**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

## Introduction

### Context

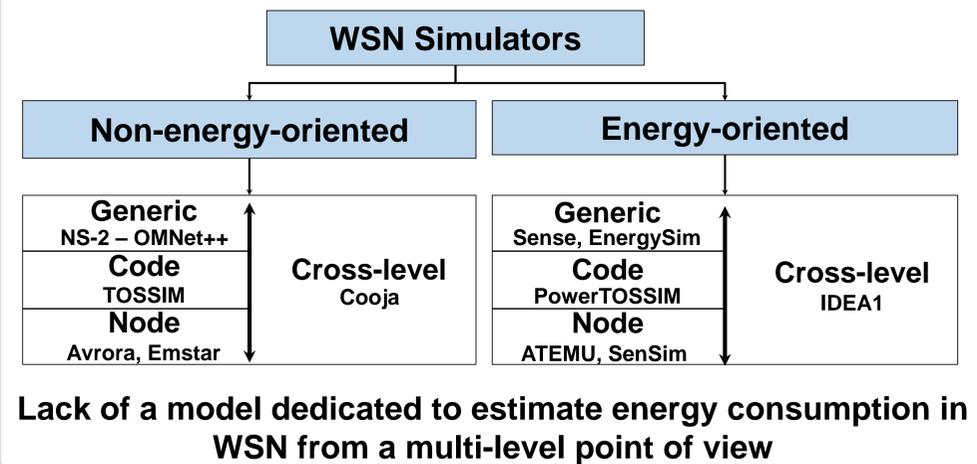

Node autonomy and energy efficiency: key issues in the WSN design

Information required about energy consumption for decision making in the design process

Need of energy model & simulator in this context of power-aware WSN design

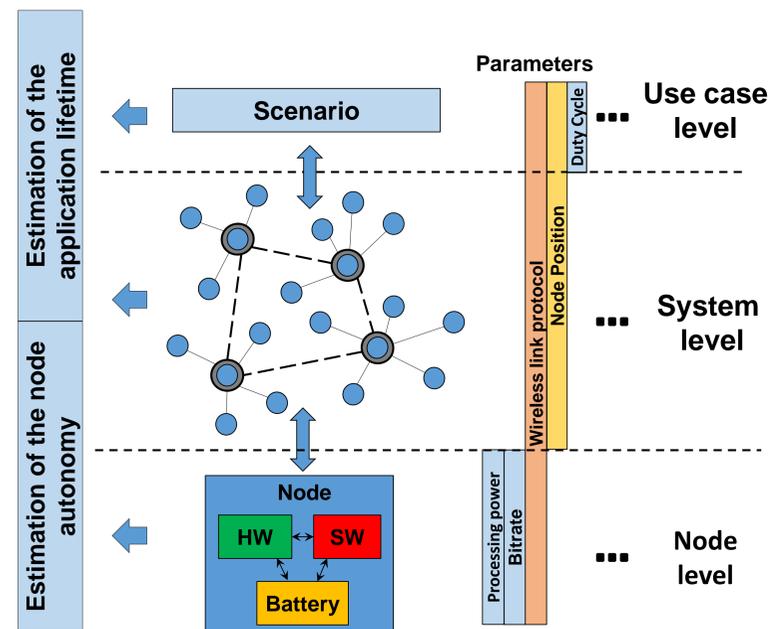

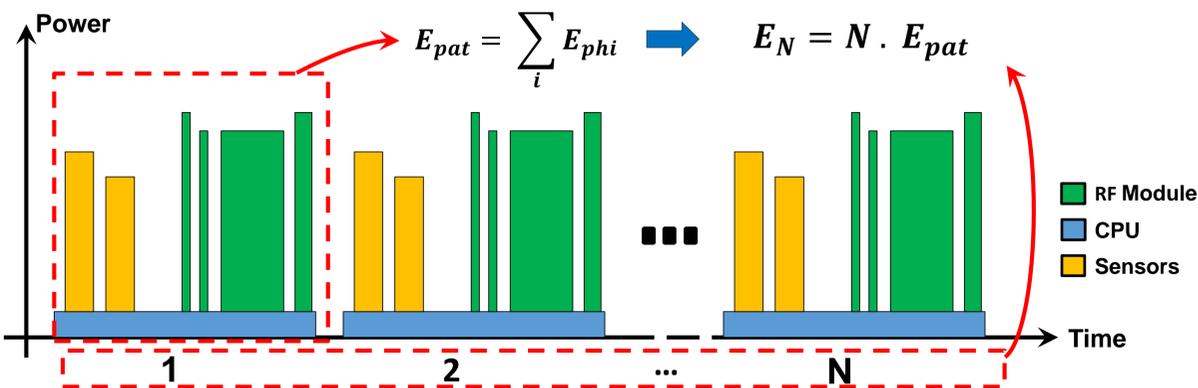

### WSN simulator classification survey

## Proposed cross-level energy model

### Our approach

- Cross-level energy model:** to evaluate several parameters impact at different levels on node energy consumption and network lifetime
- Pattern-based:** to reduce the overall simulation time → the node energy consumption is considered in an iterative way, defined as pattern
- Protocol-independent:** to ensure implementations of different wireless link protocols (e.g. 802.11a, 802.15.4 ... etc.)

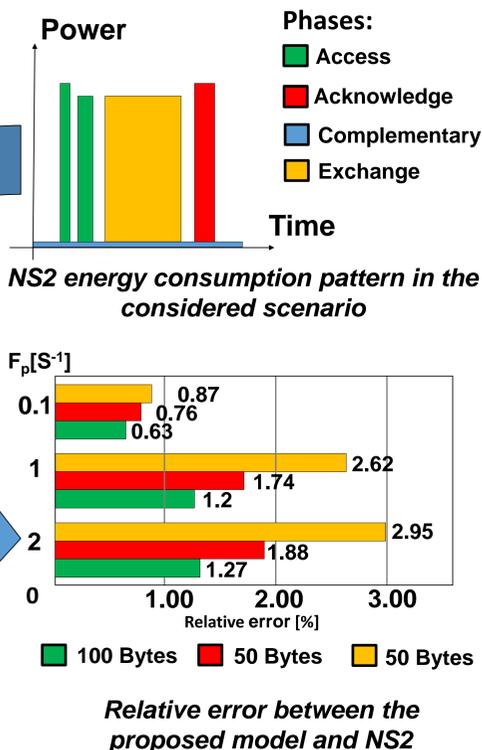

## Comparison with an existing energy model

### Comparison with NS2 energy model

Model	Payload Size	Consumed Energy (By phase) [ $\mu$ J]				Total
		$ph_{acc}$	$ph_{ack}$	$ph_{exch}$	$ph_{com}$	
NS2	10	18.88	39.07	152.8	59.7	270.4
Proposed model	10	18.89	39.07	145.7	59.7	263.4

Phase-based comparison of the energy consumption between the proposed model and NS2 with  $F_p = 1s^{-1}$

- In this comparison → Only RF energy consumption is considered
- Relative error < 3%

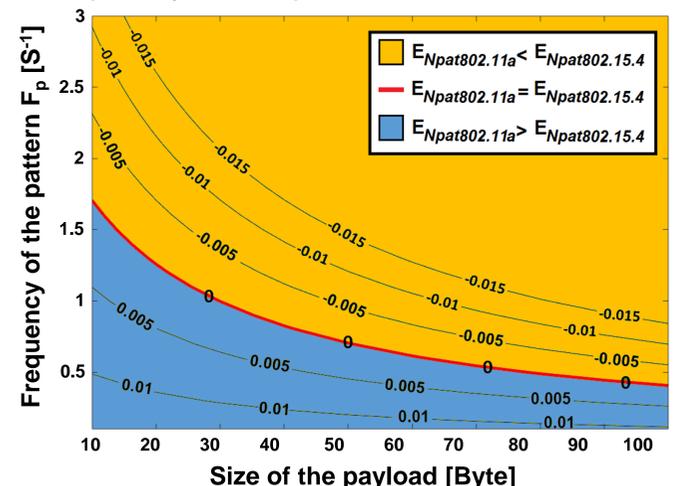

## Application of the proposed model

### Selection of Wireless link protocol

The most suitable wireless link protocol for a given scenario?

Capacity to analyse the impact of different parameters: the size of the payload, the bitrate, the frequency of the pattern...

## Future work

- Cross-level energy model implementation of the whole node (HW & SW)
- Proposition of an evaluative pattern concept for specific nodes (cluster head node...)
- Comparison with experimental results to validate the proposed model
- Use this model as a base to design a cross-level simulator

## Acknowledgement

The work presented has been financially supported by the Regional Council of New Aquitaine in the frame of the OUDINI research project.
