \mathcal{F}_p^{(s_2)} - d_p^{(s_1)T} \mathcal{F}_v^{(s_2)}\|^2.$$

G. Alessandrini, M.V. de Hoop, F. F., R. Gaburro and E. Sincich

Inverse problem for the Helmholtz equation with Cauchy data: reconstruction with conditional well-posedness driven iterative regularization

[preprint](#)

Minimization of the cost function

$$\mathcal{J}_{\mathcal{G}} = \frac{1}{2} \sum_{s_1} \sum_{s_2} \|d_v^{(s_1)T} \mathcal{F}_p^{(s_2)} - d_p^{(s_1)T} \mathcal{F}_v^{(s_2)}\|^2.$$

From Euler's equation, $v_n(\mathbf{x}_i) = -i(\omega\rho)^{-1}\partial_n p(\mathbf{x}_i)$.

Minimization of the cost function

$$\mathcal{J}_{\mathcal{G}} = \frac{1}{2} \sum_{s_1} \sum_{s_2} \|d_v^{(s_1)T} \mathcal{F}_p^{(s_2)} - d_p^{(s_1)T} \mathcal{F}_v^{(s_2)}\|^2.$$

From Euler's equation, $v_n(\mathbf{x}_i) = -i(\omega\rho)^{-1}\partial_n p(\mathbf{x}_i)$.

- **Cauchy data:** the cost function follows **Green's identity**.

Minimization of the cost function

$$\mathcal{J}_{\mathcal{G}} = \frac{1}{2} \sum_{s_1} \sum_{s_2} \|d_v^{(s_1)T} \mathcal{F}_p^{(s_2)} - d_p^{(s_1)T} \mathcal{F}_v^{(s_2)}\|^2.$$

From Euler's equation, $v_n(\mathbf{x}_i) = -i(\omega\rho)^{-1}\partial_n p(\mathbf{x}_i)$.

- ▶ **Cauchy data:** the cost function follows **Green's identity**.
- ▶ **Reciprocity gap functional** in inverse scattering.

Stability results

Lipschitz type stability is obtained for the Helmholtz equation with partial Cauchy data.

$$\|c_1 - c_2\| \leq \mathcal{C}(\mathcal{J}_{\mathcal{G}}(c_1, c_2))^{1/2}$$

Stability results

Lipschitz type stability is obtained for the Helmholtz equation with **partial Cauchy data**.

$$\|c_1 - c_2\| \leq \mathcal{C}(\mathcal{J}_{\mathcal{G}}(c_1, c_2))^{1/2}$$

- Using back-scattered data from one side in a domain with free surface and absorbing conditions,

- for piecewise linear parameters.

Additional possibilities

It allows the non-collocation of numerical and observational sources:

$$\mathcal{J}_{\mathcal{G}} = \frac{1}{2} \sum_{s_1} \sum_{s_2} \|d_v^{(s_1)T} \mathcal{F}_p^{(s_2)} - d_p^{(s_1)T} \mathcal{F}_v^{(s_2)}\|^2.$$

- ▶ s_1 is fixed by the observational setup,
- ▶ s_2 is chosen for the numerical comparisons.

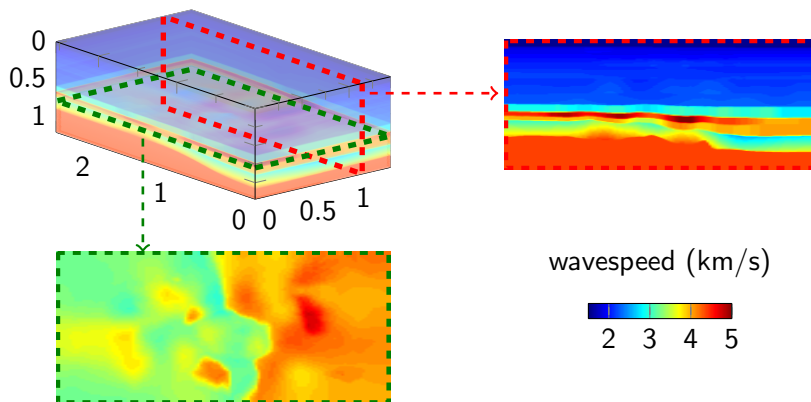

Plan

4 Numerical experiments

- Comparison of misfit functions
- Changing the numerical acquisition with $\mathcal{I}_{\mathcal{G}}$

Experiment setup

3D velocity model $2.5 \times 1.5 \times 1.2\text{km}$ using dual-sensors data.

Experiment setup

We work with time-domain data acquisition.

Experiment setup

We work with time-domain data (pressure and velocity).

Acquisition for the measures

- ▶ 160 sources,
- ▶ 100 m depth,
- ▶ point source,

For the reconstruction, we apply a Fourier transform of the time data.

Comparison of misfit functional

We respect the observational acquisition setup and perform the minimization of \mathcal{J}_{L2} or $\mathcal{J}_{\mathcal{G}}$, frequency from 3 to 15Hz.

$$\mathcal{J}_{L2} = \sum_{source} \frac{1}{2} \|\mathcal{F}_p^{(s)} - d_p^{(s)}\|^2 + \frac{1}{2} \|\mathcal{F}_v^{(s)} - d_v^{(s)}\|^2.$$

$$\mathcal{J}_{\mathcal{G}} = \frac{1}{2} \sum_{source} \sum_{source} \|d_v^{(s_1)T} \mathcal{F}_p^{(s_2)} - d_p^{(s_1)T} \mathcal{F}_v^{(s_2)}\|^2.$$

Comparison of misfit functional

We respect the observational acquisition setup and perform the minimization of \mathcal{J}_{L2} or $\mathcal{J}_{\mathcal{G}}$, frequency from 3 to 15Hz.

(a) True velocity

(b) Starting velocity

Comparison of misfit functional

We respect the observational acquisition setup and perform the minimization of \mathcal{J}_{L2} or $\mathcal{J}_{\mathcal{G}}$, frequency from 3 to 15Hz.

(a) Using \mathcal{J}_{L2}

(b) Using $\mathcal{J}_{\mathcal{G}}$

Comparison of misfit functional

We respect the observational acquisition setup and perform the minimization of \mathcal{J}_{L2} or \mathcal{J}_G , frequency from 3 to 15Hz.

But the major advantage of \mathcal{J}_G is the possibility to consider alternative acquisition setup.

Experiment with different obs. and sim. acquisition

$$\min \mathcal{J}_{\mathcal{G}} = \frac{1}{2} \sum_{s_1} \sum_{s_2} \|d_v^{(s_1)T} \mathcal{F}_p^{(s_2)} - d_p^{(s_1)T} \mathcal{F}_v^{(s_2)}\|^2.$$

Acquisition for the measures s_1

- ▶ 160 sources,
- ▶ 100 m depth,
- ▶ point source,

Experiment with different obs. and sim. acquisition

$$\min \mathcal{J}_{\mathcal{G}} = \frac{1}{2} \sum_{s_1} \sum_{s_2} \|d_v^{(s_1)T} \mathcal{F}_p^{(s_2)} - d_p^{(s_1)T} \mathcal{F}_v^{(s_2)}\|^2.$$

Acquisition for the measures s_1

- ▶ 160 sources,
- ▶ 100 m depth,
- ▶ point source,

Arbitrary numerical acquisition s_2

- ▶ **5 sources,**
- ▶ **80m depth,**
- ▶ **multi-point sources,**

- ▶ No need to know observational source wavelet.
- ▶ Differentiation impossible with least squares types misfit.

Experiment with different obs. and sim. acquisition

Data from frequency between 3 to 15 Hz, domain size $2.5 \times 1.5 \times 1.2$ km, **Simulation using 5 sources only.**

(a) True velocity

(b) Starting velocity

Experiment with different obs. and sim. acquisition

Frequency from 3 to 15 Hz, $2.5 \times 1.5 \times 1.2$ km,
Simulation using 5 sources only. -33% computational time.

(a) True velocity

(b) 15 Hz reconstruction

Plan

5 Conclusion

Conclusion

Seismic inverse problem using pressure and vertical velocity data:

- ▶ appropriate cost function to minimize,
- ▶ allow minimal information on the acquisition setup,
- ▶ other applications,
- ▶ **perspective**: design the most efficient numerical setup,
- ▶ Rk: possible for elastic media with measures of traction.

Conclusion

Seismic inverse problem using pressure and vertical velocity data:

- ▶ appropriate cost function to minimize,
- ▶ allow minimal information on the acquisition setup,
- ▶ other applications,
- ▶ **perspective**: design the most efficient numerical setup,
- ▶ **Rk**: possible for elastic media with measures of traction.

Quantitative reconstruction algorithm toolbox for time-harmonic wave,

- ▶ **Discontinuous Galerkin** discretization in HPC framework,
- ▶ large scale optimization scheme using back-scattered data,
- ▶ **acoustic, elastic, anisotropy, 2D, 3D, attenuation**.

P- and S-wavespeed reconstructions

Conclusion

Seismic inverse problem using pressure and vertical velocity data:
