

Resilience of *Colletotrichum gloesporioides* strains infecting yams to dry period and elevated temperature stresses

Sébastien Guyader

- The climate change is expected to have several effects in the Caribbean:
 - increase in temperatures (0.5 to 2°C)
 - increase in rainfall
 - increase in extremes (drier dry, wetter wet)
- This can be beneficial for yield
- But what about crop pests?

- The climate change is expected to have several effects in the Caribbean:
 - increase in temperatures (0.5 to 2°C)
 - increase in rainfall
 - increase in extremes (drier dry, wetter wet)
- This can be beneficial for yield
- But what about crop pests?
- Mostly modelling studies, concentrating on average trends
- But what about the resilience of pests to extremes?

Sébastien Guyader Resilience of C. gloeosporioides to abiotic stresses

Background Yam & anthracnose

- Yam (Dioscorea sp.) is an important tropical root crop
- Serves as staple food
- Has high market value

Sébastien Guyader

• Main constraints: weeds, pests

(a)

Background Yam & anthracnose

- Yam (Dioscorea sp.) is an important tropical root crop
- Serves as staple food
- Has high market value
- Main constraints: weeds, pests

Anthracnose : caused by Colletotrichum gloeosporioides

Symptoms are leaf blackening and shoot dieback

 \Rightarrow severe yield losses

Resilience of *C. gloeosporioides* to abiotic stresses

Background

The biology of C. gloeosporioides

Sébastien Guyader

Resilience of C. gloeosporioides to abiotic stresses

Background The biology of *C. gloeosporioides*

- Spores are dispersed through rain splashing
- Leaf wetness is necessary for spore germination
- Germinated spores produce an **appressorium**, allowing direct penetration of leaf tissues through cuticle

Sébastien Guyader

Background The biology of *C. gloeosporioides*

Background The biology of *C. gloeosporioides*

- Spores are dispersed through rain splashing
- Leaf wetness is necessary for spore germination
- Germinated spores produce an **appressorium**, allowing direct penetration of leaf tissues through cuticle

Importance of weather variables

- Rain and humidity \rightarrow spore germination \rightarrow infection
- **Temperature** \rightarrow fungus growth (infection and subsequent development)

Sébastien Guyader

Resilience of *C. gloeosporioides* to abiotic stresses

Assessing the resilience of the fungus to longer dry and hot periods

Subject spores to dryness (6 to 48h)

Sébastien Guyader

Resilience of C. gloeosporioides to abiotic stresses

Assessing the resilience of the fungus to longer dry and hot periods

- Subject spores to dryness (6 to 48h)
- Subject 1) spores and 2) mycelium to heat (36 to 40°C)

Sébastien Guyader

Resilience of *C. gloeosporioides* to abiotic stresses

Assessing the resilience of the fungus to longer dry and hot periods

- Subject spores to dryness (6 to 48h)
- Subject 1) spores and 2) mycelium to heat (36 to 40°C)
- Each time, put the fungus back to optimal conditions (wetness, temperature of 26°C)

Sébastien Guyader

Resilience of *C. gloeosporioides* to abiotic stresses

Assessing the resilience of the fungus to longer dry and hot periods

- Subject spores to dryness (6 to 48h)
- Subject 1) spores and 2) mycelium to heat (36 to 40°C)
- Each time, put the fungus back to optimal conditions (wetness, temperature of 26°C)

What did we measure

- Percentage of spores with appressoria (capacity of infection)
- Growth rate (mycelium)
- Measurements taken both during and following stresses

Sébastien Guyader Resilience of C. gloeospo

Resilience of *C. gloeosporioides* to abiotic stresses

Main results

- Spores can withstand dry conditions for up to 48h
- Spores are "dormant" while undergoing dryness
- Saturating humidity \cong wetness

A D > A A > A B > A B >

Discussion What do we get from that?

- It is important to investigate the effect of "extreme" weather variables, as the future weather conditions are uncertain, but will probably be more erratic
- In pests populations, some strains/races have a better resilience than others → we have to pay attention to the genetic diversity
- Pests have the potential to adapt
- It's hard to predict what will happen with regards to the effects of climate change
