HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

INTRODUCTION

3D printing or additive manufacturing (AM) now provides enormous freedom to design, manufacture and innovate in mechanical and biochemical engineering, design science, pharmaceutical industry, biotechnology, and even food. The literature on 3D printing technologies is booming, and with the immense potential applications unlocked by AM, a number of authors are even talking about a new industrial revolution. Even if uptake of AM in the food industry is far from obvious, there are nevertheless signs of an emerging trend for culinary applications tied to the 'food design' movement.

Our goal is to design foods with targeted functionalities by taking into account the main technology lock: Texturizing of meat products.

CONCEPTS

METHODS & RESULTS

A

Volumic Stream30 Pro MK2

B

Prusa i3: original printer and our new device

C

D

Bed temperature: 50 °C – Gel temperature: 60 °C
Needle diameter: 0.8 mm
Layer thickness: 0.2 mm

The new parts of the print head were designed using Autodesk® Inventor Pro 2018 software. The production of the parts was carried out using a commercial 3D printer type « Volumic Stream30 Pro MK2 ».

The Prusa i3 (Marlin) driver software was modified, using a text editor, to integrate the 2 extruders of the new head as well as the new displacement, temperature and extraction speed parameters of products.

The different printed parts are in PLA except the screws and gears which are in ABS-Kevlar. Two commercial syringes are used (content: 10mL).

Original post-processing system

Layer-by-layer heating with controlled depth according to a radiative process or using a laser beam. This system makes it possible to cook, dry, decontaminate the surface of the layers while preserving the thermosensitive nutrients.

The model food of our study is a gel based on animal proteins with known thermogelling properties. These proteins come from animal tissues little or poorly valued by the sectors.

CONCLUSION

The results obtained during the first tests on animal protein-based gels suggest wide possibilities of printing meat products for targeted populations of consumers (seniors, athletes, children and young adults). These foods of the future may be therapeutic or adapted to the consumption patterns of future generations of consumers.
